Congress proposed the Bill of Rights in 1789, which the states ratified in 1791. Similarly, states ratified the Eleventh Amendment in 1795, just two years after a Supreme Court decision in *Chisholm v. Georgia,* which had allowed out-of-state citizens to sue states without their consent and contrary to assurances that some Federalists had made during ratification debates.

Congress proposed the Twelfth Amendment in 1803, and the states ratified in 1804. Reacting both to presidential elections in which the president and vice president had been chosen from different parties and to the 1800 election in which Democratic and Republican presidential and vice presidential candidates tied, this amendment altered the electoral college mechanism so that electors began to cast separate votes for the top two offices.

POST–CIVIL WAR AMENDMENTS
The first twelve amendments suggested that the amending process was relatively easy, but subsequent experience proved otherwise. Despite rising tensions between the North and South, and numerous proposals for alterations that might head off conflict, Congress proposed only two amendments between 1803 and the Civil War (1861–1865), and both failed. The first would have disbarred individuals who accepted titles of nobility from citizenship, while the second would have exempted slavery from federal action.

The Civil War temporarily broke the amending logjam and resulted in the most consequential amendment in U.S. history. The Thirteenth Amendment (1865) prohibited involuntary servitude. The Fourteenth Amendment (1868) overturned the *Scott v. Sandford* (1857), by declaring that all persons,

including blacks, who were born or naturalized in the United States were citizens. It also guaranteed all such citizens the privileges and immunities of U.S. citizens and protections of due process and equal protection. The Fifteenth Amendment (1868) further prohibited voting discrimination on the basis of race. Supreme Court decisions, culminating in the doctrine legitimizing "separate but equal" treatments in *Plessy v. Ferguson* (1896), however, narrowed interpretations of the Thirteenth and Fourteenth Amendments, while states embraced poll taxes, literacy tests, and other devices that limited African American voting rights.

PROGRESSIVE ERA AMENDMENTS
The years from 1868 to 1913 marked a period of amendment stalemate, followed by another period of reform associated with the Progressive Era. The Sixteenth Amendment overturned the Supreme Court decision in *Pollock v. Farmers' Loan & Trust Co.* (1895), and allowed for a national income tax, while the Seventeenth Amendment provided for direct election of U.S. senators (previously chosen by state legislatures). The Eighteenth Amendment (1919) inaugurated national alcoholic prohibition, while the Nineteenth (1920) prohibited discrimination on the basis of sex. Significantly, the Seneca Falls Convention had called for such a right, which both the Fourteenth and Fifteenth Amendments had ignored, in 1848.

MODERN AMENDMENTS
Subsequent amendments have been largely inconsequential by comparison. The Twentieth Amendment (1933) shortened the so-called lame-duck service of the president and members of Congress after new elections. The Twenty-first Amendment (1933) repealed the Eighteenth. The Twenty-second Amendment (1951), adopted in the wake of Franklin D. Roosevelt's unprecedented election to four terms, capped future presidential service at two full terms or no more than ten years. The Twenty-third Amendment (1961) provided for representation in the electoral college for the District of Columbia while the Twenty-fourth (1964) prohibited the poll tax in national elections. The Twenty-fifth Amendment (1967) made provision for presidential disability, the Twenty-sixth (1971) provided for national voting at age eighteen, thus effectively negating the Supreme Court decision in *Oregon v. Mitchell* (1970), which had ruled that Congress could only legislate on this matter relative to national elections. Finally, the Twenty-seventh amendment, originally proposed as part of the Bill of Rights and limiting the timing of congressional pay raises until after intervening elections, was putatively ratified in 1992.

MANY ARE CALLED, BUT FEW ARE CHOSEN
Members of Congress have introduced more than twelve thousand amending proposals, most of which have been redundant. Congress has only proposed thirty-three by the required majorities, and the states have ratified only twenty-seven. In addition to proposals discussed previously, states have failed to ratify an amendment relative to congressional representation proposed with the original bill of rights, a child labor amendment, an amendment that would have granted

the District of Columbia voting representation in Congress, and a proposed equal rights amendment for women.

After comparing the U.S. amending process to those in eleven democratic nations that use a system of legislative supremacy to adopt constitutional changes—those in nine nations that have legislative supremacy with an intervening election; those in five nations that allow for an amendment referendum to bypass the legislature; and those in seven nations, including the United States, that *require* such a referendum or its equivalent in complexity—political scientist Donald Lutz found that the U.S. system was the second most difficult in the world behind Australia. Because the Constitution is interpreted capaciously, however, institutions of government, especially the courts, have been able to render many decisions that have adapted the constitution to changing times, short of formal amendments.

Constitutional Courts

Constitutional courts are judicial bodies that possess the authority to nullify or invalidate actions taken or laws enacted by governmental officials on the grounds that those actions or laws are violations of that country's constitution. This power of a court to authoritatively determine whether a legislative enactment or executive action is constitutional or unconstitutional is known as judicial review. The origin of judicial review is commonly considered to have come from the United States and the U.S. Supreme Court's landmark and politically critical decision in *Marbury v. Madison* (1803). It is in this case that Chief Justice John Marshall carved out this power of judicial review for the U.S. Supreme Court, even though the U.S. Constitution does not specifically enumerate this authority in the first place, nor does it attach such a power

as belonging to the federal courts or any other governmental actor. A variety of other nations have followed America's lead in placing this judicial check into their democratic governance structures, observed in the democratizing trends as manifested during the twentieth century—especially so after World War II (1939–1945) and in the post-1980s period.

CONSTITUTIONAL COURT STRUCTURES IN COMMON-LAW AND CIVIL-LAW COUNTRIES

The American orientation has been to give this function of constitutional adjudication to ordinary courts and to a supreme court—that is to say, they resolve disputes emanating from common law, statutory law, and the nation's constitution. However, the common practice seen in the contemporary era is for nations to construct special courts whose sole purpose and function is to engage in judicial review. These courts are called constitutional courts. Just under seventy nations now have such constitutional courts operating, and most of these nations make a point, unlike the United States, in directly establishing this authority of judicial review in their respective constitutions.

A clear pattern has emerged that shows that the U.S. form of judicial review—where ordinary courts possess judicial review authority; there are appellate courts in place to review lower court rulings; the supreme court serves as the court of last resort and final arbiter on these constitutional cases; and the dispute in question must be actual and concrete, not merely an hypothetical or abstract conflict—is often found in nations with common law backgrounds (e.g., Canada, Australia, Scandinavian countries, Pakistan, India, Burma, and a number of Latin American countries). Countries with a civil-law background are more likely to have a structure of constitutional courts separate from ordinary courts that decide constitutional cases and some of these countries allow these courts to produce advisory opinions on more abstract, less concrete disputes such as a proposed law in addition to resolving actual disputes arising from already enacted laws (e.g., Austria, France, Russia, Germany, Spain, and Italy).

DEBATE OVER THE PRIMARY PURPOSE AND FUNCTION OF CONSTITUTIONAL COURTS

In the European context of constitutional courts, the post–World War II constitutions of previously fascist states clearly stressed protections for fundamental human rights—constitutional courts would play a critical role in guaranteeing such rights and serving as a bulwark against the return of brutal autocrats. Thus, it has been argued that the overriding design of constitutional courts is to have them serve as inherently countermajoritarian institutions, working to ensure that the will of the majority would not and could not trample over basic liberties of the minority. In other words, the constitutional courts in their exercise of judicial review work to stabilize and temper forms of democratic governance. It is noteworthy that all of the postcommunist states in Eastern Europe after the fall of the Soviet Union in the early 1990s

ended up opting for a structure of constitutional courts, directly modeled from the German system.

A counterargument to this human rights protection contention is that constitutional courts have become popular due to the motivations of political elites and the accompanying incentive structures in their respective countries. As political actors in newly developing democracies deal with elections and the high probability that at some point they will not win an election and thus be out of power for a period of time, they are duly motivated to designate institutions (such as constitutional courts) to legitimately test, challenge, and potentially hinder public policy of the advantaged political opposition. In other words, constitutional courts are established instrumentally by political elites as they recognize and respond to the intrinsic electoral uncertainty associated with democratic procedures.

JUDICIAL SELECTION FOR CONSTITUTIONAL COURTS

The mechanisms used in the recruitment and selection of judges to serve on these constitutional courts varies. A common practice in these methods of appointment is to place some degree of insulation between these judges and external political influence, but at the same time try to provide a modicum of judicial accountability and responsiveness to the public. This captures one of the leading criticisms of constitutional courts: The appointment processes in place do not provide adequate levels of accountability for these judges. A variety of countries use methods that necessitate a sharing of this judicial appointment power between the executive and legislative branches, with the executive nominating the appointee and the legislature consenting or rejecting (a prime example of a checks and balances effort in the structure). Other more complex systems involve even more actors in selection process, such as all three branches (legislative, executive, and judicial) responsible for nominating a proportion of constitutional court judges. Additional recruitment iterations, albeit less common, involve a single entity, such as the chief executive, making the appointment. The typical normal tenure for a constitutional court judge is one nonrenewable term, commonly between six to nine years of service.

CONTROVERSIES

There are several inherent controversies with constitutional courts (as well as supreme courts) as they engage in judicial review. The first revolves around unelected, relatively politically unaccountable judges striking down and invalidating actions or measures taken by the people's elected representatives. With its judicial second-guessing, this antimajoritarian posture strikes some as problematically antidemocratic. The second controversy engages the challenging conundrum of how exactly these judges are supposed to go about interpreting their nation's constitution to help them decide whether a statute or governmental activity is truly unconstitutional. The ongoing debate between judicial activism and judicial restraint manifests directly in these types of questions. How much deference these judges should show the elected branches, and how close to the text of the constitution or to the specific intentions of the constitution's original writers these judges should cleave, remains uncertain.

Constitutional Democracy

A *constitutional democracy* is a form of representative, democratic governance, in which the constitution, or rule of law, is supreme. This type of democracy is premised on the doctrine of the separation of powers, resulting in a system of checks and balances. The separation of powers manifests through the constitutional authority that each branch of government exercises in checking and balancing the other branches of government. A constitutional democracy normally consists of three largely independent branches; the functions of each, however, do not operate in complete exclusivity. The executive branch is responsible for the administrative implementation of legislation; the legislature enacts and amends laws; and the judiciary interprets, and applies, the law based on precedence and legislative statutes. Each branch may be elected or appointed.

Constitutional democracies may be unitary, federal, or confederal, but most states are unitary. *Unitary states* are constitutionally governed as one single unit with authority stemming from a single legislature. In a unitary state, there may be subgovernmental units, but they are created and abolished by the central government. Any powers that subgovernmental units hold are granted and amended by the central government without the need for formal agreement from the subgovernmental units—a process known as *devolution*. A devolved state is unitary in nature, but the subgovernmental units have a great deal of autonomous decision-making authority, much like federal systems. Nevertheless, the subgovernmental units do not have any constitutional authority to override national legislation or to protect the powers they have been granted.

Federal governments consist of a central or national government alongside other autonomous legislatures, such as state

or provincial governments. These different levels of government are constitutionally recognized, with constitutionally enshrined legislative distribution of sovereignty. Areas of jurisdiction can be exclusive or concurrent, depending on the requirements laid out in the constitution. Classical federalism mandates that the levels of government are equal; there is no imbalance between the jurisdictional authorities of each level. In this way, the central government normally retains exclusive jurisdiction over matters that are of relevance to the nation as a whole, while the provincial or state governments deal with issues that are localized or regional in nature. However, this rarely occurs because federal constitutions are usually biased in favor of one level of government. *Confederal states* are rare and mirror federal governments quite closely in structure, albeit with most authority vested in peripheral government bodies, while the central government holds little power.

Centralization occurs when the majority of authority lies with the national government, whereas *decentralization* describes a system where the subnational legislative bodies hold significant jurisdictional powers. *Asymmetrical federalism* occurs when the different levels of government have imbalanced degrees of jurisdictional authority. *Fiscal federalism* stems from the devolution of power over revenue sources divided among the different levels of government, including management of any fiscal imbalances among governments.

If a legislative body acts outside of its jurisdictional authority, it is beyond the legal scope of the constitution, while legislation or statutes that are within jurisdiction are within this power. However, there are residual powers to consider in a federal system. These residual powers are areas of authority not explicitly assigned in the constitution, which are comprehensively granted to one level of government.

In federal systems, there may be additional orders of government, such as local governments, but these are usually not given explicit constitutional jurisdiction. Instead, they are often creatures of the subnational governments, serving the needs and interests of specific cities, communities, or neighborhoods. Powers may include taxation and other limited autonomy granted by the constitutionally recognized levels of government.

Some federations are multinational in scope, including national minority populations within the federation. Canada is an especially useful example of a multinational state, most notably with regard to its francophone and indigenous peoples. Very basically, in the provincial context of Quebec, extensive autonomous governing authority, rooted in historical and cultural distinctiveness, has been recognized and ensured to protect Francophone culture. While the same progress is not evident for indigenous peoples in Canada, there has been implied judicial and explicit governmental acknowledgment of Aboriginal governance. While the Canadian constitution does not explicitly lay out a third order of Aboriginal governance, as would have been the case had the 1992 Charlottetown Accord been successfully ratified by the Canadian public, several governance agreements have been implemented, or are currently being negotiated, including some jurisdictional authority for indigenous communities.

Constitutional Law

From a formal point of view, constitutional law is a normative fountain from which all other secondary norms are derived. In a pure theory of law, a constitution is the fundamental norm of the state. It represents simply the basic authorizing norm of a legal system, being at the top of a coherent and hierarchical order, as described by legal philosopher and international jurist Hans Kelsen in his various works during the 1960s. Constitutional rules are often collected in a written chart, especially in countries with Roman legal tradition, characterized by a clear distinction between constitutional law and other branches of law. Yet, the presence of a code is not an essential element: As Italian political scientist Giovanni Sartori observed in 1962, although most countries have a constitutional text, only a few of them have a form of constitutionalism.

To understand such a key point—and paradox—the formal interpretation of constitutional law is not enough. Turning to a functional perspective, only the idea of restriction of powers connotes the specific function of constitutional law. First, modern constitutions interpret the liberal aspiration to protect citizens against the arbitrariness of political powers: They limit political power by defining rules of its exercise, and according to Samuel E. Finer in *Five Constitutions*, regulate "the allocation of functions, power, and duties among the various agencies and offices of government, and define the relationships between these and the public" (15). Starting from the eighteenth century, the presence of a *garantiste* component characterizes constitutional law on the basis of its *telos:* the constitution "guarantees" itself to the citizens by providing a frame of government and the institutional devices that would structure its observance. Modern constitutionalism is new in the sense that in any state in which the will of the government has no check upon it from the constitution, there is in reality no constitution, and that state is in fact a despotism, as explained by Charles H. McIlwain in his 1940 book *Constitutionalism: Ancient and Modern.*

Procedural conception of constitutional law has emphasized, especially in the new world, the definition of a system of separate institutions competing for powers. According to

the U.S. Founders, any bill of rights represents a question to be inserted in a moral treatise more than a constitutional concern—the most important part of a constitution has to be found in its organization of powers. The Framers tried to contrast centrifugal tendencies in American political structure by embracing ideas of separation of powers, picked from Scottish philosopher David Hume and French Enlightenment thinker Montesquieu, and connected with a new conception of federalism adapted for a wide-ranging republic. In their view, a constitution had to pursue two objectives: the first one was to draw up a structure of government that could serve to protect people from government—from the danger of a tyranny of the majority in legislature; the second one was to protect people from themselves.

Only after the eruption of masses in politics, the twentieth-century constitutions acquired more focus on democratic rights. As charters superior in rank to ordinary law, they have come to represent a framework of citizen rights and duties, asking what democratic states ought to be doing and how they should design political institutions to make legitimate choices. Such second-generation democratic constitutions seem to move away from a solely pragmatic constitutional vision by including more ample declaratory preambles stating a true political manifesto for democratic states. However, the marriage between constitutionalism and democracy has been considered one of the most delicate arrangements in the modern world. As Walter F. Murphy noted in a 2001 article, a union between constitutionalism and democracy constantly endures tension because it brings together the notion that the people should rule through their freely chosen representatives, with the prescription that if the people govern, they should not govern too much. Even according to some scholars, such as Jürgen Habermas and William Rehg, constitutional democracy denotes a paradoxical union of contradictory principles, as in the idea that a "rule of law" comes on the scene alongside and together with popular sovereignty.

Constitutionalism, then, is always a difficult balance between allocation of sovereignty and limits in absolute discretion—a delicate equilibrium since constitutions are not fixed and immutable. As historical products, they adapt to their environment and reflect shifts in political forces of the states to which they refer. Any constitutional charter contains emendatory rules that permit modification of its contents. Furthermore, in addition to standard emendatory procedures, constitutional law is modified in another and probably more relevant way. Many scholars, such as Italian constitutional law scholar Costantino Mortati in 1940, have referred to the concept of *living constitution* or *material constitution* to describe how sociopolitical actors may partly drift away from static constitutional norms with no formal changes. If a constitution limits and regulates powers, political forces continuously redefine rules by interacting with each other and interpreting their own times. So, another paradox joins the concept of constitutional law: If it serves to provide regularized, and predictable, restraints upon those who exercise political power, it may also be shaped by concrete dynamics of power.

Constitutional Monarchy

Constitutional monarchy is a type of government in which a sovereign can rule under the limits of a constitution. The text of the constitution or its principles limit the sovereign power, and subsequently, government ministers formulate parliamentary acts and assume responsibility for the government. However, the sovereign has to sign these acts, and constitutionally, they are considered to be acts of the sovereign, which is politically neutral authority. Aligned with the idea that "the king can do no wrong," in a constitutional monarchy, the sovereign still keeps some ceremonial and formal powers (e.g., nomination of a prime minister or dissolution of parliament), as well as prerogative powers. The most important of the sovereign's rights are the following: the right to be consulted, the right to encourage, and the right to warn (from Walter Bagehot's "trinity of rights").

ORIGINS OF THE CONSTITUTIONAL MONARCHY

Constitutional monarchy developed from ancient and medieval types of monarchy; according to Aristotle's classification

of states, the *monarchy* is "the good government by one." Generally, this type of governing is based on the premise of *paternalism,* the notion that a benevolent ruler is needed to care for the subjects of the kingdom. Monarchies have reflected the importance of conservatism and continuity in governance and in the institutions of a society and culture. In addition, monarchies have generally emphasized the importance of religion, with the monarch an agent of God, legitimized by the deity. Before the period of democratization, there were two types of European monarchies. The first was the *aristocratic monarchy* (e.g., feudal monarchy; it did not give the sovereign absolute power but only limited power regulated by the power of noblemen). The second was the *absolute monarchy,* which allowed kings to use nonregulated power. Absolute monarchy described, first, the European monarchies such as France and Spain from the sixteenth to the eighteenth centuries and later on included Prussia, Russia, and Austria. Nevertheless, none of these monarchies were really absolute; in all there were some limits to the king's power, mostly based on custom.

The division of powers characteristic of constitutional monarchy developed in connection with the emergence of the modern state in the seventeenth century in France (e.g., the centralized state with a well-defined territory and powerful governmental authority). In Britain, the absolute monarchy was introduced under the Tudor dynasty (Henry VIII and Elizabeth I); none of these monarchs were entirely absolute in authority, however, because they had "great regard for parliamentary conventions." During the English Civil War (1642–1651), the monarchy was abolished. Parliament technically ruled supreme, although, in reality, Oliver Cromwell ruled as the country's dictator. The monarchy was restored in 1660 after Cromwell's death, but the growing power of the king sparked the Glorious Revolution of 1688. From then on, under Britain's constitutional monarchy, the king was, and the sovereign still is, subordinated to the principles of a constitution (or constitutions, in other European monarchies). This means that Parliament, especially the House of Commons, shares the legislative power with the sovereign power and House of Lords.

With the development of the philosophy of rationalism, monarchy was justified by what was seen as its natural role as a governing institution, reflected in both history and tradition. This view was held until the period of democratization in the nineteenth century. According to Richard Rose and Dennis Kavanagh, there are two prerequisites that give monarchy a chance to function with democratic institutions: "the readiness" of the reigning family to withdraw from active politics (e.g., the willingness to self-impose these restraints) and, at the same time, "the repudiation" of its members from influence on politics without needing to reduce the symbolic role of the sovereign.

DEMOCRACY AND THE MONARCHY

In a democratic system with a hereditary monarch, the role of the king or queen is nonpolitical (e.g., it is symbolic and ceremonial; the sovereign is a head of the state, a symbol of national unity, continuity, and tradition). According to Vernon Bogdanor, during the twentieth century, the sovereign's constitutional power was reduced step by step in a number of areas critically important to the constitution, but the sovereign still kept a vast number of prerogative powers. The sovereign still holds a few formal executive powers that allow, for example, naming—but not choosing—the head of a cabinet who is not politically responsible to the sovereign but to the directly elected parliament. Nevertheless, decisions about government formation are left to politicians, so the sovereign plays no active role in them. The sovereign can use the granted power to appoint ministerial officeholders on the recommendation of the prime minister, too; the sovereign is politically nonresponsible but acts on the advice of the ministers, who are willing to assume responsibility for the sovereign's acts. The sovereign is inviolable, too, and can exercise influence by using, according to Bagehot, "the rights to be consulted"; for example, consultations were an important point of the political game in the United Kingdom during the second half of the twentieth century. The sovereign in all constitutional monarchies can dissolve the parliament (on request), and also has some power that can be used in a constitutional emergency. Other important powers of the sovereign include: nominating judges (in cooperation with the executive), directing the armed forces, declaring war, making treaties, and regulating the civil service.

Constitutional monarchy in democratic states can survive only when monarchs accept their limited powers based on the constitutional text. Currently, there are only a few democratic constitutional monarchies in Europe: the United Kingdom, Spain, Sweden, Denmark, Norway, the Netherlands, Belgium, Luxembourg, and Liechtenstein; there are also a few outside Europe, such as Japan. The influence of sovereigns in these countries differs according to historical circumstances. For example, in Scandinavia the sovereigns and their families are very popular because they stress egalitarianism over many of the ancient symbols of royalty and wealth; Richard Rose mentions that they are popularly called "bicycling monarchs." Spain, on the other hand, is unique among contemporary constitutional monarchies: after Francisco Franco's death, new political leaders accepted the politically well-balanced role of Juan Carlos in transition to democracy and gave a way to restoring monarchy instead of introducing a republic. Another, rather specific case in the contemporary world is the British Commonwealth, an association of free, independent states (mostly republics) like Canada, Australia, and India. The nominal head of this postcolonial international association is the English sovereign, whose symbolic role was accepted by a free decision of democratically elected leaders of these previous British dominions, contrary to the hereditary character of this post in the United Kingdom.

Constitutional Systems, Comparative

COMPARATIVE CONSTITUTIONAL SYSTEMS

Most countries of the world have written constitutions establishing basic rights and regulating the relationships between public offices, and between these public offices and the public. During the late middle ages and early modern times, constitutions were mainly devices for establishing local, sectoral, or individual rights and limiting powers. But as those old powers to be limited were autocratic, constitutionalism almost naturally advanced with the expansion of suffrage rights and democratization. Nondemocratic constitutions are still relatively abundant in some parts of the world. As of 2005, of the 126 independent countries with information on their constitutional laws collected, only 62 percent were considered "electoral democracies"—and only 46 percent were called "free" countries, according to separate data lists provided by Axel Tschentscher and Freedom House. But the number of constitutional democracies rose enormously during the last quarter of the twentieth century, encompassing for first time a majority of total world population by 1996. (Major exceptions are China, the Arab region, and the Middle East.) Thus, constitutionalism has been increasingly linked to democratization.

MIXED CONSTITUTIONAL MONARCHY

A traditional constitutional model was a *mixed monarchy*, which united a one-person, nonelected monarch with executive powers and a multiple-person, elected assembly with legislative powers. This type of regime had already existed in certain medieval kingdoms in Europe in which an elected parliament limited the king's powers. It also existed in the German Empire, where the emperor was elected by the representative Diet, and in the Christian Church, where the pope shared powers with councils. The modern constitutional formulas of a mixed regime were formally shaped in England following the revolution of 1688 and in France by the constitution of 1791. They were replicated during the nineteenth century in monarchies such as those of Austria, Belgium, Brazil, Germany, Norway, Portugal, Spain, and Sweden. In more recent times, similar formulas have been adopted in some Arab monarchies, such as Jordan and Morocco.

With broadening suffrage and democratization, the nonelected monarch's powers were reduced, while those of the elected assembly expanded, especially regarding the control of executive ministers, thus moving towards a parliamentary regime. The powers of the one-person monarch were largely transferred to the prime minister elected by the parliament. In recent times, there are parliamentary regimes in about half of the democratic countries in the world. Some of these regimes are British-style monarchical variants, such as Australia, Belgium, Canada, Denmark, Japan, the Netherlands, New Zealand, Norway, Spain, and Sweden. Others are of the republican variant, such as Austria, Czech Republic, Estonia, Finland, Germany, Greece, Hungary, India, Ireland, Italy, Latvia, Slovakia, Slovenia, South Africa, and Switzerland.

CONSTITUTION WITH ELECTED CHIEF EXECUTIVE

In another democratic formula that originated with the 1787 constitution of the United States, it is not only the multiple-person legislative assembly that is popularly elected but also the one-person chief executive. In the United States, the nonelected English monarch ceased to be recognized and was replaced with an elected president with executive powers. (At the time, the monarch of England was actually already highly dependent on parliament's decisions.) This model of political regime implies separate elections for the chief executive and the legislative branch, divided powers, and checks and balances among the presidency, the House, the Senate, and the Supreme Court. The basic formulas of the U.S. Constitution have been replicated in a number of Asian countries under American influence, including Indonesia, South Korea, the Philippines, and Taiwan.

A variant usually called *presidentialism* emerged in almost all twenty republics in Latin American since the mid- or late nineteenth century. Some founding constitution makers in countries such as Argentina, Brazil, Chile, Colombia, Costa Rica, Mexico, Peru, Uruguay, and Venezuela claimed to be imitating the U.S. Constitution, but they were also influenced by the presidential Second Republic and the Second Empire in France. Some of them looked farther back to the absolutist monarchies that preceded mixed regimes and division of powers and aimed at having "elected kings with the name of presidents" (in Simón Bolívar's words). Instead of checks and balances, most Latin American constitutions promoted or favored high concentration of power in the presidency. Similar features can be observed in a number of postcolonial republics in East and Southern Africa.

DUAL-EXECUTIVE REGIMES

After World War I (1914–1918), Finland and Germany experimented with a different variant of political regime with separate elections and divided powers—usually called a *semipresidential* or *dual-executive regime*. This variant was more consistently shaped with the 1958 constitution of France. With this formula, the presidency and the assembly are elected separately, as in a checks-and-balances regime, but it is the assembly that appoints and can dismiss a prime minister, as in

a parliamentary regime. The president and the prime minister share the executive powers in a *governmental diarchy*. Similar constitutional formulas have been more recently adopted in a few countries in Eastern Europe, including Lithuania, Poland, Romania, Russia, as well as in a few countries in Africa.

RECENT TRENDS

Recent trends favor democratic constitutional formulas permitting relatively high levels of social inclusiveness, political pluralism, policy stability, and democracy endurance. Actually, almost no new democracy established in the world during the broad "third wave" of democratization starting in 1974 has adopted the British-style constitutional model of parliamentary regime with majoritarian electoral rules and single-party cabinets. Of the democratic countries with more than one million inhabitants, fewer than one-sixth use parliamentary constitutional formulas with a majoritarian electoral formula, while more than one-third are parliamentary regimes with proportional representation electoral rules and multiparty coalition cabinets, and about one half are checks–and–balances regimes or its presidentialist and semi-presidential variants.

Constitution Amending Procedures

From early Greek history, as scholar Melissa Schwartzberg has observed, democracies were associated with constant legal change. Like legislation, constitutions also require change as circumstances alter and as flaws reveal themselves.

TYPES OF AMENDING PROCESSES

Formal amending processes emerged in America with the birth of written constitutions. Although less than 4 percent of modern nations with written constitutions lack a constitutional amending process, the processes vary widely and require varying levels of difficulty. Donald Lutz divided such constitutions into four progressively more difficult categories. Parliamentary systems with written constitutions such as Austria, Botswana, Brazil, Germany, India, Kenya, Malaysia, New Zealand, Papua New Guinea, Portugal, and Samoa allow a single vote of the national legislature to enact such changes. Nations such as Argentina, Belgium, Columbia, Costa Rica, Finland, Greece, Iceland, Luxembourg, and Norway require at least two votes of the legislature with an intervening election. Chile, France, Italy, Spain, and Sweden permit bypassing the legislature through a referendum, whereas Australia, Denmark, Ireland, Japan, Switzerland, the United States, and Venezuela require a referendum or its equivalent. Lutz's research, on both national constitutions and on U.S. state constitutions, shows that longer documents are amended more frequently than shorter ones. Documents that are difficult to change also promote higher levels of judicial interpretation.

A convention of delegates from the states authored the U.S. Constitution. This distinguished the founding of United States from ancient states where laws had been created by a single lawgiver and were sometimes considered inviolate, and from those, like Great Britain, which traced its origins to a more continuous series of immemorial customs and usages that could be changed by new ones.

CONSTITUTIONAL MECHANISMS

Amending processes seek to promote deliberation and reflect consensus; federal systems also provide input for national and subnational actors. In the United States, for example, these goals are reflected in the mechanisms that Article V of the U.S. Constitution established for proposing and ratifying amendments. Two-thirds of the state legislatures under the Constitution have never yet requested that Congress call a convention to propose amendments. Instead, two-thirds majorities in both houses of Congress have proposed all twenty-seven U.S. amendments. They have all been ratified by three-fourths of the states, acting in all cases but one through their legislatures.

ENTRENCHMENT CLAUSES

Some constitutions attempt to entrench certain institutions or values against regular alteration. Article V of the U.S. Constitution, for example, prohibits any state from being deprived of its equal representation in the U.S. Senate without its consent. The U.S. Constitution does not mention any other substantive limits on the process, but courts in some countries—India and Germany, for example—have struck down some proposed constitutional changes as inconsistent with the document as a whole, and hence "unconstitutional."

JUDICIAL DECISIONS RELATIVE TO THE AMENDING PROCESS

Kemal Gozler has observed that the Turkish constitutions of 1961 and 1982, the Chilean Constitution of 1980, and the Romanian Constitution of 1991 specifically empowered constitutional courts to review the content of constitutional amendments, whereas others are silent on the subject. The

U.S. Supreme Court has never invalidated an amendment on the basis of its substance, and since *Coleman v. Miller* in 1939, the Court has generally deferred to Congress in ascertaining whether amendments have been legitimately ratified.

Constitutions, Unwritten

An *unwritten constitution* is the body of legislation, rules, regulations, and common law recognized by legislators, executives, and courts as the binding laws that legitimize, guide, and limit a government's powers and authority as well as the public's rule of law. With an unwritten constitution, the body of laws are not enumerated within a single, formal document as witnessed in Israel, New Zealand, and the United Kingdom. Unlike a written constitution, an unwritten constitution is modified gradually, changing by accretion of new laws, often in response to the evolving needs and environment of its sovereign state. Of note, there are numerous statutes of an unwritten constitution that do exist in written form, causing some to prefer the term *uncodified constitution*, on the premise so much of these unwritten constitutions have been documented but not itemized. For example, the United Kingdom's Houses of Parliament have the ability to approve an act of Parliament, which is a specific primary written piece of legislature serving as an addendum to previous laws or establishment of an entirely new law.

A primary trait of the unwritten constitution is the flexibility by which these constitutions have to effectively adopt new statutes or modernize existing legislature addressing emerging political prerogatives. Governments ruled by unwritten constitutions do not typically have sovereign executives or legislators with constitutional supremacy; therefore, the political, legislative, and civic institutions grew up together as the result of continuous adaptation and accretion of customs rather than abiding to a deliberate, static set of limited powers. There is no singular institution designed specifically to control the principles and implementation of legislation as demonstrated by the U.S. Supreme Court, which not only is the highest appeals court but is responsible for upholding judicial review and the system of checks and balances on congressional and executive powers. Moreover, an evolutionary democratic system based on an unwritten constitution does not mean a flexible constitution equates to unstable governance as demonstrated by the United Kingdom. Stability prevails in this system by depending on the people's feeling about the fundamental political values the legal system ought to honor.

From a constitutional perspective, the U.K. unwritten constitution is a special case of combining legal and nonconventional rules that provide the framework of government and dictate the behavior of the main political institutions. Juridical supremacy is practiced among all the supreme powers of the state, to include the Crown, Parliament, and cabinet, which can modify or abrogate British constitutional institutions and rules. This parliamentary supremacy and sovereignty in lawmaking make it difficult to distinguish between laws considered to comprise the original unwritten constitution and those laws that have gradually become part of it. Many contemporary political scientists even question the possibility to enumerate the exact number of constitutional laws embodied in the British unwritten constitution.

CASE STUDY: UNITED KINGDOM AND THE EVOLUTION OF AN UNWRITTEN CONSTITUTION

The historical and political genesis of the United Kingdom's unwritten constitution is based on a gradual development of British parliament. This legislative institution grew out of the king's council (*curia regis*), in which the monarch originally consulted with the great magnates of the realm and later with commoners who represented the boroughs and shires. The locus of power in the constitution shifted gradually as a result of changes in the political and interest groups whose consent the government required in order to be effective. Parliament was, and is, a place in which to debate specific issues of disagreement between the Crown, on the one hand, and Parliament (the House of Commons and the House of Lords), on the other. The conflicts were settled in Parliament so that its original main function was that of a court (the High Court of Parliament during the sixteenth century). During the eighteenth century, the powers of the government passed more and more into the hands of he king's first minister and his cabinet, all of whom were also members of one the houses of Parliament. According to Marshall's *British Constitution,* an evolution of the constitution occurred when the transfer of prerogative powers from the Crown was given to the Crown's ministers in a way in which the Crown acted on advice about its executive

functions. Today's parliamentary sovereignty originated from the powers of the king to make and approve law.

According to prevailing interpretations of the United Kingdom's unwritten constitution, the constitutional laws gradually incorporated significant and historical documents, including: Magna Carta Libertatum (1215), which is considered the founding step in evolution of parliamentary sovereignty; Petition of Right (1628); *Habeas Corpus* Act (1679); Bill of Rights (1689); electoral laws (1832, 1867, 1874, 1918, 1928, 1969); as well as laws transferring the power from the House of Lords to the House of Commons (1911 and 1949; the 1999 House of Lords Act eliminating Hereditary Peers for the House of Lords); and, recent devolution laws (considering Scotland, Wales, and Northern Ireland).

Moreover, this constitution embodies conventions that, according to Dicey's publication Introduction to the Study of *Law of the Constitution,* could be interpreted like "rules intended to regulate the exercise of the whole of the remaining discretionary powers of the Crown." However, the constitutional conventions do not have authoritative interpretations and the individual convention can be challenged by fresh arguments based on the interpretation of the precedence supporting them. Thus, the U.K. constitution includes the books of authority, for example Blackstone's *Commentaries on the Law of England*, which are commentaries and interpretation of the most prestigious jurists.

Constitutions and Constitutionalism

A *constitution* is a set of basic rules for making collective decisions. Rules producing enforceable decisions can solve coordination and cooperation dilemmas, which may induce individuals to prefer constraining rules to settings in which every human interaction should be adjusted independently. However, different rules may favor different decisions with differently distributed benefits among individuals and groups.

TWO CATEGORIES OF CONSTITUTIONAL RULES

Two categories of constitutional rules can be distinguished: (1) those to regulate the division of powers among the various branches of government, and (2) those to define the relationships between these branches and the public, which in democracy are based on elections. Regarding the first category, virtually all the political regimes in world history have been based on a one-person office combined with multiple-person offices. The rationale for this is that, while a one-person institution may be highly effective at decision making, a few person council may be more capable of collecting information and deliberating, and a large assembly can be representative of different interests and values in the society and able to organize consent and facilitate the enforcement of decisions.

In classical political theory (as elaborated most prominently by Aristotle), the distinction between the rule of one, the few, or the many was sufficient to define basic types of political regime, such as monarchy, aristocracy, and democracy. In modern times, an analogous distinction can be made between dictatorship, semidemocratic regimes (typically holding multiple-candidate elections with restrictions on suffrage or on the offices submitted to electoral results), and democracy. Within democracy, the rules of one, the few, and the many—would correspond to the institutions of one-person prime minister or president, the few—member cabinet, and the many—member assembly. The relationships between these institutions define different types of democratic regime, as discussed in the following paragraphs.

The second category of constitutional rules mentioned above regulates the relationships between public officers and citizens by means of elections, which makes the classification of democratic regimes more complex. In particular, we can distinguish electoral systems based on simple plurality or absolute majority rule, which produce a single absolute winner and favor the concentration of power, and those using proportional representation rules, which are associated to multiparty systems and coalition governments.

TYPES OF CONSTITUTIONAL REGIME

PARLIAMENTARY CONSTITUTIONAL REGIMES

The parliamentary regime resulted historically from the process of enhancing the role of the elected assembly and limiting the monarch's powers. According to the English or *Westminster model*, parliament became the sovereign institution, also assuming the power of appointing and dismissing ministers, while the monarch remained a ceremonial although nonaccountable figure. The Third French Republic established in the late nineteenth century was the first democratic republic with a parliamentary regime. This type of regime produces political congruence between the legislative and the executive and some "fusion" of institutional powers.

Specifically, in parliamentary regimes with majoritarian electoral rules, a single party, even with a minority electoral support, usually can find sufficient institutional levers to win an assembly majority, appoint the prime minister, and form a government. In these situations, power tends to concentrate in the hands of the prime minister, which led to an interpretation of the development of political parties as a force eroding

the central role of the parliament. In constitutional studies in the early twentieth century, the British model was provocatively labeled a "cabinet" of a "prime minister" regime, rather than "parliamentary." However, it has more recently been remarked that the growth of party was instrumental to reduce the influence of the monarch but not necessarily that of parliament. With the reduction of the monarch to a figurehead, the prime minister has indeed become the new one-person relevant figure, while the position of the cabinet has weakened. Still, the role of parliament has survived, and even, in a modest way, thrived.

The central role of parliament is more prominent in parliamentary regimes with proportional representation electoral rules, in which typically multiparty coalition governments are formed. The diffusion of power is wider in these than in regimes based on plurality or majority electoral rules. In contrast to electorally minority single-party governments, multiparty cabinets typically rely upon broad majority support both among parliamentarians and in the electorate. A multiparty coalition based on a majority of seats and popular votes is the typical government formula in most countries of continental Europe, including Belgium, the Czech Republic, Finland, Germany, Italy, Netherlands, Norway, Sweden, and Switzerland. Minority cabinets with additional parliamentary support are also formed in a few cases, as in Denmark and Spain.

PRESIDENTIAL CONSTITUTIONAL REGIMES

The second basic type of political regime resulted from the replacement of the executive monarch with an elected president, which should exert power in parallel to a representative congress. This model thus implies separate elections and divided powers between the chief executive and the legislative branch. It is usually called, in a rather confusing term, a *presidential regime*. In the original U.S. version, it implies a complex system of *checks and balances*, or mutual controls among separately elected or appointed institutions (presidency, the House, Senate, the Supreme Court). Interinstitutional relations are subjected to rules including term limits for the president, limited presidential veto of congressional legislation, Senate rules permitting a qualified minority to block decisions, senatorial ratification of presidential appointments, congressional appointment of officers and control of administrative agencies, congressional impeachment of the president, and judicial revision of legislation.

These counterweighting mechanisms play in favor of power sharing between institutions. As they induce negotiations and agreements between offices with different political orientation, they are equivalent devices to supermajority rules for decision making. The obstacles introduced by the numerous institutional checks to innovative decision making may stabilize socially inefficient status-quo policies, but they also guarantee that most important decisions are made by broad majorities able to prevent the imposition of a small or minority group's will. With similar analytical insight but a different evaluation, other analyses have remarked that separate elections and divided governments create a "dual legitimacy" prone to "deadlock," that is, legislative paralysis and interinstitutional conflict.

A *unified government* can exist when the president's party controls a majority of seats in the assembly. In the United States, there has been a situation of unified government with the president's party having a majority in both houses of Congress during less than 60 percent of time from 1832 to 2008, while *divided government* was more frequent during the second half of the twentieth century. However, U.S. congressional rules have traditionally included the ability of 40 percent of senators to block any decision by filibustering, which has almost always made the president's party unable to impose its decisions by its own. This could explain why no significant differences in legislative performances between periods of unified and divided governments have been observed.

Presidential dominance has been attempted in other countries, especially in several republics in Latin America and Africa, by supplementing the president's veto power over legislation and his control of the army, which do exist in the United States, with other constitutional mechanisms favoring the concentration of power. They include long presidential terms and reelections, the president's unconstrained powers to appoint and remove members of cabinet and other high officers, legislative initiative, capacity to dictate legislative decrees, fiscal and administrative authority, discretionary emergency powers, suspension of constitutional guarantees and, in formally federal countries, the right to intervene in state affairs. The other side of this same coin is weak congresses, which are not usually given control over the cabinet and are frequently constrained by short session periods and lack of resources. However, in democratic periods in the ten countries of South America since 1945, the president's party has not had a majority in congress 65 percent of the time; in about half of these cases, multiparty presidential cabinets have been formed by means of postelectoral, congressional negotiations (a formula which always applies, for instance, in the case of Brazil).

SEMI-PRESIDENTIAL CONSTITUTIONAL REGIMES

In another variant of regimes with division of powers, usually called *semi-presidentialism*, the presidency and the assembly are elected separately, like in a checks-and-balances regime, but it is the assembly that appoints and can dismiss a prime minister, like in a parliamentary regime. As a result, in parallel to the multiple-person assembly, two one-person offices, the president and the prime minister, share the executive powers in a *governmental dyarchy*, as in the current Fifth Republic of France.

At the beginning of the French experience, it was speculated that this constitutional model would produce an alternation between presidential and parliamentary phases, respectively favoring the president and the prime minister as a one-person dominant figure. The first phase of the alternation was indeed confirmed with presidents enjoying a compact party majority in the assembly. In these situations, the president becomes more powerful than in the classical presidential regimes, as well as more powerful than the British-style prime minister because the president accumulates the latter's powers plus those of the monarch. The second parliamentary phase was, in contrast, not confirmed, since, although in the so-called cohabitation experience the president faces a prime

minister, a cabinet and an assembly majority with a different political orientation, the president usually retains significant powers, including the dissolution of the assembly, as well as partial vetoes over legislation and executive appointments, among others, depending on specific rules in each country. This makes the president certainly more powerful than any monarch or republican president in a parliamentary regime. There can, thus, be indeed two phases, depending on whether the president's party has a majority in the assembly and can appoint the primer minister or not; however, the two phases are not properly presidential and parliamentary, but they rather produce an even higher concentration of power than in a presidential regime and a dual executive, respectively.

CENTRALIZATION OR FEDERALISM

In addition to horizontal relationships between institutions above discussed, vertical relationships can be distinguished as corresponding either to unitary states or to decentralized, federal-type large states and empires. In the unitary model, a single, central government holds all relevant powers. In decentralized polities, the party in the central government may control different proportions of regional or local governments. Analogously to what has been discussed for vertical interinstitutional relationships, the degree of coincidence between the parties in central government and those in smaller territorial governments can produce different levels of unified or divided government. In contrast to unitary states, where only those citizens whose preferences coincide with the statewide majority obtain political satisfaction, in vertically divided governments global minorities can become local majorities. In multilevel political regimes, the number of total losers is likely to be smaller than in a unitary state and the aggregate amount of social utility should, thus, be higher, only depending on the intensity of preferences given by the citizens to different policy issues associated with each governmental level.

Horizontally unified governments, such as those that are typical of parliamentary regimes with majoritarian electoral rules, do not suit well with vertical division of powers. If a single party controls the central government, but does not control most noncentral governments, it may try to increase the concentration of power by replacing the constitutional scheme of vertical division of powers with a unitary formula (as happened in Britain throughout the nineteenth century). In contrast, an effective vertical division of powers of federal type is more likely to exist and survive in the framework of a divided central government, whether in the form of multiparty coalition cabinets (like in Germany and Switzerland) or with coexistence of different party majorities in the presidency and the congress (like in the United States).

CONSTITUTIONAL CONSEQUENCES

The more direct political consequences of different constitutional formulas regard the type, party composition, and degree of stability of governments. The rest of political, economic, and social consequences from constitutions should be considered relatively remote, indirect and identifiable in terms of constraints, limits, and opportunities, rather than determining specific decisions or outcomes. They may affect economic and other public policy making, as well as the corresponding performance. Also, different constitutional formulas may help democracy to endure or facilitate its shortening.

Single-party governments in parliamentary regimes and unified government in regimes with constitutional separation of powers can be compared for their high degree of concentration of powers around a one-person institution. Likewise, multiparty coalition cabinets in parliamentary regimes with proportional representation can be considered to be a variant of divided government. However, the two basic forms of constitutional regime differ because in a parliamentary regime, the prime minister can dissolve the parliament and call anticipated elections, while regimes with separation of powers typically have fixed terms and electoral calendars. Thus, in parliamentary regimes, while single-party governments tend to be relatively consistent and durable, multiparty coalition or minority governments are more vulnerable to coalition splits, censure or confidence-lost motions, and other events and strategies provoking anticipated elections. In contrast, in separation of powers regimes, situations of divided government—if they do not lead to the formation of multiparty coalitions between the president's and other parties with a sufficient congressional majority—may produce legislative paralysis and deadlock.

Relatively stable single-party parliamentary governments, as well as presidential governments with a president's party majority in the assembly and fixed terms, tend to produce more changing and unstable policies than those relying upon the support of multiple parties or interinstitutional agreements. A parliamentary regime with majoritarian electoral rules creating single-party governments on the basis of a minority of popular votes is the classical scene of *adversarial politics*. This implies two major consequences. First, electorally minority governments with a social bias are more prone to be captured by minority interest groups and to implement redistributive and protectionist policies hurting broad social interests. Second, frequent alternation of socially and electorally minority parties in government produces policy reversal and instability (including changes in regulations of prices, the labor market, or taxes), which may depress investment incentives.

In contrast, in multiparty elections producing coalition cabinets, as well as in interinstitutional relations involving different political majorities, each party can focus on a different set of issues, globally enlarging the electoral agenda and the corresponding debate. In the further institutional process, certain issues (typically including major domains such as macroeconomic policy, interior, and foreign affairs) can be the subject of a broad multiparty or interinstitutional agreement around a moderate position. This precludes drastic changes and induces mid- or long-term policy stability. Other issues can be negotiated in a way that the minority with more intense preferences on each issue may see its preferred policy approved, whether through the distribution of cabinet portfolios to parties focusing on different domains (such as finances for liberals, education for Christian Democrats, social policy or labor for Social Democrats, etc.) or through logrolling among different groups

on different congressional issues. This second mechanism creates different but enduring political supports to decisions on each issue and also tends to produce relative policy stability.

A number of empirical studies show that parliamentary regimes with proportional representation perform better regarding electoral participation, low levels of politically motivated violence, women's representation, and social and environmental policies. They also appear to be associated to better growth-promoting policies, although they tend to imply relatively high taxes and public spending, which do not necessarily favor growth. Parliamentary regimes with proportional representation tend to develop broad programs benefiting a majority of the voters, including redistribution through social security and welfare policies, in contrast to narrower targets in both parliamentary regimes with majoritarian elections and presidential regimes. Other favorable conditions for economic growth include administrative effectiveness and an independent judiciary, which may be favored by a robust and pluralistic democratic regime. However, economic performance also depends on other factors, such as economic institutions (including those regulating property rights, contracts, and finances) and an educated population able to make technological innovation available and operational, which may not be directly associated with specific constitutional formulas.

Different constitutional alternatives have been linked to different rates of success in attempts of democratization and the duration of democratic regimes. Strategic choices of different constitutional formulas may be driven by actors' relative bargaining strength, electoral expectations, and attitudes to risk. Citizens and political leaders tend to support those formulas producing satisfactory results for themselves and reject those making them permanently excluded and defeated. As a consequence, those constitutional formulas producing widely distributed satisfactory outcomes can be more able to develop endogenous support and endure. Widely representative and effective political outcomes can feed social support for the corresponding institutions, while exclusionary, biased, arbitrary, or ineffective outcomes might foster citizens' and leaders' rejection of the institutions producing such results.

Generally, constitutional democracies favoring power sharing and inclusiveness should be able to obtain higher endogenous support and have greater longevity than those favoring the concentration of power. Empirical accounts show that democratic regimes are the most peaceful ones, while semi-democratic or transitional regimes are most prone to conflict, even more than exclusionary dictatorships (basically because the latter increase the costs of rebellion). Among democracies, parliamentary constitutional regimes are more resilient to crises and more able to endure than presidential ones. More specifically, parliamentary regimes with majoritarian electoral systems appear to be associated to higher frequency of ethnic and civil wars than presidential regimes, while parliamentary regimes with proportional representation are the most peaceful ones.

Constructivism

The term constructivism encompasses several schools of thought that emphasize the role of social constructions in the study and practice of politics. Social constructions are defined as shared interpretations or ideas on how the material world is or should be ordered. Constructions are neither objective, since they exist only by virtue of being agreed on by more or less extended groups of individuals, nor subjective, given their collective nature. Rather, they are *intersubjective.*

Social constructions operate at the epistemological as well as the ontological level. On the one hand, they provide

communities of scholars with common understandings of the reality they face; on the other hand, they are intersubjective structures influencing political life. While most, if not all, constructivists acknowledge the existence of both dimensions, they are divided as to which dimension should be assigned more weight in the analysis of political phenomena. This disagreement underlies the main cleavage in the constructivist camp—that between postmodern and modern constructivism.

POSTMODERN CONSTRUCTIVISM

The most radical of the two variants, postmodern constructivism, points to the role of constructions in the so-called scientific process to attack the positivist underpinnings of mainstream political science. Positivism asserts the existence of an objective political reality whose laws can be progressively discovered through the formulation and testing of theories. For postmodern constructivists, conversely, the presence of unobservable elements in any account of politics, and the need to replace these elements with assumptions and mental constructs, makes theory building necessarily a socially laden enterprise: one in which the formulation of hypotheses on the political world hinges to a large extent on the researcher's cultural, ideological, and political convictions. Empirical work, according to postmodern constructivists, can do very little to increase the objectivity of research. For one thing, the complexity of the sociopolitical reality, where perfect empirical tests are rare, and the ever-present possibility of formulating ad hoc explanations make it very hard, if not impossible, to disprove any theory. Second, and perhaps more important, most testing methods and procedures are themselves theory driven, and hence biased in favor of the hypotheses they are meant to evaluate.

The resulting view of science is very far from the positivist ideals of neutrality, universality, and progress. For postmodern constructivists, the subjects (i.e., researchers) and the objects of political research can never be fully separated. If there are dominant theories in certain historical periods, this is due less to their actual validity than to their consistency with prevailing cultures or professional orientations influencing scholars' interpretation of the political reality. To the extent that any meaningful political research can exist at all, the postmodern constructivists conclude that it can only be a theoretically and methodologically "anarchic" activity, in which no approach can be deemed more "scientific" than others and, ultimately, anything goes.

MODERN CONSTRUCTIVISM

Unlike their postmodern counterparts, modern constructivists do not take their concern with the intersubjectivity of the scientific process as far as rejecting positivism altogether. While partially constructed, they contend, competing accounts of the political world are not all the same, and careful empirical research, combined with theoretical debate, can help the scholarly community distinguish between plausible and untenable explanations. At least in the long run, in sum, positivist research methods can result in a faithful depiction of the sociopolitical reality.

Far more important than the constructions of the researcher are, for modern constructivists, those of the actors of domestic and international politics: voters, leaders, parties, bureaucracies, states, and so on. In contrast to rationalist approaches, which view political actors as constantly maximizing certain stable objectives (e.g., power, wealth, security, etc.), modern constructivism argues that the nature, identity, and preferences of individual and collective agents are not fixed and exogenously given, but formed through processes of socialization that shape their interpretation of the world, define appropriate behaviors and, ultimately, influence political action. The field of nuclear proliferation provides a good illustration of the differences between rationalists and constructivists: While rationalists focus on the material side of the issue and see weapons as, in principle, equally threatening regardless of who proliferates, for constructivists the consequences of nuclear armaments on international security cannot be assessed apart from the identity of the countries involved, the nature and history of their relations, and their perception of each other.

If social constructions influence the behavior of political actors, social interactions derive, by definition, from individual actions. So, while constructivism rejects individualism—the idea that the characteristics of society stem from those of the individual agents in it—it does not embrace its opposite, holism, entirely. Rather, constructivists posit the "mutual constitution" of intersubjective structures and sociopolitical agents, in which neither part logically precedes the other. As a result, the basic coordinates of politics are always subject to (more or less gradual) change.

So defined, constructivism is more of a "thin" theoretical framework than a substantive theory of politics: It draws attention to the role of social structures in the explanation of political behavior but is compatible with different specific sources of political agents' identities and preferences. Three such sources so far have received particular attention in the constructivist literature: culture, ideas, and institutions. Constructivists of the first branch emphasize the impact of consolidated cultural elements on the behavior of individuals, groups, and entire communities. Ideas, on the contrary, figure in many explanations of political change, which concentrate particularly on the ways in which cognitive and normative meanings are expressed and transmitted. Analyses focusing on institutions, finally, explain how certain social and political practices often acquire a self-reproductive character by shaping the worldviews and preferences of the actors involved.

Modern constructivism has acquired great popularity in Western academia in the past few decades, particularly in the subfields of comparative politics and international relations, where constructivists contribute to the main debates and have produced a substantial body of empirical work. Methodologically, constructivism is especially—though not exclusively—compatible with studies analyzing a few empirical observations (small-n studies) and inductive research strategies, which attempt to generalize from the examination of specific cases instead of using the latter to test previously formulated hypotheses. These methods allow constructivist researchers to

better capture the qualitative variables they work with and to trace specific processes of agent constitution. In addition, constructivists make large use of several tools and techniques originally developed in other disciplines, such as fieldwork, participant observation, and discourse analysis. These methodological preferences have provoked the criticism of many rationalist scholars, who accuse constructivism of being unable to produce truly general and falsifiable explanations. To these allegations, constructivists respond mainly by pointing out their peculiar logic of inquiry, one that does not deny or underestimate the existence of universal social dynamics, but that is nonetheless more interested in the different and the unique in each political situation, process, or phenomenon.

Consultants, Political

Political consultants are professionals who assist candidates running for office by providing one or more specialized services. They work on an ad hoc basis, taking a different set of clients each election cycle. The work is typically done on a fee-for-service basis and confined to the specific election cycle. Consultants may work individually, or more typically, as part of a political consulting firm comprised of many professionals who provide the variety of service(s) the firm offers.

Consultants are fixtures in campaigns at all levels in modern American electoral politics. Presidential candidates have stables of consultants working for their campaigns, sometimes with multiple firms providing the same service. In addition, most congressional candidates also hire consultants, though how many varies depending on whether the candidate is an incumbent, challenger, or open-seat candidate, as well as the estimated competitiveness of the campaign. While no serious candidate for office at the federal level would proceed with the assistance of one or more political consultants, the use of such consultants has even spread to state legislative campaigns, mayoral races, and school board contests.

ORIGINS OF POLITICAL CONSULTING

Political consultants are nothing new to political campaigns, although there is some disagreement as to how political consulting originated. Some scholars state that consultants were not strictly an American phenomenon and date as far back as 63 BCE, when ancient Roman Quintus Tullius Cicero advised his brother, orator and philosopher Marcus Tullius Cicero in an election for the consulship of Rome. In the American context, however, some scholars point to the founding of and debate over the ratification of the U.S. Constitution when the Federalists and Anti-Federalists engaged in political tactics that are reminiscent of those used today. In a more modern context, many observers consider Clem Whitaker and Leone Baxter as the founders of the political consulting industry, as they were the first individuals to try and make a living by providing campaign services to clients through their formation of their firm, Campaigns Inc., in 1933.

The consulting industry developed slowly after Campaigns Inc., but was helped along with technological advancements like scientific polling and electronic media, such as radio and television. These advancements meant that campaigning was no longer only a political endeavor: Candidates would need help with the sophisticated and technical tools now at their disposal. In fact, many of the first media consultants were advertisers from Madison Avenue in New York who found new clients in the form of candidates running for office.

Technical advancements also spurred another important development in the consulting industry in the form of specialization. Before this, a single person or a small group of individuals could run the entire campaign, but as the tactics of campaigning became more and more sophisticated, specialization of the industry and skills needed for campaigning developed. Today, political consulting is a highly specialized industry, with thousands of individuals working in many different fields.

SERVICES PROVIDED AND EFFECTS MEASURED

There is a core group of services that define the political consulting industry and others that support or supplement the work of these central elements. The heart of political consulting is the creation and delivery of a candidate's message, or the short statement that gives voters the reasons they should vote for this candidate rather than the opponent. The consultants typically responsible for developing and disseminating the candidate's message include a pollster, a media consultant, a direct mail specialist, and a campaign manager or general

consultant. Additional consultants may include an opposition researcher, a fundraiser, and a field or get-out-the-vote specialist. Beyond this, other services that are not as central to the overall creation of the candidate's message, but are just as important to a modern political campaign, include Web site design, media buying, printing services, and culling data from voter files and other sources to help target voters. Individuals providing these services are sometimes called *vendors,* making the distinction between their role and true consultants. These specialists come together to provide candidates with all the information and assistance they need to run a sophisticated and modern campaign for office.

Political consultants produce tangible results for their candidates. Scholars have systematically examined consultants' presence in candidates' campaigns and found that candidates who hire consultants raise more money during their campaign and get more votes on election day than those candidates who do not hire professionals. In terms of fundraising, candidates who hire consultants raise more money from party committees, political action committees, and individual donors than do those candidates who run amateur campaigns. Scholars also believe that a candidate hiring one consultant or more signals to potential donors that their campaign is serious, viable, and worth the investment of a campaign contribution.

Consultants' impact on a candidate's vote share is slightly more complex. While Stephen Medvic, in his 2001 book *Political Consultants in U.S. Congressional Elections,* finds that both the presence of consultants as well as the actual number of consultants hired by a candidate impact the number of votes that challenger and open-seat candidates receive, the same relationship is not true for incumbents. Medvic also finds that the most valuable type of consultant challenger candidates can hire is the pollster, who provides the most bang for the campaign's buck. Again, however, the same is not true for incumbents. These results may seem to indicate that consultants are not as important for incumbent officeholders seeking reelection. While this may be true for safe incumbents, for embattled incumbents, there is another dynamic at work, as embattled incumbents worry only about winning and not about how many votes they get as long as they receive more than their opponent. For those incumbents who are in a difficult race, the impact of consultants may not be best measured in votes; it may be better measured in terms of simple victory.

Consumer Society

The term *consumer society* refers to modern capitalist societies that are organized around increasing levels of consumption. The key features generally include a culture dominated by fashion, advertising, and mass marketing; aspirations, lifestyles, and identities tied to conspicuous consumption; and a lack of traditional moral restraints on individual desires. While some scholars see the emergence of consumer societies as part of the natural trajectory of capitalist development, most who use the term critique what they see as the irrationality and wastefulness of consumer capitalism.

CRITICISMS OF THE CONSUMER SOCIETY

The *paradox of affluence*—the belief that accumulating more consumer goods does not make us better off—is one of the more prominent criticisms of a consumer society. Juliet Schor and Robert Frank depict a society caught in an endless cycle of emulation, in which attempts to raise our social status through increasing displays of wealth are constantly frustrated by our neighbors' efforts to match us. Consumption becomes a no-win situation, like trying to move forward by running on a treadmill. A study by Richard Easterlin, showing the residents of wealthy countries report being no happier than those from poorer countries, is frequently cited to provide empirical support for this position. More recently, some commentators have linked social pressures to increase consumption standards (even in the face of stagnant wages) to the explosion of personal debt that precipitated the global economic crisis of 2008.

The emulation perspective draws on Thorstein Veblen, an influential American social critic of the early twentieth century. Veblen dismissed the notion that optimizing individuals make consumer choices, and that these choices determine what capitalist firms produce, which economists call *consumer sovereignty*. He maintained that the bulk of what capitalist societies produced did not serve human needs but instead fueled "predatory" emulation. John Kenneth Galbraith adds to the critique by arguing that the advertising and marketing practices of large corporations largely determine consumer choices.

For environmentalists, ever-growing consumption creates ever-higher levels of pollution, waste, and resource depletion—to the point that continuing down this path becomes both

unsustainable and immoral. Many religious traditions have long been critical of the morality of consumer societies in which secular, materialist values of pleasure seeking and profligacy crowd out traditional values of restraint, spirituality, and charity. The effects of advertising and consumer culture on the family, particularly children who are subjected to thousands of messages promoting consumption and instant gratification every day, have also traditionally been areas of concern. These criticisms have inspired a small but growing number of anticonsumerist rebels to reject the consumer society—to "get off the treadmill"—and embrace *voluntary simplicity*.

More radical critics paint a darker picture. German philosopher-sociologists Max Horkheimer and Theodor Adorno, seeking to understand why workers in capitalist nations were not revolutionary, found one answer in the ideological functions of consumer culture. In capitalist societies, the culture industry indoctrinates and manipulates consumers; creates false needs; and produces passive, alienated individuals who are incapable of critical thought or resistance. Taking the criticism to the next level, French sociologist Jean Baudrillard argues that consumer culture has imploded into every aspect of life to the extent that there are no longer true needs to be alienated from or manipulated.

REACTIONS

Theories of the consumer society have come under criticism from both the right and the left. For libertarians, these perspectives are elitist and paternalistic for asserting that consumers make choices that are not in their interest (i.e., if consumer goods do not make people happy, why do they buy them?), and moralistic for assuming that a simple life is superior to other freely chosen lifestyles. American sociologist Michael Schudson defends advertising from charges of manipulation by pointing out that many advertising campaigns are unsuccessful. These critics point to another paradox: If we are all manipulated by the forces of the consumer society, then how is it that an enlightened few have escaped its grasp, and can see how the rest of us are manipulated?

While the left largely accepts the critique of consumer capitalism, many are uncomfortable with what they see as the essentially conservative (or even puritanical) nature of perspectives that advocate simplicity and frugality. Others fear that the radical theories are fatalistic and disempowering, leaving little space for opposing the consumer society or constructing an alternative. Some feminists argue that the depiction of consumers is gendered—since women have historically been associated with consumption and have been stereotyped as irrational and easily manipulated.

Contagion of the Left

Political theorist Maurice Duverger argues that a right-wing party could change its organization and ideology to maintain its competitive position. Therefore, *contagion of the left* refers to those situations in which leftist oppositions force government to make policy decisions it otherwise would not make.

If all major political forces in a political system espouse identical policy alternatives, or all actors share political power through grand coalitions or consociational cases, then there is little or no room for policy contagion. If there is an ideologically polarized political conflict, there will be little chance for any policy influence or contagion of the left.

Considerable comprehensive and historical evidence exists to show that conditions of insecurity and socialist threat can lead political authorities to change their policies. In the late nineteenth century, Bismarck made comprehensive social reforms to undermine and ultimately destroy the popular appeal of the rising Social Democrats in imperial Germany. It was argued that fear of socialism was very real and profound for both the ruling classes and the bourgeoisie. Another example can be given from Britain. The reformist impulse labeled as "red toryism" within British conservatives materialized from the necessities of the emerging working class with their leftist political representatives.

Containment

At the outset of the cold war, George F. Kennan developed the containment concept in a major formulation of how the United States should handle the threats posed by Joseph Stalin's Soviet Union. Kennan first discussed his ideas in "The Sources of Soviet Conduct," which he authored anonymously in 1947 under the name "X" in *Foreign Affairs.* In later years, there have been references to an American policy in the 1990s of a *dual containment* of both Iran and Iraq, as well as some debate about whether American policy toward China should amount to containment or to engagement.

Some interpreters of Kennan's formula vis-à-vis the Soviet Union might have seen this as nothing more than the traditional

need to maintain a balance against the geopolitical power that Moscow could accumulate from its position at the center of Eurasia, that is, as nothing new. But, on a more positive note, Kennan was contrasting the Soviet dictatorship with that of Nazi Germany, arguing that the United States did not need to anticipate a preemptive or preventive war against the Soviets, who were more bound by ideology and not as adventurous or aggressive as Adolf Hitler had been. If Americans patiently held the line of containment, this would disprove the ideology by which the advance of communism was inevitable, and it would in the long run undermine the Soviet system.

Content Analysis

Content analysis refers to a method for classifying textual material that involves reducing it to more manageable, categorical, or quantitative data for use in comparative analysis. The basic goal of content analysis is to apply a set of explicit procedures to the analysis of texts to make systematic inferences possible about the text, the authors, or the intended recipients of the text. Content analysis differs from discourse analysis in that the latter typically focuses more on the qualitative interpretation of the meaning of language in texts, paying special attention to how context and conventions are represented through language. While *text* typically refers to written documents, it applies quite generally to recorded verbal behavior of almost any kind. Commonly analyzed examples include political speeches, media broadcasts, newspaper editorials, court decisions, business reports, psychological diaries, draft legislation, correspondence with companies, and the transcripts of customer service phone calls.

Content analysis is commonly used in the study of politics, media, business, law, psychology, and public administration. For instance, a political scientist might be interested in analyzing the policy positions of political parties and would turn to content analysis of the official political programs, known as *manifestos,* published by the parties. In fact, the long-standing Comparative Manifesto Project does just this, unitizing party manifestos into discrete *quasi-sentence* units and then assigning each quasi sentence a policy category from a predefined, fifty-six-category coding scheme.

Contentious Politics

Contentious politics, in the context of political science, means episodic, public, collective interaction among makers of claims and their objects when: (1) at least one government is a claimant, an object of claims, or a party to the claims, and (2) the claims would, if realized, affect the interests of at least one of the claimants or objects of claims. Roughly translated, the definition refers to collective political struggle.

Of course, each term in the definition cries out for further stipulations. The term *episodic,* for example, excludes regularly scheduled events such as votes, parliamentary elections, and associational meetings. The term *public* excludes claim making that occurs entirely within well-bounded organizations, including churches and firms. Contention, of course, occurs both inside and outside of public politics, but political contention involves government, however peripherally, and thereby increases the likelihood of intervening coercive agents such as police and, on the average, increases the stakes of the outcome.

Not all forms of politics are necessarily contentious. Much of politics consists of ceremony, consultation, bureaucratic process, collection of information, registration of events, educational activities, and the like; these actions usually involve little if any collective contention. This does not imply that all forms of contention conform to a single general model. Drawing upon definitions from Charles Tilly and Sidney Tarrow's *Contentious Politics* (2006), Tilly's *European Revolutions, 1492–1992* (1993), and Nicholas Sambanis's "What Is a Civil War?" (2004) the differences among three major forms of contention clarify this lack of a general model:

- *Social movements:* sustained challenges to power holders in the name of a population living under the jurisdiction of those power holders by means of public displays of that population's worthiness, unity, numbers, and commitment;
- *Civil wars:* sustained large-scale reciprocal armed conflict between two or more social actors in a population—however defined—over control of a state or over the demand of one of the actors to establish its own state;
- *Revolutions:* attempted transfers of power over a state in the course of which at least two distinct blocs of contenders make incompatible claims to control the state, and some significant portion of the population mobilizes on behalf of the claims of each bloc.

These forms of contention have different dynamics, involve different combinations of performances, and produce different levels of violence. Although they can overlap empirically and easily shift from one to another, they are best understood by examining what they have in common; they share contentious interaction between makers of claims and others who recognize that these claims bear on their interests and bring in government as mediator, target, or claimant. Considering the forms of contention in the same framework helps to understand three important properties of contentious politics: (1) the rapid formation and transformation of different forms of contention; (2) the interactions between actors that form

across institutional boundaries; and most important, (3) the common mechanisms and processes that underlie and drive contentious politics.

APPROACHES TO CONTENTIOUS POLITICS

Since the 1960s, the study of contentious politics has spawned a host of distinct topical literatures—on revolutions, social movements, industrial conflict, international war, civil war, interest group politics, nationalism, and democratization. Scholars in each group used different methodologies and mainly proceeded in cordial indifference to each other's findings. Yet different forms of contentious politics involve similar causal processes, such as mobilization, a central process in civil wars, revolutions, and social movements as well as in electoral campaigns, strikes, and warfare. As long as the same mechanisms and processes can be identified in different forms of contention, they should be studied together irrespective of the boundaries that scholars have established between these forms. Several general approaches to contentious politics have attempted to bring integration out of segmentation.

Until the late 1960s, the so-called *collective behavior approach* had dominated American studies of social movements. Best synthesized in the work of Neil Smelser in 1962, the approach emphasized the cognitive and emotional elements in collective action and focused heavily on grievances. In its extreme manifestations, it invited caricature by regarding collective action as the result of anomie, alienation, and even psychological disorder. But even more balanced proponents of the approach never solved the puzzle that there is no one-to-one relationship between the extent of people's grievances and their capacity and willingness to advance their claims. In the 1960s and after, the dominant approaches to contentious politics shifted from collective behavior to the structures that empower and constrain it.

STRUCTURAL APPROACHES

Structuralism took two forms: classical macrostructural models descended from Marx, in which major societal changes directly produce shifts in contention; and models of political structure focusing on the opportunities and threats, along with the facilitation and repression induced by political institutions and regimes. Macrostructural models were more popular in Europe, while political structural models developed in the United States, especially after the civil rights movement. But the *political process model* that resulted soon became the common property of Americans such as Doug McAdam and Europeans including Donatella della Porta, Dieter Rucht, and Hanspeter Kriesi.

Most scholars who focus on the political intermediation of contentious politics center on a cluster of variables called *political opportunity structure.* Opportunity structures are features of regimes that affect the likely outcomes of actors' possible claims. A reasonably consensual list of those features, noted by Charles Tilly and Sidney Tarrow, include:

1. Multiplicity of independent centers of power within the regime.
2. The regime's openness to new actors.
3. Instability of current political alignments.
4. Availability of influential allies or supporters for challengers.
5. Extent to which the regime represses or facilitates collective claim making.
6. Decisive changes in all of these features.

Threats are the converse of opportunities. But threats and opportunities occur simultaneously and most people engaging in contentious politics combine response to threat with seizing opportunities. Both threats and opportunities shift with fragmentation or concentration of power, changes in a regime's openness or closure, instability of alignments, and the availability of allies.

REPERTOIRES OF CONTENTION

The development of the political process approach was accompanied by systematic attention to the *repertoire* of contention—the sets of performances that people habitually use in mounting contention. Repertoires represent not only how people make claims, but also what they know about making claims and their reception by targets of their claims. Repertoires and performances evolved with the histories of industrialization and state-building. For example, the protest demonstration grew out of, and at first resembled, the religious procession to a place of worship. It turned contentious as demonstrators moved from a place of assembly to a site from which they could directly confront the targets of their claims. Later, the protest demonstration became the central form of action, mounted routinely to demonstrate a claim before the public. With the development of mass media, it could be staged to gain media attention. Change in social movement repertoires accelerated in the 1960s—as they do in any major wave of contention.

PROTEST EVENT ANALYSIS

After the 1960s, complementing the emphasis on repertoires, scholars developed a wide array of systematic methods and approaches to track the changes in the forms of contention in the public sphere. The systematic analysis of contentious events has become the closest thing to a core method for the study of contentious politics. Scholars enumerate and analyze the number of events, numbers and composition of participants, their targets and degree of violence, and the kinds of performances they involve. But in focusing on the *public politics* of contention, the new method ignored private forms of contention, such as the emotions in contentious politics, the construction of new collective actors (e.g., the new women's movement), and the study of motivations for collective action. These were the major starting points for new approaches in the 1980s and 1990s.

ALTERNATIVES TO STRUCTURALISM

In the 1980s, two alternative models began to challenge the hegemony of structuralism: a *culturalist model,* which focused on emotions, cognition, discourse, and the construction of collective action; and a *rationalist model* focusing on the dispositional microfoundations of collective action.

The culturalist model is part of the broader, cultural turn in the social sciences, but it also had social-psychological roots and led to a revived interest in Erving Goffmann's important 1974 book, *Frame Analysis: An Essay on the Organization of Experience.* Cultural factors were also important to scholars of contention in the global South, where the cultural grounding of Western social movements could not be assumed. By the turn of the century, the culturalist approach had developed into a wholesale critique of structuralism.

The rationalist model has in common with culturalism a focus on individual motivations for collective action, but it had in common with structuralism a focus on external inducements to collective action. Building on the earlier insights of Mancur Olson in 1965, rationalists observed that rational people might very well avoid taking action when they see that others are willing to act on their behalf. To solve this *free-rider problem*, rationalist-oriented scholars focused on the micro-foundations of collective action, on movement organizations, and on the social networks that underlie collective action. What remained obscure in both culturalism and rationalism were the specific links between individuals and their opposite numbers, significant third parties, and institutions. This led to an increased emphasis on relational models.

MECHANISM-AND-PROCESS APPROACHES

Mechanism-and-process-based accounts of contentious politics attempt to specify links among actors, their opponents, third parties, and institutions in studies of entire episodes of contention. Relevant mechanisms can be found in the general environment of the actors, in actors' dispositions toward significant others, or in their relations to significant others. Familiar environmental mechanisms include population shift or resource increase or depletion. Important dispositional mechanisms include the attribution of similarity (e.g., identification of another political actor as belonging to the same category as one's own, a key mechanism in coalition formation). Significant relational mechanisms include brokerage (e.g., the production of a new connection between previously unconnected or weakly connected sites). Processes can be either combinations of simultaneously developing mechanisms or regularly linked sequences of mechanisms.

Some combinations of mechanisms are fortuitous or idiosyncratic, but others combine regularly in robust processes that can be observed in a wide variety of contentious episodes. The most fundamental one is mobilization, or the shift of resources from individuals to collectivities through a combination of mechanisms.

MOVEMENTS AND INSTITUTIONS

In relating contentious politics to institutions, an earlier research tradition saw all political contention aimed against institutions. But properly seen, contention can occur outside of, within, and on the boundaries of institutions. Boundaries between institutionalized and noninstitutionalized politics are difficult to draw with precision. More important, the two sorts of politics involve similar causal processes. For example, the study of coalitions has almost always been operationalized within legislative institutions, but coalitions occur widely in the disruptions of rebellions, strikes, and social movements. As long as the same mechanisms and processes can be identified in institutional and noninstitutional politics, they can be studied together irrespective of institutional boundaries.

Of course, institutions both constrain and enable contentious politics, and, subsequently, different kinds of regimes produce different configurations of contention. These connections among contention, political power, and institutions appear in both turbulent periods and in the more routine politics of both authoritarian regimes and settled democracies. However, the more violent forms of contention are most likely to develop in weak authoritarian regimes, or *anocracies,* as termed by James D. Fearon and David D. Laitin in 2003.

LETHAL CONFLICTS

Civil wars and most revolutions involve large-scale lethal conflicts with special features that set them off from other forms of contentious politics. Two features in particular make

a difference. First, killing, wounding, and damaging affect the survival of participants well after the immediate struggle has ended. Second, creating and maintaining armed force requires extensive resources. Large-scale lethal conflicts include interstate wars, civil wars, revolutions, and genocides as well as a significant subset of struggles across religious, ethnic, linguistic, and regional boundaries. All of these involve high stakes and disciplined military organizations.

Yet there are significant commonalities between lethal conflicts and social movements. As in these more pacific conflicts, existing political opportunity structure interacts with established repertoires of contention to shape what sorts and degrees of large-scale violence occur within a given regime. When large-scale lethal contention is compared with social movements, similar mechanisms and processes emerge: environmental mechanisms, such as resource extraction or depletion; dispositional mechanisms, such as the hardening of boundaries between ethnic groups that formally lived together; and relational mechanisms, such as the brokerage of new connections between previously unconnected or weakly connected sites.

In contrast with social movements, which concentrate in high-capacity democratic or democratizing states, lethal conflicts concentrate in low-capacity authoritarian states. High-capacity states reduce the threat from challengers both by offering routine opportunities for making low-level claims and by making it difficult for anyone to create rival concentrations of coercive means within their territories. Low-capacity states fear that making concessions to low-level claims will trigger broader ones. They also more often face the threat that some rival actor will build up a major concentration of coercive means and use it to topple existing rulers.

OPEN QUESTIONS

As in any evolving field, a number of contested issues score the surface of the study of contentious politics. A brief sketch of the most important questions include:

- Do social movements that do not target the state fall outside the range of contentious politics?
- Are the major outcomes of contentious politics limited to the policy terrain, or do they also involve cultural change and biographical impacts?
- Do new forms of collective action—particularly Internet-based campaigns—challenge existing approaches to contentious politics, or will they eventually be absorbed into the repertoire of contention, much as the newspaper and television were?
- Does globalization shift the targets of contention from national states to something beyond the state, or does it simply add the possibility of "forum shopping" to claim-making strategies?

Contractarianism

Contractarianism is a theory of the development of social institutions and political morality based on the consent of free and equal people. It is primarily associated with both the descriptive and prescriptive elements of liberal political theory. Descriptively, it aims to explain the origins of political authority and why people form political communities. Prescriptively, contractarianism provides an account of the legitimate functions of the state and the conditions of political obligations. Its most well-known historical exponents are Thomas Hobbes, John Locke, and Jean-Jacques Rousseau. Its contemporary adherents include John Rawls and David Gauthier.

Contractarianism is an egalitarian approach to political morality because all individual interests are taken into account in the bargaining process. It provides a conventional view of politics and justice in which the state is created to advance individual interests, and it contrasts with naturalistic or organic accounts of politics. Despite these foundations, contractualists differ significantly as to the legitimate functions of the state and the extent of one's obligations in political society. Contractarianism is also the subject of significant critical treatment, including pluralist, associative, and feminist theories of political morality.

Contractualists theorize social cooperation and political institutions as systems of mutual advantage because rational people can be expected to consent only to arrangements from which they benefit. According to Hobbes, life without political institutions is insecure, violent, and underdeveloped. Sovereign individuals pursuing their own interests will inevitably come into conflict with one another, and without a coercive third party, find themselves in a ceaseless "war of all against all." In time, their interests and rationality will lead them to form a contract among each other to mutually transfer their natural rights to self-preservation, creating the sovereign state charged with maintaining the conditions of social peace. For Hobbes, the contract is constitutive of society, politics, property, and justice; it is also the precondition of people's capacities to pursue any human goods beyond survival. However, Hobbes's theory is not fully liberal because the social contract creates an absolute state as opposed to a constitutionally limited state.

Locke's state of nature, in contrast to Hobbes, is a much more developed situation and comes to include a fully functioning market economy. It is only after time, as inequality deepens and property becomes less secure, that individuals enter a social contract to create political authority to avoid the inconveniences of the state of nature. However, because individuals enter into the social contract in unequal circumstances, the contract solidifies differences in advantages by protecting preexisting natural property rights. In this respect, contractarianism is widely criticized for unduly reflecting baseline inequalities in terms of social cooperation. It is seen as a mutually advantageous agreement between producers that leaves nonproducers and those lacking a threat capacity, such as the severely disabled, to the system of production outside the scope of political justice. However, not all contractualists understand the social contract in this way and seek to broaden its scope and transformative effects.

Rousseau's social contract criticizes the design of Locke's contract, which protects natural property rights and locks in initial advantage. Rousseau's contract is more deeply transformative. He argues that the social contract cannot attempt to preserve the freedom humans experienced in the state of nature as isolated and independent individuals, rather it must reconcile the "chains" of a coercive political society with a new sort of social freedom. To be free in society, people must subsume their individual wills to a common or general will, which is the outcome of a contract or an agreement among others. Sovereignty is created when people contract together to create a general will that concerns the common good. When a person disagrees with the general will, this individual is, in fact, mistaken and must be made to conform to its precepts. In reconciling social rules and coercion with individual liberty through the social contract, Rousseau famously suggests people can be "forced to be free."

John Rawls's version of the contract also seeks to eliminate initial bargaining advantages in shaping political agreement. Rawls's contract is explicitly hypothetical and imagines people seeking agreement on principles of justice in the "original position." In the original position, people deliberate behind a "veil of ignorance" such that they know nothing of their own personal traits, including their gender, ethnicity, capacities, or social class. This situation creates an equal baseline and compels impartial reasoning. From this contracting position, Rawls argues that people will agree on strong egalitarian and redistributive principles of justice.

Convenience Voting

Convenience voting is the term used to describe the broad array of methods used in contemporary democracies to make it easier for citizens to cast ballots. Types of convenience

voting include absentee voting (and no-excuse absentee voting), early in-person voting, voting by mail, and various forms of electronic voting, such as voting by fax or Internet. An increasing number of countries also allow same-day voter registration. Convenience voting is perceived as a means to increase voter participation and reduce electoral costs. Opponents of convenience voting have raised concerns over the potential for voter fraud, and some studies have demonstrated no significant increase in turnout. Critics also contend that convenience voting disproportionately raises participation rates among the wealthier and better educated. Early voting also carries the risk that a major event or candidate problem could occur after citizens has cast their ballots but before the general election. Nonetheless, most developed democracies have adopted some form of convenience voting. For instance, Estonia utilized Internet voting in its 2007 parliamentary elections. Within the United States, most states utilize at least one form of convenience voting. For instance, following a 1998 referendum, Oregon initiated a system in which all elections are conducted by mail.

Convergence Theory

The central questions for students of convergence begin with whether, after centuries of industrialization, currently rich countries become more alike in social structure, culture, and politics. If they converged, the specific ways that they became alike are then pondered, followed by explanations for deviations from the common patterns. In this theory, the driving force that moves modern societies toward common structures, values, and beliefs is continuing industrialization. *Industrialization* is defined as the increasing and widespread use of tools that multiply the effects of their initial applications of energy and inanimate sources of energy.

High-energy technology is similar to how a hoe increases the effects of human energy far more when digging a hole for planting than the stick that preceded it; how a horse-drawn plow continues to multiply the effects of the human hand; how the tractor continues the escalation of effects; and how an atomic bomb can move a mountain, or destroy a city, with a push of one finger. This idea also applies to recent information technology. The same fingers that operated the keyboard for a statistical report using the IBM mainframe of the 1950s can, with the same energy expenditure, now process gargantuan amounts of information—a continuous process of making smaller microprocessors do ever-increasing work. Before the early modern period, with inanimate sources of energy, perhaps 80 to 90 percent of the total energy consumed at any one time was derived from plants, animals, and humans—an intractable limit on their productivity.

The concept of industrialization is most attainable when confined to this technological idea. If all the correlates, along with organizational and demographic outcomes, of industrialization are encompassed in its definition, it cannot be invoked as a cause of the structures, cultures, and political patterns of interest; this is why so much of the early literature on industrialism, based on broader definitions, was tautological. For example, scholars have identified industrialism as including one or more of the following: high degrees of specialization, including the concomitant monetary system of exchange; complex organizations; mechanization; urbanization; extensive use of capital; frequent technological change; rational capital accounting; emergence of a working class; a reasonably predictable political order; demographic transition; and individual work ethics. There is no way to relate the underlying increases in high-energy technology and inanimate sources of power to these variable structures and values if they are all included in the concept. Most of the empirical studies of convergence therefore use the narrow definition, roughly measured by economic level, or gross national product or gross domestic product per capita.

The term *continuing industrialization* captures two essential facts about these technological-economic changes: They cover many centuries and, despite recurrent spurts of growth, they are continuous. A gong did not ring when the industrial revolution began; it was a long and gradual process, and as economic historians reiterate, it has continued since long before the nineteenth century. The High Middle Ages (ca. 1000–1350) saw substantial economic growth and much innovation (e.g., the inanimate power of windmills, invention in armaments, marine transportation and navigation, optics, the mechanical clock).

During the early modern period (ca. 1500–1800), imperial expansion and a global trade network, combined with the spread of literacy among craftsmen and the experimental method among the educated, increased standards of living in the West. Of course, the pace of technological change picked up in the eighteenth and nineteenth centuries, in the period we label the Industrial Revolution, and accelerated markedly after about 1850 wherever science was applied to agriculture and industry.

Finally, convergent tendencies have threshold effects. The process and effects of early industrialization are not the same as the process and effects of later continuing and accelerating industrialization. The threshold for fully modern is about the level of economic development where roughly three-quarters of the modern labor force no longer work in agriculture—due to the extraordinary increases in agricultural productivity—and 40 or 50 percent of adult women work in nondomestic settings. In 1910, the United States still had almost one-third of its labor force in farming. This is about the level where France was in 1946, Japan in the 1950s, and the Soviet Union in the mid-1960s.

CONVERGENT TENDENCIES OF INDUSTRIALIZATION

Nine major structural and demographic shifts, all rooted in industrialization, characterize what is truly modern about modern—*advanced industrial*—society. However, as the range of per capita income from developing to developed countries

narrows, sheer levels of well-being fade as an explanation for national differences in structure, culture, politics, and policy. Types of political economy combining party ideology, power, and national bargaining arrangements among major economic interest groups and government explain persistent differences among equally modern nation-states that share these common trends. These convergent tendencies among the currently rich countries ignore differences in timing and concentrate on the amount, pace, and direction of change.

CHANGES IN FAMILY STRUCTURE

For over two centuries, there have been major changes in family size, composition, functions, and lifestyles; these have coincided with associated political demands and elite responses. By separating work from residence and changing the occupational and educational structure, industrialization increases mobility opportunity for both men and women, and inspires rising aspirations among parents for themselves and their children. Convergent tendencies also reduce the economic value of children and increase their cost, giving women both motive and opportunity to enter the nonagricultural labor force. This thereby increases their independence, reducing fertility rates, and increasing family breakup. Convergence also reduces the family's motivation and resources to care for aging parents and to meet the risks of invalidism, sickness, job injuries, and other shocks. The net effect is a dominant family type in industrial society—small and independent. The dramatic population response to rapid economic development, with birth rates and death rates both falling, has earned the label of *demographic transition*.

Declining birthrates and increased longevity are the product of public health measures—sanitation, control of epidemic diseases, better nutrition, and spacing of births—plus increasing access to medical care. The political responses to these structural changes include a mass demand for the welfare state, especially income and care for the aged; a family polity to help facilitate the balance between work and family; and finally, public policies that enhance gender equality. Rich democracies are moving toward the Swedish model, even Japan and Switzerland, the developed countries most resistant to gender equality.

MINORITIES' PUSH FOR EQUALITY ALONGSIDE GOVERNMENTS' INCREASING OPENNESS

Much change has occurred in equality for minorities over the last century, accelerating during and after World War II (1939–1945). Everywhere, discrimination on the basis of race, ethnicity, religion, language, gender, sexual preference, and physical disability has declined. Despite the occasional resurgence of minority-group militancy, structural and cultural integration of minority groups is increasing, even those based on race. Two sources of long-term integration are increased opportunities for education and the work, with the consequent increase in intermarriage. These trends foster some merger of values and tastes.

A recent convergence in social heterogeneity, rooted in a revival of massive migration of economic and political refugees, moves all rich democracies toward the American multicultural model. Yet, as governments respond to the demand for gender equality, the rich democracies move toward models in Scandinavia, however varied their specific policies and speed of response. The increase in equality of educational opportunity facilitates the considerable achievement of minority-group equality and the great changes in women's roles and family structure.

INCREASING EQUALITY IN HIGHER EDUCATION OPPORTUNITIES

For more than a century, education has been the main channel for upward mobility in occupation, income, and social status. The ambivalent mass demand for some combination of absolute equality and equality of opportunity—which often takes the form of demands for affirmative action or quotas for those groups presumed to be deprived—has had little effect on the essential character of higher education. Colleges and universities remain meritocratic, very much attuned to the demands of the economy, and quite vocational in emphasis. Education for alert citizenship and critical thought—for making moral judgments, for the pursuit of wisdom, for the enhancement of capacities of appreciation and performance in the arts, and for broader understanding of the individual in society—all tend to take second place. In recent decades, the laggards in mass higher education have moved toward the leader, the United States, and in a few cases have surpassed it in enrollment ratios. Finally, in response to the intensified demand for skilled or professional labor and the great variety of people to be processed, all rich countries now share the twin trends toward universality, along with specialization of institutions and curricula in higher education.

MASS MEDIA ASCENDANCE

Leaving aside nondemocracies, the convergence of rich democracies toward the American model is evident not only in mass higher education but also in the increased influence of mass communication and entertainment media in politics and culture. Industrialization links to the spread of expensive media technology and organizational forms, and also to the increase in income and leisure that it provides the audience. Despite national differences in the control, financing, and organization of the media, which persisted for decades, there is an unmistakable—recent and swift—convergence toward the commercialization and privatization of public broadcasting with a concomitant but somewhat slower shift toward American style and content. The media is now increasingly competitive, frantic, sensational, negative, aggressively interpretive, and anti-institutional. This talk-show style has itself become dominant in American print and broadcasting media only in roughly the last thirty-five years. In political campaigns, however, convergence toward the American model is quite slow—counterpressures in Europe and Asia that make the United States still exceptional among rich democracies include strong parties; government-assured access to television and radio for parties and candidates; restrictions on ads and the length of campaigns; and the well-financed, year-round public broadcasting news coverage.

INCREASED PREVALENCE AND INFLUENCE OF INTELLECTUALS

Scholars who emphasize changes in the mentality of masses or elites suggest that modernization produces a transformation toward a secular, rational, skeptical outlook. Max Weber, in 1918, spoke of "the disenchantment of the world." With a touch of irony, Joseph Schumpeter in 1942 observed that the abundance of critical, independent intellectuals might undermine the very affluent capitalist order that supports them. Plainly, scientists and intellectuals are a double-edged sword: Modern society evidences not only rational secular bureaucratic tendencies, but also periodic resurgence of backlash movements and parties among the losers and their ideological leaders (e.g., the creationist movement in the United States or the Christian right and Southern takeover of the Republican Party and its associated think tanks). In almost all of the most developed countries, populist-right protest movements and parties—sectarian religious, ethnic linguistic, or nativist—abound. The question for research is whether their incidence and influence increase or remain peripheral and cyclical.

SOCIAL STRATIFICATION AND MOBILITY

Continuing industrialization shapes social stratification—the class structure—and mobility in several ways. It blurs older class lines and creates increasing social, cultural, and political heterogeneity within each social class; the internal differences within classes then become greater than differences between them. Continuing industrialization also fosters the emergence of a politically restive *middle mass*—in the upper-working class or lower-middle class—whose behavior, values, beliefs, and tastes increasingly differ from those of the privileged college-educated, upper-middle class, the very rich above them, and the poor below. Increasing mobility adds to the heterogeneity of social classes. At every level, the mobile population and those with mobility aspirations contrast sharply with the nonmobile population at the same socioeconomic status. Finally, the persistence and even slight growth in the urban self-employed portion of the labor force—people who live in a separate world—adds another source of heterogeneity within each class.

In short, convergence theory exceeds explanations based on social class, however measured. Convergence in mass education and occupational structures; related increases in mobility among all rich countries; and multiple ladders for achieving income, status, or power all allow explanations for the behavior of modern populations of almost any major source of social differentiation. Although all affluent countries share these trends in class structure, they differ greatly in the cross-class solidarity fostered by labor-left parties and groups, and in the percentage of working and nonworking poor.

THE ORGANIZATION OF WORK

With all its variety within and across nations, the technical and social organization of work is still an area of convergence. Continuing industrialization brought a steady decline in annual average hours of work from the late nineteenth century up to about 1960, with a divergence since then as the long annual-hours countries like Japan and the United States reduced hours only slightly, while the short-hours countries like Germany, the Netherlands, and Norway continued their penchant for leisure. Within nations, the uneven distribution of work increased in recent decades; the most educated groups intensified their labor, while the rest of the population typically continued to reduce average annual hours, or suffered forced leisure. There has recently been a gradual spread of nonstandard work schedules, especially among women; and a sizable, rapid growth of contingent labor—part-time, temporary, or subcontracted work—equating to a source of widespread insecurity.

As for modern society becoming a *high-tech* or *postindustrial society*, evaluation of occupational and industrial trends shows that the vast majority of modern populations work in low-tech or no-tech jobs and that almost all of the large and fastest growing occupations are anything but high-tech positions.

GROWTH OF THE WELFARE STATE

For more than a century, since Bismarck in Germany, there has been gradual institutionalization of the social and labor market programs comprising the welfare state. The essence of the welfare state is government-protected minimum standards of income, nutrition, health and safety, education, and housing assured to every citizen as social right, not as charity. In the abstract, this is an ideal embraced by both political leaders and the mass of people in every affluent country, but in practice it becomes expensive enough and evokes enough ambivalence to become the center of political combat about taxes, spending, and the proper role of government in the economy. Because the welfare state is about shared risks that cross generations, localities, classes, ethnic and racial groups, and educational levels, it is a major source of social integration in modern society. Because it lends a measure of stability to household incomes, it has been an important stabilizer of the economy in the downswings of the business cycle, especially since World War II. Developing and developed countries, whatever the type of regime or elite motives, all move in this direction.

CHANGES IN THE POLITY

At first glance, change in the polity is an area of least convergence; a high level of economic development may not be a decisive determinant of political systems. But the first eight areas of most convergence may well foster some convergence in polities. Among the most solid findings in the literature of comparative politics are that affluence brings a decline in civil violence, a decline in coercion as a means of rule, an increase in persuasion and manipulation, an increase in pluralism, and less surely, an increase in democracy. All democracies focus on the market, though all market-oriented political economies are not democracies.

Economic development at the level of the rich democracies brings a sharp decline in internal collective political violence, and even a decline in the intensity of peaceful demonstrations. The most extensive analysis of this relationship, carried out by Ted Robert Gurr and published in his 1979 article "Political

Protest and Rebellion in the 1960s," covers the extent and intensity of civil conflict at three levels of economic development in eighty-seven countries. The first finding is that the higher the standard of living, the less deadly and extensive is civil conflict, but there may be a curvilinear relationship between economic level and collective political violence. The twenty-nine most violent countries are poor but not the poorest; they have begun a process of industrialization. Somewhat less violent are countries at very low and medium levels of development, and the twenty-nine richest countries are by far the least violent. The old idea that political violence and militant labor protest intensifies during the painful transformation of early industrialization from rural to urban, and from peasant to dependent industrial or service worker, is confirmed.

The second finding is that at low levels of development, personal dictatorships and modernizing oligarchies alike provoke the most civil violence. In contrast, the twenty-one pluralist regimes and the eight formerly communist regimes at relatively high levels of economic development yield the very least civil violence. Three forces are at work among the richer countries. Pluralist and democratic systems channel mass grievances and group protest into electoral politics while delivering abundant material benefits; communist or other centrist authoritarian regimes could keep the lid on for decades by comprehensive agencies of political and social control, including one-party domination of secret police, armed forces, mass media, schools, and workplaces.

Students of comparative politics have established that all democracies have market economies. Historically, liberal constitutional systems—the United States, Britain, and France—were established mainly to win and protect private property, free enterprise, free contract, and residential and occupational choice against government restrictions, not to achieve broad popular participation in governance. In the development of the older democracies, this emphasis on liberty to engage in trade was more prominent than the idea of equality of participation in selecting leaders. The expansion of civil liberties, the suffrage, and the rule of law in these countries was preceded or at least accompanied by the expansion of institutions supporting free markets. Yet, again, all market economies are not democracies. For instance, in periods following World War II, South Korea, Taiwan, Chile, Yugoslavia, Spain, Portugal, and Argentina were authoritarian and market oriented. To say that all the currently rich democracies have market economies does not say much about convergence, because democracies relying on the market vary greatly in the institutions in which markets are embedded—in the legal, political, economic, and social context in which finance, industry, labor, the professions, agencies of the executive, the judiciary, and the legislative interact and shape market transactions.

The interplay between modernization, markets, and democracy is complex and does not reflect any straight-line trend. Historically, as Samuel Huntington notes, democracy advanced in waves from early nineteenth century until now, and each wave was followed by reversals and new gains. Sometimes the reversals were drastic. Thus, several of the worst cases

of totalitarian or fascist rule emerged in relatively advanced industrializing societies—Hitler's Germany, Mussolini's Italy, Austria, Czechoslovakia, and Hirohito's Japan. Happily, both for democratic values and convergence theory, each reversal did not undo all previous gains: The net number of democracies by Huntington's reckoning went from zero before 1828 to fifty-nine in 1990. They are not, though, all rich or near rich, because the number includes poor Bangladesh, India, Costa Rica, Uruguay, and Botswana. It is clear, however, that the central tendency is for successfully industrializing countries to become more pluralistic and even more democratic as they become wealthier—for example, the cases of South Korea, Taiwan, Chile, Mexico, and South Africa. These countries may represent the threshold beyond which changing social structures rooted in industrialization strongly favor pluralism, and even some authoritarian regimes tolerate a few autonomous groups and limited cultural freedom. Among the relevant changes are the dominant convergent tendencies: growing middle- and upper-middle strata; accommodation of the minority-group thrust for equality; mobility out of the working class; rise of professionals and experts; growth of the welfare state; and the spread of commerce and industry, both of which require a rule of law.

Whatever the intermediate links between economic level and democracy, the two strongly correlate. Thus, the authoritarian countries that are mostly successful making the move to democracy were overwhelmingly middle income, moving toward upper-middle income. The strong causal relationship very likely runs from economic development to democracy, and not the other way round.

The level of economic development and its structural and demographic correlates help explain why democratic regimes in Greece, Portugal, and Spain by the 1980s, and the Czech Republic, the former East Germany, and Hungary by the late 1990s, successfully consolidated after their authoritarian regimes collapsed and why the transition to democracy has been so problematic in the less developed countries of Central and Latin America (except for Uruguay), and even worse in the poorer countries of Eastern Europe, including Romania, Bulgaria, Albania, and Serbia.

Ethnic warfare can further complicate the democratic transition, as it has in the former states of the Soviet Union and Yugoslavia, both of which also delivered drastic declines in standards of living. Consistent with convergence theory, however, it is the less developed countries in which ethnic conflict is most virulent and violent, especially where feeble authoritarian regimes face ethnonational rebellions, as in Bosnia, Georgia, Rwanda, and Haiti. In the early 1990s, there were about 120 shooting wars going on in the world, 90 of which involved states attempting to suppress ethnic minorities. None were among the rich democracies. In fact, economic development at above average levels and democratization together always channel such movements into nonviolent politics.

Rich democracies have both economic strength and a high degree of legitimacy—resources to use for any aspect of social peace. As Arend Lijphart suggests, dominant "majorities" do

this by sharing power (coalitions), dispersing power (bicameralism and multiparty systems), distributing power more fairly (proportional representation in its various forms), delegating power (federalism), and limiting power formally (minority veto). The mix of these electoral and constitutional arrangements varies, but all modern democracies have found ways toward minority and majority accommodation. Some form of affirmative action in assignment of jobs, political positions, or college admissions is also common, although specific government policies vary. Finally, an obvious and well-traveled road to social peace is expansion of the franchise and a well-developed, universalistic welfare state.

DEMOCRATIC TRANSITION AND CONTEMPORARY RESEARCH

Research on the breakdown, emergence, or consolidation of democracy is a growth industry. Among scholars analyzing lengthy lists of conditions favorable to the democratic transition, such as Huntington, all note the importance of economic level or material conditions for the emergence and the consolidation of democracy. However, they all offer a list of noneconomic determinants of uncertain relative importance. Major contributors to knowledge in this area include S. M. Lipset, Robert Dahl, John Stephens, Larry Diamond, and Juan Linz and Alfred Stepan.

Among social scientists, convergence or modernization theory was most popular in the 1940s through the mid-1960s when it went out of fashion. But it has recently been revived. The scholars who early articulated these ideas include Wilbert Moore; Daniel Lerner; Neil Smelser; Clark Kerr and colleagues; Samuel Huntington; and, on the social psychological correlates of economic development, Alex Inkeles. A chorus of criticism emerged in response. Students of the organization of work, such as Ronald Dore and Reinhard Bendix, emphasized the national and sectoral variations in authority relationships in the workplace and society. Many political critics, including André Gunder Frank, emphasized what they saw as the Eurocentric or North America–centric, or the conservative bias, of convergence theory. Emmanuel Wallerstein, in 1974, counterposed the idea of a world system dominated by a core of imperial capitalist states including the United States; others, like Peter Evans in 1979, accented the related theme of dependent development. A few critics allege that convergence theorists ignore politics; they forget that theorists and critics are not contending camps at war—economic determinists versus political or social determinists. In fact, the most systematic and creative work in this area deals with the interplay of markets and politics (political economy) or the social bases of politics (political sociology) or both. The trick is to learn how much of the explanation of outcomes is attributable to industrialization and how much to alternative theories, including variation in political and social organization. Using both quantitative and comparative historical methods, much recent research does exactly that, for example the less polemical students of varieties of capitalism, including Peter Hall and David Soskice. Indeed, many contemporary scholars such as Ruth and David Collier, John Stephens, and Harold Wilensky focus fruitfully on the interaction of economic and noneconomic forces shaping diverse paths of development among nations and regions of the world—a continuing challenge for researchers today.

Cooperative Security

The concept of *cooperative security* arose in the United States during the later stages of the cold war period as it became apparent that the Soviet Union under Mikhail Gorbachev was not as inclined to imperial aggression as had been earlier assumed. Although Soviet forces in East Central Europe were evidently configured to attempt to occupy Western Europe in the event of war, it was conceded that such a posture could reflect an underlying intention not to initiate war, but simply to defend Soviet territory in a manner informed by the experience of World War II (1939–1945). If so, then it might be possible to stabilize the situation by negotiating measures designed to prevent surprise attack. These were officially termed *confidence-building measures,* but the phrase *cooperative security* was used as an expression of the underlying principle, namely, that each side would cede the legitimacy of territorial defense and would cooperate to impose restraint on offensive operations.

With the dissolution of the Soviet Union and its alliance system, the original focus of concern essentially disappeared. A combined arms assault was no longer possible on continental scale, and the engagement of nuclear weapons in such an event was no longer the potential trigger for global catastrophe it was once considered to be. Primary security concerns shifted to more localized forms of conflict and to the process of weapons proliferation. In particular, it was recognized that the Russian Federation as principal successor to the Soviet Union had inherited a nearly intractable set of security burdens—most notably, a contracting economy that could not support the remnants of Soviet conventional forces redeployed from East Central Europe, deterrent forces still actively engaged with the increasingly more capable American forces, and a fractured system for exercising managerial control over the massive arsenal of nuclear weapons the Soviet Union had assembled.

In this new context, the Carnegie Corporation of New York, a leading American foundation, initiated a special project to address the problems of nuclear weapons proliferation with the burdens of the Russian Federation specifically in mind. The initiative was inspired by the president of the foundation, David Hamburg, and by Sam Nunn, a U.S. senator from Georgia, with cooperative security explicitly advanced as the central concept of the project. The phrase connoted not merely a stabilization of residual confrontation but a fundamental transformation of security relationships whereby all governments, the Russian Federation and the United States in particular, would collaborate in assuring the legitimate defense of sovereign territory by measures designed to preclude attack, and in establishing higher standards of managerial control over the large arsenals of nuclear weapons and stockpiles of explosive isotopes that had accumulated during the cold war.

The practical effect of the Carnegie project was significant but more limited than the cooperative security concept envisaged. The project was directly instrumental in initiating and developing what came to be known as the Nunn-Lugar program through which the United States provided financial and technical assistance to the Russian Federation to secure some portion of the nuclear weapons, explosive materials, and delivery systems deactivated from the inherited Soviet arsenal. From 1991 to 2007 as the United States provided some $1.8 billion in financial assistance, approximately twenty-five hundred weapons delivery systems were jointly deactivated, and collaborative projects were undertaken at nearly all permanent installations involved in the operations of Russian nuclear forces. Originally administered by the U.S. Department of Defense, the scope of the effort grew to include programs managed by the Department of Energy, the Department of State, and other U.S. government agencies. The accomplishments of the program were nonetheless limited by the fact that fundamental security policy in both countries featured indefinite continuation of legacy deterrent practices, with decreasing emphasis in the United States on bilateral legal regulation and increasing emphasis on preemptive potential. Although the size of the U.S. deterrent force was reduced, it still preserved enough firepower on immediately available alert status to decimate the Russian Federation and to threaten the retaliatory capability of its deterrent forces. That operational fact preserved confrontation as the dominant security principle and limited the scope for direct cooperation.

In the academic literature, cooperative security was recognized as a departure from the self-styled realist perspective on security, which holds that national interests immutably conflict and can only be assured by superior military power—a perspective that appears to require the advantages that only the United States has recently enjoyed. With varying degrees of politeness, realist theorists rejected the cooperative security idea as indefinitely impractical in principle. In contrast, an emerging globalist perspective holds that the process of globalization has altered the scale and character of primary threat as well as fundamental interest. The contention is that the massive forms of aggression that have been the traditional concern are very unlikely to occur because no country has either the incentive or the capacity to undertake them. Instead,

the primary source of threat is said to come from civil violence and associated terrorism, apparently arising from conditions of endemic economic austerity. Those forms of violence, the argument holds, undermine basic legal order necessary to support global economic performance and thereby threaten the dominant common interest all countries have in assuring their own economic performance. If so, then cooperation for mutual protection can be expected to emerge as the primary imperative of security policy, even for the United States.

It may take some time before the viability and endurance of the cooperative security idea can be reliably judged. Both its conceptual and its practical standing appear to depend on the eventual fate of the realist and the globalist perspectives—a contest that, at least in the United States, is yet to be decided.

Copyright

Copyright prohibits people from copying a wide range of works—music, books, movies photographs, computer code, and so on—without prior permission. By putting restrictions on use, copyright attempts to provide content creators with financial compensation in an effort to ensure they have an incentive and the means to continue creating work in the future. It also helps prompt investment in their works.

Copyright legislation creates intellectual property, which recognizes works as the expression of ideas; it is the physical manifestation that is protected through legislation—not the ideas themselves. The history of copyright is long and has been turbulent at times. The first copyright legislation was the United Kingdom's Statute of Anne passed in 1709, which gave authors control over the use of their work and took some power away from publishers.

INTERNATIONAL COPYRIGHT

Understanding copyright law is complicated as it varies from country to country. However, an international legal system exists to tackle disputes arising from differences in national legislation. International cooperation has been ongoing for more than two hundred years, starting, most notably, with the Berne Convention for the Protection of Literary and Artistic Works in 1886. Today, the World Intellectual Property Organization (WIPO) is tasked with administering international copyright agreements States belonging to the European Union are also subject to copyright regulations at the European level.

Two distinct attitudes toward copyright have emerged and are very much reflected in the evolution of legislation in different countries. On one hand, there is the view that once a work is made available for public consumption, people should have a certain freedom to use it as they please. According to this line of argument, copyright owners should receive only limited control over—and compensation for—use of their work. This view tends to underpin American and British attitudes and legislation toward copyright. On the other hand, there is the view that favors the natural, or moral, right of those who created a work to receive compensation for its every use, and such an attitude is often reflected in European legislation.

NEW CHALLENGES

While it was technological advancement that brought copyright into being, such advancements led to great challenges for owners of copyright. With technology like the printing press and the photocopier, exact copies of works could be reproduced relatively easily. Today, the Internet facilitates the ease of copying, lowering costs and making the process faster. As a result, the unauthorized copying of many works—or piracy—has been on the rise.

In spite of the challenges raised by technology and the concerns of copyright owners over piracy and loss of revenue, technological advancements have also contributed to ease when it comes to the management of copyright. Programs that allow for the legal downloading and purchasing of music not only make work easier to distribute, but also help to ensure that compensation is received when work is accessed. Growing attention has been paid to the development of digital rights management (DRM) strategies because many copyright owners look toward encryption as a means of protecting their work.

The protection of digital work has not been without controversy and complication. Critics claim that some DRM strategies undermine privacy and in some cases even compromise our personal property, as Sony BMG found out when its CDs were found to make computers vulnerable to viruses. DRM has also been frowned upon as it clashes with the fair use doctrine built into the copyright system that allows copyrighted material to be used for specific purposes such as teaching.

The challenges posed by new media prompted copyright owners to call for changes to copyright legislation, and WIPO responded with two Internet treaties in 1996: the WIPO Copyright Treaty and the WIPO Performances and Phonograms Treaty. Individual countries followed with legislative change to implement the measures outlined in the treaties. The United States, for example, passed the Digital Millennium Copyright Act in 1998. As technology continues to evolve, we can anticipate further changes to ensure a balance among the rights of copyright owners, creators, and consumers.

Corporation

Large corporations affect the lives and livelihoods of hundreds of millions of people around the world. They employ a large portion of the world's population, own the rights to most global technology patents, and yield tremendous influence over governments. The history of the modern corporation reflects a continued path towards greater wealth, influence, and international power—a power that critics contend is wielded with little regard to the social, environmental, or public local costs. As such, a variety of advocacy groups, watchdog organizations, and nongovernmental organizations have mobilized against large corporations' intent to force corporate reforms toward more socially and environmentally conscious ends. While for some, social pressures may foreshadow a new age of tempered capitalism and diffuse power, for others, corporate changes are regarded as superficial and do not limit their power or influence nor alter their profit-seeking goals.

BRIEF HISTORY

In many ways, the nature of the corporation parallels the evolving political relationship between the state and the market. In the days of monarchic rule, as seen in sixteenth- and seventeenth-century Europe, the state's economy and resources were regarded as extensions of the state's authority. During this period, a corporation would have to obtain permission from the state to come into existence. In an attempt to curry favor with the monarch to ensure passage of its charter, corporate founders would frame their mission as being in the service of the state while highlighting explicit benefits to the monarch. Describing the role of the corporation during mercantilist time, Frederick Maitland in *Political Theories of the Middle Ages* (1900) noted, "The corporation is, and must be, the creature of the State. Into its nostrils the State must breathe the breath of a fictitious life."

This relationship evolved with philosophical developments in political and economic theory in subsequent centuries. In the eighteenth century, the Scottish Enlightenment philosopher, Adam Smith, extolled the virtues of a self-organizing marketplace unrestricted by the intrusive power of the monarch. Individual liberty within the marketplace was now cast as the necessary component for not only the individual's but the state's greater economic prosperity. While Smith's classical economics did not explicitly extend this concept to corporations, since Smith perceived corporations as a potential risk to market competition, free market advocates and neoclassical economists after him often refer to Smith's ideas to advocate limited government interference within a free marketplace and specifically on corporations. Toward the middle of the nineteenth century, obtaining a corporate charter became a matter of bureaucratic formality no longer contingent on the approval of rulers, and therefore corporations were no longer obligated on serving a goal or public interest for the state.

OPPOSING THEORIES OF THE CORPORATE FIRM

The now dominant neoclassic economic theory has firmly transformed the original role of the corporation and its relationship to the state. The purpose of the firm, as theorized by economist Ronald Coase, is to integrate various production operations into one organization in order to minimize external transaction costs. This pervasive and purely economic view of the corporation has overtaken the originating concept in which the firm should serve the greater goals of society. A purely economic view places little restraint on a corporation's dedication to minimize costs and increase shareholder wealth, encouraging the unbridled expansion of these integral organs of capitalism. The largest global corporations have influence spanning the globe, extending beyond economic powers, but exert influence well into international and political spheres. Of the largest one hundred economies in the world, fifty-three are corporations. The largest corporation in 2000 had revenue greater than the GDP of more than 180 countries, according to M. Gabel and H. Bruner in *Global Inc.: An Atlas of the Multinational Corporation*.

Today the relationship between the state and the firm has been described as a special relationship of mutual interdependence. This interdependent relationship between governments and powerful corporations was made evident during the worldwide economic crises during 2008 and 2009, following the housing market collapse. Criticisms were hurled at the U.S. government for bailing out major banks; however, counterarguments stated the large financial institutions were the pillars of the global economy and, if allowed to fail, the United States as well as global markets would suffer greater collective losses. Whereas once the corporation remained solidly under the authority of the state, today's corporations wield tremendous influence among government policy makers and politicians; this causes many to fear these singularly profit-seeking entities are overriding the publicly interested goals of the state.

The controversy surrounding the role of corporations in society can be summarized in two opposing theories of the firm. First, the classical economic or shareholder view of the firm insists on the absolute primacy of profit maximization as the goal of corporations. The well-known quote by economist Milton Friedman in "The Social Responsibility of Business Is to Increase Its Profits" (1970) states, "The social responsibility of business is to increase its profits"—a claim he made in response to the rising tide of another theory of the firm. The competing stakeholder theory does not deny the necessary goal of profit seeking, but insists that beyond the sole interests of shareholders, firms must also consider the interests of every stakeholder group impacted by its operations. The list of stakeholders includes employees, customers, the community within which it operates, and the environment within which it is located.

While these two theories have caused significant debate among scholars, policy makers, and corporate managers as to the actual objectives of a corporation, a simple deduction shows the two theories considerably overlap. When enough people, consumers, and corporate managers believe firms should be sensitive to interests of all stakeholders, it creates an incentive for firms to comply with this normative standard. In other words, adopting the stakeholder theory of corporate behavior may in fact be the best way to meet the goals of the shareholder theory.

NEW HORIZONS

Today we observe the proliferation of corporations engaged in voluntary self-regulation, self-auditing, and various other programs of corporate social responsibility (CSR). Even with little empirical evidence of a direct link between profits and CSR, corporations continue to adopt these practices, according to David Vogel in *The Market for Virtue: The Potential and Limits of Corporate Social Responsibility* (2005). Benjamin Cashore, in his 2002 article "Legitimacy and the Privatization of Environmental Governance," states the emergence of nongovernmental organizations, advocacy groups, corporate watchdog organizations, and nonstate market based governance systems create an institutional network of interests aiming to shift, yet again, the relationship between the corporation and the state. This shift, however, is not identical to the role corporations held centuries earlier, in which they were compelled to serve a role more aligned with larger public interests. While corporations may engage in more social and environmental responsibility, it is not necessarily born out of pressure or negotiations with states, but rather to appease the variety of actors and civil society groups, some of which are active stakeholders.

Correlation

In political science, two variables are said to correlate when they tend to vary together. More precisely, correlation can be positive if the variables move in the same direction (they both increase or decrease at the same time), or negative if they move in opposite directions (when one variable increases, the other decreases).

In statistics, *correlation* is more specifically defined as a measure of the strength, or consistency, of the linear relationship between two variables in a population. Graphically, this statistic indicates how well the scatterplot obtained by representing the observations on a Cartesian plane with the two variables as dimensions fits along a straight line. Correlation is most commonly measured—or estimated, when only a sample is available—with the Pearson product-moment coefficient (ρ or r in statistical notation, respectively, for populations and samples), a standardized indicator whose value ranges between –1 (perfect negative correlation) and 1 (perfect positive correlation), and where 0 denotes the absence of correlation.

The correlation coefficient is an inadequate statistic when the relationship analyzed is believed to be nonlinear or when the variables of interest are nominal or ordinal. In these cases, alternative measures of association such as the chi-square, Spearman's ρ, or Kendall's τ might be more suitable.

Corruption

See *Democracy and Corruption*.

Corruption, Political

Most definitions of *corruption* emphasize the abuse of public power or resources for private benefit. Many basic terms of that definition, however, are themselves contested: Legal standards, public opinion or social values, or the public good may judge *abuse*. Terms such as *public, private, power,* and *benefit* may also be matters of dispute. Variations on the theme emphasize public office dimensions (duties, powers and their limits, process issues, accountability), market processes (using public power to extract rents, or allocating public goods on the basis of demand rather than need), and the public interest, among other factors, as defining characteristics. A continuing debate has to do with the role, if any, that cultural differences should play in defining corruption. Thus, there is no universally agreed upon definition of corruption.

As a concept, corruption has a long lineage. In classical times, it referred to a collective state of being. In this state, leaders forfeit, by their conduct, their claims to virtue and thus their right to lead; citizens or followers fail to play their roles in society; and the overall political order loses its moral structure and justifications. Modern conceptions of corruption originate not only in the works of thinkers like French philosopher Jean-Jacques Rousseau but also out of political contention over accountability and the limits of power. These

conceptions tend to treat corruption as a property of a particular action or actor. An official might take bribes, for example, without corrupting the overall political order. While the modern conception dominates, classical ideas are still relevant. For example, citizens of many democracies perceive fundamental corruption in the process of financing campaigns, even where funds are raised and spent in legal, publicly disclosed ways. Corruption in that sense has less to do with rule breaking than with leaders and a political order made unresponsive and unaccountable—and citizen choices made meaningless—by factors such as money and favoritism. Whether or not analysts agree with such perceptions, they can pose a real problem for the vitality and credibility of democratic politics.

MODERN VIEWS OF CORRUPTION

Corruption was a significant issue among scholars and agencies concerned with development during the 1960s and 1970s, but received less attention between the mid-1970s and late 1980s. The reasons for that hiatus are unclear, but among them might be the reluctance of analysts to appear to blame developing countries for their own problems; resistance on the part of Western governments, international organizations, and businesses to the idea that their own activities might contain or encourage corruption; and the inability of analysts to devise effective reforms. Academic analysis during those early periods often *relativized* the issue—treating corruption and its consequences as matters of opinion, or as so diverse as to resist comparisons across societies—and focused on the *functionality* question—whether corruption might do more good than harm in developing societies despite its illegitimate status. Corrupt dealings occurring or originating within advanced societies often received insufficient attention. A related cultural critique held that corruption was a Western concept; and that some varieties, in developing societies, were extensions of longstanding acceptable social practices; and that corruption should not be viewed in negative terms.

The end of the cold war and economic globalization, however, brought corruption back to the fore. Governments and international lenders sought better results from aid and assistance, and corporations, faced with intensifying international competition, began to see corruption not as an overhead cost of doing business but as a deadweight loss. Research beginning during the 1990s led to new kinds of data, including a number of attempts to measure and compare levels of corruption internationally (usually based on perception surveys), and to much improved theory. As corruption is generally a clandestine phenomenon, however, any sort of measure will be imperfect. In his 2007 article, "What Have We Learned about the Causes of Corruption from Ten Years of Cross-National Empirical Research?" Daniel Treisman reviewed the literature regarding studies of corruption. He concluded that mature liberal democracies and market-oriented societies are regarded as less corrupt, while fuel-exporting countries and those with intrusive regulation and unpredictable inflation tend to be seen as more corrupt. While higher development does cause lower perceived corruption, when income is taken into account many predictors of perceptions are only weakly related to individuals' reported experiences with corruption. Strong evidence that corruption delays, diverts, and distorts economic and political development superseded functionality arguments—that corruption is not "grease for the wheels," but rather "sand in the gears." To a striking extent, this line of research places relatively little emphasis on definitions.

REFORM SOLUTIONS

The past generation's policy recommendations and reforms have often been broadly consistent with the Washington *consensus* view, and neoliberal outlooks that revived the debate. The worldview that emerged, first of all, sees corruption primarily as bribery, and thus as a transaction that is quid pro quo and amenable to economic modeling. It holds that smaller governments, by reducing interference in the marketplace, will produce less corruption as well as more growth; that democratic politics is another, parallel sort of market; and that the state's proper functions, often termed *good governance*, should be primarily technical and administrative—in effect, a referee role in liberalized societies. Much theory and data support such views, particularly to the extent that we conceptualize corruption in terms of rent-seeking, regard public institutions more as obstructions to market processes than as foundations for them, and idealize the ways markets and governments would work in the absence of corruption. Indeed, evidence does suggest that where corruption is apparently more common, inspections, delays, and red tape are more extensive, and economic processes less vibrant, than in societies where it is less extensive, and that corruption is a major factor keeping poor people poor.

More recent research, while accepting the basic view of corruption as broadly harmful, has reemphasized the value of politics and public institutions. It suggests that the consensus view—and international corruption indices—overlook variations among and within societies and in the kinds of corruption problems they experience. Cultural variables resurfaced too, less as definitions than as clues to the origins of certain forms, and clues to the social significance, of corruption. Mediating cultural institutions such as *guanxi* in Chinese societies and *middlemen* in India, have major implications at those levels. Such arguments remind us that active markets and democratic politics require social and institutional foundations, rather than just liberalized processes, and that we have no way of knowing how real economies and governments would function without corruption.

In the United States, reform has been a long-running research and policy concern shaped by both the abolitionist movement and the struggle against machine bosses like William M. Tweed of New York's Tammany Hall. Both that struggle, and the Progressive Era more generally, gave rise to administrative and civil service reforms that undercut many corrupt practices; New Deal social services likewise weakened the power of machine politicians' petty favors and gifts. Critics see these reforms, however, as introducing fragmentation, rigidity, and new costs into government.

Contemporary research issues associated with corruption include the further elaboration of Principal–Agent–Client (P-A-C) models, and other conceptions of incentives and constraints often drawing upon economics theories; improved measurement, including assessing corruption indirectly using indicators of government performance; and the analysis of reforms. Most democratic societies have instituted political finance rules and, less commonly, subsidies; many are also scrutinizing corporate governance, accounting standards, and the transparency of markets with renewed vigor. On the international front, organizations such as the Organization for Economic Cooperation and Development, Organization for American States, and the United Nations have ratified anticorruption treaties and conventions, usually backed up by ambitious intergovernmental scrutiny and assistance schemes. At all levels, major themes in reform include accountability, transparency, and the responsibilities and strength of civil society.

Corruption and Other Political Pathologies

In an ideal democracy, the polity faithfully maps the preferences of citizens into public choices. Protections for individual rights constitutionally limit the range of democratic choice, but within those constraints, citizens' preferences rule. In practice, real governments fail to measure up. Some of this divergence is the result of disagreements among citizens over policy; other difficulties arise from the nature of representative government. If preferences diverge, the state must aggregate preferences to make choices using methods that are subject to strategic manipulation and that produce winners and losers. This will happen even in a direct democracy lacking any of the institutions of the modern state beyond elections. Furthermore, most democratic states require representative institutions in order to function, and under these structures some will have more power than others because of their geographical locations or their strategic positions. These are not pathologies but are, instead, inherent in the structure of representative government.

Such difficulties, which need to be acknowledged and managed, are distinguishable from others that represent direct challenges to the legitimacy of governments, however democratic their nominal structure. The tendency of political systems to provide narrowly focused goods and services, *pork barrel* projects, is a familiar complaint about democracy, but it is not pathological. It is the inevitable result of a political system that elects representatives from single-member districts. These representatives will try to satisfy the local demands of their constituents as well as work for broader public goals. Two types of political pathologies are, however, of concern: *corruption* and *clientalism*. The former involves the illicit personal enrichment of public officials, often combined with excess profits for those who pay bribes. The latter is a more subtle phenomenon occurring when public officials provide benefits to their supporters in a way that undermines general public values. As Jana Kunicová and Susan Rose-Ackerman argue in their 2005 article, past work has too often conflated pork barrel politics, clientalism, and corruption. It is important, however, to analyze them as separate, if overlapping, phenomena. For example, structural reforms designed to limit pork barrel politics may lead to higher levels of illegal corruption that diverts public money and power to the private benefit of politicians and their corrupt supporters.

The focus here is on states that have not descended into chaos and anarchy. States where corruption, clientalism, and other political pathologies are endemic may, of course, eventually collapse, but sometimes such states are quite stable and long lasting. As Robert Rotberg argues, the system may be pathological in the sense of not reflecting the interests of most citizens and of not providing security, but it does endure.

The line between pathology and normal democratic politics is not always easy to draw. Extreme cases are easy to identify—Zaire under the thirty-two year presidency of Mobutu Sese Seko, Cambodia under Khmer Rouge leader Pol Pot—but what should we make of democratic states where private wealth has a major impact on public choices? How much of this is the normal and predictable result of the fact that elections cost money, and when does the use of private funds to support political careers become corrupt or pathological? When is support for public works in one's home district an indication that a representative system is working well, and when does it tip over the line into dysfunctional clientalism?

In a political system that pays lip service to notions of public accountability and is, in fact, controlled by corrupt officials, the basic problem is the interaction between officials' venality and corrupt inducements offered by private groups and individuals. Alongside alternative models of corrupt public and private interactions, the more familiar case of a functioning democracy is, nevertheless, deeply influenced by clientelistic networks and concentrations of private wealth.

CORRUPTION

Corruption describes a relationship between the state and the private sector. Sometimes state officials are the dominant actors; in other cases, private actors are the most powerful forces. The relative bargaining power of these groups determines both the overall impact of corruption on society and the distribution of the gains between bribers and bribe payers. The nature of corruption depends not just on the organization of government but also on the organization and power of private actors. A critical issue is whether either the government or the private sector has monopoly power in dealing with the other.

In *Corruption and Government: Causes, Consequences and Reform* (1999), Susan Rose-Ackerman distinguishes between *kleptocracies,* where corruption is organized at the top of government, and other states, where bribery is the province of a large number of low-level officials. On the other side of the bribery "market," there is a difference between cases with a small number of major corrupt private actors and ones where the payment of bribes is decentralized across society. Table 1 from Rose-Ackerman's book illustrates four polar cases: kleptocracy, bilateral monopoly, mafia-dominated states, and competitive bribery.

KLEPTOCRACY

In the extreme case of a kleptocratic ruler who faces a large number of unorganized potential bribe payers, a powerful head of government can organize the political system to maximize its corrupt extraction possibilities. According to American economist and social scientist Mancur Olson in his 1993 article "Dictatorship, Democracy and Development," such a "stationary bandit" acts like a private monopolist, striving for productive efficiency, but restricting the output of the economy to maximize profits. The ruler sacrifices the benefits of patronage and petty favoritism to obtain the

profits generated by a well run monopoly. Under this model, high-level corruption is not as serious a problem as low-level corruption under which officials "overfish" a "commons," according to Olson, in their search for private gain. However, this claim ignores the fact that kleptocratic rulers have more power than lower level officials and may use this power to expand the resources under state control. Furthermore, even if they expand the state, kleptocrats frequently have a weak and disloyal civil service, a poor resource base, and a vague and confusing legal framework. Such kleptocrats, described as "official moguls" by Michael Johnston in *Syndromes of Corruption: Wealth, Power, and Democracy* (2005), favor a bloated and inefficient state that maximizes corrupt possibilities.

Of course, some powerful rulers do manage to avoid inefficient policies. They enrich themselves and their families, but do not push rent-generating programs so far as to significantly undermine growth. Countries with a high degree of corruption that are politically secure and tightly controlled from the top may suffer from less inefficiency than those with an uncoordinated struggle for private gain. They have a long-run viewpoint and hence seek ways to constrain uncoordinated rent-seeking. This type of regime seems a rough approximation to some East Asian countries which have institutional mechanisms to cut back uncoordinated rent-seeking by both officials and private businesses. However, many corrupt rulers are not so secure. In fact, their very venality increases their insecurity. Furthermore, corruption at the top creates expectations among bureaucrats that they should share in the wealth and reduces the moral and psychological constraints on lower level officials.

BILATERAL MONOPOLIES AND MAFIA-DOMINATED STATES

The two cases where private interests exert power over the state differ depending upon whether or not the state is centrally organized to collect bribes. In the first, bilateral case, a corrupt ruler faces an organized oligarchy so that the rent extraction possibilities are shared between the oligarchs and the ruler. Their relative strength will determine the way gains are shared. Each side may seek to improve its own situation by making the other worse off through expropriating property, on the one hand, or engaging in violence, on the other.

In *The Sicilian Mafia* (1993), Diego Gambetta defines a *mafia* as an organized crime group that provides protective services that substitute for those provided by the state in ordinary societies. In some bilateral cases, the state and the mafia share the protection business and perhaps even have overlapping membership. Donatella della Porta and Alberto Vannucci, in *Corrupt Exchanges: Actors, Resources, and Mechanisms of Political Corruption* (1999), provide examples from Italy. Louise I. Shelley highlights this feature in a 2001 article, "Corruption and Organized Crime in Mexico in the Post-PRI Transition," and Shelly and Svante E. Cornell, in a 2006 article, document state and mafia interpenetration in "The Drug Trade in Russia."

A powerful corrupt ruler extorts a share of the mafias' gains and has little interest in controlling criminal influence. If the

TABLE 1: TYPES OF CORRUPT GOVERNMENTS

MULTIPLE BRIBE RECIPIENTS AT LOW LEVELS OF GOVERNMENT	Competitive bribery with a possibility of spirals	Mafia-dominated state

mafias get the upper hand, they will enlist the state in limiting entry through threats of violence and the elimination of rivals. Furthermore, organized crime bosses who dominate business sectors may be more interested in quick profits through the export of a country's assets and raw materials than in the difficult task of building up a modern industrial base. The end result is the delegitimation of government and the undermining of capitalist institutions.

Criminal mafias are only the most extreme form of private domination. Some states are economically dependent on the export of one or two primary products. These countries may establish long-term relationships with a few multinational firms. Both rulers and firms favor productive efficiency and the control of violent private groups, but the business and government alliance may permit firms and rulers to share the nation's wealth at the expense of ordinary people. The division of gains will depend upon their relative bargaining power. If investors have the upper hand, there may not be much overt corruption, but the harm to ordinary citizens may, nevertheless, be severe. The size of the bribes is not the key variable. Instead, the economic distortions and the high costs of public projects measure the harm to citizens.

In the case when officials of a weak and disorganized state engage in freelance bribery but face concentrations of power in the private sector, the monopolist could be a domestic mafia, a single large corporation, or a close-knit oligarchy. Yet in each case, private power dominates the state, buying the cooperation of officials. The private actors are not powerful enough to take over the state and reorganize it into a unitary body, and the very disorganization of the state reduces the ability of the private group to purchase the benefits it wants. Making an agreement with one official will not discourage another from coming forward. Such a state is very dysfunctional as officials compete for corrupt handouts.

COMPETITIVE BRIBERY

In cases of competitive bribery, many low-level officials deal with large numbers of citizens and businesses. This could occur in a weak autocracy or in a democratic state with weak legal controls on corruption and poor public accountability. The competitive corruption case is not analogous to an efficient competitive market. A fundamental problem is the possibility of an upward spiral of corruption. The corruption of some encourages additional officials to accept bribes until all but the unreconstructed moralists are corrupt. Two equilibria are possible—one with pervasive corruption and another with very little corruption.

Reform requires systemic changes in expectations and in government behavior to move from a high corruption to a low corruption equilibrium. Unfortunately, the states that fall into this fourth category, such as many states in sub-Saharan Africa and in South and Southeast Asia, are precisely those that lack the centralized authority needed to carry out such reforms. The decentralized, competitive corrupt system is frequently well-entrenched, and no one has the power to administer the policy shock needed for reform.

CLIENTALISM, CAMPAIGN FUNDS, AND PRIVATE WEALTH

More subtle and difficult pathologies arise in democracies with well-established competitive electoral systems. Democratic processes are expensive. Because the state can provide targeted benefits, award procurement contracts, and impose regulatory and tax costs, private interests seek political influence. Even if they only do this within the law, those with wealth are likely to do better than others. Of course, more diffuse interests have an impact both through the ballot box and through grassroots protests, but the well-off often can either co-opt mass opinion or counteract it through their own actions.

What can wealthy interests bring to the table beyond more pay for lobbyists and lawyers? In functioning democracies, a key resource is the provision of campaign funds and in-kind benefits, ranging from free media exposure to free travel and trips for volunteer campaign workers. Skirting close to the corrupt edge are the conflicts of interest that arise when government officials are given favorable access to investment opportunities, are promised private sector jobs, or are themselves associated with prominent business families. Even when there is no direct quid pro quo that runs afoul of anticorruption laws, ongoing connections and past patterns of favors can distort choices.

Clientalism operates in the other direction, as demonstrated in Junichi Kawata's edited volume, *Comparing Political Corruption and Clientalism* (2006). Powerful politicians, sometimes in alliance with wealthy private interests, develop vertical ties that make ordinary citizens dependent on them for jobs; they also help with regulatory hurdles and access to public services. The state does not provide benefits to citizens as a right. Rather, its benefits are dispensed as favors, and costs are imposed on those who do not show proper deference. The clients may then provide help during electoral campaigns. Masaya Kobayashi, in the article "A Typology of Corrupt Networks" (2006), makes the useful distinction between the long-term reciprocal relations typical of clientalism and the specific purchase of services that characterizes bribery. Clientalism may be more deeply entrenched and harder to counteract than individual instances of corruption.

Restrictions on campaign finance are one response to both clientalism and corruption in established democracies. Solutions approach the problem from four dimensions. First, reducing the length of time for campaigns and limiting the methods available can reduce the costs of political campaigns. Second, stronger disclosure rules can be established. Disclosure permits citizens to vote against candidates who receive too much special interest money. In *Voting with Dollars* (2000), Bruce Ackerman and Ian Ayres, however, suggest the opposite strategy; they recommend that all donations should be anonymous so that no quid pro quo is possible. This idea invites donors to find ways to cheat, but if successful, it would likely discourage contributions from all but the most ideological donors.

Third, laws can limit both individual donations and candidates' spending. In the United States, such limits are in tension

with the constitutional protection of free speech. The basic issue, however, arises everywhere: To what extent can a democratic government interfere with citizens who wish to express their political interests through gifts to support political parties or individual candidates?

Fourth, alternative sources of funds can be found in the public sector. In the United States, the federal government provides funds for presidential candidates under certain conditions, and several American states provide public support for political campaigns. Also, a number of proposals have been made for more extensive public funding. One idea is to grant public funds to candidates who demonstrate substantial public support. Ackerman and Ayres, for example, argue that giving vouchers to voters to support the candidates of their choice could achieve this. This plan would combine public funding with an egalitarian system for allocating funds and, if combined with secrecy for private gifts, would reduce the influence of wealthy interests. If not well-monitored, however, it might increase illegal payments. Furthermore, their proposal does not respond to the pathologies of clientelistic systems where voters might still support entrenched incumbents who offer jobs and targeted services with little concern for broad public values.

CONCLUSIONS

All political systems fall short of the democratic ideal. Constitution writing and legislative drafting are pragmatic exercises requiring compromise and a realistic appreciation of the limits of institutions to control self-seeking behavior. Nevertheless, some political systems are worse than others. They have crossed the line into kleptocracy or into state capture—be it by mafias using intimidation and violence or by large business corporations leveraging their economic clout. Some states risk slipping into such pathologies and into outright failure, but one also needs to acknowledge the more subtle ways in which private wealth and public power can interact in more advanced systems. These interactions can undermine government legitimacy and divert the benefits of state action to narrow, unrepresentative groups. The policies required may not be as drastic and transformative as in kleptocratic or fully captured states, but they, nevertheless, require difficult confrontations with powerful vested interests both inside and outside of government.

Corwin, Edward Samuel

Edward S. Corwin (1878–1963) was a leading political scientist and constitutional law scholar during the first half of the twentieth century. He was widely recognized for his writings on a broad range of constitutional issues. Corwin also made significant contributions to the study of the U.S. Supreme Court and the presidency. Corwin's work has been referred to in U.S. Supreme Court opinions and continues to be cited in current academic scholarship.

Corwin completed his undergraduate studies at the University of Michigan in 1900, where he developed an interest in American constitutional thought. After spending two years teaching high school students, Corwin enrolled in the University of Pennsylvania and received his doctorate in early American history in 1905.

Corwin spent his entire academic career at Princeton. In 1911, at the age of thirty-three, he became a full professor. In 1918, he succeeded Woodrow Wilson as McCormick Professor of Jurisprudence. Corwin was also the first chair of Princeton's department of politics. He was active in the profession and became the president of the American Political Science Association (APSA) in 1931.

Corwin was a prolific writer and authored more than twenty books and over 150 scholarly articles. He is often noted for the advances he made by analyzing constitutional concepts in historical context. Many of his studies were considered landmark contributions when they were published and continue to be read today. For example, Corwin's book, *The*

Constitution and What It Means Today, was first published in 1920 and is now in its fourteenth edition.

One of Corwin's most famous essays is "The 'Higher Law' Background of American Constitutional Law," which was published in 1928. In this article, he examines the intellectual roots of American constitutional thought and explanations relating to the Constitution's dominance. The importance of this article is underscored by the fact that scholars continue to debate its merits many years after its publication.

Corwin was a frequent commentator on public issues of the day. He was not shy about writing for the popular press or granting newspaper interviews. He advocated U.S. entry into World War I (1914–1918) and was a vocal supporter of Franklin Roosevelt's New Deal.

Corwin provided guidance in different capacities to two presidents. The advice he gave to Woodrow Wilson was more informal and not always implemented. During Roosevelt's administration, Corwin served as an adviser to the Public Works Administration. Corwin then worked in a consulting capacity for the attorney general.

The most controversial aspect of Corwin's career was his defense of Roosevelt's court-packing plan, which included testifying before the Senate's Committee on Court Reorganization. He had difficulty defending his views before the committee because, earlier, he was quite critical of the plan. It has been suggested that Corwin's support of the court-packing plan and his lackluster Senate testimony ended any reasonable chance of him receiving an appointment to the Supreme Court. After these events, Corwin became more politically conservative and openly critical of Roosevelt.

Corwin retired from Princeton in 1946, but continued to pursue an active research agenda, publishing several books and a handful of articles. The APSA offers an annual award in his name for the best doctoral dissertation in public law.

Cosmopolitan Democracy

See *Cosmopolitanism.*

Cosmopolitanism

Cosmopolitanism, a term derived from the Greek word *kosmopolitês* meaning "citizen of the world," is used to refer to a variety of beliefs and attitudes about the relationship between the individual and humanity (or the world) as a whole.

From a Stoic point of view, the citizen of the world is indifferent to particular places and detached from particularistic commitments. In other words, the citizen of the world is at home nowhere, except perhaps in the realm of ideas, where goodness in its purist form is to be found and where justice reigns unchallenged by the ignorance and selfishness of humankind. In this light, cosmopolitanism has less to do with the transcendence of national boundaries than it does with an allegiance to the *kosmos*—meaning, the intelligible realm of forms—above and beyond the visible world of endless cruelty and conflict. This may be what Plutarch means when he attributes to Socrates the designation of citizen of the world in his essay "On Banishment."

From a cultural point of view, the world citizen is world traveler who appreciates variety in culture, art, literature, cuisine, and so on, and who is open to different ideas and ways of life. From this perspective, articulated by Jeremy Waldron, the citizen of the world is at home everywhere, including the realm of contested truths and hybridized identity. Like Stoic cosmopolitanism, cultural cosmopolitanism requires a level of detachment from one's own culture and context. But unlike Stoic cosmopolitanism, the wider world exists both to be appreciated and to be learned from by the world citizen, not to be renounced in its entirety in favor of a higher level of existence.

What is generally meant by political cosmopolitanism is the recognition that the activities of one's own state affect the lives of people living in another state and the belief that these people are worthy of consideration and respect. It does not mean that an individual is devoted to all states (or peoples) equally or to the idea of a world state. Immanuel Kant, in "Perpetual Peace," looked to humanity's unsociable sociability as the engine that would drive the emergence of political cosmopolitan and an international federation of free nations. But there is nothing inevitable about the historical development of political cosmopolitanism—or cosmopolitanism of any kind, although imagining rationally self-interested states as the drivers of cosmopolitan change, as Kant did, does go against a utopian basis for such speculation.

Some contemporary philosophers, including Martha Nussbaum, argue that people should owe their primary allegiance to the world, not to any association more limited or local, while others, such as Kwame Anthony Appiah, have argued more modestly for a rooted cosmopolitanism that allows individuals to preserve a special or prior obligation to a local

or national community, rather than insisting on a potentially unlimited obligation to aid the worst off in the world. Another contemporary view of cosmopolitanism is offered by Seyla Benhabib, who recovers and expands upon the Kantian concept of hospitality, understood as a cosmopolitan right of individual members of a global civil society to be welcomed and protected by other nations. Since this right intersects with the sovereignty of states, Benhabib argues that citizens of democracies who are convinced of the validity of cosmopolitan norms must articulate it into positive law.

Critics of cosmopolitanism, including Richard Rorty, have argued that since the global moral community does not exist as an empirical reality, people cannot be morally attached to it or feel loyalty toward others as fellow members of it. Rorty goes further by arguing that cosmopolitan norms cannot emerge from anything like Kantian rationality, as Benhabib suggests, and that the only hope for the gradual emergence of a global moral community is for people to abandon the pretense of universality. Until that happens, citizens of more affluent, developed countries are unlikely to identify with or sacrifice their prosperity for the sake either of strangers living in a far corner of the world or strangers arriving on their shores.

Cost–benefit Analysis

Cost-benefit analysis is a technique to determine the best alternative out of many available options by comparing the expected costs and benefits. It can be applied to the analysis of almost any course of action characterized in terms of its benefits and costs, including opportunity costs. The comparison of one alternative course of action to another is based on their net present values. The net present value of an alternative is the difference between the sum of all future benefits brought by the course of action and the sum of all future costs resulted from that course of action. A discount rate must be chosen in order to calculate future costs and benefits in present terms. For actions with long-term consequences, this choice is controversial because it requires predicting financial market performance, and often evaluating the value of the welfare of future generations.

The cost-benefit analysis is used in many areas. In finance applications, the cost-benefit technique helps to determine the most profitable projects. In government policy applications, the cost-benefit tool is often used to judge the effectiveness of government regulations for preventing market failures. The international relations between countries are also based on cost-benefit calculations. For example, the choice of a certain foreign policy action takes into account the expected subsequent positive and negative reactions of other countries, which generate the benefits and costs. However, where perfect markets for the inputs to the analysis do not exist, deriving the required costs and benefits is controversial.

Counter–Enlightenment Political Thought

Counter-Enlightenment political thought refers to a range of views that share the belief that the eighteenth century Age of Enlightenment in the West was fundamentally mistaken in ways that have seriously damaged religion, morals, and society. The Enlightenment was a period of reform when prominent and influential European and American philosophers, historians, economists, and politicians challenged many traditional beliefs and institutions in the name of reason, science, and progress. Critics of this movement's emphasis on the power and centrality of reason in human affairs have sought to depict it as both exaggerated and dangerous.

Over the past 250 years, the Enlightenment has attracted critics from across the ideological spectrum, ranging from devout conservative Catholics to radical feminists, from nineteenth-century romantic poets to twentieth-century neo-Marxists and even liberals. Most disagree on their interpretation of what the Enlightenment was; however, there is broad agreement among its adversaries that the period was socially and politically harmful, if not disastrous. There have been, and still are, many Counter-Enlightenments, from the eighteenth century to the present, covering not only a wide range of specific criticisms of the Enlightenment, but also many different, and sometimes incompatible, depictions of the Enlightenment by its critics, each of which suits their own beliefs, agendas, and interests.

EARLY CRITIQUES OF THE ENLIGHTENMENT

The first serious, systematic critique of the Enlightenment came from the eighteenth-century Swiss writer Jean-Jacques Rousseau, who had been a friend and ally of many of its leading proponents such as the writer Denis Diderot and the philosopher and mathematician Jean d'Alembert. Yet in his *Discourse on the Sciences and the Arts* (1750) Rousseau praises ignorance and associates the acquisition of knowledge of the arts and sciences with decadence and moral depravity. Many philosophers were shocked by this stance, which they saw as

a betrayal of the ideals of the Enlightenment. D'Alembert sought to counter it in his *Preliminary Discourse to the Encyclopédie* (1751), which became the French Enlightenment's unofficial manifesto. This early skirmish over the effects of the arts and sciences on morals soon escalated into an epic clash between Rousseau and the philosophers of the Enlightenment, which has continued without interruption ever since.

In the decades preceding the French Revolution (1789–1799), Enlightenment philosophers sparred constantly with orthodox religious writers such as the conservative Jesuit Guillaume-François Berthier, who assaulted the *Encyclopédie* for attacking Christianity and for its alleged corrosion of traditional morals and beliefs. After 1789, many writers blamed the violent excesses of the French Revolution on the Enlightenment which, it was widely believed, had systematically destroyed the legitimacy of monarchy and aristocracy in Europe and plunged the continent into decades of political chaos and bloodshed. The most eloquent proponent of this view was the conservative Savoyard Catholic Joseph de Maistre, whose *Considerations on France* (*Considérations sur la France,* 1796) depicts the events of the 1790s as divine punishment for the sins of the Enlightenment. Its most popular advocates were the Anglo-Irish statesman and philosopher Edmund Burke, author of the influential *Reflections on the Revolution in France* (1790), and the Abbé Augustin Barruel. Barruel's bestselling *Memoirs Illustrating the History of Jacobinism* (*Mémoires pour servir à l'Histoire du Jacobinisme,* 1797) makes the case that a conspiracy of Enlightenment philosophers, Freemasons, and the secret Illuminati Order deliberately sought to overthrow established monarchs and governments in Europe in the name of reason and progress.

Many romantic writers at the end of the eigteenth century and early nineteenth century in France, Germany, and Britain condemned the Enlightenment as antireligious, although their own religious views were often far less orthodox than those of its earlier Enlightenment critics such as Berthier. The belief was widespread among these romantic poets and writers that the Enlightenment's allegedly narrow emphasis on reason at the expense of emotion and passion had led to a world devoid of beauty, imagination, and spirit. This is a central theme of François-René de Chateaubriand's enormously popular and influential book *The Genius of Christianity* (*Le Génie du Christianisme,* 1802), an aesthetic defense of Christianity that depicts the beauty and mystery of faith as a casualty of the Enlightenment's relentless assault on traditional religious beliefs in the name of reason. Many romantic writers shared the mistaken conviction of earlier religious opponents of the Enlightenment that the philosophers of the Enlightenment were mostly atheists; in fact, very few were.

TWENTIETH-CENTURY COUNTER–ENLIGHTENMENT THOUGHT

Attacks on the Enlightenment were common throughout the nineteenth century, most notably in the later works of the German philosopher Friedrich Nietzsche, who associated it with the French Revolution as its earlier critics

had done. But it was not until the end of World War II (1939–1945) that Counter-Enlightenment thought became as widespread as it had been during and after the French Revolution. According to a generation of intellectuals born at the turn of the century, the Enlightenment played a central role in the emergence of twentieth-century totalitarianism, epitomized by Adolf Hitler's Germany and Joseph Stalin's Soviet Union. After World War II, German critical theorists Max Horkheimer and Theodor Adorno associated the Western conception of Enlightenment with a narrowly instrumental form of reason that was repressive and totalitarian in their very influential book *Dialectic of Enlightenment* (1947). Cold–war liberals of the same generation, such as philosophers Jacob Talmon and Isaiah Berlin, saw the legacy of the Enlightenment as directly linked to twentieth-century communism. In addition, their conservative contemporaries Michael Oakeshott and Eric Voegelin restated earlier, orthodox attacks on Enlightenment rationalism for its disastrous political and spiritual effects.

Among later generations of thinkers, postmodernists have been the Enlightenment's most vociferous critics. Works such as *Madness and Civilization* (1961) and *Discipline and Punish* (1975), by French philosopher and historian Michel Foucault, chronicle the emergence in the late eighteenth and early nineteenth centuries of a new disciplinary society that was liberal and humane in name and rhetoric but sinister and highly controlling in practice. Postmodern feminists such as Sandra Harding have attacked the Enlightenment for its supposedly pure conception of reason in which important gender differences are suppressed in the interests of men.

New forms of Counter-Enlightenment thought continue to proliferate today, for example, among some environmentalists critical of the modern West's faith in science and technology. Given that so many of the values, practices, and beliefs of modern Western civilization are rooted in the eighteenth-century Enlightenment, it is certain that its assumptions and consequences will remain matters of deep and abiding contestation.

Counterfactual

A *counterfactual,* also *contrafactual*, is a hypothetical situation usually created to examine what may have happened given a different course of events or set of conditions. Counterfactual experiments substitute variables of the historical context and analyze how these changes would have affected outcomes; for example, "If the United States had not gone to war against Iraq, it would have been able to fight terrorism worldwide more effectively." Counterfactual reasoning is used in any field in which researchers want to draw cause-effect conclusions but cannot perform controlled experiments in which they consider conditions that differ only in the presence or absence of the hypothesized cause. It is assumed that good counterfactuals should rest on multiple factuals, and, as sociologist Max Weber (1864–1920) claimed, they "should make as few historical changes as possible." Counterfactuals are often crucial for theory building and interpretations, may provide analytical insight, help to acknowledge the role of chance, and can facilitate, in Philip Tetlock's words, "learning from history." Limitations of this method are associated with the inherently subjective process and the certainty-of-hindsight effect.

Coup d'État

A *coup d'état* involves the sudden, often violent, overthrow of an existing government by a small group. In contrast, revolutions are achieved by large numbers of people working for basic social economic and political change. In almost all cases, a coup d'état is essentially identical to military coup because it either replaces a civilian government with the military or one military group with another.

There are three kinds of coups. The first is a *breakthrough coup d'état* that occurs when a revolutionary group overthrows a civilian government and creates a new elite. Examples of this type of coup include China (1911), Egypt (1952), Greece (1967), and Liberia (1980). A *guardian coup d'état* takes place when a group comes to power to ostensibly improve public order, as occurred in Pakistan with Prime Minister Zulfikar Ali Bhutto's overthrow by Chief of Army Staff Muhammad Zia-ul-Haq in 1979. Finally, a *veto coup d'état* occurs when the army vetoes democracy. The most famous example took place in Chile in 1973 when the military overthrew the elected socialist President Salvador Allende Gossens.

There is a question whether attempted plots and failed coups should be included in a study of the causes and effects of coups. Failed coups may have as large an effect as a successful coup. For instance, if a group were to attempt a coup and fail, the response of the regime that survived the attempt would likely not be much different from the actions of a group that succeeded; political repression is the common outcome. This, in turn, ferments resentful out-groups prone to violence that often lead to countercoups or civil war.

By way of illustration, Patrick McGowan breaks down the analysis of coups in sub–Saharan Africa into two periods, from 1958 to 1979 and 1980 to 2001. The causes of these coups across both periods are clustered along four explanations: the characteristic of the military, the level of political development, social mobilization, and the national political economy. But, there is disagreement on how these various causes positively or negatively affect change. For instance, does pluralism abate or accelerate coup d'états?

The centrality of the military is almost always a key cause, and related to this is the characteristic of the military, such as its ethnic composition. Countries with large militaries, particularly where they have strong ethic affinities, are strong candidates for a coup d'état. There is also broad agreement that poor economic performance is a powerful catalyst. Coups, of course, in turn have a negative impact on gross domestic product, which creates a viscous circle. In both cases, the causes of coups can be associated with the hollowing out of the state that eventually cripples it—a process that always precedes state collapse.

There is more debate on the association between pluralism and coups, and there are two important points here. First, whatever impact the level of pluralism has on coups, once a coup occurs, the possibility of a subsequent coup is high, and therefore the lack of political development and coups will have a high correlation. The relationship between pluralism and coups may also depend on the time period. For example, in Africa, the coups that took place between 1958 and 1975 occurred mostly in civilian regimes and those between 1976 and 1984 occurred mostly in military regimes. The effect here is key. A coup d'état that overthrows a military regime is much more likely to lead to military factionalism, which not only predicts further coups, but also plants the seeds for competing militias that characterize state collapse. The possibility of further violence heightens if the military splits after a coup, with each side supporting a different faction of elites. One way back to power is a countercoup.

Finally, one of the most commonly accepted effects of coup d'états is the contagion effect—it spreads to contiguous states. However, there is no conclusive explanation for this. Nonetheless, in Africa—and elsewhere—there is a geographic pattern to coups. Of the five major regions, west and central Africa seem to have been most prone to coups, while southern Africa has been remarkably free of coups.

Covenant

THE BIBLICAL COVENANT

The *biblical covenant* is a mutual and voluntary pledge between God and humankind for the attainment of the common good and justice. A congregation of equals (since people were created alike and in God's image) consents to a covenant; God does not force them to obey (Deuteronomy 4:1). A transcendent sovereign oversees the content of the covenant, and intervenes occasionally to ensure all act according to its terms. God submits to the same law he proposes for humans (Deuteronomy 7:12), limiting his omnipotence. Subsidiary covenants establish different sets of rights and obligations: between rulers and the ruled, under God's supervision (2 Samuel 5:3, Joshua 24), or international treaties (Genesis 21:27–32, Joshua 9).

Failure to comply with these stipulations leads to internal collapse, preceding the destruction of Israel by a foreign power. This causes the replacement of the original covenant (Jeremiah 31:31–32) and the introduction of a mediator between God and humankind, which warrants Christ, the new covenant in the New Testament (Hebrews 12:24). The new bond is anchored on grace and faith and sealed with baptism, which replaced circumcision.

COVENANT THEOLOGY IN THE REFORMED CHURCH

The Protestant theologians of the sixteenth century saw Reformed Christians as the new chosen people, a new Israel persecuted by a papal monarchy that identified them as "false teachers" (2 Peter 2:1). Reformation embodied the restoration of the covenant and the original purity of the religion of the patriarchs. The right to resistance to Catholic false idols and gods was therefore a religious obligation that extended to the civil domain through the duty to depose rulers who renounced true faith. The task was to govern according to God's will for the benefit of the population, which corresponded to a subsidiary double covenant between the people and the political leader and between the political leader and God. Violation of these conditions would lead to tyranny, which would contradict the biblical horizontal paradigm. This paradigm is based on a democratic republic moderated by the aristocracy of magistrates, such as Moses and pious kings. The Christian magistrate, a man of staunch faith answerable only before God, would adapt this model.

SECULAR VERSIONS

In the following two centuries, establishing a parallel between the biblical episodes prior to the covenant God made with Abraham and the condition without government, contractarians identified both with the state of nature. For Thomas Hobbes, this is a state of "war of one against the other" that can be overcome only by a covenant, through which people irreversibly deliver all rights to a sovereign whose powers are absolute. John Locke acknowledges the inconveniences of the state of nature, given the absence of a universally accepted law and coercive power. This creates a need to transfer certain rights to a sovereign with power that is conditional upon fulfillment of the compact with the people who can always depose the sovereign. For Jean-Jacques Rousseau, in the state of nature, humans were "noble savages" who were later corrupted by society. The social contract, signed by the people who collectively exercise sovereignty and obey no one but themselves, is the means to restore the freedom enjoyed in an idyllic state of nature.

AMERICAN SYNTHESIS

Religious and secular versions merged in the foundation of the early American Republic. The country was built by religious confessions—Puritans, Baptists, Presbyterians, Quakers, German Sectarians, Huguenots—in the name of liberty. The means to that end lay in the covenant paradigm; just as the Israelites had entered freely into a covenant with God, so did early Americans voluntarily agree to the creation of a church or a political society. That rationale was extended to all domains—labor unions, businesses, professional associations, towns, cities, states, the federal Union—through a network of secularized versions of the covenant. Saintly conduct—charity, interdependence, self-discipline, submission of the private interest to the community, obedience, virtue—ensured by influential churches, was translated in the political realm. This resulted in limited government, popular sovereignty, equity, and an equal share in the decision-making process.

Crime Policy

Government response to crime begins first with defining what constitutes criminal behavior. In totalitarian regimes, *crime* is often defined as any behavior that threatens the authority of the state. In liberal democracies, crime often mirrors the public's judgment of right and wrong behavior. Although these judgments may vary from state to state, most democratic nations condemn behavior that threatens the life, liberty, and property of others.

LIMITATIONS ON CRIME PREVENTION POLICIES

Social scientists and philosophers actively debate what causes people to commit crime. Some experts adhere to a medical model of crime, which posits that crime is a symptom of individual or societal dysfunction. Other experts assert that crime is a choice made by rational actors who act as free moral agents. Over time, lawmakers have incorporated both perspectives in their attempts to prevent crime: Officials will commit public funds to improve living conditions, educational opportunities, and vocational resources for their citizens while at the same time enacting tough sentencing laws that communicate the consequences of bad behavior.

Although public officials are concerned about the problem of crime, they are limited in their ability to stop it since many of the influences that impact criminal behavior are beyond government control. For example, research has shown that individuals with absent or dysfunctional families, negative peer relationships, and inadequate moral or religious training are more likely to commit crime; yet policy makers are often precluded from intervening in these private spheres. Similarly, studies have found that individuals with poor self-control are at higher risk for engaging in criminal behavior, but government policies can do little to change individual character traits. Nonetheless, when crime rates rise, increased public concern puts pressure on lawmakers to take immediate action to reduce crime. Accordingly, policy makers enact policies that alter the role of police, adjust the prosecutorial response, or amend the punishment scheme.

ALTERING THE ROLE OF POLICE

In most jurisdictions, local police agencies are charged with enforcing criminal statutes and maintaining social order. In the United States, police agencies have been transformed from loosely structured partisan organizations to professionalized bureaucratic agencies. Urban unrest in the 1960s and 1970s prompted a renewed interest in creating a community service role for police officers. Instead of patrolling neighborhoods in police cars—a practice that created distance between officers and citizens—offers were reassigned to foot patrol to encourage a stronger affinity between police and community residents. This also allowed officers to implement the zero tolerance theory of policing, which required officers to address minor disturbances in order to keep more serious crime at bay.

On occasion, lawmakers have enacted policies that change the way police officers do their jobs. When civil rights advocates complained that officers were indifferent to domestic violence and other crimes against women, policy makers curtailed traditional police discretion by enacting mandatory arrest policies and requiring certain procedural protections for victims of sexual violence. Similarly, police organizations with a history of racial prejudice have been the subject of targeted reforms, particularly with regard to the hiring, training, and evaluation of police officers. In some jurisdictions, civilian oversight of police agencies remains a source of contention as police officers view such policies as being unnecessarily restrictive or overly meddlesome.

Since the start of the modern war on terror, counterterrorism efforts have increasingly involved local police agencies. Many policy makers believe that police agencies are better suited than the military for counterterrorist operations because officers are regularly trained to detect, apprehend, and interrogate criminal suspects without compromising individual civil liberties or incurring civilian casualties. They are also in a better position to work with community leaders and other local agencies to prevent and respond to terrorist attacks. Other lawmakers, however, believe that counterterrorism efforts should be coordinated by national agencies because police agencies are ill-suited to handle the national security implications of terrorist related threats. They also lack the ability to direct personnel and resources outside of their local jurisdictions.

ADJUSTING THE PROSECUTORIAL RESPONSE

In liberal democracies, state attorneys are responsible for initiating judicial proceedings against criminal suspects. They weigh evidence collected from the police and file criminal charges with the court. In many instances, prosecutors have independent authority to decide whether to initiate proceedings against the suspect; in other jurisdictions, policy makers compel prosecutors to press charges in certain types of cases.

In recent years, governments have vacillated in their prosecutorial response to terrorism. Some governments have allowed terrorist suspects to have full due process rights, while

others have treated terrorists as enemies of the state. Before the attacks against the United States on September 11, 2001, U.S. officials routinely prosecuted individual terrorists as criminal suspects in civilian courts; however, after the 2001 attacks, the George W. Bush administration began to treat some terrorist suspects as unlawful enemy combatants. Instead of facing criminal charges in regular court proceedings, these suspects were prosecuted and tried in military tribunals. Since the 2008 election of Barack Obama, however, federal Department of Justice officials have been authorized to selectively prosecute high-profile terrorism cases in civilian proceedings.

AMENDING THE PUNISHMENT SCHEME

In most liberal democracies today, convicted criminals are punished with loss of liberty or property, and occasionally, with loss of life. Although the death penalty remains a punishment option in some nations, its use has decreased dramatically in the last several decades. In most nations, government officials are more likely to punish criminals with alternative sanctions, such as monetary fines and restitution, compelled participation in rehabilitation programs and community service, and fixed terms of imprisonment. In some jurisdictions, judges have full discretion over criminal sentencing; elsewhere, lawmakers are responsible for determining the terms of punishment.

Since the early twentieth century, sentencing policies have reflected a variety of philosophical beliefs. Some lawmakers assert that offenders can be rehabilitated through compelled participation in educational and behavioral modification programs. Others contend that bad behavior can be deterred by more punitive sentences or prevented altogether by sentences that incapacitate incorrigible offenders. Still others insist that the government only impose sentences that are justly deserved. Since each position has its practical advantages and disadvantages, democratic lawmakers have struggled to find a policy mixture that can curb crime while minimizing costs and maximizing liberty. Accordingly, when crime rates fluctuate, officials will often try to amend the sentencing scheme first before examining other parts of the system.

Crisis Rhetoric

Rhetoric is the use of persuasive language or other symbols, while *crisis* is a type of rhetorical terminology that conveys a sense of urgency and suggests that a threatening event, different from routine events, has occurred.

GENERATIVE AND STRATEGIC CRISIS RHETORIC

Crises may be rhetorical in two senses: generative and strategic. First, the language that policy makers use to talk and write about issues, whether intentional or not, influences their perceptions of reality. They then convey these depictions of reality to journalists and citizens, often unconsciously, through their messages. When government officials choose to speak about armed conflict in another country as a "crisis," for instance, their language immediately heightens the importance of events there and generates perceptions of a particular political reality for themselves and others.

Crises also can be rhetorical in the strategic sense that Aristotle described in *The Rhetoric* as the ability to identify, in any situation, "the available means of persuasion." Leaders may intentionally adopt a crisis terminology and construct messages in order to win public opinion in line with their view that a crisis exists and that their policy choice is the best means to resolve the crisis. In 1947, most Americans did not view the Soviet Union as a threat, but U.S. president Harry S. Truman and his State Department embarked on a campaign to convince them otherwise and to gain support for the Truman Doctrine. Conversely, leaders may use language strategically to downplay perceptions of crisis, as when the Sudanese government in 2009 attempted to avoid Western intervention with claims, quoted by Reuters's news service, that the humanitarian crisis in Sudan was "absolutely under control."

U.S. PRESIDENTS AND CRISIS RHETORIC

In the United States, since the end of World War II (1939–1945), presidents have been particularly prone to employing rhetoric that encourages perceptions of foreign crisis, and their rhetoric tends to have a number of recurring characteristics. First, presidents depict dangerous scenes of crisis abroad that pose a threat to both American interests (e.g., American lives) and ideals (e.g., freedom). Presidents argue that these scenes, in turn, dictate particular actions and goals. The portrayal of crisis scenes serves to frighten listeners and usually represents the world in black-and-white terms that simplify complex issues. In so doing, presidents attempt to justify particular policies as the only options available by claiming that time is of the essence if devastating consequences are to be avoided.

A second aspect of presidential foreign crisis rhetoric is its depiction of the United States. In their messages, presidents usually portray a nation that is powerful and determined, yet also peaceful and patient. When presidents take military action, they describe the United States as reluctant to do so, but—in the face of grave threat—resolute. Presidents often draw upon the myths of mission (the idea that the United States should be a model for all the world) and manifest destiny (the idea that the United States is destined to spread American institutions and values) to depict the nation as a moral agent with sacred world responsibilities. Presidents also consistently depict crises as tests of character in which the United States must prove its credibility, often through acts of military intervention.

A third facet of presidential foreign crisis rhetoric is its treatment of the enemy. When presidents urge strong military action, they frequently depict an enemy that is too dangerous and too wicked to ignore. Conversely, presidents interested in diplomatic solutions choose to deemphasize enemy portrayals, for fear that such language will undermine public support for diplomacy or even lead to demands for a military response.

A fourth characteristic of presidential foreign crisis rhetoric is its reliance upon references to the president's office, title, and responsibilities as a way to legitimize policy decisions. Since the Korean War (1950–1953), U.S. presidents have regularly used crisis rhetoric to justify military actions that they already have taken, thereby deepening the need to appeal to presidential authority.

When presidents choose to convince citizens that foreign crises exist, they also can depend on a number of advantages to help them do so: Americans's limited knowledge of international relations, the institutional credibility of the presidency, and the rally around the president phenomenon in which citizens tend to support their presidents, at least in the short term, during crises.

In addition, presidents can rely upon a largely compliant mass media to convey their messages for two basic reasons. First, administrations have become adept at news management, an activity that began to accelerate during the latter half of the twentieth century and includes tactics to affect coverage positively, such as President John F. Kennedy's use of exclusive interviews and the Ronald Reagan administration's "line of the day." Second, as media companies have come to treat the purpose of news as profit, rather than public service, they have cut resources from news gathering and encouraged coverage that is entertaining in order to appeal to a wider audience. Such changes, along with a compressed news cycle, have encouraged journalists to rely on official sources, rather than investigating issues themselves, to fulfill the constant demand for stories easily and inexpensively.

From another vantage point, presidents may seem less able to influence public opinion today since the number of media outlets, and hence choices, has proliferated; electronic news coverage tends to summarize presidential messages rather than airing them as spoken; and media coverage, while not questioning facts, discusses politicians' motives cynically.

Nonetheless, when a foreign crisis appears to threaten the nation and citizens have rallied around the president as a representative of the nation, journalists still become especially deferential, thereby allowing presidents to convey their views readily, as President George W. Bush did after the September 11, 2001, attacks on the United States. Presidents find their persuasive task more difficult, however, when they cannot resolve a crisis or their personal credibility is badly damaged, as with Lyndon B. Johnson and Vietnam and Jimmy Carter and Iran.

Over time, the relationship between presidential power and foreign crisis rhetoric has tended to be symbiotic: presidents have used their power to support their rhetoric, and they have used their crisis rhetoric to expand their power. From 1990 to 1991, for example, George H. W. Bush sent 400,000 U.S. troops to Saudi Arabia without asking for congressional consent or invoking the War Powers Resolution of 1973. Presidents have regularly used crisis rhetoric to legitimize unilateral actions and, most often, Congress has assented, thereby ceding the executive branch greater control over foreign policy. If critics oppose military action, they may be attacked for not "supporting the troops."

Foreign crisis rhetoric also discourages careful deliberation by arguing that danger leaves no time for delay, as in George W. Bush's insistence that Congress complete any debate on Iraq prior to the November 2002 elections. Equally troubling, foreign crisis rhetoric may justify extreme measures that violate civil liberties to achieve security.

WORLD LEADERS AND CRISIS RHETORIC

While American presidents have been particularly prone to using crisis rhetoric, other world leaders have often been similarly inclined. Spanish prime minister José María Aznar, for example, engaged in crisis rhetoric before the Spanish parliament in 2003 to justify his support for an impending U.S.–led war against Iraq. According to Teun A. van Dijk in a 2005 article, Aznar depicted a crisis, created by Iraq, which threatened the entire international community, and portrayed his government's actions as peaceful and defensive in nature. In 2004, Russian president Vladimir Putin likewise used crisis rhetoric to represent Chechen hostage takers as part of an international terrorist threat and to bolster perceptions of his own leadership, thereby obscuring Chechen grievances. International leaders have also learned from the example of American presidents that news management techniques can be instrumental in attaining positive media coverage for their crisis interventions. When Israeli military forces invaded Gaza in January 2009, Israeli prime minister Ehud Olmert gave Western journalists easy access to Israeli locations where Hamas rockets had landed, but prevented them from covering the bloodshed in Gaza.

In an era when so many issues vie for public attention, the allure of crisis rhetoric remains strong. The government of North Korean leader Kim Jong-il demonstrated this point quite well with its March 2009 accusation, quoted in *The Boston Globe* and *The Wall Street Journal,* that U.S. president Barack Obama's administration "is now working hard to infringe upon the sovereignty" of North Korea "by force of arms in collusion with the South Korean puppet bellicose forces." According to analysts, this crisis rhetoric was both a response to the new, more conservative South Korean government and a bid to gain U.S. attention.

Critical Juncture

A *critical juncture* is an episode of pivotal transformation, during which an institution undergoes fundamental and revolutionary change. Critical junctures are unlike other changes because critical junctures are not incremental: They are one-time episodes with lasting consequences. The critical juncture secures a choice or a path through which the institution continues after the juncture has passed. The choice is secured, or "locked in," because other choices are either excluded from later analyses or because other options are eliminated through cost-benefit comparison. As part of the path–dependency analysis, a critical juncture helps establish the trajectory of a society.

Identifying a critical juncture is, strictly speaking, only possible after the fact. Analysts cannot know that a critical juncture is in fact critical until afterwards, because it requires that the institution(s) it fosters become self-reinforcing. Identifying an event as a critical juncture often involves creating counterfactual projections as to what might otherwise have occurred. In this way, an episode may be identified as critical to an institution's creation, it or contributes to how an institution has changed. Counterfactual arguments explain how a moment was critical by creating possible alternatives to history.

Of course, journalists and politicians often see particular movements as historic even as they happen, but a historic moment is not necessarily a critical juncture. At times, it seems that social forces move inexorably toward a certain outcome. For instance, given the preceding rise in women's status in the legal profession, the appointment of a woman to the U.S. Supreme Court in the twentieth century seemed inevitable at some point, if not exactly when it would occur.

By contrast, critical junctures are contingent on preceding events, but yield unexpected outcomes of these events. A crucial facet of critical junctures is that, though proceeded by enabling social conditions, they are context specific and differ from society to society. These episodes may last moments or linger on for years, depending on the circumstances. Critical junctures interrupt or profoundly influence existing institutions, but are unpredictable even by those familiar with a society's institutions.

Scholars who employ path dependency as an explanation of events therefore investigate antecedent conditions to a critical juncture, but rely more heavily on posterior events. Not only do different environments and actors within societies affect how critical junctures affect the development of an institution, but different institutions and processes are more susceptible to change than others. Antecedent conditions cannot reliably predict if there will be a critical juncture, what will change, or how the institution will change. Following a critical juncture is a period of *historical legacy* in which the effects of the juncture persist. This legacy may become evident directly after the juncture, or it may become evident only long after the event has transpired. For instance, the Magna Carta in 1215, which established certain rights of the nobility in England, is now recognized as a critical step toward universal human rights.

Critics of analyses that employ critical junctures argue that the concept is either too broad to be useful or too vague to explain anything. The idea of a critical juncture may be applied to different contexts, but it may also be so context specific that it cannot be generalized to other circumstances. The same scenarios, actors, and processes are unlikely to occur

in and influence disparate processes. Likewise, the concept of a critical juncture leaves unanswered how long a juncture might last or specific attributes that a critical juncture must entrench before it becomes important.

Analyses that use the critical juncture framework are also criticized as being overly deterministic, and exclude the role of individual actors outside the critical juncture and may be unfalsifiable. Also, path dependent solutions work only in hindsight, and while most historical analysis allows analysts to develop predictions, a key component of a critical juncture is that the outcome is either random or unpredictable. In this way, critical junctures inhibit prediction. Lastly, deterministic arguments may create logical tautologies: Something is a critical juncture because it shaped an institution as such, and something was shaped as such because of the critical juncture.

Critical junctures are widely used within political science to explain important moments in the history of a society or institution. Scholars point to seemingly important events and attempt to show how an incident shaped an outcome that might not have been, no matter how entrenched it has become. While many argue that such analysis lacks scientific rigor, others argue that explaining these critical moments is important to understanding how institutions develop.

Critical Race Theory

ORIGINS AND DEVELOPMENT

Critical race theory (CRT) began in the early 1980s as an insurgent intellectual movement within the American legal academy. The movement's impetus was, according to Kimberlé Crenshaw, Neil Gotanda, Gary Peller, and Kendall Thomas, the editors of the 1995 book, *Critical Race Theory: The Key Writings That Formed the Movement,* "a deep dissatisfaction with traditional civil rights discourse" felt by students and younger professors, mostly of color, in top U.S. law schools. CRT students and scholars maintained that legal academic elites such as the Harvard Law faculty promulgated a naïve view of racial justice, which worked to preserve de facto white supremacy by underestimating the breadth and depth of racial injustice in the United States. CRT proponents held that an implicit social compact existed between liberals and conservatives in the American intelligentsia about how racial justice would be debated and understood. As described by Kimberlé Crenshaw and her colleagues in *Critical Race Theory: The Key Writings that Formed the Movement,* liberals and conservatives together would exclude "radical or fundamental challenges to [the] status quo . . . by treating the exercise of racial power as rare and aberrational rather than as systemic and ingrained" (xiv). Racism would be conceived as the "intentional, albeit irrational, deviation by a conscious wrongdoer from otherwise neutral, rational, and just ways of distributing jobs, power, prestige, and wealth. The adoption of this perspective allowed a broad cultural mainstream both explicitly to acknowledge the fact of racism and, simultaneously, to insist on its irregular occurrence and limited significance" (xiv). The intended effect of this tacit agreement was to forestall radical challenges to de facto white supremacy and to confine racial reform to liberal incrementalism.

The radicalism of CRT's critique of American white supremacy elicited shock, outrage, and even ridicule from both the law school establishment and the American intelligentsia. But as CRT produced a steady stream of law review articles deconstructing the conventional wisdom of American legal liberalism—illustrating the gap between that conventional wisdom and real-life minority experience—the movement won adherents. Closely allied with critical legal studies (CLS), which sought to expose the ways American law systematically perpetuated and legitimated economic exploitation, CRT drew sustenance from the Marxist and poststructuralist insights of CLS while at the same time forcing it to move race closer to the center of its inquiry. CRT thus constituted of both "a left intervention into race discourse and a race intervention into left discourse" (Crenshaw et al., xix). Today CRT scholars hold tenured professorships in prestigious law schools and are making inroads in the disciplines of history, sociology, political science, and philosophy. While there is less resistance to CRT today than there was at its inception, many scholars and pundits still consider CRT to be conspiratorial and antiwhite.

PREMISES AND TENETS

CRT is a diverse intellectual movement without a rigid orthodoxy. Its adherents nevertheless share some premises and tenets. First, critical race theorists insist that though *race* is bankrupt as a biological concept, it is significant as a social concept. For five centuries, changing conceptions of race legitimized the enslavement, dispossession, colonization, and oppression of African, Native American, Latino and Latina, Asian, and Jewish peoples; though those conceptions of race have been discredited, they still organize inequality and infect modern thought. To diagnose the ways those conceptions of race continue to distort social perception and structure inequality, it is necessary to employ race as a social category. In addition, to avoid essentialism and overgeneralization, it is important to study the various ways different groups have been racially categorized and characterized at different points in time.

Second, critical race theorists consider white supremacy to be constitutive of, and not anomalous to, the American polity. This premise overturns the mainstream belief that civil rights advances of the 1950s and 1960s—*Brown v. Board of Education* (1954), the Civil Rights Act of 1964, and the Voting Rights Act of 1965—purged the laws of racial injustice, removed all obstacles to racial equality, and restored the legitimacy of an otherwise just system. Critical race theorists opt for their historical view not out of eagerness either to discount the triumphs of the civil rights movement or to be reflexively anti–American, but rather out of a carefully considered belief that (1) their view more accurately reflects American historical and sociological reality, and (2) any sugarcoating of that reality provides a false sense of comfort and forestalls the achievement of racial equality. Critical race theorists also wish to emphasize that America's achievement of racial justice is not destined and inevitable. History can and does move backward; realizing racial justice thus requires moral vigilance and political action.

Third, CRT is highly critical of the turn toward the ideal of *colorblindness,* both in the judiciary's interpretation of the Fourteenth Amendment and in American political culture generally. While many critical race theorists agree that a colorblind society is the ultimate goal, all are skeptical that social and economic white supremacy can be dismantled without color-conscious, results-oriented public policy. Maintaining that racial justice means substantive racial equality, they argue that those who opt for formalistic understandings of racial justice—intentionally or not—act to preserve the social and economic privileges white Americans accumulated over three centuries of de jure white supremacy. Against those who characterize prominority remediation as morally equivalent to antiminority discrimination, critical race theorists respond that the two are morally asymmetrical. They urge judges to consider social and historical context in adjudicating color-conscious public policies, and measure their constitutionality by whether they reinforce or undermine de facto white supremacy.

Fourth, CRT emphasizes the importance of attending to *intersectionality*—how individuals live within multiple identities. Because both antidiscrimination law and identity-based social movements typically are organized around single dimensions of identity—race *or* sex *or* sexual orientation, to name just three—our structures of law and protest are ill-equipped to address problems that arise from hybrid forms of oppression. If a black woman, for example, is denied a promotion because her boss feels special animus against black women, that boss can defuse her race-based or sex-based antidiscrimination claim by pointing to recent promotions of black men and white women. The law's insensitivity to the fact that people suffer hybridized forms of discrimination leaves these victims without legal recourse. Scholars of intersectionality analyze these dilemmas and develop conceptual frameworks capable of addressing them.

Critical Realignment Theory

Popularized in the 1960s and 1970s, critical realignment theory gained credibility through the efforts of such notable scholars as V. O. Key Jr., E. E. Schattschneider, James L. Sundquist, and Walter Dean Burnham. For years, critical realignment theory was considered conventional wisdom, and political scientists pondered over when the next critical realignment would occur. Not without its critics, critical realignment theory garners an important place in political science with its definition of eras and electoral politics.

Shortly before the end of World War II (1939–1945), the field of political science began toying with the idea of realigning elections. In *A Theory of Critical Elections,* Key provided the first conceptualization of a critical election. Having studied American presidential elections, Key suggested that two types of elections occur—a few defining *critical elections* and a larger number of quite ordinary and undistinguished elections. Key argued that the defining features of critical elections are (1) voters' involvement is more intense, (2) voters are concerned with the result of the election, (3) the results of the election produce a transformation in the electorate, and (4) the results of the transformation endure for several election cycles. These critical elections usher in a new era in which the electorate shifts as a whole and the dynamics of the electorate are redefined. Although Key identifies two elections that meet the criteria of critical elections, the U.S. presidential elections of 1896 and 1928, he fails to discuss periodicity or the affects these elections have on government processes or policies.

Sundquist builds on the work of Key and Schattschneider and illustrates the significance of the eras that mark the time in between critical elections. Sundquist finds that not all realignments occur in one election, but may be the result of several critical elections. Several features are characteristic of

critical realignment theory. Again, in examining voter support of political parties over time, two types of elections are prevalent, realigning and nonrealigning. The existence of critical elections that foster a realignment in the electorate occur in regular intervals. The cycle between critical elections culminates with a transformation in the electorate approximately every thirty years. Many of the transformative effects are the result of oscillation between a weakening and strengthening party identification. As party identification strengthens so too does voters' concern with the election, and high turnout results. There is also evidence suggesting that third parties usually perform well right before a critical election and this may factor into the realignment. Furthermore, realigning elections or critical elections usually focus almost predominately on national issues. Those elections that are characterized as critical elections produce notable changes in the political order. Different interests are recognized as salient to the voters, new ideological issues act as cleavages between the parties, and a long span of unified government emerges. As a result, new government policies emerge that seek to address these new differences or salient issues.

Building on the work of Key and others, Burnham was the first to articulate a specific time period to identify the time span between elections that can best be categorized as a critical election. These critical elections serve to disrupt the current party system at the time and thereby usher in an era that identifies with different policies, ideologies, theories, and presuppositions. Burnham specifies that these critical elections occur every thirty to thirty-six years and, as a result, exhibit a cyclical quality.

Although critical realignment theory is customarily considered an influential theory of elections in political science, it does have its share of critics. Perhaps the greatest critique leveled at critical realignment theory is the failure of a critical election to occur in more than seventy years. The last election that scholars support and recognize as a critical election is the presidential election of 1932. A few scholars have posited the occurrence of a critical election in the 1970s, and perhaps the 1990s, but these elections fail to meet the criteria of a realigning election as established by the theory in the 1960s and 1970s. As David Mayhew states, " . . . the chief contemporary charge against the realignments genre is that it has ceased to be relevant: No certifiable electoral realignment has occurred since 1932." Several explanations exist. First, more than seventy years since a critical election results from the decay of the American parties in the 1960s and 1970s as a result of ticket splitting and increasing numbers of independents. Second, parties seek out the median voters in elections and actively attempt to be less polarizing in order to garner their support. Last, a critical election did not occur as per the schedule of every thirty years because there was not a strong enough event to cause realignment.

Critical Theory

Critical theory as a philosophical tendency was formed within German culture, but the term was actually coined in the United States. The critical theory project took shape at the Institute for Social Research, founded in 1923 in Frankfurt. The first director of the institute, Carl Grunberg, and many of its early members like Henryk Grossman, Fritz Sternberg, and Felix Weill were primarily interested in the study of political economy, imperialism, and the history of the socialist labor movement.

MAX HORKHEIMER, WALTER BENJAMIN, AND THE FRANKFURT SCHOOL

Max Horkheimer, who took over as the new director of the Institute for Social Research in 1930, changed the orientation of critical theory. Seminars of an interdisciplinary sort were organized among the members of Horkheimer's inner circle and, ultimately, they would produce the major works of critical theory normally associated with the Frankfurt school. Participants included Leo Lowenthal, an expert in literary criticism who joined the institute in 1926, and Theodor W. Adorno, who was considered valuable for his knowledge of music, and who began his collaboration with the institute in 1928, yet only became an official member ten years later. There was also Erich Fromm, a gifted psychologist, who started his nine-year collaboration in 1930; Herbert Marcuse, a philosopher and former student of Martin Heidegger, who joined in 1933; and Walter Benjamin, the most unique of these thinkers, who never officially was a member at all.

Benjamin was completely unknown in the United States until the preeminent political theorist, Hannah Arendt, edited a collection of his essays, *Illuminations* (1969). Benjamin thereafter became celebrated as an iconoclastic thinker involved with investigating and meshing traditions as diverse as Jewish messianism, baroque, modernism, and Marxism. With the new popularity of the radically subjective postmodern movement during the 1980s, however, his fame reached extraordinary proportions: A library of secondary works has appeared and almost every volume of Benjamin's four-volume *Selected Writings* has become an academic bestseller. His critique of progress and optimistic illusions, his attempt to reconstruct theory through the assimilation of seemingly mutually exclusive traditions, his skepticism concerning traditional foundations and universal claims, and his preoccupation with subjectivity produced a transformation of the entire critical project. Benjamin's work spoke directly to many on the left who, following the collapse

of the social and cultural movements associated with the 1960s, felt they were living in an age of ruins. Above all, however, his inability to decide whether to emigrate to Israel or the United States and his subsequent tragic death in 1940, while attempting to flee the Nazi invasion of France, put a particularly dramatic stamp on his life and the experience of exile.

Exile marked the work of the Institute for Social Research. Horkheimer, in fact, only coined the term *critical theory* in 1937, after having fled to the United States. His seminal essay on the subject, "Traditional and Critical Theory" (1937), treated it as an approach qualitatively different from "vulgar" materialism—that is to say positivism or behaviorism—and metaphysical idealism. Following the approach developed in the classic works of unorthodox Western Marxists like *Marxism and Philosophy* by Karl Korsch and *History and Class Consciousness* by Georg Lukács, Horkheimer insisted that critical theory should be understood neither as a philosophical system nor a fixed set of proscriptions. He instead viewed it as a method of liberation, a cluster of themes or concerns that would express an explicit interest in the abolition of social injustice and the psychological, cultural, and political reasons why the international proletarian revolution failed following the events of 1917 in Russia. With the publication of "Authority and the Family" (1934), for example, Horkheimer sought to analyze how a patriarchal familial structure inhibited the development of revolutionary consciousness among workers. "The Jews and Europe" (1938) insisted that confronting bigotry called for confronting economic exploitation: or, as Horkheimer put the matter in his essay, "he who wishes to speak of anti-Semitism must also speak of capitalism." Works like these set the stage for a new mode of *dialectical thinking*—a version of Marxism—that went beyond the economic interests of classes and elites as well as the institutional dynamics of the state.

THE CRITIQUE OF IDEOLOGY AND TOTALITARIANISM

Reactionary sexual mores, mass culture, the division of labor, and the need to grasp the universal through the particular would prove essential themes for the Institute for Social Research. Deeper issues mired in the anthropology of human existence also became matters of concern for critical theory. Indeed, the need for a response to these issues turned critical theory into an ongoing threat to the stultifying dogma and collectivism of "actually existing socialism." In the spirit of Marxism, critical theory leveled an attack on all ideological and institutional forms of oppression including those justified by Marxism itself. Critical theory was—from the first—intended to foster critical reflection, a capacity for fantasy, and new forms of political action in an increasingly bureaucratized world.

Most members of the institute remained suspicious of the different ways in which supposedly neutral formulations of science veiled repressive social interests. That is why they employed a methodological approach indebted to both the *critique of ideology* (*Ideologiekritik*) that derived from German idealism and Marx's sociology of knowledge. Ideals of freedom

and liberation thus provided the basis for the social critique of the existing order. In the United States, however, the character of this engagement changed dramatically from that of the early days. The most compelling reasons were connected with the failure of the proletarian revolution, the increasingly stark reality of totalitarianism, and the looming shadow of McCarthyism.

Major scholars associated with the Institute for Social Research—albeit often at the fringes—added much to an understanding of the ideological forces behind the new totalitarian phenomenon and its structure. Its emergence in Germany was analyzed in diverse works of an interdisciplinary character. *Escape from Freedom* (1941) by Erich Fromm, which proved enormously popular, analyzed the psychological appeal of Nazi totalitarianism. Siegfried Kracauer, who was close to Adorno and Benjamin, offered what would prove a classic examination of German film in the Weimar Republic in his work entitled *From Caligari to Hitler* (1947). In a more social scientific vein, Otto Kirchheimer contributed *Political Justice* (1961) and Franz Neumann, with *Behemoth* (1942), introduced the first significant work that analyzed the structure of the Nazi state. Horkheimer himself edited a five-volume work, *Studies in Prejudice* (1949), for the American Jewish Committee while Adorno led a team of researchers in producing the classic book *The Authoritarian Personality* (1950). In the context of the United States, both looking backward to the 1930s and forward to McCarthyism, *Prophets of Deceit: A Study of the Techniques of the American Agitator* (1948) by Leo Lowenthal and Norbert Guterman as well as Lowenthal's work on American anti-Semitism, *Images of Prejudice* (1945), are significant works.

Following the Hitler-Stalin Pact that unleashed World War II (1939–1945), the proletarian revolution ceased to serve as the ultimate aim of the critical enterprise. The working class lost its standing as the revolutionary subject of history and the Frankfurt school no longer saw its interests as sufficient for generating a critique of the status quo. A new phase in the development of critical theory began with the completion of *Dialectic of Enlightenment* (1944), including a sensational last chapter "Elements of Anti-Semitism," in 1947. Horkheimer and Adorno, its authors, called into question the old belief in progress, science, and the benefits of modernity. They insisted that by privileging mathematical reason, the Enlightenment not only assaulted reactionary forms of religious dogma, but also, whether intentionally or unintentionally, the more progressive normative ways of thinking. Scientific rationality divorced from ethical concerns was, indeed, seen as culminating in the number tattooed on the arm of the concentration camp inmate.

Dialectic of Enlightenment offers less the vision of a better world emerging from the Enlightenment than one increasingly defined by the commodity form and bureaucratic rationality, in which the individual is stripped of conscience and spontaneity. Stalinism on the left, Nazism on the right, and an increasingly bureaucratic and robotic mass society emerging in the United States inspired this book: mass society, the horror of war, and—perhaps above all—the concentration

camp universe. The new reality demanded a significant revision in the more traditional understandings of critical and radical theory.

THEODOR ADORNO AND THE CRITIQUE OF THE BUREAUCRATIC ORDER

Communism had turned into a nightmare, Nazism was even worse, social democracy had been integrated into the status quo, and liberalism—with its emphasis upon the abstract individual of the social contract—had seemingly become anachronistic. For Horkheimer and Adorno, the possibility of revolutionary transformation faded in the face of an apparently seamless bureaucratic order buttressed by the culture industry intent on eliminating subjectivity and any genuinely critical opposition to the status quo. This development is what required rethinking of the usually positive view that progressives had traditionally accorded the Enlightenment. Not the *philosophe* or the political critic but the bohemian intellectual, who challenged society in its entirety, was seen as embodying whatever emancipatory hope existed for the future. Thus, for the proponents of critical theory, it had become necessary to supplement the dialectical framework of Hegel and Marx with the more modernist and subjectivist tenets of nineteenth-century German philosophers Arthur Schopenhauer and Friedrich Nietzsche in combating the collectivist strains within advanced industrial society.

It was now incumbent upon a genuinely critical theory to explore the ways in which civilization in general, and modernity in particular, were flawed from the beginning. The critical theory of society would thus require a more directly anthropological form of inquiry. According to Horkheimer and Adorno, indeed, it was now necessary to highlight not the needs of some class-bound and collectivist "revolutionary subject" like the proletariat, but the ways in which individual subjectivity might resist the conformity generated by an increasingly administered and culturally barbaric universe. Political resistance thus made way for a philosophico-aesthetic assertion of subjectivity in *Negative Dialectics* (1966) and *Aesthetic Theory* (1970), two monumental works by Adorno, while Horkheimer emphasized a philosophico-religious understanding of resistance in *The Longing for the Totally Other* (1970).

Adorno was probably the most talented proponent of this new turn in critical theory. His interests extended from musicology and literary analysis to sociology, metapsychology, and philosophy. Adorno's works evidence a rare standard of intellectual brilliance. They include extraordinary studies on modern music, in his masterful *Aesthetic Theory,* and *Minima Moralia: Reflections of a Damaged Life* (1947).

Adorno's work exemplifies the abstruse style that has become identified with the Frankfurt school. The heritage of dialectical philosophy surely had an impact on its formation and the complex use of complex concepts employed often demanded a complex articulation. Especially in the ideologically charged context of the war and its aftermath, however, members of the Institute for Social Research also self-consciously employed an *Aesopian* form of writing. As exiles living in the United States, they sought to hide their indebtedness to Marx by substituting the highly abstract language of Hegel. But also noteworthy about the style of Adorno and Horkheimer, their famous analysis of the culture industry developed in *Dialectic of Enlightenment,* written while they were living in Los Angeles, implied that popularity would necessarily "neutralize" whatever critical or emancipatory messages a work might retain. Nevertheless, there was nothing ambivalent about the willingness of Erich Fromm—or Herbert Marcuse—to engage the public in a radical fashion.

ERICH FROMM AND HERBERT MARCUSE

Erich Fromm was surely the most lucid stylist to emerge from the Institute for Social Research. He was also the most popular and, arguably, the most loyal to its original purpose insofar as he always sought to link theory with the practical demands of social change and individual transformation. Fromm grew up Orthodox and he studied with some of the leading rabbis in Europe. His dissertation dealt with the Jewish Diaspora and another of his early works with the Sabbath. The psychoanalytic institute he founded in Berlin with his first wife, Frieda Reichmann, soon became known as the Torah-peutikum. His interest in the psychological appeal and ethical impulse provided by religion, indeed, never fully disappeared.

Fromm was initially one of the most influential members of the institute and a close friend of Horkheimer. His concern was with how psychological attitudes mediated the relation between the individual and society. Even during the 1920s, he was intent upon linking Sigmund Freud's psychoanalytic theory with Marx's historical materialism. For this reason, when Adorno first insisted on developing an anthropological critique of civilization from the standpoint of Freud's instinct theory, he clashed with Fromm, who insisted upon the primacy of Freud's more practical clinical studies. The dazzling newcomer won the battle. Fromm divorced himself from the institute by 1940 and proceeded to write a number of bestsellers, including *Escape from Freedom.* Quickly enough, his former colleagues condemned him for the "superficial" quality of his writings even while his influence soared among left-wing intellectuals and a broader public from the 1950s to the 1970s.

As for Herbert Marcuse, while in the United States, he not only worked with the Office of Strategic Services as an expert on West European politics, but also wrote papers on totalitarianism and, in 1958, published a highly respected study entitled *Soviet Marxism.* In spite of his penchant for utopian thought, so prominent in *Eros and Civilization* (1955), Marcuse also remained faithful to the original practical impulse of critical theory. His most influential work, *One-Dimensional Man* (1964), actually anticipated the seminal role of the new social movements and a radical cultural politics in responding to the bureaucracy, commodification, and conformism of advanced industrial society. Pessimism concerning the future of a society in which all radical alternatives were being absorbed, and all ideological contradictions were being flattened out, combined with a utopian vision built upon the radical humanism of the young Marx, the *play principle* of Schiller with its

utopian assault upon the repression demanded by reality, and the metapsychology of Freud. This tension, indeed, permeated all of Marcuse's writings.

THE LEGACY OF THE FRANKFURT SCHOOL AND FUTURE OF CRITICAL THEORY

In the United States, the popularity of Fromm and Marcuse contrasted strikingly with a virtually total ignorance of the work produced by the rest of the Frankfurt school. The legend that critical theory inspired the movement of the 1960s is, certainly in America, misleading; its major works were translated only in the 1970s. During that decade, journals like *Telos* and *New German Critique* helped publicize its ideas and the works of its most important representatives. In Europe, however, the influence of the Frankfurt school on the partisans of 1968 was strong. Its emphasis upon alienation, the domination of nature, the regressive components of progress, the mutability of human nature, and the stultifying effects of the culture industry and advanced industrial society made the enterprise relevant for young intellectuals who had come of age through the movement of the 1960s.

Horkheimer and Adorno, however, were appalled by what they had helped inspire. Following their return to Germany, the former became rector and the latter, somewhat later, a dean at the University of Frankfurt. It is somewhat ironic that these new stalwarts of the establishment should have anticipated the movement's concern with a cultural revolution and the transformation of everyday life demanded by so many of their students. These themes were as real for many activists of the 1960s, both in Europe and the United States, as the quest for racial justice and the anti-imperialist opposition to the Vietnam War (1959–1975). Nevertheless, these themes lost their salience in the general malaise that followed the collapse of the movement and the emergence of a neoconservative assault upon the so-called adversary culture.

A new set of academic radicals embraced instead the deconstructive and radically subjectivist elements in the thinking of the Frankfurt school in general, and in the work of Adorno and Benjamin in particular, with their emphasis upon the fragmentary character of reality, the illusion of progress, and the need to substitute experimental cultural for political resistance. All this fit the time in which radicalism retreated from the streets into the university. Critical theory of this new *deconstructive* or *poststructuralist* sort invaded the most prestigious journals and disciplines ranging from anthropology and film to religion, linguistics, and political science. Elements of it have, indeed, have become features of the very society that the Frankfurt school ostensibly wished to challenge.

But that time, too, is passing. If it is to remain relevant, especially in the United States, critical theory must begin taming its metaphysical excesses, mitigating its subjectivism, and affirming its repressed political character. These concerns inform much of the work undertaken by Jürgen Habermas, the brilliant student of Horkheimer and Adorno, who came to maturity in the aftermath of World War II. Of particular interest, in this vein, is his *Philosophical Discourse of Modernity: Twelve Lectures* (1985). Habermas was never in exile: He experienced the impact of totalitarianism directly in his youth, and it left him with a profound respect for the liberal political legacy, the *public sphere*, and the repressed possibilities of *communicative action*. Habermas has also gained a large academic following in the United States. Nevertheless, his work provides an important beginning for resurrecting the critical undertaking.

A *clash of civilizations*, globalization, new forms of imperialism, and a powerful tide of conservatism are creating new problems for a new generation of critical theorists. It is becoming increasingly necessary to begin reconstructing the practical impulse of the critical project, its repressed political purpose, and its speculative legacy for the present. Critical theory was originally intended to foster social justice, cultural experimentation, and human happiness. Its academic transformation into a form of metaphysics cannot remain immune from criticism. Remaining honest to the tradition of critical theory thus calls for confronting it from the critical standpoint. Whatever the other differences between them, all of its major representatives would assuredly—today—find themselves in agreement with that claim.

Croce, Benedetto

Benedetto Croce (1866–1952) was an Italian philosopher of history and aesthetics who emphasized the importance of the human imagination, consciousness, and intuitive understanding in the concrete experiences of living. Born near Naples, Croce was raised in a wealthy family. In 1883, only Croce and his brother survived the earthquake of Casamicciola, which killed his parents and sister. At age sixteen, he went to Rome to live with his uncle, Silvio Spaventa, who introduced Croce

to art and politics. He studied law at the University of Rome without taking a degree, returned to Naples, and enriched his intellectual life by traveling to Spain, Germany, France, and England.

In 1910, Croce was made a life member of the Italian Senate in honor of his work. When Mussolini rose to power, Croce left his one-year tenure as minister of education (1920–1921). Croce's 1925 *Manifesto of the Anti-Fascist Intellectuals* severed his relationship with philosopher Giovanni Gentile (1875–1944), who supported Mussolini's Fascism. Croce continued to be a critic of the Fascist regime, publishing his bimonthly review *La critica* from 1903 to 1944. Subsequently, the Fascists raided his personal library was raided, and his books were banned. Due to his international reputation, Croce avoided imprisonment. After the fall of Mussolini in 1943, Croce led the Liberal Party and remained its president until 1947, the same year he established the Italian Institute for Historical Studies.

Giambattista Vico, Giovanni Gentile, and G. W. F. Hegel were major influences. Croce applied Vico's cyclical theory of social progress to the relation between art, philosophy, and practice. Also, many scholars view Croce as neo-Hegelian because of his view of history as dialectical and progressive. Unlike Hegel, Croce opposed idealism as a systematic, utopian philosophy, because of human's lower nature. Croce also rejected materialism and positivism as morally bankrupt. Fighting against the ideological illusion of systematic certainty, he argued for moral ambiguity in knowing the ethical ideal. Since Croce believed logic rested on intuitive knowledge, the foundation of his philosophy as aesthetics was an ongoing process of moral experience and expression. Croce's core philosophical writings are *Aesthetic,* published in 1902, along with *Logic* and *The Philosophy of the Practical,* both published in 1908. Because of his stress on the arts and the power of symbols and language as the imaginative source for knowledge, Croce's liberalism was aristocratic.

In *History as the Story of Liberty,* published in 1938, Croce distinguishes four forms of history: politics or economy, ethics or religion, art, and thought or philosophy. The standard of judgment correlated to these forms are the useful, the true, the beautiful, and the good. Underlying these diverse forms is one individual human spirit of liberty activating its expression. The unity is organic as new realizations of particular premises revise earlier manifestations of the same type of knowledge. In Croce's view, political philosophy arises from the particular individual acts in society, which ideally express morality and truth. It is only in the concrete historical situation that one can realize one's higher nature in politics. Croce defined philosophy as historical, and hence aesthetic and practical, a view criticized as *historicism*—giving undue credence to immanence as if transcendence were not a separate metaphysical, spiritual reality.

Crosland, Charles Anthony Raven

Charles Anthony Raven Crosland (1918–1977) was a leading British socialist intellectual in the mid-twentieth century whose theories had a major influence on the evolution of the Labour Party. He also occupied key cabinet positions in several Labour governments.

Under Prime Minister Harold Wilson's first government in 1964, Crosland was deputy to George Brown, who had run against Wilson. In 1965, Crosland was appointed secretary of state for education and science and began a campaign for comprehensive education in England and Wales. In 1967, he moved to the Board of Trade as its president, remaining until 1969. He then became secretary of state for local government and regional planning until 1970.

In the 1970s, Crosland became the leader of the right wing of the Labour Party. After Roy Jenkins resigned, Crosland stood for the deputy leadership of the party but was eliminated in the first round. After Labour's return to power in 1974, he became secretary of state for the Department of the Environment. Following Wilson's retirement in 1976, Crosland contested the leadership but finished last in the poll. He then switched his support to the eventual winner, James Callaghan, who duly rewarded him by appointing him foreign secretary in 1976.

Crosland was an active member of the Fabian Society, an organization founded by Sidney and Beatrice Webb that sought the establishment of a democratic socialist state in the United Kingdom, and he contributed to their major publications.

Crosland expanded on his revisionism in *The Future of Socialism* (1956), in which he challenged the dominance of the Webbs in Fabian thinking and countered their ascetic top-down Fabianism with a more liberal version. Crosland was a revisionist in the manner of German political theorist Eduard Bernstein, who rejected the Marxist analysis of modern societies and defined socialism in terms of ethical goals rather than class and the common ownership of means of production. Crosland argued that classical capitalism was dead in the sense that robber barons no longer controlled the means of production as they did in the nineteenth century. State regulations had dispersed and curtailed ownership, and decision making now resided with managers and technocrats rather than capitalists. Power relations had irrevocably changed in society, and Marxism had to change as well. Socialism had to be redefined in terms of greater social equality and greater social justice, encompassing not merely economics but also other areas such

as gender, race, and politics. Public ownership, until then one of the cardinal tenets of socialism, had to be jettisoned because it was no longer the essential component of a socialist society, but only one of a number of means to achieve economic equality. The desirability of public ownership depended on its effectiveness in advancing social justice.

In *Socialism Now* (1974), Crosland advocated for a "democratic equality," which he defined as a dynamic concept. He recognized that some inequality may be good for society or for an efficient economy because otherwise the have-nots might be worse off under equality of outcome. Incentives, Crosland asserted, are necessary to entice scarce talent and enlarge the common good. Equality is not a virtue in itself but only in relation to its efficacy as a means to social justice.

Crosland believed in leveling up rather than leveling down. Thus, without economic growth, everyone would be worse off than before and equally poor. Economic growth has fiscal dividends that enable governments to use public expenditure to redistribute or transfer wealth without impoverishing any sector of society. Growth in income ultimately equalized opportunity and access. It led to better lifestyles and improved efficiency. Crosland also placed emphasis on comprehensive education as a means to achieve greater social equality and reduce social disparities incrementally. He had little sympathy for the idealistic socialism that had dominated nineteenth-century thinking.

Crossman, Richard

Richard Howard Stafford ("Dick") Crossman (1907–1974) was a writer, diarist, and British Labour Party politician who served as member of British parliament for Coventry East from 1945 to 1974. He held high ministerial positions in Harold Wilson's Labour governments from 1964 to 1970, but his most lasting contribution to British political life was the publication of three volumes of his controversial ministerial diaries.

In his youth, Crossman won a scholarship to Winchester College and later a scholarship to Oxford University's New College to read classics. After taking first-class honors, in 1930 he became a don and tutor at New College, where he taught and published books on political philosophy. In the late 1930s, he left Oxford for Labour Party politics, working

as a writer and editor for the left-of-center *New Statesman*. During World War II (1939–1945), he served in the Ministry of Economic Warfare, coordinating political propaganda and psychological warfare. After the end of the war, he won the seat of Coventry East and began his career as a member of Parliament.

Despite his demonstrated abilities, Crossman remained on the Labour backbenches for nearly two decades, in part because of his contentious role in various Labour leadership challenges of the 1950s. His association with Aneurin Bevan and later with Harold Wilson marked him as a left-wing rebel, and it was not until the death of Hugh Gaitskell in 1963 that Crossman was able to use his close relationship with Wilson to help Wilson win his campaign for the party leadership. When the Labour Party won the general election of 1964, Crossman was named minister of Housing and Local Government.

Crossman served as housing minister until 1966, when a cabinet reshuffle gave him the position of lord president of the Privy Council and leader of the House of Commons, a position that he did not greatly enjoy. His diaries reveal that he missed the power and authority that the department had given him. In 1968 when Wilson combined the departments of health and social security to form the single Department of Health and Social Security, Crossman received the charge of the department. As its minister, he worked on a proposal to revise the existing flat-rate state pension program by adding a new earnings-related component.

When the Labour Party lost the 1970 election, Crossman resigned from his party's front bench to accept the editorship of the *New Statesman.* He also began to edit and format his political diaries for publication—a task that acquired a particular sense of urgency when he was diagnosed with cancer. Crossman's determination to give a full and complete account of his time within the Wilson cabinet ran into strong opposition from the cabinet office. Not only did his diaries flout the official secrets acts, which protected government documents from early release, but also his near-verbatim accounts of discussions in cabinet and between ministers and civil servants broke the long-standing tradition of confidentiality within the British political system. The ensuing legal battle to prevent publication was still unresolved when Crossman died in April 1974, but his ministerial diaries would eventually be published. To this day, the Crossman diaries remain a valuable resource for historians and politicians, and the precedent set by their publication opened the way for the printing of other political diaries, both by Crossman's contemporaries and by future politicians.

Cryptography

Cryptography, from the Greek *kruptō,* meaning "to conceal," and *graphō,* meaning "to write," is the science of concealed writing; it is a technical term referring to the translation of messages into ciphers or codes. *Cryptology* is the study of both cryptography and cryptanalysis. *Cryptanalysis* is the science of decrypting ciphers and codes without a key. Within modern cryptology, there are many theories and practices, particularly focusing on the basic infrastructure used in cryptographic systems.

The fundamental intention of cryptography is to enable two individuals, normally called "Alice" and "Bob," to communicate information securely. "Oscar" is the potential third-party adversary who wants to intercept the message.

A general model of a cryptosystem can be visualized as follows: Alice wants to communicate a plaintext message to Bob. She ciphers the plaintext message using a key according to the encryption rule of the system. Bob receives the ciphertext, which can also be received by Oscar, who can be either a passive observer intending to gain the key for reading all the communication messages or an adversary intending to impersonate the original messenger and to modify the message to the receiver. Cryptosystems are intended so only Bob is able to decode (decrypt) the ciphertext because he possesses the key that reconstructs the message into plaintext, thereby preventing Oscar from receiving any information from the message. The difference between enciphering and encoding is enciphering requires each letter (or numeral) of a message to be replaced by another letter (or numeral), whereas encoding replaces entire sentences, syllables, or words. The code is the predetermined rules for converting the messages from one representation to another. A cryptosystem using an encryption key for message communication is specified by a five-tuple representing P, C, K, E, and D. P is a finite set of every possible plaintext; C is a finite set of every possible ciphertext; K is a finite set of every possible key; E is the space of the encryption rule; D is the space of the decryption rule; therefore, $k \in K$, e_K: P→C. Conversely, each $k \in K$ and each $x \in P$ contain a d_K, such that $d_K(e_K(x)) = x$ for all plaintexts x.

The antiquity of cryptology is well attested in the history of civilization. The beautiful hieroglyphic script of ancient Egypt, for instance, would have been impossible to decipher without discovery of the Rosetta stone by French soldiers in 1799. The Spartans used a cryptographic device called a *scytale,* wherein a sheet of papyrus with a message relating to their military campaign was wound around a cylinder; to read the cipher, the recipient had to possess a staff of the same diameter on which the papyrus could be unwound. The Greek historian Polybius created a 5 × 5 grid using the twenty-four letters of the Greek alphabet, known as the Polybius square. During World War I (1914–1918), the Germans used the ADFGX cipher for communication. The German cipher used a 6 × 6 grid based on the Polybius square. The cipher of Julius Caesar encrypted messages in a rotated alphabet that used a shift of three letters to the immediate right. In the New Testament, the name *Babylon* was sometimes used as a designation for Rome. Jewish literature equated Edom, Egypt, Kittim, and Rome with Babylon as a type of cipher.

Ancient ciphers and codes, however, were much more simplistic than those of the computer age. Crypotological progress was essentially halted between the decline of the Roman Empire and the rise of Islam. Cryptanalysis among Arabs was pioneered in the eighth century and subsequently continued. The necessity of mathematical advances, which had not yet occurred, meant that cryptology would not be developed further until late in medieval history. In 1412, Arabic knowledge of cryptology was described in the *Subh al-Asha,* the classical fourteen-volume encyclopedia, with tremendous detail. Francis Bacon developed a biliteral alphabet, known as the biliteral cipher, in his *De Augmentis Scientiarum* (1624) using the two characters, *a* and *b*, in groups of five letters. Edgar Allan Poe, in his 1843 short story, "The Gold Bug," popularized cryptanalysis with a detailed description of methodology to decipher any monoalphabetic substitution cipher. Additional development in cryptology occurred in harmony with the emergence of modern armies and intelligence services throughout the nineteenth century. The end of the world wars and invention of the computer advanced cryptology even further. The ciphers and codes of the present age are so advanced that it is impossible to decode them without the combination of both human ingenuity and computer proficiency.

Cube Law

Cube law is a theory about democratic politics positing that in single-member electoral systems with two dominant parties, there is overrepresentation by the party or grouping that receives the most votes in elections. Concurrently, the party that secures the least number of votes is underrepresented.

Cube law is not applicable to systems with more than parties or to electoral arrangements with proportional or cumulative voting. Articulated by J. P. Smith in the 1909 report of the British Royal Commission on electoral reform, cube law holds that if the ratio of votes gained by two parties is X/Y, then the proportion of seats gained by the respective groups should be X^3/Y^3. Hence, if party X secures 60 percent of the vote and party Y gains 40 percent, the ratio would be 60/40 or 1.5 votes for the majority party for every 1 for the minority. The seat ratio would be $60^3/40^3$ (3.375/1), which would give the majority party seventy-seven seats to the twenty-three for the losing party. Cube law has been fairly accurate in predicting elections in two-party systems, especially contests in the United States. Decomposed cube law was developed in the 1960s in an effort to apply the theory to multiparty systems.

Cue Taking

The cue taking model centers upon how a member of a legislative body makes thousands of decisions every term, including those on bills requiring a high level of technical expertise but falling outside particular areas of interest. There is an opportunity cost of time and resources if the representative tries to learn more about those issues. Hence, in order to cope with the volume of decisions, legislators need a technique to deal with the information overload.

There are two sets of actors in the system: *cue takers* and *cue givers.* When a members must cast a roll call vote on a complex issue outside their expertise, they behaves as cue takers. Cue takers look for cues provided by cue givers. Cue givers are trusted colleagues who—because of their formal position in the legislature or policy specialization—are more informed on the issue; in addition, cue givers are those individuals with whom the cue taker would probably agree if their own individual research was completed. In that sense, legislators efficiently allocate their resources since they do not need to know about every single bill being voted, and they can trust other legislators who know more about the issue. Many representatives act as cue givers on some issues and cue takers on others.

From this classical usage as proposed by Donald Matthews and James Stimson, political scientists have expanded the study of cue taking to include voters, who take cues from political elites, and *outer ring* media outlets, which take cues from "prestige" media outlets. These studies show that cue taking is a pervasive phenomenon, but the extent of its importance varies in different populations and must be verified empirically.

Cult of Personality

Cult of personality refers to the common practice among twentieth-century dictatorships of promoting religious types of devotion to their national leader. As described in George Orwell's novel *1984,* through skillful use of the mass media and pervasive secret police monitoring, a modern state can create fanatical mass adulation of its leader on a scale not possible in premodern dictatorships. In the absence of democratic elections, this provides a mechanism to secure the loyalty of a state's subjects.

The practice arguably began with Russian leader Joseph Stalin's decision to place the corpse of revolutionary Vladimir Lenin, the founder of the Russian Communist Party, on public display after Lenin's death in 1924. By 1930, the public veneration of Lenin had expanded to include Stalin. Similar cults developed in the fascist regimes of dictators Adolf Hitler in Germany and Benito Mussolini in Italy, and in the later communist regimes of China's Mao Tse-Tung, North Korea's Kim Il-Sung, Cuba's Fidel Castro, and others.

The term itself originated with the February 1956 speech by Soviet leader Nikita Khrushchev in which he denounced Joseph Stalin's "cult of personality." Although Leonid Brezhnev, the Soviet president from 1964 to 1982, did not wield Stalin's power, he did generate a so-called cult of personality, as did some post-Soviet leaders, notably Saparmurat Niyazov in Turkmenistan. One open question is to what extent *personality cults* are the result of pressure from below, from local officials and ordinary citizens, rather than being simply constructed from above by the national leadership.

Cultural Policy

Broadly defined, *cultural policy* deals with institutional support and guidance for ways of life or culture as understood in anthropology. Such support can include the diffusion of governance to make possible the cultivation of specific tastes and habits, through educational and other means. Examples of cultural policy include the support of particular languages and other symbols of nationhood to foster patriotism and nationalism. Cultural policy can be viewed in the narrow sense of institutional support for creative and aesthetic human

expression, yet all cultural expressions, narrow or broad, are important for cultural identities and often emerge at the forefront of political debates.

Cultural policy studies in general are interdisciplinary and broad in focus, though public policy literatures in political science attending to cultural policy tend to confine their understanding to institutional support for creative and aesthetic human expression. These include fine and performing arts and creative or entertainment industry products such as films, music, and publishing. Beyond these core aesthetic expressions, cultural policy can often relate to cultural tourism exploring the tangible and intangible heritage of societies and design elements of industries, such as advertising, architecture, and textiles.

FROM PATRONAGE TO SUBSIDIES

Historically, support for cultural expressions depended on patronage from royalty, religious institutions, or the wealthy elite. In ancient India, the fine and performing arts flourished in and around temples; Indian classical dance and music, for example, had religious significance. The Florentine Renaissance, from the fourteenth to the seventeenth century, was spurred by the impetus given to the arts by the house of Medici. The modern era broadened the categories of the wealthy, in turn expanding patronage and thus encouraging new forms of art. The English bourgeoisie, which arose from the early Industrial Revolution in the late eighteenth century, gave a boost to English romantic painting through an emerging trend of private art collecting that spurred the romantic painters with a market for their works. Meanwhile, absolutist monarchies such as the Bourbons in France or the Hapsburgs in Austria preferred grand symbols of patronage, such as magnificent opera houses designed for imperial or national glorification.

After World War II (1939–1945), governments played an active role in cultural policy by giving various kinds of direct and indirect support to the arts and thus encouraging the growth of artists as a professional class. Historically, most artists had worked part-time, bringing about the popular image of the starving artist. Direct support for the arts came from government subsidies and grants and support for institutions such as museums, performing arts centers, and arts festivals and fairs. Indirect support for the arts came from tax, philanthropic incentives, and restrictions on creative industry products from other countries, ostensibly to encourage national ones.

CULTURAL POLICY IN THE UNITED STATES

The United States, in particular, has encouraged tax and philanthropy incentives to encourage arts financing. While the total budget of the National Endowment for the Arts (NEA) in the United States was only $132 million in 2006, charitable giving to the arts was $12.51 billion. The NEA budget was itself supplemented by other federal appropriations for arts institutions such as the Smithsonian ($517 million), Corporation for Public Broadcasting (CPB; $416 million), and the Kennedy Center ($18 million).

The United States does not have an official cultural policy because support for the arts comes from agencies such as the NEA, and the government keeps itself at arms length from issues of culture that are supposedly left for the citizens and private industry. In practice, the U.S. government does intervene in arts controversies, such as the reining in of the NEA or CPB when they were deemed too far to the left in the 1980s or, on the other hand, the quite visible impetus given to U.S. cultural products in public diplomacy initiatives. Despite these interventions, it is generally believed that independent arts agencies such as the NEA, or its role model, the UK's Arts Council, tend to keep direct political interference more to a minimum than when the support comes from ministries of culture. Nevertheless, public choice theorists often note that bureaucrats in arts agencies have an incentive to follow conservative policies in the arts so as to avoid highly charged controversies, especially around images of national heritage.

INTERNATIONAL MINISTRIES OF CULTURE

Most countries in the world boast of ministries of culture even though, as in the United Kingdom, they might have independent funding agencies for the arts. Thus, the ministry of culture in France has been historically important not only for inculcating a sense of French identity but also for supervising important funding organizations such as Centre National de la Cinématographie (CNC), a crucial pillar in the support of French cinema. Public support for the arts is difficult to calculate because of the myriad instruments and institutions involved, and thus comparative estimates are difficult. It is estimated that France and Austria have some of the highest yearly arts expenditure per capita at €180 and €179, respectively.

Ministries of culture are also gaining importance in the developing world after years of neglect in the postcolonial era, due to lack of resources or relegation of culture to recessive tradition, as opposed to the impetus given to modernization through industrialization. Countries like China and India have now prioritized creative industries in their economic development while cities that thrive on arts and creativity and derive their identity from it are coming up all over the world. Centers of music production are flourishing in places such as Bamako, Mali, and Bogotá, Colombia, while film production takes off in Mexico, South Africa, and India. The spectacular opening ceremonies at the XXIX Olympiad in Beijing directed by film director Zhang Yimou, choreographer Zhang Jigang, and composer Tan Dun presented a culturally confident China to an estimated global television audience of between two and four billion people.

At the international level, many countries feel threatened by foreign, especially U.S. or Hollywood, creative industry exports. The Uruguay Round of trade talks (1986–1994) at the General Agreement on Tariffs and Trade (GATT) galvanized the debates on cultural exports. The European Union (EU), especially with French backing, vigorously contested the market liberalization that would ensue from GATT's measures, fearing that Hollywood would further dominate their cultural

markets and weaken the influence of domestic cultural products and policies. The EU, therefore, did not make any commitments in the audiovisual negotiations, the so-called cultural exception. The phrase was often used in European context to note that the importance of creative products to cultural identity was such that they needed a special exception to global norms governing international trade. The fear of future liberalization goaded Canada and Francophone countries led by France to assemble an international coalition of cultural ministries and civil society organizations to act concertedly to frame the United Nations Educational, Scientific and Cultural Organization (UNESCO) Convention on the Protection and Promotion on the Diversity of Cultural Expressions, which came in to force in March 2007. The purpose of this convention is to recognize the importance of cultural industries to national and societal cultural identities and diversity of cultural expressions. More importantly, the convention seeks to promote national autonomy in cultural policy and exempt it from global market norms. Nevertheless, UNESCO itself lacks effective enforcement powers and thus the future impact of the convention remains unclear.

CONCLUSION

Cultural policy is intricately tied with cultural identity and politicians, and cultural industry elite often exploit this link to their advantage in trying to restrict or ban particular cultural expressions or flows of cultural products. For example, the EU's Television Without Frontiers directive that went into effect in 1992 has tried to reserve a majority of the television broadcast content in its twenty-seven member states to national or EU programming for the explicit purpose of promoting European cultural identities. Nevertheless, cultural products and flows continue to grow globally. Cultural identities, as a result, continue to assimilate many influences—as they always have.

Cultural Relations

In terms of foreign relations and policies, cultural relations exist at various levels. Cultural relations can be set between a given government and its artists, writers, and producers. Cultural relations can exist within the private sector; between countries; ministries between universities in different countries; or involve states, nongovernmental organizations and institutions like the United Nations Educational, Scientific and Cultural Organization (UNESCO) as a promoter and facilitator of cultural endeavors. Cultural relations may include the arts and artists, producers and distributors, but also museums and donors.

Over the past twenty years, the balance of cultural relations has been faced with the issue of diversity of cultural expressions, which seeks to promote—in a single place—a broader horizon of artists and works from various cultural backgrounds and countries. Since the 1990s, diversity of cultural expressions has become a significant issue for many states where the cultural landscape is heavily influenced by a significant proportion of products (movies, popular music, magazines, television programs) from the United States, in particular, through the phenomenon of cultural dumping. The commerce of culture is not like others because art and culture cannot be reduced only to mere merchandise. In 2005, UNESCO approved a Convention on the Protection and Promotion of the Diversity of Cultural Expressions in recognition of the importance of cultural diversity around the world.

The basic notion of cultural relations as a dialogue of cultures can take many forms of expression, sometimes unsuspected or unpredictable. The Olympic Games with official ceremonies and national anthems, an exhibition about a foreign country in a national museum, the world tour of the Red Army Choir, and the banning of Salman Rushdie's novel *The Satanic Verses* are all examples of cultural relations that simultaneously carry, at an international level, a strong political dimension within the expressions of art and culture. Here, culture is understood as the expression of a nation's specificity and uniqueness through its art, language, literature, history, symbols, and traditions.

Scholars in political science and international relations have mixed perspectives about cultural relations: Some academics in North America often neglect these aspects as being outside of their discipline, while others, especially in Europe, would likely consider cultural relations as a core, although overlooked, part of their field.

The relationship between power—that is, the governments—and artists, has sometimes been in conflict. In the former Soviet Union, Josef Stalin persecuted composer Dimitri Shostakovich (1906–1975), who had a love-hate relationship with the dictator. Incidentally, the genius composer once dedicated his Tenth Symphony as a musical tribute to the life of Stalin. Also in the former Soviet Union, abstract artists like Kazimir Malevich were rejected by the regime during the 1930s because their art was too far from the official social realist trend. During the same period, expressionist painters like

Max Beckmann also faced banning from the 1930s and were forced into exile from Nazi Germany.

THE HOLLYWOOD FILM INDUSTRY

The Hollywood film industry should is more than just a sector of the cultural industries; it ranks among the three most important exporters of the United States. Scholars like Thomas Guback, Manjunath Pendakur, Ian Jarvie, Toby Miller, John Trumpbour, and Janet Wasko have demonstrated that the Hollywood movie industry operates as an oligarchy, which explains why U.S. movies dominate the most lucrative markets (movie theatres, DVD rentals) in North America and in many countries, even though the United States is not the biggest film producer in terms of quantity (India produces a far greater number of feature films each year). The U.S. movie industry is political and linked with the highest power: Through the decades, the U.S. government has sometimes imposed boycotts of countries, such as England in 1949, which did not want to fully cooperate in terms of opening their markets to Hollywood movies.

Movies themselves can have a highly political content, especially documentaries. Some directors, like Leni Riefenstahl, used film to glorify Nazism and Hitler in her famous documentary *Triumph of the Will* (*Triumph des Willens,* 1935). But on the other hand, contemporary filmmakers like Australian Dennis O'Rourke (*Half Life,* 1985) and Peter Watkins (*The Journey,* 1987) masterfully demonstrated how politics, culture, and the media can hide the maneuvers of the most powerful leaders even when the media do provide news stories, which are often revealed to be uninformative. However, these important political documentaries about international issues are often available only through alternative networks and are hard to find in stores. For example, in the documentary *Half Life,* O'Rourke provides an impressive amount of archival footage about the side effects of the secret U.S. nuclear testing made in the Pacific Ocean during the 1950s, where hundreds of islanders were exposed to radioactivity without being protected or treated.

MUSEUMS AND MEMORIALS

Museums are not just houses for exhibitions about old objects and the past; in their narratives on history, these institutions acknowledge and interpret how past events, including conflicts and wars, should be understood now and tomorrow. Since any museum's mission is to educate citizens and visitors (in addition to preserving its collections), a country's history museum can be a challenging place to highlight and explain both sides of sensitive issues such as colonialism, slavery, ethnic tensions, and warfare. Hence, visitors can visit the Hiroshima Peace Memorial Museum, in Hiroshima; the Maison des esclaves (House of the Slaves) on the Gorée Island in Senegal; and the recent Museum of Genocide Victims in Vilnius, Lithuania. All of these sites serve as tangible proof of the human rights violations that occurred there. The transition from one political regime to another can be told by museums as well, as Steven Dubin explained in his analysis of the South African museums that dealt with colonialism and apartheid.

As French historian Pierre Nora has demonstrated, even places can have a history, even if a place's specific story is not always obvious; for instance, the location where President John F. Kennedy was shot in Dallas, or the site of a battle. The history of these places and events can be remembered and commemorated by memorials. Similar to a paraphrase, a memorial seems to say in symbolic terms: "something important happened here, even though you cannot tell or see any trace anymore." Sites of former concentration camps in Germany, Poland, and central Europe are notable examples; regardless of whether or not the original buildings remain intact, people ought to know that a significant part of world history has occurred there. For newcomers and younger observers, testimonies are just words; buildings and historical places are tangible. In his book *Memorial Museums: The Global Rush to Commemorate Atrocities,* Paul Williams analyzes the processes and uses of memorializing through the years. Today, a fundamental question remains for museums who own objects that are not tolerated anymore. How should the artifacts that were used to legitimate an oppressive system be displayed? Giant portraits of former dictators or symbols of a previous colonial presence can become disturbing exhibits for a new generation of visitors. Should these works be retired and hidden? Depending on their policies, institutions answer in various ways.

PEACE PARKS

Borders are sometimes seen as zones appropriate for cultural relations, as international frontiers can create special forums of exchange between countries. There are times, however, that frontiers are so imbued with conflict that the only possible use is a demilitarized zone, and sometimes a peace park. Such peace a park exists, for example, between the North and South Korea, which used to be considered a no-man's-land. Peace parks can exist either between "good neighbors" or between states in conflict; they are built by two countries (or sometimes more) that agree to dedicate a region to a common cause, in many cases in order to protect first the environment and wildlife, but sometimes to avoid unwanted uses.

CULTURES CONFIRM DIFFERENCES

In an era of new technologies, globalization, and the Internet, individuals can be in touch with others in just a few seconds, despite the distance between them. But as French sociologist Dominique Wolton demonstrated, this illusion of proximity should not hide the barriers created by the sometimes deep differences between people, that vary significantly from one culture to another, one country to another, or one continent to another. These sorts of differences can be seen, for example, when American businesspersons go abroad and experience different corporate cultures, rules of hospitality, and etiquette.

In the twenty-first century, cultural relations are not exclusively handled by political leaders and policy makers, as proven by the emergence of celebrity diplomacy, whenever rock stars and actors use their image to promote what they consider to be worthwhile causes, as did John Lennon (1940–1980) for peace during the late 1960s and 1970s. Some artists were even recognized as diplomats. In Europe, popular singers like Nana

Mouskouri and Salvatore Adamo were nominated as ambassadors of good will for the United Nation's Children's Fund. In 2009, Armenia named popular French singer Charles Aznavour as its ambassador to Switzerland.

Diplomacy schools are no longer the only road to becoming a world-class diplomat because some celebrities have gained levels of respect and credibility, not only in their country, but also from an international audience. Moreover, celebrities can sometimes attract awareness from the media for overlooked issues, thereby providing the issue with increased public exposure. This can often take the form of popular artists meeting with notable advocates or important political figures like Nelson Mandela, for example. For many observers unaware of current politics and international relations, these types of meetings are perhaps their only encounter with political and human rights issues.

Cultural Rights

DEFINING CULTURAL RIGHTS

Cultural rights as identified in the International Bill of Rights (Universal Declaration of Human Rights [UDHR 1948], the International Covenant on Civil and Political Rights [ICCPR 1966], and the International Covenant on Economic, Social and Cultural Rights [ICESC 1966]) appear as a discrete category of human rights, separate from political, civil, economic, and social rights. *Cultural rights* in international law include the right to education; the right to "take part in cultural life;" the right to "enjoy the benefits of scientific progress and its applications;" the right to "benefit from the protection of the moral and material interests resulting from any scientific, literary, or artistic production of which he [the person] is the author;" and the freedom to pursue "scientific research and creative activity" (UDHR, Articles 26 and 27; ICESC, Articles 13, 14 and 15).

Together these rights in effect point to an expansive notion of culture. Elsa Stamatopoulou, chief of the United Nation's Permanent Forum on Indigenous Issues and extensive advocate for cultural rights, identified three different meanings of the word *culture* as applied by international law in her 2004 article "Why Cultural Rights Now?" They are:

1. Culture in its *material sense,* as product, as the accumulated material heritage of mankind, either as a whole or part of particular human groups, including but not limited to monuments and artifacts;

2. Culture as *process* of artistic or scientific creation, that is, the emphasis being placed on the process and on the *creator(s) of culture;* and

3. Culture in its anthropological sense, that is, *culture as a way of life* or, in UNESCO's words, the "set of distinctive spiritual, material, intellectual and emotional features of society or a social group"; it encompasses "in addition to art and literature, lifestyles, ways of living together, value systems, traditions and beliefs."

GLOBAL PERSPECTIVES ON CULTURAL RIGHTS

In the arena of global human rights, political and civil rights are often referred to as the *first-generation rights* while economic, social, and cultural rights are referred to as the *second-generation rights.* This sequencing of rights has understandably led to endless debate over whether these rights can and should be ranked by way of priority. Yet regardless of where one stands on the issue, the reality is that cultural rights were a much neglected category of rights until the 1990s, especially as they pertain to culture in both the material and the anthropological senses of the word.

The change appeared to be closely associated with the dynamics of global politics since the collapse of communism in the early 1990s. The reign of free market economy has triggered an unprecedented scale of movement among people in search of economic opportunities and improved livelihood, while some are simply dislocated by development. In addition, with the end of the cold war, multifarious identity-based conflicts, often of ethnic origin, have emerged to replace the previous wars of polarized ideologies. Given the enormous changes that took place in the last two decades and the speed with which preindustrialized societies and nonmarket economies are being displaced, it is no wonder that cultural rights have quickly emerged as a category of human rights that need much rethinking.

POLITICS OF CULTURAL RIGHTS

Since the global debate over cultural rights evolved in the 1990s, one of the most contested issues is whether cultural rights are rights of groups or individuals. The issue is challenging for two reasons: (1) human rights are typically conceived of as individual rights, as they are first and foremost meant to affirm and protect the dignity of individuals qua individuals, especially against entities such as the state; and (2) in both its material and anthropological senses, culture is associated with

a collectivity whose members appear to have something in common.

The tension thus generated is particularly challenging to liberalism, given its endorsement of the sanctity of the individual on the one hand, and the premium that it places on pluralism on the other. In the context of the contemporary Western world, this tension is articulated through the characterization of cultural rights as minority rights and they are typically associated with immigrants from the non-Western world. The political dynamics between the white majority and the nonwhite minorities is called the politics of multiculturalism, in which cultural differences are to be accommodated rather than obliterated.

Among the most influential theorists of multiculturalism is the Canadian philosopher Will Kymlicka. His distinctive contribution lies in reconciling the tension between cultural rights and individualism in liberalism by identifying cultural membership as a "primary good" in the Rawlsian sense, that is, a good that is essential to individuals in pursuit of a good life. At stake is Kymlicka's view that as individuals exercise their freedom to make choices that are deemed by them to be worthy of pursuit, they do not make their choices in a vacuum. Rather, in his 1989 book *Liberalism, Community, and Culture,* Kymlicka says they require "a context of choice," which he calls "culture". Thus considered, cultural membership plays a crucial role in the attainment of self-respect, which no good life can dispense with. Kymlicka's theory of minority rights maintains that if the preservation of group identity can foster the context within which individuals make choices, then in the end group rights are by no means antithetical to liberalism. Although these special rights are rights that individuals have qua members of a group, they are meant to enhance, rather than suppress, individual autonomy. Specifically, in the context of a multiethnic state, minority rights support the claim to self-government by national minorities while immigrants are entitled to what Kymlicka refers to as "polyethnic rights." In *Multicultural Citizenship: A Liberal Theory of Minority Rights,* Kymlicka states that the latter are "group-specific measures" that enable ethnic groups and religious minorities to "express their cultural particularity and pride" but with the intent "to promote integration into the larger society, not self-government."

Another controversial issue is whether the formulation of cultural rights as human rights is in effect an oxymoron. Human rights are by definition universalistic, whereas cultural rights are most often used to affirm differences. Culture understood as a way of life implies that there is more than one way to live a life. The right to participate in cultural life can therefore be interpreted to mean the right to be different to the point where differences can no longer be adjudicated by some common standard. In other words, cultural rights can lead to both cultural essentialism and cultural relativism, rendering human rights ineffective as global normative standards. This confrontation between universalistic human rights on the one hand, and particularistic cultures on the other, seems to be fuelling a new polarity that has emerged since the 1990s. Instead of the previous ideological divide between liberal democracy and communism, we now have a comparably uncompromising cultural divide between the West and the non-Western world.

Culture Wars

Culture war refers to a situation of radical conflict between opposite values or worldviews. The term derives originally from the German *Kulturkampf*, which denotes the policies enacted between 1871 and 1878 by Otto von Bismarck, chancellor of the German Empire, to fight the influence of Catholicism. By extension, the term came to mean not just the opposition between secular and religious worldviews, but more generally all situations of confrontation of radically conflicting values. In the United States, the term has been used in this sense by sociologist James Davison Hunter, who argues that a culture war on divisive issues such as abortion, homosexuality, and guns is currently taking place in America.

METAPHOR OR REALITY

The objects of a culture war are potentially unlimited. All cultural values can become the object of a radical opposition among social actors, including both individuals and communities. A few possible objects of culture wars include diverging religious faiths; secularism as opposed to religious worldviews; contrasting political ideologies; arguments in favor of or against gender discrimination; same-sex marriages; and other controversial issues such as abortion, euthanasia, and stem-cell research.

Different forms of culture wars can be grouped according to the intensity of the conflict. The intensity of conflict ranges

within a spectrum whose extremes are war as a metaphor for a cultural opposition between conflicting values, and war as a reality, that is, as an armed conflict. Discussion of either end of the spectrum relies on the concept of conflict.

In a broad sense, a conflict denotes a situation in which two or more social actors try to impose their will on objectives perceived as incompatible. The objectives of conflict can be material resources or ideals. The first case involves a conflict of interests, while the second entails a conflict of ideologies (or, more recently, of identities). These are ideal types that never appear in their pure form in social life. Most of the time, the different components of conflict are so intermingled with one another they can hardly be distinguished. All the same, it is helpful to distinguish them at the analytical level.

Conflicts differ, among other things, in the different means employed in them. In particular, nonviolent conflicts differ from conflicts based on violence, which can be understood as physical coercion. In nonviolent conflicts, the term *war* is a hyperbole—a rhetorical figure to denote the harshness of cultural conflict. Violent conflicts entail a real war, meaning an act of violence to compel the enemy to do act on the other's will. Examples of nonviolent conflicts abound in all multicultural societies characterized by a pluralism of values and where, therefore, a radical confrontation between conflicting values and worldviews is a common experience. The innumerable wars in history are all examples of violent conflict. Intermediate kinds of conflict are also possible, such as so-called "symbolic violence." The term refers to situations such as gender and racial discrimination, which do not necessarily imply the recourse to physical coercion, but nevertheless display high degrees of violence.

THE QUESTION OF A GLOBAL CULTURE WAR

Another possible criterion to characterize culture wars is their scale. Culture wars can take place within bigger or smaller political communities as well as among them. An example of culture war within community borders is the *Kulturkampf*, which took place within the German Empire at the end of the nineteenth century.

An example of culture wars on a larger scale is the alleged clash between civilizations—a confrontation between world civilizations that, according to some interpreters, now occurs. Since its publication in the early 1990s, Samuel P. Huntington's 1993 *Clash of Civilizations and the Remaking of the World Order* has ignited a lively debate. According to Huntington, in the post–cold war world, the critical distinctions between people are not primarily ideological or economic, but cultural. In particular, it would be the Islamic and Asian challenges to the supposedly universal Western ideals that would reconfigure the fault lines of world politics.

Although many saw in the September 11, 2001 attacks on the United States a confirmation of Huntington's concept, scholars continue to strongly criticize his thesis. Some question the scale of conflict Huntington described; others reject the thesis altogether. Among the former, some do not necessarily reject

the idea of culture wars but view it on a different level than Huntington. According to Benjamin R. Barber, for instance, the struggle between the jihad and the "McWorld" is not a struggle between civilizations, but rather between two different worldviews. More radically, in *The Clash Within: Democracy, Religious Violence, and India's Future,* an analysis of contemporary India, Martha C. Nussbaum argues that the greatest threat does not come from the clash between civilizations, but from the clash "within" them and even within each of us as we oscillate between self-protective aggression and the ability to live in a world with others.

Among those who reject the thesis of a clash between civilizations, Charles A. Kupchan observes in *The End of the American Era* (2002) that Huntington tends to ignore politics while overemphasizing cultural factors. Kupchan contends that the ongoing struggle between the United States and Islamic radicals is not the result of a clash between civilizations, but rather of the behavior of extremist groups preying upon discontent within Muslim majority states. Others, such as Fawaz A. Gerges in *America and Political Islam: Clash of Cultures or Clash of Interests?,* criticize the very idea of a culture war by arguing that it is a clash of interests and not of cultures that is shaping contemporary world politics. In this view, the idea of a culture war is not only a mistaken metaphor, but an ideological cover for conflicts that find their true sources elsewhere.

Cumulative Voting

Cumulative voting is an electoral procedure in which instead of being limited to casting a ballot for a single candidate, voters are given multiple votes and may divide those votes any way they chose. Voters may cast all of their votes for a single

candidate or divide them among two or more office seekers. The number of votes given a citizen is dependent on the number of candidates. Hence, in an election with four candidates, a voter would receive four votes and could cast them in one of sixteen possible combinations.

By encouraging participation by small or minor parties, cumulative voting has been touted as a means to increase voter turnout and enhance the diversity of political systems. Voters do not face the dilemma of the wasted ballot in which they avoid voting for their preferred candidate because they don't believe that office seeker can win the election. In addition, the system lessens the negative impacts of the winner-take-all system. Proponents of cumulative voting argue that it can mitigate political gerrymandering. Some scholars have proposed using cumulative voting to increase the political representation or participation of disadvantaged groups by granting some voters additional points or votes during elections.

Cybersecurity

Cybersecurity concerns keeping the space provided by the computer and the Internet safe for the various users of the technology. Section 2 of the Homeland Security Act of 2002 clearly outlines the concerns of the U.S. government when it comes to cybersecurity in the following words: "The term 'cybersecurity' means the prevention of damage to, the protection of, and the restoration of computers, electronic communications systems, electronic communication services, wire communication, and electronic communication, including information contained therein, to ensure its availability, integrity, authentication, confidentiality, and nonrepudiation." Such a concern operates on several different levels and indicates how various activities bordering on the illegal and the criminal are within the purview of what constitutes the concern of cybersecurity.

ISSUES
Protecting users from criminal and illegal activities in cyberspace necessitates determining what these activities are. Michael Margolis and David Resnick outline two types of cybercrimes: network crimes and computer crimes. *Network crimes* are activities that use the Internet but do not necessarily entail corrupting or breaking into computers. People are the victims of these crimes, such as gambling and pornography, in much the same way as those committed in the real world. Various crimes committed in cyberspace, such as consumer fraud, stock manipulation, and various types of sexual predation, resemble life offline with their share of scammers, crooks, and predators. Thus law enforcement officials and government agencies have had to develop expertise in fighting particular types of crimes that follow crooks into cyberspace, such as "hacker hunting."

In contrast, *computer crimes* may or may not employ the Internet in committing the crime; a computer is its target. People are victims only in the sense that the computer is the object of the activity, that is, hacking into computers to steal data, spread computer viruses or worms, and disable computer systems. As a result, policing the Internet has become a routine activity.

REMEDIES
Cybersecurity standards have also been created because sensitive information is now frequently stored on computers that are attached to the Internet. This affects the individual, businesses, and governments equally. Many tasks that were once done by hand are now carried out by computer, thus the need for security to guard against information theft, which leads to identity theft. Businesses need security to protect trade secrets, proprietary information, and customers' personal information. The government also needs to secure their information. This has been particularly critical after 9/11, since some terrorist acts are organized and facilitated by using the Internet.

Various protection programs address the protection of data against unauthorized access. Data can be secured by issuing passwords and digital certificates to authorized users. To go beyond authorization to authentication, the use of digital certificates and biometric techniques (fingerprints, eyes, voice, etc.) provide a more secure method. Beyond user authentication, sensitive data can be further protected through encryption, which prevents information from getting into the wrong hands.

Computer systems use various cybersecurity technologies to remedy threats; these include the use of routers, firewalls, antivirus protection software, intrusion detection systems, intrusion protection systems, and auditing and monitoring computer usage. Various risk management strategies and techniques, as well as training and education, are valued in protecting the network.

ORDER VERSUS FREEDOM
There are those, however, who view all of this protection as a threat to individual liberty, one's quality of life, and human dignity. There clearly is a struggle between the measures to protect privacy and safeguard intellectual property and the measures that are undertaken to ensure that law and order is enforced in cyberspace. It seems that self-regulation and voluntary enforcement procedures such as shunning, flaming, and blocking people from e-mail lists and forums can no longer be used as enforcement mechanisms. Closing down illegal operations and fining and imprisoning lawbreakers are now becoming necessary with the advent of laws governing relationships in cyberspace. However, state-sponsored surveillance and commercially motivated data collection done without the consent and knowledge of the entity under surveillance can lead to cries of lost freedom.

Thus the dilemma for those who are concerned with cybersecurity is whether the primary goal should be security and order first, and freedom and access second, or vice versa. For security advocates on the national defense level, where there is constant fear of giving away too much information about high-value targets, the goal is certainly law and order first. Freedom of access is secondary for security agencies but is not necessarily so for the ordinary user.

Cyberterrorism

Cyberterrorism is the use of modern communication technology in the commission of terrorist activities. Although not strictly limited to the Internet, there is a strong bias toward using the Internet to exemplify the concept of cyberterrorism. Cyberterrorism does not have a single definition: In some instances, it refers to use of the Internet to disrupt information systems by formal, recognized terrorist organizations. In other instances, cyberterrorism refers to Internet use by recognized governments that may be seen as supporting or encouraging terrorist activities. When states launch attacks using the Internet, it is usually referred to as *cyberwarfare.* Sometimes cyberterrorism refers strictly to activities carried out by organizations, other times to activities carried out by individuals pursuing a common goal but without a formal organization. Cyberterrorism may refer to activities executed across international borders or within a single country.

Cyberterrorists go beyond the law and the general norms of the countries they attack to accomplish a political agenda agreed on by only a small minority within the country, and with which the majority of the country usually disagrees. Cyberterrorism is undertaken through such avenues as worms, viruses, and backdoors and has several important purposes for which it is undertaken, including extortion, the creation of economic disruption, and identity theft. The actual use of the Internet in cyberterrorism ranges from preparative acts to propaganda to carrying out an act of terrorism. Preparative acts of cyberterrorism include buying airline tickets, researching building plans, and acquiring weapons. Propaganda acts of cyberterrorism are generally limited to exhorting potential recruits into joining terrorist organizations and exhorting sympathizers to contribute money and resources. Carrying out acts of cyberterrorism on the Internet is generally limited to deluging opponents with threats or attacking computers and networks.

Much cyberterrorism is international in nature. Many groups recruit from and are active in a number of countries, and try to change the international activities of a specific country. Individuals within one country, or a small number of countries, use cyberterrorism to try to exact vengeance against another country for a perceived affront against either their homeland or their social group. Rebels fighting within one country who live and work outside of the country use the Internet to continue fighting against the government of the country through correspondence and recruitment and propaganda activities. This last situation usually occurs when a demographically identifiable group within a country fights for independence from that country or for equal or special rights. This does not negate the existence of cyberterrorist activities by groups within a single country. As a result of the frequently international nature of cyberterrorism, many countries have started working together to combat it.

Governments trying to stop cyberterrorism have used a combination of tools. Whenever possible, existing laws have been applied to stopping cyberterrorism. For example, purchasing illegal weapons on the Internet equates to purchasing illegal weapons in person or through other means. There are also specific treaties aimed at halting cyberterrorism internationally. The creator of *malware* (malignant software) is no longer punished solely according to the laws of the country of residence. Now, when malware goes international, the country that either suffered the most damage or has the harshest punishment, depending on the specifics of the treaty being applied, issues the punishment. Law enforcement agencies and sometimes militaries are now working much more closely when pursuing cyberterrorists.

Examples of cyberterrorism come from around the world. In the United States, abortion opponents use e-mail to harass doctors providing abortions. Al-Qaida operatives in Europe, the Middle East, and the United States have used the Internet to research bombing targets, purchase supplies, and recruit members. A female al-Qaida operative in Belgium used the Internet to exhort people to join and participate in bombings. Palestinians, Israelis, Chinese, Taiwanese, and Americans are known to have used the Internet to hack into and attack business and government Internet sites. Although the respective governments are sometimes blamed when this happens, complete evidence of this sort of cyberterrorism, often referred to as *hactivism,* or computer hacking as activism, is not available.

Davos Conference

The Davos Conference, or World Economic Forum, is an annual meeting of political and business leaders, representatives of nongovernmental and private-volunteer organizations, and scholars. On average, there are about 2,000 attendees, including 20 or so heads of state that attend the week-long series of meetings. The meeting was originally organized in 1971 by German scholar Klaus Schwab and was subsequently sponsored by the European Management Forum, a Swiss nonprofit organization. The meeting was created as a means to enhance European economic cooperation and competitiveness. The conference expanded its scope in the late 1970s and became the World Economic Forum in 1987. In 1988, the forum expanded its portfolio to include efforts at peace building and conflict resolution. It was instrumental in the negotiations between Greece and Turkey that resulted in the Davos Declaration, which averted a conflict between the two countries. In 1992, the conference was the site of the first face-to-face meeting between South African President F. W. de Klerk and Nelson Mandela, which helped accelerate the end of apartheid. Two years later, the forum was instrumental in mediating the initial draft agreement on Gaza between Israel and the Palestinian Liberation Organization.

Dealignment

Dealignment is a weakening of partisan attachments that leads to a decline in the portion of the electorate affiliated with political parties. During periods of partisan dealignment, party coalitions dissolve, leaving larger shares of the electorate as independents.

There are individual and group dimensions of dealignment. In terms of groups, the concept of partisan alignment as developed by early scholars of electoral behavior is based on the notion that political parties' social bases were built on strong class, ethnic, or religious identities in Western democracies. Hence some scholars have attributed dealignment to a weakening of those core group identities due to socioeconomic modernization. At the individual level, modernization has been associated with increasing levels of education. More educated individuals can more easily make political decisions without relying on the cues given by parties, leading to the detachment of younger, better-educated generations from parties. Changes in communications technology, particularly the rise of television, have reduced individuals' reliance on parties to interpret political reality.

Dealignment contrasts with *realignment,* which signifies the movement of group attachments from one party or coalition to another. A significant empirical issue is whether dealignment is a secular trend unlikely to be reversed or whether parties can reestablish strong social bases.

Debates, Political

Political debates allow candidates for a particular office to directly exchange and discuss ideas in a formalized and structured environment. Voters seem to find political debates particularly compelling because of the possibility for spontaneous occurrences that could give them a greater sense of the candidate's true character and abilities. Indeed, the history of political debates in the United States is full of memorable and defining moments that help to explain why candidates seem so eager to control the exact number, format, and timing of these exchanges. Research has shown that political debates can have important effects on the opinions of those who watch them and thus on eventual election outcomes.

THE DEVELOPMENT OF DEBATES

The history of political debates in the United States dates back many years. The 1858 Lincoln–Douglas Senate debates in Illinois are often noted for their large crowds and sense of spectacle, despite their highly formalized structure in which the candidates exchanged lengthy addresses over many hours. While it was common in early campaigns for congressional candidates to confront each other in formal exchanges, presidential candidates used surrogates to debate on their behalf.

SOURCE: Corbis

This allowed them to stay above the fray while providing party politicians with an opportunity to increase their stature.

Political debates entered a new era with the growth of broadcast media. In 1948, Republican primary candidates Harold Stassen and Thomas Dewey held a formal debate broadcast over the radio, and in 1956 the first televised debate occurred between Democratic primary candidates Adlai Stevenson and Estes Kefauver. The first Kennedy–Nixon debate in 1960 is often remembered for the fact that television viewers thought Kennedy had beaten the haggard-looking Nixon, while radio listeners gave the edge to the Republican vice president. There were no presidential debates in 1964, 1968, or 1972 due to Congress's unwillingness to suspend the "equal time" provision (allowing minority candidates into the debate) and a reluctance on the part of the incumbent presidents (Johnson and Nixon) to share the debate stage with their challengers.

Presidential debates returned in 1976 and have since provided many memorable moments, affecting voters and thus candidates' fortunes. For example, although Gerald Ford performed quite well in his 1976 debates with Jimmy Carter, most memories are limited to his clumsy assertion that there was "no Soviet domination of eastern Europe." In 1984, Ronald Reagan deftly addressed concerns about his age with a humorous quip about how he was not going to "make age an issue in this campaign" because he did not want to "exploit for political purposes (his) opponent's youth and inexperience." Insight from a spontaneous moment was also provided in 1988 when Michael Dukakis remained unmoved and policy oriented in his response to a moderator's question about the hypothetical rape of his wife. In addition, 1988 Democratic vice presidential nominee Lloyd Bentsen uttered one of the most striking debate lines when he told Dan Quayle that he was "no Jack Kennedy." The debates in 1992 and 1996 are often remembered for Bill Clinton's ability to connect with people through

the town hall format, while the 2000 debates gave viewers a revealing sense of Al Gore's personality when his frustration with George W. Bush became audible to viewers.

ESTABLISHING DEBATE FORMATS

Before debates occur, there is often a "debate about the debates" in which candidates wrangle over details such as the number of debates, their format, location, and timing—candidates try to gain advantage even before the debate occurs. It is common for incumbent candidates to request fewer debates, while challengers often look for more opportunities to confront their opponents, because it increases their profiles and can help establish their worthiness for office. Candidates may also tussle over the format of the debate given that some feel more comfortable behind a podium, while others excel in a more casual format. Finally, candidates may insist that debates occur in favorable locations and at times that fit with their strategic plans.

It was this type of constant haggling that eventually led the League of Women Voters to pull their sponsorship of presidential debates, opening the way for the Republican and Democratic parties to create the Commission on Presidential Debates in 1987. (This put third–party candidates at the mercy of the major parties in terms of getting into a debate.) Rather than reducing conflicts, the commission has actually institutionalized the back-and-forth between candidates. In fact, the Bush and Kerry campaigns used this arrangement to broker a deal that covered nearly every minute detail of the 2004 debates.

Once there is agreement on the debates, candidates spend considerable time preparing so that they can think quickly and effectively "on their feet" in this somewhat spontaneous environment. Candidates also want to ensure a strong performance given that debate audiences are typically quite large, and media attention is intense. The 1976 debates, for example, are estimated to have drawn between seventy-five and ninety-five million viewers, while the second presidential debate in 2000 garnered fifty-one million viewers despite competition from two baseball playoff games.

Debates do not really end, however, with the last closing statement. The media is quick to analyze the debate, providing immediate discussion of the issues and interpretation of who won and who lost. This interpretation is so critical that campaigns have developed elaborate "spin" strategies in which campaign staff work through the media to frame their candidate's performance in the best possible light. What happens after a debate can ultimately be as important as what happened during the debate.

THE IMPACT OF DEBATES ON VOTERS

Research confirms that political debates can have important effects on voters. Political scientists have shown that viewers routinely claim to learn a great deal from debates, and there is evidence showing that they do, indeed, gain valuable information about the candidates and their positions. Debates can be particularly informative for those who may otherwise have limited interest in the campaign and/or limited knowledge

of the candidates beforehand. Moreover, early debates (e.g., during the primaries) help establish perceptions of viability and electability, which can shape a candidate's eventual success or failure. A good debate performance can produce a bounce in public support as the candidate gains more favorable media attention, and previously undecided voters start to express clearer preferences. History has shown that some of these bounces have given candidates critical momentum while others have quickly faded with the next political event.

While most studies suggest that strict partisans are resistant to persuasion effects and typically have their opinion reinforced by debates, there is reason to believe that debates could still affect them by priming certain considerations that are then given increased weight in subsequent evaluations. Of course, for those who are less devoted to a party, debates can be an important determinant of vote choice, especially if little attention is paid to other campaign events. Finally, an intriguing line of research shows that viewers often react as much to postdebate commentary as they do to the actual debate performance. For many who watched a particular debate, they may rely on the media to interpret the performance or at least confirm their impression. Postdebate commentary and coverage can even influence those who watched little or none of the exchange by providing a summary judgment.

Political debates give candidates an opportunity to directly engage each other on important issues. While debates are often seen as spectacles with memorable moments, research confirms that they can play an important role in helping inform voters and enabling them to make important political decisions.

Decisionism

Decisionism is a concept that gained currency in political discourse shortly after World War I (1914–1918). In general terms, it is the doctrine that ultimately political choices are based only upon rationally ungrounded beliefs or political interests. It arose in response to the beginnings of the decline in faith in the Enlightenment and liberalism. Until World War I, the political thinkers and statesmen in the West generally presumed that the Enlightenment, and liberalism in

particular, could provide the foundations and justification for a legitimate political and social order, one consistent with the liberal respect for popular sovereignty, representative democracy, the rule of law, political equality, and individual liberty. In this respect, Western political actors believed that social and political life could be rationally grounded.

By the 1930s, however, several developments had emerged to shake the faith that the West had in its own project. The irrationalities of the causes and the horrors of the conduct of World War I, the economic collapse of the leading national economic powers and the international monetary order, the seeming intractability of the problems facing mass society and the implications for individualism worked to undermine the Enlightenment and liberal projects. Constitutional democracies in particular seemed to be immobilized in the face of the multiplicity of problems facing mass, industrialized societies. In addition, fascist political movements began to attract increasing numbers of sympathizers and supporters, more than is often acknowledged.

In response to this crisis, several thinkers, most notably Carl Schmitt, argued that the attempt to ultimately ground social and political order in some version of rational deliberation was ultimately flawed. There being no universal reason available to establish legitimate political authority, ultimately the choice of one political alternative over another is a consequence of a nonrational, mere choice or decision that political actors make. Hence, the liberal idea that legitimate political authority could be grounded in human reason or in a social contract was a myth, Schmitt argued.

This view of the act of a nonrational decision being the basis of political order helped establish two other uses of the term *decisionism*. First, it ushered in the idea that a political decision was legitimate simply because it was made by those in political authority and not necessarily because it lived up to some legal, moral, ethical, or religious standard by which it could be judged.

The second subsequent meaning is the idea that what is important in politics, particularly in times of crisis, is not how political decisions are made but only that some resolute decision is made and carried out effectively. This last point is sometimes associated with the idea of a state of exception and argues that in times of emergency, there are political choices that do not neatly fall within the boundaries of a constitutional order or the rule of law. It is the decision of those exercising sovereign power who decide what constitutes such an emergency or state of exception. Such choices are *extraconstitutional,* that is, they go beyond legal authority and are backed by the power of the state rather than by the rule of law. The fear concerning such a view is that it can be used to justify the most repressive forms of political rule in the name of the state of exception caused by alleged crises.

Recently, some political and social theorists have been willing to acknowledge that there may be times when challenges emerge requiring political action that does not fit neatly into the procedures outlined in a specific constitutional order. The task then, as Jürgen Habermas (1990) argues, is to ensure that

the decisions are made in ways that most completely reflect the values and commitments of representative democracies, political freedom, and the rule of law.

Decision Theory, Foundations of

People have been consciously coping with decision problems for at least as long as history has been recorded. Some of the best advice modern theory can offer appears to have been known to the ancients. For example, the biblical Jacob, fearing his brother Esau's might, divides his camp into two bands, saying, "If Esau come to the one company and smite it, then the other company which is left shall escape" (Genesis 32:8)—thereby holding a claim to having invented diversification.

HISTORICAL BACKGROUND

Yet decision theory, and, in particular, decision under uncertainty, was not explicitly studied until the mid-seventeenth century, when probability theory was introduced. The person most associated with the concepts of probability and expectation, Blaise Pascal, also introduced decision theory in his famous "wager." In this argument, designed to convince nonbelievers that they will be better off becoming believers, Pascal introduced several basic notions of decision theory: (1) the *decision matrix,* in which one's acts are independent of nature's choices, or the "states of the world"; (2) *domination between acts,* in which one act is better than another no matter which state obtains the goal; (3) *expected utility maximization,* according to which the choice between undominated acts should be made according to the mathematical expectation of the utility of the outcomes they yield; (4) *subjective probability over the states,* which is an application of the mathematical probability model as a way to capture one's beliefs; and (5) *nonunique probabilities,* in which one's beliefs are too vague to be captured by a single probability vector. But even after this dramatic inauguration, decision theory was largely neglected until the twentieth century, with the exception of Daniel Bernoulli's (1738) explicit introduction

of the expected utility hypothesis applied to monetary payoff and given probabilities.

By contrast, mathematicians and philosophers have been interested in the mathematical theory of probability throughout the past centuries. Jacob Bernoulli (1713) discovered the law of large numbers and also discussed different types of probability. Thomas Bayes (1763) introduced the idea of Bayesian updating of "prior" probabilities to "posterior" ones.

AXIOMATIC FOUNDATIONS

Whether all uncertainty can be quantified probabilistically has remained a topic of dispute from the very early writings on probability to the present. Frank Knight (1921) famously argued that this is not the case, and he distinguished between situations of *risk,* in which probabilities can be assumed given, and situations of *uncertainty,* in which probabilities are neither given nor can they be inferred from past statistical data. A major proponent of the opposite view was Frank Ramsey (1931), who, in the spirit of logical positivism, suggested defining and measuring one's subjective probability by one's willingness to bet. He suggested that reasonable decision makers will behave *as if* they had a subjective probability that guided their decisions, even if objective probabilities are not part of the description of the decision problem. Bruno de Finetti (1931, 1937) offered an "axiomatization" of subjective probabilities in the context of maximization of expected monetary value. That is, he provided a set of conditions on presumably observable choices and showed that they are equivalent to the claim that the decision maker maximizes expected value relative to *some* probability vector, which is taken to be that person's subjective probability. The conditions are called "axioms" partly because they are presented as intuitive, if not compelling, and partly because they are in line with the logical positivist dictum of defining theoretical concepts ("subjective probability") with observations (pairwise choices between bets).

A similar axiomatic derivation of the concept of "utility" was offered by John von Neumann and Oskar Morgenstern as a by-product of their introduction of game theory in *Theory of Games and Economic Behavior* (1944). They considered a presumably observable preference relation between pairs of "lotteries," namely random variables with known distributions, and they showed that a set of axioms on the relation is equivalent to the claim that this relation can be represented by a utility function such that, confronted with any two choices, the decision maker would opt for the one that has a higher expected utility.

von Neumann and Morgenstern provided a definition of utility, coupled with the expected utility paradigm, based on a primitive notion of probability, whereas de Finetti did the opposite: He defined subjective probability based on a primitive notion of "utility." However, when neither utility nor probability is well defined, it is not obvious that the theory of expected utility maximization relative to a subjective probability is very convincing, whether interpreted descriptively or normatively. This problem was rectified by Leonard J. Savage (1954), who showed that both utility and subjective probability

can be derived, with the expected utility maximization rule, from basic axioms on "acts," which are not defined numerically and presuppose neither probabilities nor utilities.

The axiomatic results of von Neumann and Morgenstern and Savage had a tremendous impact on research in decision theory, game theory, and in the applications of these in the social sciences. The mainstream view among theorists is that expected utility maximization, with respect to a subjective probability, is the only rational way of behavior. Moreover, many also believe that it is the only reasonable model to be used in applications in which a formal model attempts to describe reality. However, the theory has been challenged, mostly, but not solely, from a descriptive viewpoint.

CHALLENGES

One of the earliest, and perhaps the most radical, objection to the theory was raised by Herbert Simon in 1957. He coined the term *bounded rationality* and argued that people do not optimize; rather, they "satisfice"; that is, as long as their performance is above a certain "aspiration level," they stick to their previous choice. Only when their performance is below that threshold do they experiment with other choices. Simon thus challenged the very paradigm of optimization, and while his theory is seldom incorporated into formal decision models, it has had a remarkable impact on the thinking of many decision theorists, who have developed models that are classified as bounded rationality, even if their departure from the basic paradigm is much less dramatic than that of satisficing behavior.

Expected utility maximization was also attacked based on concrete examples in which it turned out to provide a poor prediction of people's choices. Maurice Allais (1953) provided a "paradox" in the context of decision under risk (with known probabilities). In this example, many people violate a key axiom of von Neumann and Morgenstern (the independence axiom), and therefore behave in a way that cannot be captured by expected utility maximization (for *any* utility function). Allais's example showed that people tend to put more weight on certainty than the standard theory predicted. In other words, people tend to behave in a way that is nonlinear in probabilities. Daniel Ellsberg (1961) proposed examples (also dubbed "paradoxes"), in which many people violate one of Savage's basic axioms (the "sure thing principle"). In Ellsberg's examples, many people behave in a way that cannot be described by subjective probability. Specifically, people tend to prefer situations with known probabilities to situations with unknown probabilities. This phenomenon is referred to as *uncertainty aversion,* or *ambiguity aversion* (following Knight's and Ellsberg's terms, respectively). Expected utility theory was generalized to deal with uncertainty aversion by David Schmeidler (1989) and Itzhak Gilboa and David Schmeidler (1989), among others.

Starting in the late 1960s, Daniel Kahneman and Amos Tversky launched a systematic experimental study of decision theoretic axioms. In carefully designed experiments, they have shown that practically any axiom of decision theory is violated in some examples. Moreover, they uncovered several implicit assumptions of the decision theory, which were also too idealized to describe actual choices. For example, they documented the "framing effect," which shows that different representations of the same problem may result in different choices. They also suggested "prospect theory" (Kahneman and Tversky 1979) as an alternative to expected utility maximization for behavior under risk.

One key idea in prospect theory is that people respond to given probabilities in a way that is nonlinear in the probability, especially near the extreme values of 0 and 1. Another idea, with potentially far-reaching implications to research in political science, is that people react differently to gains as compared to losses. That is, the (monetary) bottom line is not all that matters to the decision maker: It also matters whether this bottom line is perceived as a gain or a loss relative to a "reference point" that decision makers have in their minds.

CONCLUSION

Formal decision theory has been extremely powerful in providing important insights into the behavior of agents in social and political environments. Formal models help analyze real-life situations and reveal analogies that might otherwise be difficult to identify. At the same time, formal models have been justifiably criticized on various grounds. Some of these criticisms have to do with assumptions of decision theory per se, such as the existence of probabilistic beliefs, and some have to do with assumptions of related fields, such as the concept of equilibrium in games. It is important not to discard the powerful insights that formal analysis might generate on account of some assumptions that need to be refined or replaced. It is to be hoped that future research will improve understanding of political phenomena using formal models, while taking each assumption thereof with a grain of salt.

Decolonization

Decolonization refers to the process through which subject territories acquire independence. It forms the converse of colonialism, which entails the extension of formal and informal control over dominated polities. While colonialism establishes a hierarchy between polities, decolonization severs that relationship. When the international community recognizes this severing of ties as legitimate, the formerly subject polity becomes an independent sovereign state.

Historically, the subjugation of one entity by another has been a feature of every empire. However, the term *colonialism* is more commonly used to describe the expansion of the European maritime powers. From the end of the fifteenth century, technological breakthroughs and emerging capitalism allowed Spain and Portugal to expand their influence to all corners of the globe. They were soon followed by the British, Dutch, and other European powers. During this expansionary phase, the colonial powers formally annexed all of the Americas and much of Asia. This annexation reached its apex with the division of the African continent in the Treaty of Berlin (1885).

History is replete with incidences of resistance to European domination. Whereas many of the indigenous populations lacked the technical and military means to resist the colonial powers, the American settlers succeeded. The United States declared its independence first and was soon followed by the Latin American colonies after the Napoleonic wars ended. The rhetoric used by these revolutionaries would later inform some of the decolonization efforts after World War II (1939–1945).

Nevertheless, although such independence movements might be considered examples of decolonization, in that they shed their hierarchical subjugation, decolonization usually refers to the end of European domination in the twentieth century. Some of the more prominent white settler colonies, for example, Canada, Australia, and New Zealand, early on gained a considerable measure of independence, transforming their status to that of dominions prior to World War I (1914–1918). After 1918, the colonies of the defeated imperial powers, particularly those of Germany and the Ottoman Empire, were not given outright to the victorious powers but were to be managed as mandates. Thus, the international legitimacy of imperial control had begun to change at the same time that indigenous nationalist movements became more effective. The Asian nationalist movements, such as the congress movement in India, were particularly well organized.

Decolonization, however, only really took hold in the aftermath of the World War II. A variety of factors conspired against the imperial powers. The United States proved unwilling to support the continuation of imperial rule. Also, the liberal economic order of the postwar period delegitimized imperial preference schemes that protected the economies of the colonial powers. Moreover, even the more powerful European states no longer seemed able to bear the military and economic burdens that came with forceful subjugation of the colonies. Nationalist movements had also grown in strength, partially due to the support of the socialist countries. Finally, the United Nations provided an international forum to give voice to independence movements. Almost 100 states thus gained their independence in the three decades following 1945. These processes are well captured by John Hargreaves in *Decolonization in Africa* (1996), and Miles Kahler explains in *Decolonization in Britain and France* (1984) why decolonization followed different trajectories.

The study of decolonization has recently been reinvigorated, because scholars have gained greater access to previously sealed government records. New compilations of information and fresh perspectives have generated multidimensional analyses of empire and decolonization (see, e.g., Brown and Louis 1999).

Moreover, although decolonization has come to refer to the end of European empires after 1945, the more recent breakup of the Union of Soviet Socialist Republics (USSR) has led to examining parallels between the two processes. Thus, the study of decolonization has been extended to a broader range of cases, including those of continental empires such as the USSR.

In addition, the study of empire and decolonization has been useful for understanding the partition of territorial polities in general. For years, many multinational states such as Yugoslavia and the USSR seemed quite stable, only to unravel in short order at the end of the cold war. Why such multinational entities ended up being perceived by their composite units as imperial remains a key question for analysis, as it sheds light on general processes of territorial integration and fragmentation. Indeed, arguably the study of decolonization can illuminate cases of territorial domination that are not usually perceived as empires.

Finally, the study of imperial administration, cultural domination, and nationalist movements is relevant to the issue of failed states today. One might, for example, ask whether the colonial legacy retarded African attempts at state and nation building as well as their attempts at economic development.

Delegated Legislation

All countries that adhere generally to separation of powers find themselves in a dilemma. To an increasing extent, law in these countries is made not by the proper legislature, that is, the elected parliament, but rather by the executive branch. With the blessing of courts, legislators have delegated much of their lawmaking powers to administrators. Constitutional purists mourn that separation of powers is a major guarantee for freedom and that the shift of lawmaking authority from the legislative to the executive branch departs from the basic principle that *delegatus non potest delegare* ("a delegate cannot delegate"). These considerations, however, have long been bypassed by the need for administrative institutions to exercise lawmaking authority. The U.S. Supreme Court, for example, acknowledges that "In our increasingly complex society, replete with ever-changing and more technical problems, Congress simply cannot do its job absent an ability to delegate power." These developments have placed administrators in a very powerful position. Thus, it has become one of the major tasks of constitutional and administrative law to channel this power. Above all, delegated legislation is further remote from the source of legitimation, the people, than parliamentary lawmaking. In a comparative perspective there are three approaches of ensuring that delegated legislation carries sufficient democratic legitimation.

A first means is parliamentary predetermination of the executive rule. German law, for example, proves that the proper legislature under the sword of Damocles of unconstitutionality is in most cases well able to prescribe for the executive a substantive program of delegated legislation. As the German Federal Constitutional Court puts it, the legislature is obliged itself to make the "essential" decisions to guarantee that parliament elected by the people bears political responsibility for all laws, including those created by the executive. This requirement can also be found in the judicature of the European Court of Justice. Originally American law was similar. The Supreme Court once forced Congress to make the "important choices of social policy." The parallel is striking but not surprising, since American law was to a certain extent godfather at the birth of the actual German constitutional law after World War II (1939–1945).

In the meantime, however, American law allows more-or-less unfettered legislative delegation. The so-called nondelegation doctrine, once developed to restrict the delegation of lawmaking power, is "moribund," as described by Chief Justice Marshall in *Federal Power Commission v New England Power* (1974). American courts generally are willing to accept meaningless formulas such as "public interest" to avoid the need to strike down statutes delegating power. In Britain, "skeleton legislation" is as legally acceptable as it is in the United States. Under the doctrine of unlimited sovereignty, there are no constitutional restrictions on the delegation of legislative powers.

A second technique of democratic legitimation is that parliament participates in the delegated rulemaking procedure. German and British law, for example, show that by means of subsequent approval, the proper legislature assumes political responsibility beyond the original empowerment. A lack of substance in the empowering legislation may be compensated by retrospective parliamentary participation in the creation of the executive rule. Similar reasoning governs to a certain extent the "comitology" procedures in the law of the European Union. In view of the far-reaching delegated powers and the independence of public bodies promulgating rules, one could be led to think that the U.S. Congress could at least also determine that rules created by administrative agencies require its prior approval. Indeed, Congress used to exercise such a legislative veto until—to the disappointment of many commentators—the Supreme Court in the notorious case *Immigration and Naturalization Service v. Chadha* (1983) pronounced the legislative veto to be unconstitutional on the grounds that it infringes the separation of powers.

Beyond this background, American law was left to develop a third approach to solve the problem of democratic legitimacy. Following the Supreme Court's reasoning in *Schechter Poultry v. U.S.* (1935), public participation in the delegated legislative process serves as compensation for the lack of substantive definition of the empowering norm. One basis for this is the so-called interest representation model (somewhat supported by the "public choice theory"). According to the (albeit controversial) American approach, delegated legislation then has democratic legitimation similar to that of a statute if the public exercises influence over the rule-creating authority in a way similar to that exerted on parliamentarians ("corridoring" rather than "lobbying"). The tightly structured and judicially controlled public participation in administrative legislation is a unique character of American law. It is seen as a substitute for the classical democratic process of decision making, where parliamentary decision makers are elected and are politically answerable to the voters. The American model of participatory democracy shows that the characteristic elements of the proper legislative procedure—publicity of decision making, orientation toward balance of interests, and involvement of political minorities—can enrich the exercise of delegated powers and must do so in case the due legislative process cannot exert sufficient influence on rule creation.

Delegation, Theories of

Delegation of power is a ubiquitous feature of political life at all levels, reflected in the delegation of governing powers from electorates to legislatures (in democratic systems); from legislatures to governments (in parliamentary systems); from legislatures and governments to various nonmajoritarian institutions such as independent regulatory agencies, central banks, and courts; and in international politics, from states to international organizations, courts, and tribunals.

Such diverse acts of delegation raise two fundamental questions for political scientists: First, Why delegate? Why do political "principals" ever delegate power and authority to "agents"? Second, How can political principals, whether electorates or legislatures or states in the international system, control the discretion of their agents such that those agents will use their powers in the interests of the principals and not their own private interests?

Contemporary theories of delegation in political science have drawn largely, though not exclusively, from the rational-choice tradition and in particular from principal-agent analysis. The question of delegation cannot be divorced completely from that of the agent's discretion and subsequent behavior, but theories of delegation tend to focus on delegation of powers from legislatures and governments to various types of domestic and international agents.

WHY DELEGATE?

Delegation in politics has been defined as "a conditional grant of authority from a *principal* to an *agent,* in which the latter is empowered to act on behalf of the former" (Hawkins et al. 2006, 7, emphasis in original). Such an action, however, raises the question as to why any political principal or principals would delegate such power to another actor whose interests might not be identical with their own. The basic approach of rational-choice theories to this question is functional: Institutional choices, such as the choice to delegate, are explained in terms of the functions that a given institution is expected to perform and the effects on policy that it is expected to produce subject to the uncertainty inherent in any institutional design.

Within American politics, a pioneering literature on political delegation examines the transaction costs involved in the making of public policy, which make it difficult for reelection-minded members of Congress to produce efficient policies and satisfy their constituents without delegating powers to an agent or agents. Such models of delegation emphasize two specific transaction costs of policy making that might be reduced through delegation. First, informational transaction costs arise when legislative principals are confronted with complex policy questions that may require technical information and expert advice to craft effective public policies. Delegation to expert bodies charged with information gathering and/or technical regulation can reduce such costs. Second, legislators may encounter problems of credible commitment, in which they prefer to adopt certain kinds of policies (such as a strict monetary policy or evenhanded regulation of powerful firms) but cannot bind themselves or their successors to maintain those policies over time. For this reason, legislators may often delegate powers to bureaucratic agents (such as congressional committees, regulatory agencies, or independent central banks) who, because of their independence and their insulation from day-to-day electoral pressures, are more able to commit to maintaining a given policy into the future. All else being equal, therefore, transaction cost theories predict that political principals will delegate power, and discretion, to agents where these two types of transaction costs are high.

Having thus delegated powers to an agent, political principals encounter a second problem, namely, whether the agents use their delegated powers to pursue their own preferences that are distinct from the preferences of their principals. Hence, when delegating authority, principals can adopt two general types of control mechanisms over their agents: *Ex ante* administrative procedures define more-or-less narrowly the scope of agency activity and the procedures to be followed by it; *ex post* oversight procedures enable principals to monitor and sanction agency behavior. Such *ex post* monitoring mechanisms may include "police patrol" oversight by the principals themselves, or "fire alarm" oversight, in which agency misbehavior is caught and signaled by constituents to the principals, who may then sanction errant behavior.

Furthermore, according to such models, political principals do not apply a one-size-fits-all approach to delegation and discretion but rather carefully tailor political mandates and control mechanisms depending on the nature of the task being delegated and on various aspects of the political environment. Empirical studies of variation in delegation and discretion across issue areas and countries have largely supported such hypotheses.

Nonetheless, while dominant in the literature, rational-choice accounts are not the only way to theorize delegation, and some sociological institutionalist and constructivist theorists have suggested that political principals delegate powers to agents, not to reduce transaction costs, but rather because such delegation is widely accepted as legitimate or appropriate. For example, governments delegate powers to bodies, such as central banks or science bureaucracies, which are widely considered to be the hallmark of "modern" states. This diffusion of institutional forms across borders has been demonstrated by scholars in various studies, but evidence that these acts of delegation are motivated by normatively legitimate institutional templates rather than transaction cost calculations remains inconclusive.

DELEGATION IN DOMESTIC, COMPARATIVE, AND INTERNATIONAL POLITICS

The contemporary study of political delegation derives in large part from the study of American congressional politics, but delegation is a much more widespread and timeless phenomenon that raises questions for all four subfields of political science. From its American beginnings, the study of delegation has moved to comparative politics, where scholars have attempted both to map and explain cross-national variations in patterns of political delegation to governments, regulatory agencies, private and public-private bodies, and courts. In recent years, the study of delegation has traveled from domestic to international politics, where scholars have applied both rationalist and constructivist theories to delegation in the European Union and other international organizations. Finally, at the risk of stating the obvious, the delegation of powers raises normative questions about democracy, accountability, and legitimacy that have been at the core of political theory for millennia.

Deliberation

A number of political theorists, notably Joshua Cohen, Amy Guttmann and Dennis Thompson, and Jürgen Habermas, have sought to define the nature and purposes of deliberation, identify prerequisites for its existence, and construct models of "ideal deliberation." Central to most definitions of *deliberation* is giving reasons and weighing arguments and information in favor of, or against, public policies. Most models of deliberation also assume that citizens share a basic level of agreement on issues before they can deliberate effectively. Because deliberation includes a variety of dimensions, however, no consensus exists about the precise definition of deliberation. In *The Mild Voice of Reason: Deliberative Democracy and American National Government* (1994), government scholar Joseph M. Bessette provides a common definition as "reasoning on the merits of public policy." Some definitions of deliberation, however, do not require public-spiritedness or other motivations as requisites for deliberation. Individuals deliberate as long as they acquire and use substantive information related to public policy, even if their goals are narrowly self-interested. Scholars have put forward a variety of criteria to judge deliberation, including fairness, inclusiveness of participation, the breadth of viewpoints considered, responsiveness to popular desires, the logical and empirical validity of arguments, and contributions to democratic legitimacy.

ADVANTAGES AND DISADVANTAGES OF DELIBERATION

Political theorists argue that deliberation provides a number of benefits and advantages. Deliberation should improve the effectiveness of policy. If policy makers seriously consider arguments bearing upon policy decisions and weigh evidence carefully, their decisions should be more consistent with their values, and they should make fewer mistakes, than they would otherwise. Notorious policy debacles like the Vietnam War (1959–1975), the Iraq War (2003–), the collapse of the U.S. savings and loan industry in the 1980s and 1990s, and persistently large budget deficits appear to arise, in part, from faulty deliberation. Deliberation has intrinsic, not just instrumental, value. In a properly functioning democratic system, deliberation encourages citizens to seek common ground, provide reasons for their positions, and give due consideration to the arguments of others. Deliberation thus promotes mutual self-respect and legitimacy and minimizes disagreement.

Deliberation has potential drawbacks, however. It may reduce democratic participation. Because deliberation stresses logically sound and empirically grounded arguments, it may discourage or discount the participation of less educated and less economically well-off individuals who may lack deliberative capabilities. Deliberation disfavors emotional appeals that are useful in activating citizen involvement in politics. Some observers discount the relevance of deliberation altogether by denying that policy makers deliberate in any meaningful way or by assuming that deliberative activity has no impact on their decisions. What matters are interests and power, not

ideas and evidence. According to this view, policy making is a nondeliberative process of bargaining and compromise driven by self-interest.

ELITE DELIBERATION

Literature on the subject of deliberation identifies legislative bodies as quintessential deliberative institutions. In his review of over two dozen case studies of policy making in Congress and the careers of several key congressional leaders, Bessette (1994) interpreted much of what goes on in the U.S. Congress as deliberative activity and contended that bargaining plays only a limited role in legislation. In *Deliberative Choices: Debating Public Policy in Congress* (2006), Gary Mucciaroni and Paul J. Quirk studied the empirical claims about the effects of existing and proposed policies that members of Congress make when they debate public policy issues. Analyzing debates over welfare reform, estate tax repeal, and telecommunications deregulation, they found that debate was more realistic and informative in the Senate than the House, under bipartisanship, when interest groups were active on both sides of the debate, and when legislators spent more time debating issues.

The focus of much of the empirical literature on deliberation is on the United States, perhaps because of alleged shortcomings with liberalism or because explanations of policy outcomes in the United States have emphasized non-deliberative forms of political behavior, such as the exercise of power and bargaining. However, in 2005, political scientist Jürg Steiner and colleagues examined floor debate in four nations using political philosopher and sociologist Jürgen Habermas's discourse ethics as a theoretical framework. Steiner and colleagues noted that students of consociational democracies in Europe—polities characterized by elite consensus despite deep social divisions—alluded to a "spirit of accommodation" among elites as essential to such systems, but they did not make clear the key role of deliberation in those systems. Steiner et al. found variation in the quality of deliberation across institutions and issues. Deliberation was better in polities with more consensual than competitive political institutions (such as broader cabinet coalitions and multiparty systems), second (upper) chambers, more veto players, and with nonpublic deliberative arenas.

Deliberation takes place in other institutions as well. Benjamin I. Page, in *Who Deliberates? Mass Media in American Democracy* (1996), found that the quality of deliberation through the mass media varied according to the issue on the agenda, but that overall, the diversity and decentralization of media sources of information approximate a well-functioning "marketplace of ideas." John Burke and Fred I. Greenstein compared decision making over the Vietnam War during the Dwight D. Eisenhower and Lyndon B. Johnson administrations in their 1989 study of how well presidents "test reality." Eisenhower's deliberation was more disciplined and realistic, because his leadership style and advisory system encouraged more rigorous and careful discussion of a broader range of alternatives. Public policy scholar R. Shep Melnick (1983) and others find that courts have limited institutional capacity for policy

deliberation. The judiciary's adversarial process, case-based decision making, decentralized structure, access determined by litigants' interests rather than the questions about the merits of policy, and judges' training as generalists detract from deliberation. In 1990, political scientist Marc K. Landy and his colleagues examined the Environmental Protection Agency (EPA) and found that the agency oversimplifies environmental issues and fails to educate the public about the difficulties inherent in their resolution. The EPA's mission as an advocate for environmental interests makes it impossible for it to search for common ground and engage in persuasion. As a result, it fails to orchestrate effective deliberation on the technical, political, and ethical merits of environmental policy.

CITIZEN DELIBERATION

Before the advent of mass democracy, theorists viewed deliberation as an elite endeavor. James Madison and other framers of the U.S. Constitution saw elite deliberation as a bulwark against the public's impulses and uninformed opinions. Legislators were responsible for filtering and refining public opinion in such a way that they would discover their constituents' true opinions—what the public would think if citizens had the same capabilities to deliberate as their leaders. Today, many observers consider *citizen* deliberation a vital component of democratic participation and a mechanism for maintaining democratic accountability. Citizens cannot limit their participation to voting, leaving policy deliberation to their leaders.

The quality of citizen participation may improve with deliberation. In a study of individuals who attended a forum on Social Security reform, individuals who attended the forum gained more knowledge about the program than similar individuals who did not attend. Second, deliberation produced opinion change over policy options for which there was already some consensus. For policy options on which citizens had little consensus at the outset, opinions changed only among citizens who held their opinions weakly, according to a 2004 study by public opinion and policy scholar Jason Barabas. Properly designed institutions may help to develop citizens' capacities for deliberation without sacrificing the political equality and legitimacy that are the hallmarks of modern mass democracy. Among the ideas for building citizens' capacity for deliberation are "deliberative opinion polls" and holding "deliberation days" just before elections.

Whatever the potential drawbacks to deliberation, few people seem to be concerned that we run the risk of having an excess of it. Given the proliferation of economic and foreign policy calamities of recent decades, it may be more plausible that governments suffer from too little careful deliberation than too much of it.

Deliberative Democracy

Deliberative democracy denotes a normative model of democracy that rests on the belief in the persuasive power of systematic argumentations and resolutions reached in public debates and in the central role of understanding-oriented communicative action. Thus, this model of democracy is intimately connected with the discourse theory of philosopher Jürgen Habermas.

On an ideal level, Habermas defines deliberative democracy as a third kind of democracy, different from the liberal and republican models but integrating aspects of both. The main distinction among these three types of democracy bears on the role assigned to the democratic process. The deliberative model of democracy draws on the conditions of communication, under which it is assumed the political process tends to generate reasonable results, because the process takes place in a deliberative manner. Like the republican model, the deliberative model places emphasis on the process of forming the political opinion and will but does not consider a collectively acting citizenry as a condition for the realization of deliberative politics. This kind of politics depends instead on the institutionalization of the required procedures.

Discourse theory stresses the intersubjectivity of the understanding processes, which take place in parliamentary consultations and within the communication network of political publics. The informal process of opinion formation flows into institutionalized decision making and legislative resolutions, which transform the communicatively generated power into administrative power. Like the liberal model, deliberative democracy respects the demarcation between state and society. However, society is not considered to be a market-based plurality of private interests that the political process aggregates. Civil society is a base for autonomous publics and in this sense differs both from the economic handling system and the public administration. As in the republican model, solidarity plays a central role as a social integrative power, which should develop through autonomous publics and constitutional procedures of democratic opinion formation, and which should be able to withstand the influences of money (economic system) and the administrative power (political system).

According to discourse theory, the communicative conditions for the democratic formation of opinion and political will function as an important channel for the wide-ranging rationalization of decisions, which are made by the law-bound government and administration. Rationalization is more than just legitimization, as in the liberal model, but also less than constitution of power, as in the republican model. It is only the political system that can "act," not the society as a collective subject.

Though the society cannot govern by itself, it can direct the administrative power into specific channels. The political public is a differentiated arena in which the decentered society detects, identifies, and deals with social problems. In this sense, there is no need to concretely define the subject of sovereignty. The interpretation of the sovereignty of the people is intersubjective: It continues to exist, but it becomes anonymous and retreats to the democratic procedures and legal implementation of its ambitious communication requirements in order to assert itself as a communicatively generated power. From this discourse-theoretical perspective, the political system is not the society's summit, nor its center, nor its structure-giving model, but it is instead only one of many handling systems.

Related to Habermas's approach, many conceptualizations and some concretizations of deliberative democracy have been developed. They all refer to an "ideal . . . association whose affairs are governed by the public deliberation of its members," as noted by Joshua Cohen in his 1989 article "Deliberation and Democratic Legitimacy," and they share some characteristics: Deliberative democracy is a *normative* and *procedural* model. It describes how democracy *should be* based upon a specific communicative *procedure.* Although public deliberation requires some necessary conditions (e.g., equality among free citizens) and is oriented to specific ends (common good), the deliberative dimension is the theory's pivotal point. Free deliberation is conceived as a communicative process that disposes of a transformative character. It stresses neither the importance of giving due weight to each individual's distinct preferences (as in the liberal model), nor the ethical validity of the outcomes. As David Miller notes in his 1993 article "Deliberative

Democracy and Social Choice," it rather "relies upon a person's capacity to be swayed by rational arguments and to lay aside particular interests and opinions in deference to overall fairness and the common interest of the collectivity" (77).

As a normative model, deliberative democracy is situated on a high level of abstraction and lacks depth to give the concept concrete form. It is based on a communicative and cooperative conception of human nature. As for its implementation, even when given the ambitious conditions for a widely open and free deliberation over "rational arguments," it is difficult to imagine how the influence of "nonrational" aspects, such as emotions and status, on this process can be avoided. Moreover, the model delivers no clear criteria for the "rationality" and "reasonability" of arguments. Its emphasis on the desirability of a genuine understanding in the context of a free and open communication in which all citizens are involved are its main merits.

Democracies, Advanced Industrial

The label *advanced industrial democracy (AID)* is difficult to define. At its most basic, the label would seem to apply to democracies that are both advanced and industrialized. Yet does the label apply to a specific type of democracy, or only to those countries that are "advanced" in economic terms? Most comparative political scientists and economists have a pretty clear notion of which countries are involved, but they often use these for different comparative purposes.

On the one hand, students of the welfare state focus on AIDs in their research; on the other hand, it is regularly used for public policy analysis in democratic states. The main purpose is to analyze the relationship between democratic politics and representative government, on the one hand, and social and economic policy making within the context of the market economy, on the other hand, particularly the relationship between the size of government and economic growth.

In general, the term *AID* applies to the members of the Organization for Economic Cooperation and Development. Most, but not all, members receive this designation. Mexico, South Korea, and Turkey are often not included, and only recently have the formerly communist states Hungary, the Czech Republic, Slovakia, and Poland been included, though many full members of the European Union like Bulgaria, Romania, Latvia, Estonia, Lithuania, and Slovenia, are not. Hence, apparently the level of "democraticness" of a country is a defining characteristic of being an AID. This is confusing, if not inconsistent. For example, postcommunist countries all introduced after 1989 a democratic constitution and transformed their economic systems into market economies, but not all of these nations are considered AIDs. Additionally there are doubts about countries like South Korea and Mexico in view of their democratic performances.

The same observation in terms of "advanced" (society) and "modernity" (or industrialization) would seem to apply. Less-developed nations, such as India, South Africa, and Turkey, do not receive the AID label, but they could develop the necessary characteristics at some point in the future. Some of these characteristics include the use of modern technologies, secularization, and a welfare state. Researchers have made an attempt to capture this difference in development by means of the *human development index (HDI),* which ranks countries by level of development—*developed, developing,* or *underdeveloped*—by assessing life expectancy, education/literacy, and standard of living. Yet the HDI is not the sole measure used to determine whether a country has an advanced industrial economy, and it certainly is not used to determine whether a country is a democracy. For instance, oil-rich states (e.g., Venezuela) score relatively high on the HDI but low on industrialization, whereas other countries like Argentina and India move toward industrialization but are slow in democratization.

What then makes a country an AID? In general, as defined in most comparative political science studies, an AID always is a fully fledged democracy in which the rule of law is supreme and a legitimate political authority exists. Examples include Canada in North America, Australia in the southern hemisphere, Japan in the Far East, and most West and Central European countries. Second, an AID is expected to have an open market economy and a welfare state. By defining an AID in

this manner, determining whether or not a country is an AID becomes relatively straightforward and allows for meaningful analyses of the relationships between democracy and economy, between market and state, between democratic politics and welfare state development, and between economic development (or growth) and the role of the public economy. These four relationships represent the main, often contested, themes within comparative politics and political economy.

Democracy

Democracy is a political regime form based on the rule of the many, in contrast to the rule of the few (e.g., oligarchy or aristocracy). What exactly the term denotes is the subject of dispute among both scholars and politicians. The multitude of forms that existing democracies take is mirrored by an abundance of theoretical concepts and models of democracy in the social sciences. Essentially, this makes it a contested concept.

THEORY

The history of democratic theory can be divided into classic (500 BCE) and modern (since the seventeenth century CE) schools of democratic thought. The same term underlies these schools: The word *democracy* is of Greek origin and consists of the words *demos* (often translated as "full citizens") and *kratos* ("to rule"). Despite their common terminological base, the two schools are very different with regard to how and by whom popular rule should be exercised. While modern democratic thought stresses that political power must lie in the hand of all adult nationals, the *demos* in ancient Greece consisted only of the adult, male, and free population of a city (in ancient Athens, the *demos* formed only about 10 percent of the total population). Here, popular rule was exercised collectively, directly, and in rather small communities. Modern democracies, on the other hand, tend to be nation-states in which popular rule is exercised by representatives selected in competitive elections.

1. *Classic understanding of democracy.* Classic democratic thought was nurtured by a specific form of political rule in ancient Greece. Here, democracy (*demokratia*) denoted the form of government practiced in the city of Athens about 500 BCE. It was a regime form that incorporated the *demos* in the making of collective political decisions, rendered them equal before the law, and allowed them to run for political office irrespective of wealth or social background.

Political decisions were made following public debates and elections in an assembly consisting of full citizens. While this body fulfilled legislative functions in the Athenian democracy, a 500-member council, whose members were drawn by lot from volunteers from the 139 territorial units, served as a secretariat. From the council, an executive body with rotating membership was also drawn by lot, as were the juries in the popular law courts.

Ancient Greek philosophers such as Thucydides and Plato regarded democracy as a bad form of government, likening it to mob rule. Aristotle, on the other hand, saw much virtue in the rule of the many, provided it was exercised for the common good. He suggested that this could be achieved by drawing up rules that divided and regulated the exercise of power and therefore made the democratic process less prone to abuse by powerful groups or individuals. He called the "good" form of the rule of the many *politeia* (constitutional government) and its pathological counterpart *democratia.*

2. *Modern understanding of democracy.* In the wake of the American and French Revolutions in the late eighteenth century, democracy as a form of government returned to political life after more than 2,000 years in which nondemocratic forms of rule were prevalent in the world. In political thought, Enlightenment writers such as de Alexis de Tocqueville, Montesquieu, and Jean-Jacques Rousseau reflected on equality-based state-society relations and thereby contributed to giving democracy a better image than it had had in ancient Greek thought.

Democracy continued to spread with the emergence of nation-states. However, the overwhelming majority of these new democracies were not direct (as in Athens) but were representative democracies in which the rule of the people was exercised by means of elected proxies. In his 1976 book *Capitalism, Socialism, and Democracy,* Joseph Schumpeter, one of the most prominent pioneers in modern democratic thinking, explicitly rejected the "classical doctrine" of direct democracy and advocated a "leadership democracy" based on competitive elitism. Today's democracies consist of political offices that are filled by means of contestation, with all adult citizens regardless of gender, ethnicity, or religious persuasion participating in the process and deciding the outcome by vote.

As a consequence of this bifurcation into voters and representatives, a dualistic understanding of state and society evolved. Given the only gradual extension of opportunities to formally participate in the political process, often as a result of social stuggles to extend suffrage from privileged social classes toward all social strata and finally to women, the relationship between state and society tends to be seen as potentially antagonistic in modern democratic thought. For this reason, it is stressed that individuals should be as free from state interference in their private lives as possible. In a liberal democracy, which today is regarded as normatively superior to a nonliberal democracy

and other forms of political rule, individual and minority rights are protected by a constitution and can be asserted against the government. Checks and balances between the executive, legislative, and judiciary branches (horizontal accountability) and federalism (vertical accountability) serve further to prevent democratic governments from abusing their powers.

The precondition for meaningful democratic participation in and beyond elections is a vivid civil society; that is, citizens can form or join parties and interest groups, and they are able to exercise their other democratic rights. Therefore, modern democratic theory views individual freedom, personal responsibility, and the rule of law as cornerstones of a democratic system.

CONCEPTS

Three issues are prevalent in the empirical study of democracy. The first is defining the features that separate democracies from nondemocracies. The second is classifying those regimes that have been identified as democracies. The third issue pertains to the classification of so-called hybrid regimes, which are neither clearly democratic nor clearly nondemocratic.

1. *Democratic procedures.* Scholars do not agree on what procedural characteristics a regime needs to display in order to be called a democracy. The minimalist "electoral democracy" concept, for example, demands elections that are free, fair, inclusive, and meaningful. Such elections not only entail a real chance for the opposition to come to power, but they also presuppose a range of civil liberties, such as freedom of organization, speech, and information. Some scholars believe this is not enough and add to these characteristics a wide range of civil rights, the absence of veto players not legitimized by democratic procedures, horizontal accountability, and the rule of law.

Among the many existing concepts of democracy, the most cited procedural one is political scientist Robert Dahl's polyarchy. In the Dahlian understanding, *polyarchy* (Greek for "rule by the many") denotes a "modern representative democracy with universal suffrage" and refers explicitly to modern representative democracy as a historically unique form of government, as opposed to Athenian democracy. Public contestation and participation are the two main polyarchal attributes. Dahl defines eight minimal criteria that a political regime must fulfill to be considered a polyarchy: (1) freedom to form and join organizations, (2) freedom of expression, (3) right to vote, (4) eligibility for public office, (5) right of political leaders to compete for support, (6) alternative sources of information, (7) free and fair elections, and (8) preservation of governmental accountability.

Different as all these concepts may be, they have two features in common that pose considerable difficulties in the process of separating democracies from non-democracies: (1) They are made up of several criteria, which are all necessary elements of a democracy, and (2) more problematically, most of these indicators relate to phenomena that are not either/or conditions, but matters of degree. In consequence, the researcher must decide on artificial thresholds that separate existence from nonexistence of the elements inherent in this concept. For example, how many persons need to be prevented from voting in order for the condition of universal suffrage to be violated? When exactly do elections cease to be free and fair? Resulting from (1) and (2), further conceptual difficulties emerge: Is the half-fulfillment of two conditions equal to the nonfulfillment of one condition? And is a regime that fails on five of eight conditions less democratic than a regime that fails on only one?

2. *Categorial concepts (classical subtypes).* Especially since the 1960s, comparative democracy studies focused on the differences among democracies of member nations of the Organization for Economic Cooperation and Development (OECD). Researchers created categorical subtypes by adding certain attributes to the procedural core concept of democracy to arrive at semantically dichotomous pairs. In the wake of what political scientist Samuel P. Huntington called the "third wave of democratization," which began with Portugal's democratization in 1974, the application of these concepts was extended to young democracies in southern Europe, Latin America, Eastern Europe, Africa, and Asia.

One influential categorization, the distinction between presidential and parliamentarian democracy, builds on different relations between the executive (head of state and government) and legislative (parliament) powers in a democratic system of government. In a parliamentarian democracy, the parliament selects and can recall a government. It is also characterized by a double-headed executive (head of government and head of state), strong factions of political parties, and party coalitions. In contrast, a strong executive who cannot be dissolved by parliament (only by impeachment) and who is legitimized through popular elections characterizes presidential democracies. As opposed to parliamentarian systems, in presidential systems parliament and government are legally separated, and the simultaneous holding of a government post and a legislative mandate is not possible. Moreover, the head of state and the head of government are the same person. For a long time, scholars assumed that parliamentarian democracies provided more stability and were more conducive to democratic consolidation. However, the successful democratizations in Latin American after the 1980s provided empirical evidence that there is no best system and that the correlation between democratic success and institutional arrangements depends on the contexts of these regimes.

Another influential categorization, consensus/consociational versus majoritarian democracy, distinguishes modes of political conflict resolution and decision making. In consensus democracies such as Switzerland and Mali, political conflict is resolved through negotiations, compromise, and proportional rule (by means of a proportional electoral system). Diffusion of power and the institutionalized integration of all social and political forces in the political process (e.g., protection and representation of minorities) are conceived as the main features of consensus democracies. In contrast, majoritarian or competitive democracies, such as the United States and Great Britain, are characterized by elections that give power to the

strongest party (for instance, by means of a majoritarian electoral system often resulting in a two-party system) and by a political process in which power is concentrated. The enforcement of majoritarian interests, as opposed to the equal representation of all societal and political forces, characterizes this democratic subtype.

3. *Gradual concepts (diminished subtypes).* Arguably the most prolific reaction to the conceptual difficulties of distinguishing democracies from nondemocracies is the creation of ad hoc concepts to characterize regimes that share most, but not all, attributes associated with a liberal democracy. In most cases, the deficiency is expressed with an adjective, resulting in terms such as tutelary democracy, illiberal democracy, neopatrimonial democracy, and delegative democracy. In their famous treatise on conceptual innovations in comparative politics, David Collier and Steven Levitsky call these concepts diminished subtypes of democracy.

In contrast to classic subtypes, diminished subtypes are characterized by the lack of one or more of the defining attributes of a liberal democracy. This results in the root concept being diminished to increasingly resemble the minimalist concept of an electoral democracy. For example, a regime in which horizontal accountability is absent is no liberal democracy anymore, but might still be more democratic than an electoral democracy. Hence, a fluid conceptual boundary encompassing both the minimalist and maximalist concepts is imposed between democracies and authoritarian regimes, and various "defects" or "deficits" mark the difference between electoral and liberal democracy.

The advantage of creating diminished subtypes is that the perceived deficiencies of individual regimes are highlighted and that democracy can continue to serve as the root concept where a regime is perceived to verge closer to democracy than to authoritarianism. However, there are several notable disadvantages in this strategy. First, some scholars argue that it is unethical to classify one-third of the countries in the world by what political scientists perceive to be their deficits. The more serious disadvantage, however, is the conceptual dilemma this strategy poses. In terms of the strict demands of a typology, since these diminished subtypes do not possess all the necessary attributes of a liberal democracy, they should not be called democratic if liberal democracy is the root concept. In this case, it might be better to take electoral democracy as the root concept and create categorial concepts. Finally, the proliferation of such "democracies with adjectives" (according to one count, the number reached the hundreds) has created confusion and makes systematization difficult.

ASSESSMENT AND MEASUREMENT

In the 1970s, comparative democracy research turned to the quantification of attributes of political rule and created indices that aim at measuring democracy. They are an additional source of political regime assessment, but they cannot substitute qualitative classifications. Indices are easier and quicker to read than qualitative analysis, and cross-time analysis is more efficient, because changes over time can be easily detected.

At first glance, they seem more impartial and correct and less corruptible than qualitative analysis. But critics have provided evidence that they are less reliable than they appear. There are three common pitfalls in the building of indices. First, there are methodological problems in the conceptualization, measurement, and aggregation of data. For instance, indices are often subject to measurement error due to a lack of equal access to data over time. Moreover, the high aggregation levels of data often result in loss of information. Second, country cases are frequently miscoded because of limited knowledge of cases. Third, indices measure only certain elements of concepts of democracy, rather than democracy as a whole.

Three frequently updated and often-cited indices measure democratic attributes: the Freedom House (FH) index, the Polity IV dataset on political regime change, and the Bertelsmann transformation index (BTI). (Although the World Bank's governance data set comprises democratic features, it is more often referred to when measuring corruption or efficiency.) The correlation between the three scales is high despite their differences in conceptualization, operationalization, and aggregation. However, scales based on highly aggregated scores easily blur the existing differences between the political regimes under scrutiny. This deficit is partly addressed by the individual country reports that come with each dataset.

1. *Freedom House (FH) index.* This international watchdog organization has worked to promote freedom throughout the world since 1941. In 1972, FH began measuring freedom, an integral element of democracy. Using twenty-five indicators, FH annually classifies the status of political rights and civil liberties in all countries and some disputed and related territories around the world (all are referred to as "countries," a total of 194 in 2009) on a scale of 1 *(free)* to 7 *(unfree)*. FH considers countries "free" that rate 1.0 to 2.5 on scales that measure political rights and civil liberties (eighty-nine countries in 2009); those that rate 3.0 to 5.0 are considered "partly free" (fifty-eight countries in 2009); and those that rate 5.5 to 7.0 are "not free" (forty-seven countries in 2009).

These ratings are based on the operationalization of seven attributes of political rights (electoral process, political pluralism, and functioning of government) and civil rights (freedom of expression and belief, associational and organizational rights, rule of law, and personal autonomy and individual rights). Although FH is well known for its parsimony, a closer look shows that the underlying concept of democracy entails not only procedural but also substantial features, such as economic rights, property rights, and social rights. Scholars frequently criticize the lack of transparency of FH's disaggregated data and measurement process. Whereas such indices as Polity IV and BTI provide a codebook, FH's standards of measurement are not made public. This is especially noteworthy since critics report that the organization has adjusted ratings according to political considerations of respective U.S. administrations. Thus, FH must be accepted largely on faith.

2. *Polity IV dataset.* The Polity IV index of political scientists Monty G. Marshall and Keith Jaggers of the Center of

Systemic Peace leads back to University of Maryland distinguished professor Ted Robert Gurr's Polity I conceptualizations of 1975. Polity IV captures the degree of contestation and transparency of 163 political systems on an annual basis and provides a time series that dates back to 1800. It codes five dimensions of political rule (competitiveness of participation, regulation of participation, competitiveness of executive recruitment, openness of executive recruitment, and constraints on executive). Polity IV classifies countries on a scale of -10 to +10. Countries with a score from -10 to -6 (twenty-three countries in 2009) are generally considered to be *autocratic;* -5 to +5 are called *anocracies,* regimes that are considered neither full democracies nor full autocracies (forty-eight countries in 2009); and a score between +6 and +10 indicates a *democracy* (ninety-two countries in 2009). Critics of Polity IV contend that the index fails to include participation in its various facets. Polity IV does not measure the right to vote, which is normally an uncontested constitutive factor of democracy.

3. *Bertelsmann transformation index (BTI).* In 2003, the Bertelsmann Foundation launched the BTI, which is based on the concept of a market-economic democracy. It began a biannual publication schedule in 2006. The complex index examines and assesses political and economic transformation processes as well as political management in 125 nations in two sets of rankings, the status index and the management index. The third index, the BTI status of democracy, measures the progress toward democracy along five criteria (stateness, political participation, rule of law, stability of democratic institutions, and political and social integration) and seventeen indicators (subdivided into fifty-two questions) in international comparison. Scores given along each of the seventeen indicators range from a minimum of 1 to a maximum of 10. The BTI does not explicitly mark a cut-off point between democracy and nondemocracy. Nevertheless, in its 2010 summary, the BTI stated that in 2009, seventy-six of the 128 countries under scrutiny were democracies, while fifty-two were autocracies. The BTI builds no extra category (as the FH index and Polity IV dataset do) for so-called hybrid regimes. Instead, it identifies defective democracies, or democracies with flaws (fifty-three in 2009). In doing so, the BTI blurs the conceptual border between democracy and nondemocracy. BTI critics further emphasize that the underlying concept of market-economic democracy induces a high degree of normativity that lowers the analytical value of the BTI. In addition, the BTI cannot be used for cross-time analysis, and it studies fewer countries than the other indices. In 2009, the Bertelsmann Foundation launched the sustainable governance indicators. They include thirty OECD member nations and aim at capturing the differences between established democracies.

Democracy, Future of

In the aftermath of the cold war, democracy became the most common form of government in the world. Policy makers, the general public, and scholars—especially those who followed arguments such as Francis Fukuyama's in his book, *The End of History and the Last Man*—embraced the notion that the end of the superpower conflict marked the triumph of liberal democracy as the preferred form of government and the means by which many of the globe's economic and social problems would be ameliorated. Although democratic revolutions transformed regions such as Eastern Europe, as of the early twenty-first century, democracy had failed to achieve its promise or potential in many states. Such disappointments highlighted current challenges within representative systems and obstacles to the future spread of democracy. The success of democratization in the Middle East and the ability of large developing countries like China to succeed in establishing full democracy are at the forefront of current debates on the future utility of the concept.

DEMOCRACY AND ITS DISCONTENTS

Modern democracies are typically based on representative models in which citizens elect deputies to debate and decide policy choices on their behalf. Full democracies are those systems in which there are universal suffrage, regular elections, an independent judiciary, relatively equal access to power for all groups, and extensive civil liberties that are combined with protection for minorities and disadvantaged groups.

Some states have met with repeated obstacles as they endeavor to implement democratic systems, while others have established "illiberal" or partial democracies as discussed by Fareed Zakaria in *The Future of Freedom: Illiberal Democracy at Home and Abroad*. Although these systems hold elections, basic civil liberties and governmental transparency may lack. Even in today's full democracies, there are a wide range of continuing problems in securing minority rights and expanding economic, social, and political access to disadvantaged members of society. Furthermore, many freedoms that form the core of democratic systems have prompted societal backlashes over the perceived erosion of values and morals, especially in cases in which governments attempt to balance the rights of the individual with the common good of society. Finally, security threats, including terrorism, have prompted many democratic states to adopt measures that limit individual and collective freedoms, particularly after the September 11, 2001, terrorist attacks in the United States and subsequent bombings in Spain and the United Kingdom.

After the cold war, many countries faced similar problems as they transitioned to democratic systems. First, societies had to be reoriented toward democracy after decades or centuries of totalitarian rule. In many states, efforts to protect minority groups were limited in scope. For instance, ethnic Russians faced discrimination in many of the states of Eastern Europe. Second, along with government reforms came economic reorientations as states embraced the free market. Often this caused widespread unemployment and social disruption. Third, the elites who had dominated societies under antidemocratic systems were often able to retain a disproportionate amount of economic and political power through political organizations and power networks. The former officials usually did not embrace democracy and instead undermined democratic reforms. Fourth, many states, notably Russia, lost international power and prestige, even as other nations lost aid or assistance from the superpowers. This combination of factors impeded the functioning of new democracies and undermined public confidence in the new systems. One result is that citizens in transitional democracies often support undemocratic measures or political movements because of their impatience with the inability of democratic governments to provide for the common good of all people.

Such disillusionment can be overcome through a variety of means. States that are most likely to successfully transition to full democracies usually meet five criteria as identified by Samuel Huntington. These are past democratization efforts; a comparatively high and relatively equal level of economic development; outside support for democracy by international actors and neighboring states; reforms efforts during a worldwide "wave" of democracy; and a peaceful, rather than violent, installation of a democratic government. Hence, the states of Eastern Europe, many that had a history of democratic government and significant levels of economic development, were able to transition relatively smoothly as a result of significant internal support for democracy and diplomatic and economic assistance from neighboring states in Europe as well as the United States and the European community. Absent such factors, states face a much more difficult transition. China, for example, failed to embrace democracy and instead launched a broad crackdown during the 1989 prodemocratic demonstrations in Tiananmen Square.

Huntington's thesis is that states tend to democratize in waves (he identifies three waves, 1828–1926, 1943–1962, and 1974–1990) and that reverse waves following these periods of democratization often undermine fledgling democracies.

Consequently, a new wave would be necessary to spread democracy in the post–9/11 era. There are a range of criticisms of Huntington's argument, especially over how democracies are defined, for instance, whether many of the newer democracies in the third wave emerged as full democracies. Scholars such as Fareed Zakaria and Larry J. Diamond argue that the current period reflects a rise in pseudo democracies that are exemplified by states such as Pakistan, the Philippines, and Venezuela. In addition, in the 2000s, antidemocratic trends in countries in Latin American and Africa underscored the need for greater economic and social equality to forestall reverse democratic waves.

In the current period, one test for democracy will be its success or failure in the Middle East, particularly in Iraq after the 2003 United States–led invasion that toppled Saddam Hussein's regime. Under the Bush Doctrine, the U.S. government actively promoted democratization in Iraq and concurrently in Lebanon, but whether or not Western-style democracy will flourish in the region remains to be seen. The world's attention will be focused on the Middle East in determining the future malleability of democracy around the globe.

DEMOCRACY AND EQUALITY

Questions over the future of democracy are not limited to concerns over the ability of new states to transition from authoritative regimes. Even within full, mature democracies, there continue to be deep disparities in economic and social status. Many democracies have experimented with various forms of affirmative action—economic, social, or political preferences—to improve the status of marginalized groups. For instance, in the past two decades the European Union (EU) has initiated systemwide affirmative action programs to ensure women have more political power, while the United States began programs during the 1960s to improve the economic condition of minority groups and women and continues to enact and debate such legislation. Critics of affirmative action argue that such programs exacerbate tensions between groups and fuel the rise of antidemocratic sentiments among majority populations.

Citizen participation in the democratic process has declined significantly in many full democracies. This trend is especially apparent with the rise of voter apathy. Voter turnout has been on the decline in Europe, Japan, and the United States since the 1970s, with the greatest drop in the United States. Compulsory voting laws have limited declines in turnout in states such as Australia, Argentina, Belgium, Greece, and Singapore, which average more than 95 percent turnout during balloting. Disconnectedness between voters and government is often cited as the main reason for apathy and has led some democracies to experiment with new systems of combined proportional and single-candidate balloting. Meanwhile, there have been repeated efforts to reform the Electoral College and winner-take-all system in the United States, but none have made significant progress at the federal level.

Although democracy as a governmental form continues to face a variety of challenges, the spread of the system tends to reinforce trends toward representative government. Support from established democracies, including election assistance and requirements that states be democracies in order to join organizations such as the EU or the North Atlantic Treaty Organization, have proved effective aids in the democratic transition. However, the success of such inducements highlights the need for further regional support for democratic transitions in order to secure the future of democracy.

Democracy and Corruption

Democracies operate in concert with economic institutions. In a private-market economy, the wealthy can purchase more and better-quality services than other consumers. Yet, when it comes to politics, each person has a single vote, and legal "persons" such as corporations have no votes at all. Market purchases are individualized quid pro quo deals. The level and type of government services are determined by a collective process that requires cooperative effort. These fundamental differences between the state and the market create pressures for one sphere to invade the other. Wealthy individuals or firms, which can purchase anything they want in the market, may not see why the same should not be true in politics.

Democracies are not isolated from the money economy. Elections cost money, and the more competitive or "democratic" they are, the more they cost, as candidates battle for voters' support. Furthermore, government services, regulations, and taxes provide benefits and impose costs. On the one hand, politicians demand funds to support election campaigns, and, on the other, wealthy private interests may supply funds in return for benefits. Going one step farther, voters themselves may realize that their votes are valuable and sell them to politicians for private gifts of money or in-kind benefits, such as

public sector jobs. Payoffs by the wealthy to incumbent politicians can be used to buy the acquiescence of ordinary voters.

All democracies must police the line between illegal corruption of the political process and the acceptable use of money to influence politics. Politics and economics do not exist in completely separate spheres. Hence, if neutrality with respect to individual wealth is a political ideal, as Susan Rose-Ackerman's work argues, political economic research can help isolate the social structures and constitutional institutions that are more or less open to the influence of private wealth. One must consider both which constitutional structures are more likely to be influenced by private wealth, and for any given structure, how to draw the line between corruption and legal efforts to attract political support.

Historical and country-level case studies of corrupt elections provide background material. Quantitative work focuses on the impact of corruption on government performance and on patronage politics and the politics of reform. Cross-country research links the level of corruption to the constitutional structure of government.

COUNTRY STUDIES

Historical studies of American urban machine politics by James Scott and Rebecca Menes should give pause to those who assume that election fraud is somehow inconsistent with American democracy. Research by Donatella della Porta and Alberto Vannucci, Byeong-Seog Park, and Steven R. Reed on Italy, Korea, and Japan, respectively, illustrates the global pervasiveness of quid pro quo politics. Reform presents a puzzle. How can a system reform when corrupt officials benefit from its preservation? Barbara Geddes explores this question in Latin American democracies and concludes that reform is most likely under a grand coalition that can share both the gains and the losses. Ronald Johnson and Gary Libecap study the roll-call votes that led to the passage of the U.S. civil service act in 1883 and show that supporters tended to come from districts with customs offices or major post offices, whose constituents would benefit most from reform. Economic interests supplemented progressive calls for change. Case study research in the United States in a book edited by Bruce Stave also shows how economic interests collaborated with ideological reformers to effect political change in machine-dominated cities.

CROSS-COUNTRY RESEARCH

Cross-country research on the association between corruption and constitutional structure misses the nuance and detail of the more fine-grained and case-oriented research, but it compensates for this in its ability to capture broad regularities. Thus, Jana Kunicová and Susan Rose-Ackerman find that presidential systems that elect their legislatures through proportional representation (PR) tend to be the more corrupt than other democracies. PR, especially closed-list PR, tends to produce strong parties whose leaders can make credible corrupt bargains with the president. The multiple parties typically produced by PR limit the incentives for opposition party candidates to police the corruption of incumbents. Parties

may hope to get a free ride on the anticorruption efforts of others so that no one takes the trouble to push reform. Furthermore, politicians may be reluctant to criticize incumbents if they may be future coalition partners. Finally, with a party list, representatives are subject to little monitoring by voters.

Kunicová and Rose-Ackerman and Torsten Persson and Guido Tabellini both argue that first-past-the-post electoral systems are superior to PR as checks on corruption. This contradicts both Arend Lijphart's claim that consensual democracies are less corrupt than others and Roger Myerson's theoretical model suggesting that the larger district magnitude in PR systems should reduce corruption. Kunicová and Rose-Ackerman then part company with Persson and Tabellini over the corrupting impact of presidential systems. Persson and Tabellini believe that presidential systems should be less corrupt than parliamentary ones due to checks and balances. Kunicová and Rose-Ackerman, however, find more corruption in presidential systems and argue that this stems from the president's ability to create rents in the executive in spite of the greater difficulty of passing statutes. *Because* of checks and balances—not *in spite* of them—rents that the president allocates corruptly will have staying power. The legislature will not easily be able to override corrupt bargains.

PUBLIC POWER AND PRIVATE INTERESTS

Work on constitutional structure assumes that ordinary voters lose from corruption and will punish corrupt incumbents if they learn of their malfeasance and are given honest alternatives. As the historical and case study literature suggests, this is not always so. In such cases, as Michael Johnston argues, constitutional structure may be relatively unimportant because powerful public and private interests collude to maintain control of valuable rents, limit opposition, and buy off voters with nominal private benefits. As Jong-Sung You and Sanjeev Khagram show empirically, corruption can help cement an oligarchic structure in spite of underlying democratic forms and periodic elections. Democracy needs to reach a basic level of electoral competitiveness before constitutional structure and voting rules can affect corruption levels.

Democracy and Democratization

Modern conceptions of democracy focus on what Robert Dahl calls "contestation" and "participation." A modern democracy (which Dahl prefers to call a "polyarchy" to distinguish it from ancient or direct democracy) allows the opposition to contest incumbents for control of the state. A state is also democratic if all adults have the right to express their views and to shape the behavior of public officials. The central component of participation is the right to cast ballots in regularly scheduled and fair elections. Participation also includes the freedom to publicize antigovernment views and to assemble in public and in private spaces. This minimalist definition is commonly traced to Joseph Schumpeter, who famously discussed democracy as a struggle among elites for electoral support.

The conventional definition of democracy comes with at least three assumptions. First, it is threadbare. It says little about basic rights and liberties. For instance, it is not clear whether a government that is a product of free and fair elections can inspect personal correspondence in wartime. Nor does the conventional definition say much about the limits of public gatherings. For example, it does not say whether protest marches that block street traffic and thus affect the rights of third parties are acceptable ways of participating in politics. The conventional definition is thin because it distinguishes between democratic and nondemocratic regimes. It does not offer a measure of how a democratic political system is or can be more or less democratic.

Second, the conventional definition is in fact an empirically oriented definition, and it has little to say about the normative importance of democracy. Dahl's characterization at least implies that democracies are desirable, because they permit citizens to choose their leaders. Making key public officials win elections forces them to listen to public concerns, because, among other reasons, the opposition will inform voters when incumbents are not representing citizens effectively. However, there is nothing in minimalist conceptions that rules out the developmental or participatory virtues of democracy. In *Considerations on Representative Government,* John Stuart Mill argues that talking about politics, making demands of government, and otherwise participating in democratic government not only keeps public officials honest but also is part of the good life. Deliberation requires contemplating alternatives and reaching conclusions, characteristics that help humans to become autonomous individuals.

Third, modern understandings of democracy assume that the values of democracy have fixed empirical manifestations. Though a newly democratic regime can no longer curb the suffrage rights of women or of illiterates, democracies of the past had little problem in restricting these rights. Lowering the minimum voting age to 18 is a development of the second half of the twentieth century; a handful of political systems, such as Austria or Nicaragua, have lowered it further to 16. The history of democratic regimes, however, is full of age thresholds that exceed either of these minimums. And, while parliaments seem to be integral parts of democracy, because they are key deliberative arenas, there is nothing in minimalist conceptions of democracy that prohibits constitutions from marginalizing legislatures and strengthening executives.

TYPES OF DEMOCRACY

There are at least three important schemes for classifying democratic systems. The first (and perhaps most basic) way of sorting democracies is by the procedure for choosing the chief executive. The second uses alternative counting schemes to identify the fragmentation of political systems. The third empirically measures central features of political systems to create two- or three-category classifications of political systems. The existence of more than one classification suggests that democracies come in a variety of shapes and sizes that complicates efforts to catalog them. Nevertheless, each classification scheme seeks to sort democracies by how centralized their lawmaking authority is.

The first scheme to classify democracies draws a distinction between parliamentary and presidential systems. In parliamentary systems, the parliaments select heads of government, typically called *prime ministers.* Though prime ministers can typically remain in office for no more than four or five years, they can lose the legislature's confidence and be forced to leave office before their mandates expire. In presidential systems, *presidents* are elected independently of the legislature and are simultaneously heads of government and heads of state. *Semipresidential systems* have both prime ministers (as selected by parliaments) and independently elected presidents.

Differences regarding the election of executives do lead to dissimilar outcomes. Research shows that parliamentary systems last longer than presidential ones. Using a database of all democracies that existed between 1946 and 2002, José Antonio Cheibub calculates that the expected life of a parliamentary system is 58 years and that of a presidential system is 24 years. Presidential systems also tend to run budget surpluses more

often than parliamentary ones. Depending on the powers of the president, semipresidential systems can operate more like classic parliamentary systems or like presidential systems. If the powers of the president and prime minister are relatively evenly balanced, then semipresidential systems can produce unique kinds of dynamics that we do not completely understand. As of 2002, 45 percent of democratic regimes were parliamentary, 33 percent were presidential, and 22 percent were semipresidential.

The original impetus behind the second scheme to characterize democratic political systems dates to the eighteenth century, especially to the writings of Baron de Montesquieu and James Madison. The purpose of systems that divide the powers of government among three branches is to prevent dominance by either the royal or legislative branch. This division is known as *separation of powers* or as the *fragmentation of political systems.* If a unified state (where the powers of government are concentrated in one part of the government) possesses the unity to oppress the body politic, then fragmenting the state will protect individual liberty. According to Madison, responsibility for the multiple functions of government must be shared among officeholders, each of whom will check the power of the other. The U.S. political system is the embodiment of this type of "checks and balances" democracy, and *The Federalist Papers* remains the most thorough exposition of its principles.

Parliamentary sovereignty, a doctrine that Madison opposed, gradually displaced monarchical political systems in Europe during the nineteenth century as suffrage reform made popularly elected assemblies the central lawmaking branch of government. These democracies centralize political power, because supreme or constitutional courts cannot strike down parliamentary acts as unconstitutional. They also use single-member districts whose occupants are determined in first-past-the-post electoral systems, which enable the largest minority to convert its share of the vote into a parliamentary majority. The English political system remains the paradigmatic case of parliamentary sovereignty, such that this form of government is known as a "Westminster political system," though the rise of constitutional review and territorial devolution to parliaments in Scotland and Wales has weakened the power of the English Parliament. The political systems that many Scandinavian countries had until the mid-twentieth century, and those of former British colonies in Africa, the Americas, and Asia, are based upon parliamentary sovereignty.

Several political systems in the twentieth century refashioned the separation of powers into what Bruce Ackerman calls the "new separation of powers," which adopts functional specialization as its core principle of constitutional design. Instead of splitting each function of government between two or more parts of government, he recommends assigning each function of government to a single part of government. This principle of constitutional design emphasizes the careful delimitation of the authority among the organs of the state. As in the old separation of powers, the multiplicity of state agencies prevents the concentration of power that can lead to tyranny. Unlike the theory of checks and balances, functional specialization reduces conflict and allegedly leads to a more efficient running of the state. By empowering each part of government to pursue a specific function of government, the new separation of powers enables the state as a whole to remain democratic, to protect individual liberty, and to have a unity of purpose often lost with the old separation of powers.

Two prominent classification of democratic government build upon these notions. Arend Lijphart's distinction between majoritarian and consensual democracies pits Westminster political systems against the new and old separation of powers systems. Lijphart argues that consensual systems (which require the consent of multiple centers of power to change the law) perform better on a host of economic, political, and social indicators than majoritarian systems. George Tsebelis eschews the development of any such typology and instead develops a set of rules to identify the institutions and parties in each political system that can block policy change, actors that he usefully classifies as "veto players." Tsebelis's central claim is that changing policy is more difficult as the number of veto players increases, a hypothesis that builds upon and extends thinking about comparative government since the eighteenth century.

The final scheme for classifying democratic governments is more empirical in nature. It is a product of efforts to distinguish between democracies and dictatorships. Though one major effort simply differentiated between democracies and authoritarian systems, most subsequent efforts create a third category of regimes to recognize that a wide range of countries have political systems that combine features of democratic and autocratic regimes. Partial or semidemocracies hold competitive elections but systematically bias participation against certain interests in society. They often also have dysfunctional political institutions, that is, institutions that undermine the accountability so characteristic of well-functioning democratic systems. Using Polity IV data, Figure 1 shows that more dictatorships existed in the world (in countries with more than half a million people) than democracies until the early 1990s, when mobilization and political reform reversed this trend. By 2001, more than half of all nation-states had democracies.

DEMOCRATIZATION

Democratization refers to the shift from nondemocratic to democratic forms of government. Samuel P. Huntington suggests that there are three waves of political change through which regimes have become more competitive and inclusive. The first and longest wave started in 1828 with the elimination of property requirements in many states of the United States, so that nearly half of (white male) voters cast ballots in the presidential elections of that year. The first wave ended in 1926 with the fascist coups in several European countries. Political systems in the first wave began to contest control of the state before they gradually extended suffrage rights to the rest of the population. The second wave runs between 1943 and 1962. The third wave begins with the Portuguese

generals negotiating a retreat from power in 1974. It crests with the decline of military government in Latin America during the 1980s and attempts to create new, democratic states in the wake of the Soviet Union's collapse in 1991.

Research on democratization has reached several conclusions. First, four decades of cross-national research indicates that, on balance, higher GDP per capita levels do not cause political systems to democratize, even if development is associated with democracy as Seymour Martin Lipset postulated in 1959. Adam Przeworski and his colleagues, using a database of political systems in 135 countries between 1950 and 1990, found that increases in levels of development do not boost the probability that a political system will become democratic. Nevertheless, they showed that democracy is less likely to collapse at higher levels of development, which they argued explains why wealthier countries are more likely to be democratic than poorer countries. Carles Boix and Susan Stokes argued that economic development does a better job of predicting democratization for countries before rather than after World War II (1939–1945). Daron Acemoglu and colleagues, who used a database of political systems in 120 countries between 1960 and 2000, found that no relationship exists between economic development and democracy once country-fixed effects (that is, statistical models that control for the effects of unexplained or omitted variables in cross-national regression equations) are taken into account. They suggested that the relationship

between the two factors is a product of how long countries have been independent, how many checks and balances exist on executive authority, and religion. Though Epstein et al. argue in favor of Lipset's thesis, their findings are contingent upon a threefold classification of democracy: While development does not encourage autocracies to become democracies, departures from autocracy into partial democracy and transformations from this hybrid regime into democracy are highly contingent upon the dynamics of partial democracies.

Second, authoritarian regimes in the post–World War II era have different propensities to turn over power to democratically elected politicians. Barbara Geddes shows that personalist dictatorships end up being overthrown, either in a coup or revolution. One-party regimes like Mexico's survive the longest. But, when opposition movements threaten their survival, they negotiate a transition to democracy in the hopes of continuing to win in what will be more competitive elections. Finally, military regimes are the most likely to negotiate agreements with civilian politicians, because factionalism makes them the least stable of authoritarian systems. As economic downturns or social movements threaten their unity, they often reach agreement to bargain with their opponents.

Third, the decision to democratize presents both autocrats and opposition movements with a strategic dilemma whose resolution determines both the pace and final outcome of regime liberalization. Przeworski contends that hard-liners on

both sides of this divide have no incentives to negotiate with their rivals, because neither wants to share state power. Incumbent hard-liners do not want to change the nature of the autocracy, and opposition hard-liners want nothing less than the dictatorship to capitulate. Neither will back the actions of moderates who are willing to compromise on ultimate ends for the sake of political change. Knowing this, hard-liners exercise their veto to prevent encounters between pro- and anti-government moderates from reaching concrete agreements.

In these strategically fluid circumstances, Przeworski finds that successful democratization is a product of at least one of several conditions. First, regime moderates disguise their true intentions and gain the assent of their military hard-liners to negotiate a mere broadening of the regime's support coalition. Once negotiations have reached a certain point and the opposition is able to mobilize large sectors of society, regime moderates show their true colors, and democratic forces win the showdown with authoritarian hard-liners. Second, the dictatorship begins conversations with the opposition and discovers that it cannot repress its opponents. It updates its preferences and negotiates an agreement to democratize government. Third, contacts between the regime and its opponents create the possibility of a compromise, because the two sides learn to trust each other. Hard-liners conclude that regime change will not endanger their core interests, because accords can be reached with their opponents.

Authoritarianism can persist because the ruling bloc remains united and represses the opposition. The destruction of the youth movement in the Tiananmen Square protests of 1989 indicates that the Chinese Communist Party, after several days of apparent disagreement, had decided to quash the prodemocracy movement. Even with the increase in the number of democracies (and states) during the third wave, 15 percent of all countries still have dictatorships.

Note too that conflict is intrinsic to both those cases that experience a transition to democracy and those that remain autocratic. Even if consensus on fundamental policy or values is a trait of stable democracies, the absence of disagreement is more characteristic of autocracies. Discord is pervasive in many democracies. At least since Dankwart Rustow, some students of democratization have highlighted this point. A central implication of this claim is that electoral competition within well-defined institutional boundaries—or constitutional democracy—is fragile, even if it appears to be well entrenched in 30 or so countries.

Establishing a well-functioning democracy therefore requires governments and opposition movements to devise a myriad number of institutions to contain and resolve conflict. At least since Dahl, analysts have recognized that there are multiple routes to democracies. Dahl himself discussed two paths. In the first path, contestation develops before inclusiveness. These are the oldest and most stable democracies, the ones politicians and citizens constructed during the first wave. In many other democracies and semidemocracies established during the second and third waves, incumbents and opposition movements must bargain about legislative procedures,

executive-legislative relations, legal institutions, electoral laws, and the nature and scope of individual rights (to name just a few areas of institutional engineering) as they negotiate a transition away from authoritarianism. The complexity of these negotiations helps to explain the institutional diversity among democracies and why time is associated with more stable democracy.

Democracy and Development

Does democracy cause prosperity, or do prospering nations develop democratic structures? How far do critical junctures in history determine both a society's economic development and its level of democracy? While these questions have occupied a central place in modern comparative political economy, they, nevertheless, remain highly disputed. The starting point of this ongoing debate lies in the strong correlation between the level of democracy and different measures of economic prosperity. Societies equipped with democratic institutions—such as free and fair elections, a free press, and checks and balances among the executive, the legislative, and the judicial branches—are on average better off economically than those with more autocratic structures.

Modernization theory provides the traditional explanation for this correlation. Economic prosperity strongly augments the likelihood for a society to develop democratic structures. From a more cultural perspective, citizens of prospering societies slowly change their political behavior and attitudes. As a consequence of rising education levels, citizens tend to develop a political culture more receptive to political participation and tolerance, crucial elements for the emergence and stability of democracy. Increasing education also improves citizens' capacity for monitoring political processes and articulating demands toward the government, both factors constructive for democracy. Finally, there is an economic argument that relates economic modernization to democratization. In developed and diversified economies, the tax base of the state will increasingly depend on the middle classes and educated labor. But diversified taxation comes with the diversified demand of political representation. Thus, modern economies augment the likelihood of a prodemocracy bargain between citizens and the state actors. Citizens grant the state the privilege to tax only if the state is organized in a way that allows citizens to participate in the decision-making process on how public resources are spent.

While modernization theory has gained empirical support, especially with regard to the impact of education, more recent studies have carved out evidence that points toward an economic dividend of democracy. On average, democratic countries provide more public goods—such as education, health, the rule of law , and productivity-enhancing policies—than autocracies provide. The underlying theoretical argument states that autocracies and democracies differ with regard to their societal support. These differences result in different incentives for economic policy making. Autocratic regimes generally depend on a relatively small fraction of society—for example, the military, bureaucracy, or mighty oligarchs—and exclude the majority of citizens from political participation. Such a setting enables the government to supply itself with huge economic privileges. To maintain the regime, it is more rational for autocratic leaders to engage overproportionally in the distribution of economic privileges (rents) to the small distribution coalition than in providing development-promoting public goods for the majority.

In contrast, democratic governments need much broader support for political survival. Accordingly, they will find it rational to invest their resources overproportionally in nonexclusionary public goods that benefit large fractions of society. Therefore, the different incentive systems of different kinds of political order have strong implications for public policy making, which strongly affects overall economic development. Still, this theoretical perspective does not neglect the possibility of development under autocratic rule and makes a case for a more gradual differentiation between the economic impact of different levels of democracy and autocracy.

Finally, there is a third alternative for explaining the correlation between democracy and development; it focuses upon the importance of crucial events in history. Accordingly, the correlation between democracy and development is a result of endogeneity. The emergence of democracy and economic development are both caused by crucial events in a society's past. Historic path dependency becomes a critical factor from which single countries cannot easily escape. For instance, the varying quality of political institutions *and* the different levels of economic development in developing countries today are said to be heavily influenced by different types of colonization dating back centuries. Therefore, societies' political and economic development reflects critical junctures in history that are difficult to neutralize by "ordinary" political changes. While it is certainly true that history matters, the difficulty consists in making terms such as critical junctures or path dependency operational. What kind of historic events constitute tipping points that drive a society toward a new pathway from which it cannot easily deviate?

Altogether, the debate about democracy and development can easily appear as a whirlpool of interdependencies, where different scientific schools fiercely defend their claims. These competing perspectives have, nevertheless, generated most valuable insights about the relations between politics and economics. Today, the challenge consists in providing more fine-tuned explanations for the correlation between democracy and development that provide context sensitivity and show under which specific conditions the different theoretical approaches are of particular importance.

Democratic Centralism

Democratic centralism is a form of internal organization and party discipline associated with Leninist political parties. Its "democratic" aspect is the idea that party members discuss and debate proposals and that decisions are taken by majority vote. "Centralism" means that once a decision is reached, all members, even those that disagree with the decision, are obligated to uphold it. Democratic centralism also has a vertical or hierarchical dimension: Lower organs in the party may offer input in decision making, but decisions from higher-ranking party bodies must be followed by the lower-level structures. Its defenders would maintain that democratic centralism allows an organization to reflect the preferences of its members while maintaining unity in action.

The origins of the term *democratic centralism* lie with the German Social Democratic Party in the late 1800s, but it gained more currency after being endorsed by Vladimir Lenin in *What Is to be Done?* (1902), in which he formulated the requirements for a professional, revolutionary party. Among Russian Marxists, Lenin's ideas were not universally accepted, and Lenin's advocacy of democratic centralism was one reason for the 1903 schism between Lenin's Bolsheviks and the Mensheviks, who preferred looser party discipline.

In 1921, after gaining power in Russia, Lenin used the idea of democratic centralism to ban factions within the Bolshevik Party. Lenin's goal was to establish his authority, promote party unity, and prevent the emergence of counterrevolutionary tendencies. Later, under Joseph Stalin, alleged participation in anti-Stalin factions led many individuals to be dismissed from the party and ultimately put on trial and executed. Leon Trotsky, himself accused of leading such a faction, decried Stalin's approach, maintaining that freedom of criticism was essential for party democracy. Stalin prevailed over his critics, and under his rule, "democratic" elements effectively ceased to exist, as political decisions were made at the top with little or no input "from below." Few dared to speak out against Stalin's preferences.

Democratic centralism was formally enshrined in Article 3 of the 1977 Constitution of the Soviet Union, which read,

> The Soviet state is organized and functions on the principle of democratic centralism, namely the electiveness of all bodies of state authority from the lowest to the highest, their accountability to the people, and the obligation of lower bodies to observe the decisions of higher ones. Democratic centralism combines central leadership with local initiative and creative activity and with the responsibility of each state body and official for the work entrusted to them.

Critics of Soviet practices, however, noted that the principles of democratic centralism were contradictory and necessarily led to concentration of power at the top. For example, while democratic centralism prescribes a collective approach to the work of all organizations, criticism of agreed-upon policies is permissible only for the top leadership, not for rank-and-file party members. Hence, discussion of previously agreed–upon policies can take place only after the leadership has decided to permit it. If a policy is unsuccessful, the leadership would be hesitant to permit criticism of it, for fear that such discussions will undermine its power and authority. Another contradiction concerns accountability. While lower-level bodies are supposed to elect higher bodies, it also prescribes that the lower-level bodies are subordinate to higher bodies. In practice, this means that superiors appoint those who nominally elect them to their positions and tell them what decisions to make. Due to these factors, democratic centralism, in practice throughout communist states, led to overcentralization, corruption, and little policy innovation. In the 1980s, Mikhail Gorbachev's glasnost and perestroika reforms were designed, in part, to move away from democratic centralism by democratizing decision making and soliciting participation of new actors in the political process.

Although all political parties try to impose party discipline, democratic centralism usually has a pejorative meaning because of its association with communist dictatorships. By orders of the Comintern (Communist International) in 1921, it was imposed by Lenin and the Russian Bolshevik Party upon all communist parties in the world and became a guiding principle of political life in those countries (e.g., China, Cuba, countries of Eastern Europe) where communist parties gained power. Some debate what Lenin truly meant by the term, and emphasize its usefulness at the time in Russia in the early 1900s for a clandestine revolutionary organization. Nonetheless, practice suggests that once a party or movement that practices democratic centralism gains power, its practices, especially in a single-party state, lead to concentration of power at the top, not greater popular input into policy, and they are used to justify repression of real and would-be political opponents.

Democratic Peace

Democracies rarely, if ever, go to war with one another. Instead, they traditionally opt to build stable zones of peace or rely upon diplomatic engagement. This concept is called the *democratic peace.* Although some scholars have cited instances of wars between democracies, the concept of democratic peace is statistically supported. Today, the claim of a joint, separate peace between democracies has become, as one scholar puts it, "as close as anything we have to an empirical law in international relations" (Levy: 1988).

As early as 1795, the German philosopher Immanuel Kant wrote, "The natural state [among men] is a state of war. . . . A state of peace, therefore, must be *established*" (*Immanuel Kant: The Perpetual Peace,* 1795). Even more important, it *can* be established, according to Kant. He developed the idea of a relationship between a state's form of government and its hostile or aggressive external behavior. In the following centuries, this classical liberal insight was long buried under the theoretical dominance of *realpolitik,* a practical approach to foreign policy, often disregarding ethical or moral views to gain a goal. In recent decades, scholars' interest in the connection between democracy and peace has increased again. Compiling the first studies on democratic peace in the 1980s and 1990s, scholars Michael Doyle, Ernst-Otto Czempiel, and Bruce Russett were pioneers in this field.

Despite extensive research on democratic peace, scholars remain divided as to whether democratic nations are generally more peaceful than nondemocracies. While some scholars maintain that this is the case, empirical studies have cast doubt on this theory. Whereas democracies may not fight one another, generally, they are no less belligerent than nondemocracies, since democratic states have historically engaged and continue to engage in wars and armed conflicts with nondemocratic states. Attempts to explain democratic peace must review these empirical findings.

EXPLAINING THE DEMOCRATIC PEACE

Two explanatory approaches, the structural-institutional and the normative-cultural, are predominant in regard to democratic peace. Both have been formulated in monadic and dyadic versions, the former focusing on the internal features of democracies, the latter focusing on the interaction between states.

The *structural-institutional* approach in its monadic variant builds upon the Kantian proposition, which is that public citizens in democracies are war averse, because they want to avoid the significant costs and risks associated with wars. Only in democracies, however, do the public's and policy makers' preferences translate into actual peaceful policies in an effort to evade war. Additionally, the complex and often slow processes of decision making in democracies likely makes it difficult for such governments to go to war even if they intend to do so. Moreover, it is argued that democratically elected leaders tend to refrain from initiating wars, since they perceive that supporting external conflicts could cost them their reelection. The dyadic version further supports this rationale. When two democracies oppose one another, governments still use the avoidance of war as a means to protect their free societies and prevent citizen and property losses, but avoiding war also serves to preserve their personal popular support and remain in power.

The *normative-cultural* approach in its monadic variant draws upon the assumption that democracies domestically adhere to norms and values such as the rule of law, free political participation, and a high regard for human rights. Violence as a means to promote one's goals is outlawed. Thus, citizens of democratic states believe it is morally wrong to resolve conflicts through the use of force. In their international relations, democracies externalize this tendency toward peaceful conflict settlement. The dyadic variant emphasizes that democracies act on the assumption that autocratic states will externalize their aggressive domestic behavior, thus creating an international security dilemma and in turn rendering democracies more security cautious and potentially aggressive.

Comparing the monadic and dyadic variants of both approaches, only the latter dyadic normative-cultural variant appears to address the empirical finding questioning whether democracies are completely peaceful or just peaceful with each other.

CRITICIZING THE DEMOCRATIC PEACE

Democratic peace theory is criticized from various directions. Some scholars take issue with the methodological design of most democratic peace research. According to democratic peace studies, democracy and war are defined so that all critical cases that might be anomalies are singled out from the beginning, skewing the analysis. Critics further posit both international war and democratic dyads have historically been very rare in the international system, possibly rendering democratic peace only a statistical artifact.

Other scholars point out gaps and inconsistencies in the two predominant approaches while suggesting alternative or complementary explanations for democratic peace. Some legitimate factors that democratic states likely gauge, either each one singly or combined, when considering aggressive behavior include the effects of economic welfare and interdependence, joint membership in international organizations, imperial rule, alliances, the balance of power, and geographical proximity.

Finally, the democratic peace is also criticized from a normative or moral perspective. Some scholars believe the idea of democratic peace can be misused as an ideology manifesting Western dominance and enabling perceived violent democratic crusades. Furthermore, it is argued—under the assumption that only nondemocracies cause problems in international relations—that democracies are given a carte blanche for their foreign policies.

AMENDING THE DEMOCRATIC PEACE

In recent years, research has shed light on contradictions and ambivalences within and between the established causal mechanisms of democratic peace theory. These so-called antinomies have the potential to generate unexpected behavior of democracies in several fields, such as arms control, democracy promotion, and international law.

Perhaps most salient in this regard is a tendency among democracies, especially since the end of the cold war, to fight a large number of wars against nondemocracies for reasons other than self-defense. This observation, in addition to the striking variance among democracies regarding their war-proneness, led to the establishment of a complementary research agenda: democratic wars.

Highlighting the role of antinomies might help explain the war involvement of democracies with nondemocracies. There are specific democratic or liberal reasons for democratic states to fight wars against autocratic regimes. The ambivalent

character of liberal norms can lead democracies to wage war in order to promote universal values, such as the enforcement of the rule of law, the protection of human rights, or the elimination of the perceived unjust enemy.

Harald Müller contends it is not sufficient to distinguish between democracies and nondemocracies. Instead, he stresses the differences between democracies in order to account for the empirical findings mentioned above. Political cultures and identities are responsible for how democratic states interpret liberal norms and which sense of appropriateness is derived from them. Accordingly, one can distinguish between militant and pacifist democracies, with most democratic states tending toward the latter category.

Despite some persistent puzzles, the democratic peace continues to be a fascinating empirical phenomenon and fruitful research program. Since its rediscovery in the late twentieth century, much progress has been made, but there remain many opportunities and questions for future research.

Democratic Socialism

Democratic socialism is a term meant to distinguish a form of socialism that falls somewhere between authoritarian and centralized forms of socialism on the one hand and social democracy on the other. The rise of authoritarian socialism in the twentieth century in the Soviet Union and its sphere of influence generated this new distinction. Authoritarian versions of socialism are generally forms of state socialism that are highly centralized, equating state and society, and they employ extensive intervention into, and control of, public and private life, including communications, culture, and social life, in addition to centralized control of the economy.

Democratic socialists reject this authoritarian version of socialism. They contend that socialism is not a transitory state (a dictatorship of the proletariat) to a communist society but rather that it is an autonomous form that requires democracy. The idea of a transitory state was often used to justify undemocratic and even authoritarian measures as required by the initial stages of a state's transition to communism.

Though democratic socialists reject the revolutionary model and advocate a peaceful transformation to socialism carried out by democratic means, they also reject the social democratic view that capitalist societies can be successfully reformed through extensive state intervention within capitalism. In the view of democratic socialists, capitalism, based on the primacy of private property, generates inherent inequalities of wealth and power and a dominant egoism that are incompatible with the democratic values of freedom, equality, and solidarity. Only a socialist society can fully realize democratic practices. The internal conflicts within capitalism require a transition to socialism. Private property must be superseded by some form of collective ownership.

ORIGINS OF DEMOCRATIC SOCIALISM

While there have been many utopian proposals, the origins of modern democratic socialism lie largely in a critique of the egoism and inequalities of private property and a belief that a socialist order is feasible. Seventeenth-century English Protestant religious reformer Gerrard Winstanley, founder of the Diggers, is sometimes seen as a founder of democratic socialism. Winstanley held that "the earth is a common treasury" that God gave to all men. Diggers rejected private property and lived a communal lifestyle. Certainly eighteenth-century Enlightenment philosopher Jean-Jacques Rousseau's emphasis on equality in the claims of community and his critique of private property were consistent with socialism, though he did not use the term. Early nineteenth-century socialists like Claude-Henri Saint-Simon (the first to use the term *socialism*), Charles Fourier, and Robert Owen also developed utopian communities based on versions of socialism aiming to cure the ills of industrial society. Another early socialist, French politician Louis Blanc, suggested that the state should supply capital for national workshops run by democratically elected leaders.

The early writings of nineteenth-century German political philosopher Karl Marx have often been considered a source of democratic socialism. Marx argued that "true democracy"

requires the supersession of the state and the creation of a condition in which there is no alienation between human beings and society; in this condition, human communal essence and the commonwealth are merged. This is not, however, consistent with most forms of democratic socialism. For the most part, as noted above, democratic socialists rejected Marx's theory of revolution and his idea that the state could be superseded.

Nineteenth-century British philosopher John Stuart Mill began his intellectual life as a staunch defender of the free market but later came to see himself as a democratic socialist. Mill's work reflected two main strains of democratic socialism. He took issue with the inequalities of wealth and power created by a private property economy, but he also stressed the need for democratic education and public discussion in a civil society in which political maturity could be achieved.

Mill's ideas of cooperative economics and representative democracy were a major influence on non-Marxian socialism in England, particularly the Fabian socialists. This group, which included Irish playwright George Bernard Shaw, philosopher and historian Bertrand Russell, author H. G. Wells, and political reformers Sidney and Beatrice Webb, advocated cooperative economics and a peaceful transition to socialism. Fabian ideas were incorporated into the Labor Party in England, which advocated nationalization of industry (a task only partially achieved).

Political theorist Eduard Bernstein, who had fled Germany to England to avoid persecution and had extensive contact with British socialists, also looked to recast Marx's theories. His version of evolutionary socialism took issue with Marx on several counts. First, he thought Marx's historical materialism had neglected ethical considerations. He also wanted to account for social changes that Marx did not anticipate, such as increasing material comfort. Like other democratic socialists, he thought that democratic institutions could not be created through violent means

MODERN IDEALS OF DEMOCRATIC SOCIALISM

In the 1970s and 1980s, following the reforms instituted in Yugoslavia, a number of philosophers known as the praxis group stressed extensive workers' control and democratic control of production. They employed a Marxist conception of human nature as self-realizing. North Americans like Carol Gould have taken up some elements of this project, stressing extensive democratization of political, social, and economic life, but with a decidedly feminist twist.

In the post-Marxist era, democratic socialists have focused on political arrangements and institutions that are compatible with ideas of equality, autonomy, and equal respect. Liberal ideals and democratic socialism have found some common ground. An early proponent of this type of approach was Canadian political theorist C. B. Macpherson, who fused the ideas of John Stuart Mill and Karl Marx to develop liberal democratic socialism. More recently, Italian political philosopher Norberto Bobbio, working in the tradition of Italian liberal socialism, has gone even further than Macpherson in advocating the combination of liberal democratic ideals and institutions such as constitutionalism, parliamentary government, and a multiparty system with socialism. Belgian political theorist Chantal Mouffe, while accepting Bobbio's stress on liberal democracy, takes him to task for excessive individualism. She argues that liberal democratic socialism still has to take into account the question of social cohesion. Other notable contributions include John Keane's work on civil society and David Held's work on democratic autonomy. Merging the concept of liberalizing institutions with the concept of decentralizing economic self-governance, British sociologist Paul Hirst proposed an "associational democracy." Hirst's proposal combined flexible specialization with regional economic regulation and extensive pluralism and self-government.

Other democratic socialists have responded to the issues that arise with a centralized command economy with notions of "market socialism." This group advocates a market mechanism for prices that can be combined with public ownership and direction by market planners. Regulated in this way, proponents argue, markets do not produce the large-scale inequalities of the capitalist market. For this idea first proposed by Polish economist Oskar Lange in the 1920s, economists and political theorists such as Alec Nove, John Roemer, and David Schweikart are among the major proponents.

Democratic Theory

The field of democratic theory can be divided into two sub-fields: descriptive and normative theory. The role of *descriptive* democratic theory is to characterize and study certain features of political systems that are considered democratic. *Normative* democratic theory focuses less directly on describing existing institutions and systems and instead inquires into the moral basis for democracy as a method of political decision making and governance. While this essay will focus primarily on normative aspects of democratic theory, descriptive theory must also play a significant role if one takes a democratic system to be normatively desirable only if it is in some significant way feasible.

Theorists do not agree about what they mean when they invoke the term *democracy*. A working definition is that it is a process of decision making in which all participants enjoy equal standing in some form. The etymology of the word *democracy* is simple enough; it is derived from the Greek term δη∞οκρατία *(dēmokratía),* which translates as "popular power." However there is much contention among democratic theorists over what such a power amounts to. For some democratic theorists, like Joseph Schumpeter, democratic power means minimally that rulers are selected through a competitive electoral procedure. For others, like Carole Pateman, democracy demands not only democratic political institutions but also a civil society based on participation, equality, and liberty. The role of democratic theory is less to resolve definitional disputes and more to ascertain whether there is a form of democratic governance that is legitimate and morally desirable given existing political conditions.

MAJOR THEMES

Among the central themes of democratic theory, the first is democratic legitimacy. Since it is rare that a political decision is reached unanimously, democratic theory must account for how collective decisions can be legitimately authoritative and have coercive power over dissenting participants. There is also the general project of justification of democracy: Why is democracy a better form of government than others? Theorists provide both instrumental and intrinsic arguments in answering this question. Instrumental arguments, like that of John Stuart Mill, point out that democracy brings about good political outcomes such as just social or economic conditions as well as a more tolerant, informed, and engaged citizenry. Amartya Sen invokes an instrumental justification of democracy when he argues that famine has never occurred in a democratic state with a relatively free press. David Estlund has argued that democracies have epistemic advantage over other forms of government, since democratic procedures that involve many have a tendency to produce good political decisions, which are more legitimate than the decisions of the expert few. To supplement the instrumental benefits that democracy offers, there are intrinsic justifications as well. Many theorists such as Joshua Cohen and Jeremy Waldron have argued that given the pluralistic nature of modern societies, democratic decision-making procedures are the fairest way to achieve some form of agreement among conflicting factions.

Even when theorists agree about the moral underpinnings of democracy, controversies remain over the contours of the ideal form of the democratic process. For instance, there are many questions surrounding democratic representation: Most notably, Is the form of government a direct democracy where every person directly engages in the collective decision making, or should the citizens be represented by intermediary political actors? Jean-Jacques Rousseau forcefully argues that a direct democracy is integral to producing well-informed and engaged citizens, though such a system is unlikely to be a practicable solution to the concerns of large and complex modern political societies, which characteristically demand a substantive division of labor in governance. If representative democracies strike the right balance of practicality and normativity, then a further question must be considered as to the proper role of political representatives; James Madison argued that representatives should act as delegates and simply follow the directives of their constituents. In contrast, Edmund Burke believed that representatives are the trustees of the will of the people and should act on their own judgment about matters of justice.

HISTORICAL CRITICS

Normative democratic theory need not be an affirmative project; those who are engaged in the discipline may be critical of its feasibility or normative advantage. Many criticisms of democracy are instrumental arguments; in some way or other—perhaps because of human fallibility, or the structure of the democratic process itself—democracy does not produce just outcomes. Both Plato and Aristotle argue that *democracy*—as Plato defines it ,"the rule by the governed"—was a less favorable form of government than *monarchy* (rule by an individual) or *oligarchy* (rule by the elite class). Plato believed that democracy tended to conflate expertise in governance with expertise in winning elections. In order to win elections, statesmen must appeal to the base beliefs of their constituents rather than pursue legislation that promotes justice and the common good. Hence Plato worried that democratic systems reward those who are talented at winning the favor of the public and disadvantage those who have the temperament and judgment to govern properly.

Thomas Hobbes likewise believed democracy to be an inferior form of government, because it encourages dissention and instability among citizens. According to Hobbes, a monarchy furthers the common good, since the monarch's private and public interests are entangled, forcing political decisions by the monarch to track the interests of all subjects. Hobbes could be understood as criticizing democracies for cultivating subjects and politicians whose private interests cannot be integrated with the common good. Anthony Downs and other contemporary public-choice theorists echo both Plato's and Hobbes's criticisms, arguing that citizens are not adequately informed about political matters and are too often motivated

by their own private interests to appropriately engage in collective decision making.

CONTEMPORARY STRANDS

Contemporary democratic theories continue engaging in the historical debates of the discipline and can be grouped into three major strands: procedural, substantive, and deliberative democratic theories. Procedural (or minimal) theorists, such as Dahl, Schumpeter, and Waldron, focus primarily on the democratic processes themselves rather than on the fairness of their outcomes or the development of citizen's preferences that are inputs into the decision-making procedure. Substantive theorists, such as Pateman, argue that while democratic procedures are an important component to bringing about just results, they are not sufficient and must be supplemented with, among other things, institutionally guaranteed rights. Deliberative democrats, such as Gutmann, Thompson, and Cohen, concentrate on the individual preferences of citizens and contend that deliberative procedures foster the development of appropriate and public-minded participants.

Democratic Theory, Parties in

Today, most scholars would agree with E. E. Schattschneider's famous assertion that "the political parties created democracy, and modern democracy is unthinkable save in terms of the political parties" (1942, 1). However, parties as political institutions are a relatively new phenomenon, one that was at first perceived as neither unavoidable nor desirable. Indeed, criticism of parties was first raised in the eighteenth century and in some sense predates the emergence of parties in their modern political form in the nineteenth century.

PARTIES IN EARLY POLITICAL PHILOSOPHY

The assessment of parties as political institutions depends very much on the underlying concept of democracy. While for theories of popular sovereignty, *democracy* means the implementation of the common good, or to use Jean-Jacques Rousseau's term, the general will (*volonté générale*) of the people through the rule by the people, liberal democratic theories tend to conceive of democracy as a political method to safeguard individual liberty against state power and to promote the pursuit of individual interests. From both perspectives, early political philosophy often tended to view parties as a threat to democracy. Group interest representation through parties was perceived as rejecting the interests of the individual and thus as incompatible with the idea of liberal democracy. In contrast, from the perspective of democracy as popular sovereignty, the idea of representation of particular and competing interests through parties was seen as jeopardizing common values and thus as a threat to the general interest.

One of the first political philosophers to write about parties was David Hume, who considered them "the most extraordinary and unaccountable phenomenon that has yet appeared in human affairs," (1742, 60) but was rather critical: "As much as legislators . . . ought to be honoured and respected among men, as much ought the founders of sects and factions to be detested and hated," he argued that factions "beget the fiercest animosities among men of the same nation, who ought to give mutual assistance and protection to each other" (ibid., 55). Similarly, James Madison (1787) saw the development of parties, or factions, as inevitable given the diverse interests in society, but he believed that majority factions posed a threat to the public good, individual liberty, and minority rights. Yet not all were as critical: Edmund Burke (1770) is considered the first thinker in the history of political philosophy to argue for the respectability of parties, contending that people could disagree about the common good and unite in different parties to promote what they believed to be in the national interest.

PARTIES AND MODERN DEMOCRATIC THEORY

The main change in the perception of parties came at the turn of the twentieth century with the arrival of mass democracy, which legitimized parties as political actors. As shown by Stein Rokkan (1970), parties played a historical role in integrating newly enfranchised groups into politics through the

development of mass parties. As a result, institutionalized party competition was increasingly seen as a valuable, or at least necessary, characteristic of democratic politics. Yet authors of the early twentieth century remained concerned about the role of parties in modern society. In particular, Moisei Ostrogorski (1902) and Robert Michels (1911) challenged the idea that mass parties promoted participatory democracy and popular sovereignty. Instead, they drew attention to the parties' undemocratic and oligarchic tendency to empower party leaders, thus denying individuals their sovereign right to decide and instead submitting them to strict party discipline.

Joseph Schumpeter (1942), in contrast, rejected the classic idea that democracy was a mechanism to realize the common good through self-rule by the people. Since the people were susceptible to manipulation by agenda-setting politicians, the idea of rule *by* the people was not only unrealistic, it was also undesirable. Instead, he advocated a minimalist conception of democracy as rule *for* the people, in which electoral competition between political elites, or parties, legitimized government. The electoral competition will became the outcome of the political process rather than its origin. Schumpeter's theory of democracy also opened up a new perspective on parties as actors in a political market, explicit in Anthony Downs's *An Economic Theory of Democracy* (1957) and Otto Kirchheimer's catch-all party, characterized by a "drastic reduction of the party's ideological baggage," powerful party leadership, and a deemphasis of both the role of the individual party member and the ties to specific social groups "in favour of recruiting voters among the population at large" (1966, 190). In this view, politics turns into the electoral competition between professional party elites that simply seek to maximize their vote share. While Downs emphasized the moderating effects of competition between two parties that had to compete for the same voters in the center, Kirchheimer was critical of catch-all parties that in his view performed badly with regard to mobilization and representation.

Thus, since the turn of the twentieth century, neither main strand of democratic theory has considered parties as obstacles to democracy per se, but the strands imply different views on the parties' roles and functions. Theories of popular sovereignty advocate a participatory form of democracy. Accordingly, the role of parties is to provide mass mobilization and integration, and their legitimacy depends primarily on direct popular involvement in party decision making. In contrast, the main role played by citizens in liberal democracies is to choose (or reject, and thus hold accountable) their leaders by means of competitive elections, while individual participation in politics as such is not an important ideal. Consequently, in this view parties are seen as a necessary instrument of electoral competition but do not need to emphasize mass membership, internal democracy, or even a particular ideology.

PARTIES AND CONTEMPORARY DEMOCRATIC THEORY: THE LACK OF DIALOGUE

Today, authors such as Richard Katz (2006) or Ingrid van Biezen and Michael Saward (2008) point out that with few exceptions, research on political parties and normative democratic theory have for some time developed in mutual isolation. While current party scholars often take a specific interpretation of the inherently contested concept of democracy for granted, the broad literature on modern democratic theory has largely ignored the wealth of empirical studies of political parties. As a result, authors argue that modern political science has done little to address or even understand current pressing concerns: A number of empirical studies have shown that parties appear to be losing some of their key functions, such as representation, mobilization, and interest aggregation. Growing disengagement from partisan politics and increasing levels of popular distrust in political parties are widespread. However, if parties are essential for representative democracy but at the same time unable to perform their representative functions, what are the implications for democracy? Are parties failing democracy, or do we need to reinvent them and their role? Do we need to reinvent democracy again? As van Biezen and Saward remind us, it is only when democratic theory and the study of parties reengage with each other "that we can try to make sense of the place of parties in contemporary democracy and, indeed, of the nature of modern democracy itself and its potential futures" (2008, 31).

Democratic Transition

Democratic transition is the process of changing, without major violence, from a nondemocratic regime to a democratic one. It can be distinguished from other paths to democratization that involve higher levels of violent conflict: "revolution," as occurred in late eighteenth-century France, and "foreign intervention," such as that undertaken by American and allied troops in Western Europe and Japan at the end of World War II (1949–1945).

During the nineteenth and early twentieth centuries, peaceful processes of democratization took place in a number of countries that already had multicandidate elections. This democratization was done by enlarging the eligible electorate within the country. In the United Kingdom, the United States, and other former British colonies, suffrage rights were allocated gradually to different minority groups through a slow, lengthy process of moderate reforms. By a different path, in Germany and in northern European countries, such as Sweden, Norway, and Finland, enfranchisement of the electorate was sudden. Such a rapid change could have created political instability, but this shift was made in conjunction with the establishment of proportional representation electoral rules and other institutional inclusive devices.

New ways of democratization advancing more directly from dictatorial or colonial regimes developed in the late twentieth century. Social mobilization and bargaining among the elites have led to democratic transitions in southern Europe since the mid-1970s, in Latin America and Eastern Asia since the early 1980s, and in eastern Europe since the late 1980s. As a result of these processes, a majority of the world's population now lives in democratic or liberal regimes for the first time in human history.

A democratic transition requires three components. First, there must be a variety of political actors with different political regime preferences. The incumbent government may be split between hard-liners and soft-liners who promote different responses to the threat of opposition movements. Within each of these groups, radical and moderate elements can be distinguished for their propensity to either reject or accept intermediate compromises with other actors.

Second, the dictatorial regime can be successfully challenged following a triggering event, such as the death of the dictator, an economic crisis, the failure of authoritarian rulers to deliver on their promises and meet the people's expectations, or a foreign military defeat.

Third, opportunities for choice appear. On the incumbent rulers' side, the costs of implementing repression against the opposition can be compared with the potential benefits of opening the system or calling an election under relatively favorable conditions to retain or share power. On the opposition's side, the costs of fighting, including the risks of provoking a civil war and the subsequent losses and destruction, can be compared with the potential benefits of accepting a provisional compromise that establishes better conditions for further action and organization. In the end, the government and the opposition may come to an agreement because of their different expectations and uncertainty about the future.

Different models of democratic transitions can be distinguished by the roles of their actors, the paths that the transitions take, and the consequences of the transitions. First, the *transaction model,* also called *establishment of democracy without democrats, transition from inside, transformation,* and *agreed reform,* implies significant exchanges between factions of rulers while keeping the opposition in a weakened state, the introduction of liberalization before democratization, and the enjoyment of relatively advantageous conditions by former authoritarians to survive and evolve in power. Cases of initial liberalizing reforms launched from above in a nondemocratic regime include Brazil and Spain in the second half of the 1970s and the Soviet Union in the second half of the 1980s.

Second, the *round table model,* also called *extrication* or *transplacement,* involves more formal and balanced negotiations between reform rulers and opposition movements, as happened in Chile as well as in Poland and Hungary in the late 1980s.

Finally, the *collapse model,* also called *breakdown, defeat, or replacement,* implies sudden changes imposed by an unexpected crisis, improvised conversations between former persecutors and the persecuted, and quick, dramatic decisions. Changes in Portugal and Greece in the 1970s, Argentina in the early 1980s, and East Germany and Czechoslovakia in the late 1980s, among others, can fit this model.

The focus on actors' strategies might complement more traditional discussions on structural conditions for democracy. The "strategic" approach permits the use of tools from game theory to identify crucial actors, bargains, and decisions. Studies of democratic transitions also consider the role of international organizations and information as well as the relations between the path of change and institutional choices, economic reforms, and further degrees of democratic consolidation and stability.

Deontology

Deontology derives from the Greek *deon,* "duty," and *logos,* "science." The term refers to a branch of ethics concerned with actions as guided by moral obligation or duty. The tradition is associated with the work of the German philosopher Immanuel Kant, who argued that there exist ethical values that require morally obligatory actions, regardless of their consequences. According to Kant, duty is effectively based on logical, universal unchanging sources, formulated in his principle of the "categorical imperative." In the same way, in deontological ethics, an action is considered good because of its commitment to higher-order moral values of the action itself, not because its product is good. (One cannot undertake immoral acts like torture of spies even if the outcome is morally preferable.) The emphasis on the type of motivation for action contrasts the deontological approach with consequentialism and utilitarianism. More extreme versions of deontology have been criticized as ignoring the goals and consequences of actions and/or leading to impossible situations, sometimes even producing harm. Neo-Kantian theories have been developed that try to resolve these difficulties, for example, by combining deontology with utilitarianism or additional values (such as equality and social justice).

Dependence

Dependence is an unequal relationship in which an actor, group, or nation is forced to rely on an external power for resources, economic activity, or security. Dependence creates vulnerability and the potential for exploitation among the dependent actors. Within domestic political systems, dependence may emerge when individuals or groups become reliant on policies or resources. In international relations, dependency theory emerged in the 1950s as an approach to explain unequal patterns of development. Dependency theory posits that the world is divided into *dominant* and *dependent* states (also known as *core* and *periphery* states). Dominant states are economically advanced and have diverse economies and high standards of living. Dependent states have low gross national products and often have economies that are tied to the export of a narrow band of resources to the developed states. The economic inequality is the result of the actions and policies of external actors, such as multinational corporations, international financial bodies, and world markets, which encourage underdeveloped states to export resources and to import manufactured goods, products, and services from industrialized nations. Resources flow from the underdeveloped states, the periphery, to the industrialized core. These economic patterns are self-perpetuating and reinforce dependence.

Dependency Theory

Dependency theory was a critical reaction to the conventional approaches to economic development that emerged in the aftermath of World War II (1939–1945). There are two dependency schools: the *Marxist,* influenced by Paul Baran and developed by Samir Amin, Theotônio dos Santos, Arghiri Emmanuel, André Gunder Frank, and Aníbal Quijano, and the *structuralist,* built on the work of Raúl Prebisch and others at the Economic Commission for Latin America and the Caribbean, and best represented by Fernando Henrique Cardoso, Enzo Faletto, Peter Evans, Osvaldo Sunkel, and Maria da Conceição Tavares.

Both groups would agree that at the core of the dependency relationship between industrialized countries, referred to as "*the center,*" and less-developed countries, referred to as "*the periphery,*" lies the inability of the periphery to develop an autonomous and dynamic process of technological innovation. The main contention between them was related to the possibilities of economic development in the periphery.

MARXIST DEPENDENCY THEORY

Marxists would argue that development in the periphery was impossible, while structuralists would argue that dependent development was feasible. The vigorous growth in some parts of the developing world in the 1950s and 1960s seemed to justify the views of the latter group. However, the enduring process of stagnation after the 1980s debt crisis led to a reconsideration of the relevance of dependency situations.

For the Marxists, the origins of the center-periphery relationship were strictly technological and determined by the international division of labor. The center produced manufactured goods for itself and the periphery, while the latter produced commodities mainly for the center, as well as maintaining a relatively large subsistence sector. In this view, development was based on capital accumulation—which, in turn, depends on surplus extraction. A larger surplus led to more accumulation of capital and a higher growth rate. Furthermore, for Marxists it was in the uses of the surplus that the differences between developed and underdeveloped regions were most evident. In the most backward countries, where the process of industrialization did not take hold and agriculture was still dominant, underdevelopment resulted from the patterns of land tenure.

The predominance of large estates in plantation societies meant that a great part of the surplus remained in the hands

of landowners, which emulated the consumption patterns of developed countries. Excessive and superfluous consumption of luxuries would then reduce the potential for investment and capital accumulation. Hence, conspicuous consumption would be the cause of stagnation in the periphery.

If industrial development took place, then a new pattern of dependency would emerge. Industrialization would take place with participation of foreign capital, which would tend to control domestic markets. The periphery then would jump into the monopolistic phase of capitalistic development, with local governments controlled by the monopolists. However, the surplus extracted by monopolistic capital would not be reinvested in productive activities in the host country. Part of it would simply be sent abroad as profit remittances, while the other part would be spent on conspicuous consumption.

STRUCTURALIST DEPENDENCY THEORY

Structuralists argued that capitalist development in the periphery was possible, even starting off in a dependent relationship with the center, and that foreign investment was not detrimental to growth. Dependency was not a relationship between commodity exporters and industrialized countries, but one between countries with different degrees of industrialization. Furthermore, structuralists distinguished between political and economic variables in explaining dependent development.

Development and underdevelopment were economic categories related to the degree of development of the productive structure and to its level of technological development. Dependency and autonomy referred to the degree of development of the political structure and the ability or lack of ability of local political elites to take economic decision making into their own hands. As a result, dependent development in association with foreign capital was possible and occurred in countries like Argentina, Brazil, and Mexico and in parts of East Asia.

Structuralists emphasized the importance of domestic internal developments, in contrast to the external forces of the world economy, as the main determinant of the situation of dependency. It was the internal political process that led to outcomes that favored foreign actors in the process of development. Furthermore, national capitalist development was not incompatible with the absorption of technological knowledge from multinational firms.

However, the structuralist version of dependency, in refuting the Marxist emphasis on the relevance of external factors, went to the other extreme and claimed that internal forces were the almost exclusive determinant of development. The inability to generate a domestic dynamic of technical progress incorporation, the domestic patterns of consumption, and the limitations of the domestic elites that opted for political dependency were to blame. If the successful industrialization of some parts of the periphery showed the weakness of the Marxist tradition, then the debt crisis and the failure to renovate the process of development in the 1990s proved that the optimism of the structuralist approach was not always justified.

CONCLUSION

More recently, dependency authors emphasized that industrialization and technical progress in the periphery were insufficient to break the dependency ties with the center. Financial dependency is reflected in the inability of peripheral countries to borrow in international markets in their own currencies, and constitutes the real obstacle to development. The inability to borrow in international markets in their own currencies reflects the inability of the domestic currencies of peripheral countries to acquire all the functions of money as a reserve of value, unit of account, and medium of exchange. The ability of a currency to function as international money is a question of degree. The main problem associated with the inability to provide all the monetary functions is that financial markets remain underdeveloped in peripheral countries, and the process of capitalist accumulation is hindered.

Interestingly enough, mainstream economists have also dealt with financial dependency. Ricardo Hausmann argues that, in part, underdevelopment results from the so-called original sin—that is, the fact that the currencies of developing countries are inconvertible in international markets. In this view, the external instability of domestic currencies in the periphery hinders the process of development. While mainstream and dependency authors agree on the importance of currency inconvertibility, they would disagree on the solutions. Mainstream authors would emphasize the importance of sound fiscal policies and monetary rules that promote credibility, while dependency authors would emphasize the need for capital controls and reduced integration with international financial markets.

Deracialization

Deracialization is the process of breaking with practices of representing the Other (individuals or groups) as racialized. Racialization can be understood as a historical and cultural process that leads to the classification, distinction, and qualification of humanity into races, and it consists of representational practices that mark racial difference and signify the racialized Other. French philosopher Michel Foucault refers to this process as *fragmentation,* which is one of the functions of racism, a technology of power that permitted modern European colonization. In other words, colonial institutions exercised their power and their domination on colonized societies by creating a racialized Other as different from the Self.

The concepts of *race* and *nation* developed in connection with one another. In countries such as the United States, these relationships of power are still expressed in contemporary categories such as those of "people of color," "community of color," and "racial minorities," with which nonwhites are classified as systematically different from whites. Therefore, the process of deracialization would imply the dismantling of both social relationships and the practices of representation that were built on racism, as well as practices that construct or perpetuate stereotypes and binary oppositions, and naturalize difference. The election of President Barack Obama might illustrate the process of deracialization of social relationships in the United States.

Deregulation

Deregulation is the removal of businesses or whole industries from the process of government regulation. Deregulation can also refer to the sale of state-owned enterprises, known as *privatization,* but privatization may entail the creation of new regulatory institutional arrangements and does not necessarily represent an absence of regulation. In theory, the term can be used broadly to refer to businesses becoming exempt from all types of regulation, from price controls and competition law to pollution abatement rules to equal employment opportunity law.

Recent history has shown that deregulation is most likely to dismantle economic regulation and occurs mainly in industries that are considered ideal for natural monopolies. *Natural monopolies* are generally characterized by high fixed or start-up costs and by increasing returns to scale, where profits are realized only by serving large numbers of customers. This includes utilities, such as telecommunications and electricity, and transportation industries, such as trucking and commercial air travel. For much of the twentieth century, companies in these industries acted as monopolies that were either state-owned or regulated by public competition authorities.

The United States undertook deregulation of these industries in the late 1970s in order to let the free market play a greater role. Similar deregulation occurred in European countries as well as in developing countries in Africa, Asia, and Latin America, but the transformation there involved privatizing nationalized industries followed by the creation of new independent regulatory agencies to oversee the newly privatized businesses. Deregulation and privatization have been pushed by economists and politicians in order to reduce public sector costs, to increase efficiency in the production of services, and to reduce manipulation of output and prices for political reasons. The process, as well as the effects of deregulation on both continents, has been the subject of extensive research in economics, political science, and public administration.

DEREGULATION IN THE UNITED STATES

In the United States, several factors set the stage for deregulation in the transportation and utilities industries. First, for decades, the biggest companies had functioned as natural monopolies, overseen by regulatory agencies, yet dominating their respective industries. High fixed or overhead costs and increasing returns to scale had provided the traditional justification for natural monopoly status, but this conventional wisdom began to change as more academics and policy analysts suggested that these industries should be opened to market competition. Additionally, the belief that regulation was contributing to business costs led presidents Gerald Ford and Jimmy Carter to see deregulation as a potential solution to the rising inflation problem.

Perhaps most important, by the late 1970s a substantial amount of economic research was demonstrating that economic regulation existed primarily for the benefit of the regulated industries. In *The Politics of Deregulation,* political scientists Martha Derthick and Paul Quirk argued that this body of economic work was the primary engine that drove the efforts to deregulate several industries (1985). Marver Bernstein, one of the first scholars to analyze the issue, suggested that regulatory agencies endured a life cycle in which the agency's initial enthusiasm and eagerness to provide corrections to the free market eventually gave way to a perceived need to protect existing firms from competition, thus resulting in industry "capture" of the regulating agency (1955).

Economist George Stigler followed up on the work of Bernstein, most notably with his article "The Theory of Economic Regulation," published in 1971. To support his claim

that regulation benefited regulated interests first and foremost, he analyzed market entry regulations in the trucking industry as well as occupational licensing requirements. According to Stigler, such regulations hindered competition by inflating the profits of established competitors while blocking market entry to smaller firms, ultimately resulting in higher consumer prices. The situation could sustain itself, argued Stigler, only because the costs of regulation to each consumer was not worth the cost of organizing other consumers in order to bring about change. Stigler's highly influential work served as the basis for other important articles on the social costs of regulation by Gary Becker (1983), Sam Peltzman (1976) and Richard Posner (1975). James Q. Wilson also built on this research by arguing that capture was more likely to occur in situations where the benefits of regulation were narrowly concentrated on industry, while the costs were widely dispersed across consumers (1980).

Derthick and Quirk showed that demand for deregulation often came from agency staff. Economists within the Civil Aeronautics Board recommended against continuing regulations that erected significant barriers to market entry against smaller airline companies. Additionally, future Supreme Court Justice Stephen Breyer, who worked then as special counsel on the Senate Judiciary Committee, convinced Senator Ted Kennedy of the anticompetitive effects of airline regulation, and, therefore, of the need to deregulate. Thus, the ideas of economists brought together a coalition of market-oriented Republicans, inflation hawks, and consumer advocates, such as Ted Kennedy and Ralph Nader.

Competitive reforms were passed in the airline industry with the Airline Deregulation Act of 1978, in the trucking industry with the Motor Carrier Act of 1980, and in telecommunications with the breakup of AT&T into the regional "baby" bells in 1984. The irony of the success of Stigler and others was that their theories dictated that deregulation could only occur if regulated firms no longer wanted to be regulated. Indeed, in his 1989 retrospective examination of the theories behind deregulation, economist Sam Peltzman suggested that regulated firms had come to believe that, by the late 1970s, the benefits of regulation no longer outweighed the costs. It is important to note that deregulation in the United States had its limits. The Reagan administration wanted to scale back environmental, worker safety, and health regulations, but Congress was divided over such plans. Additionally, there was variation in the extent to which the states implemented the reforms. Public policy scholar Paul Teske showed in a 1991 article that after the AT&T divestiture, not all the states followed the advice of economists, and in a 1994 article, Teske and colleagues demonstrated that the trucking industry was able to move to the state level to capture regulators and secure beneficial regulation.

In the 1990s, the financial sector also witnessed a strong movement toward deregulation with the Gramm-Leach-Bliley Act of 1999, which repealed the Glass-Steagall Act of the Great Depression era. Proponents of the Glass-Steagall Act claimed that it eliminated conflicts of interest in finance by keeping a firm barrier between commercial and investment banking. The banking industry, on the other hand, had sought its repeal in order to expand the operations of individual financial institutions. Additionally, Congress passed the Telecommunications Act of 1996, which outlined the regulation of broadcast spectrum and further reformed the regulation of telecommunications. However, critics such as Ralph Nader have maintained that the law has allowed large media companies to further consolidate and reduce competition in media markets.

DEREGULATION IN THE EUROPEAN UNION AND THE DEVELOPING WORLD

Deregulation followed a somewhat different trajectory in the European Union (EU), although, as with the United States, the movement was toward liberalization of markets. Postwar European regulatory institutions generally consisted of executive ministries that directly controlled nationalized industries, again in areas once thought appropriate for natural monopolies, such as transportation, energy, telecommunications, and broadcasting. In order to implement deep macroeconomic reforms, but also partly due to the influence of research by Stigler and others, such arrangements were gradually dismantled at varying speeds across Europe. Political executives then delegated the authority to regulate markets to independent agencies, with the idea that agencies would foster industry competition and limit state intervention.

In his analysis of European deregulation, public policy scholar Fabrizio Gilardi found that governments in several European countries delegated regulatory authority to independent agencies in order to enhance their credibility and potentially increase investment in newly regulated companies (2002). Thus, while deregulation may have occurred in the form of reduced state intervention, this regulatory regime was replaced by one of independent agencies, prompting some European Union public policy scholars, such as Giandomenico Majone, to ask whether they were witnessing deregulation or reregulation (1990).

Majone has posited that these changes have resulted in the creation of the modern "regulatory state" in Europe (1996). He argued that governments are primarily responsible for redistribution, stabilization (e.g., macroeconomic), and regulation, yet in the EU, government's role as regulator has grown at the expense of its other two roles. To Majone, EU governments that had once primarily focused on manipulating nationalized industries, in order to achieve particular income or employment targets, now delegated authority to agencies that were charged with correcting market failures. Moreover, the EU's stated goals of achieving a single, integrated market have required continual efforts to harmonize regulations across member states. Thus, somewhat ironically, deregulation in the EU has led to the creation of the European "regulatory state."

Deregulation in developing nations has also largely followed a path of privatizing state-owned enterprises. Much of the academic research in this area has come from economists attempting to evaluate the effects of privatization on production costs, prices, and consumer access to the goods in question. Numerous studies have been conducted; David Parker

and Colin Kirkpatrick summarize much of the literature on privatization evaluation in a 2005 article. They find that privatization by itself is often ineffective, but that when it is accompanied by competition and regulation by an independent public agency, privatization can lower production costs and lower prices for consumers, while increasing the choices available to them. However, the authors also indicate that many studies suffer from methodological flaws and that it may be difficult to generalize such findings beyond the most common context for such research, telecommunications.

THE FUTURE OF DEREGULATION

In industries once considered natural monopolies, deregulation has achieved mixed results, but research has helped to specify the economic and political conditions under which deregulation or privatization can be successful. However, the global financial crisis of 2008–2009 created strongly unfavorable impressions of the deregulation of financial institutions in the United States in the 1990s. Many observers attribute the repeal of the Glass-Steagall Act to the development of sophisticated debt instruments and questionable housing loans that combined to cause the crisis. Moreover, varying standards of regulation induced some commercial banks, such as Countrywide Financial, to shift their status to that of thrift or savings-and-loan institutions, which were less heavily regulated. Finally, some observers also perceived a regulatory conflict of interest, as enforcement was financed by fees collected by regulated entities. These events, as of 2009, have created strong demand for tight regulation of financial institutions, particularly in the United States, where many believe the crisis originated. Thus, while we may be witnessing a long-term trend toward privatization of natural monopoly industries, deregulation of other sectors of the economy has been more controversial and may experience greater volatility in the level and strength of government regulation.

Derrida, Jacques

Jacques Derrida (1930–2004) was an Algerian-born French philosopher. He is considered the founder of *deconstruction,* an approach to textual analysis (used mainly in the fields of philosophy and literary theory but also in the study of political discourse) that seeks to understand the meaning of texts by unveiling the inherent oppositions between the apparent features and the essential message. Issues such as sovereignty, otherness, and decision making are present in many of his works, but his political criticism went beyond theory, actively questioning and engaging in issues such as the Vietnam War (1959–1975), apartheid, and the death penalty.

Born in El-Biar (close to Algiers), Derrida grew up in a Sephardic Jewish family. In 1952 he was admitted to the École Normale Supérieure in Paris, France, where he defended his master's dissertation ("The Problem of Genesis in Husserl's Philosophy") in 1954. His 1966 lecture at Johns Hopkins University was followed by a long list of visiting appointments in renowned institutions, and he presented his doctoral thesis in 1980. In 1982 he cofounded and served as first director of the Collège Internationale de Philosophie in Paris, and a year after that he joined the École des Hautes Études en Sciences Sociales. In 1987 he also started lecturing at the University of California.

In 1967 Derrida published three works that introduced the concept of deconstruction: *Writing and Difference, Speech and Phenomena,* and *Of Grammatology.* The basis of deconstruction is that any text always has more than one possible interpretation, making interpretative reading a complex task constantly limited by the simultaneous existence of incompatible but at the same time closely woven meanings. Derrida, in his literary approach, suggests than it is by prioritizing appearance over essence that deconstruction operates and is able to unveil these textual oppositions. Deconstructive strategies include the diachronic or genealogical study of conceptual term usage and the critical identification of the aporias (contradictions or paradoxes) and ellipses contained in writing and thought.

Significant applications of deconstruction to political phenomena can be found in Derrida's *Force of Law* (1989), *Specters of Marx* (1993), and *Rogues* (2003), in which the tensions among democracy, sovereignty, and power are explored. Derrida argues that in a democracy, power is always abused, as it inevitably requires force, freedom, decision making, and, ultimately, sovereignty. But as democratic universalized
Algerian-born French philosopher Jacques Derrida fathered the approach of deconstruction, which allows that any text may have more than one possible interpretation.

decision making is necessarily a slow process, and many governmental decisions need to be made immediately, there is always a tendency to concentrate and unify power, to move toward imperial hegemony, excluding others from the process of decision making.

The most recurrent criticisms of Derrida and his works are usually linked to his lack of clarity and, in some instances, what has been viewed as intentional obfuscation (intent to confuse). His style was often more literary than analytical, leaving argumentation aside and opening the doors for contradictory interpretations. Derrida himself admitted that his notion of deconstruction was not easy to explain through discourse, as its object of critique is writing itself.

Descriptive Representation

Representation has many meanings, including acting on the instructions of the represented (delegate), acting in the interests of the represented (trustee), acting as the personal agent of the represented (attorney or ombudsman), and so forth. These roles primarily refer to an individual representative. While they are also relevant to the idea of representation by a legislative body as a whole, attention to representative assemblies also allows consideration of a sense of representation that only makes sense with many representatives. In Johns Adams's famous terms, the "representative assembly should be in miniature an exact portrait of the people at large," or according to James Wilson, "the legislature ought to be the most exact transcript of the whole society, the faithful echo of the voices of the people."

Although the idea of representation as mirroring appears to be self-evidently desirable, it has its detractors, who observe that it may shift the locus of decision regarding policy compromises and coalition strategy from the voters to the representatives, and may allow members of legislatures to act in ways that are opposed by large numbers of citizens while still claiming to be representative because literally on the surface they "look like" the people as a whole. In part, the seriousness of this problem depends on how "mirroring" is understood, as indicated by the contrast between the quotations from Adams and Wilson.

In Wilson's terms, mirroring appears to require an accurate reflection of the political opinions ("the voices") of the people. In this case, one might reasonably expect representatives to make the same decisions as the people would have made themselves. The Adams formulation, and modern attention to "descriptive representation," focuses on the degree to which the assembly looks like the people ("an exact portrait") with regard to such characteristics as race and gender and perhaps also age, social class, religion, language, or other characteristics. Given the diversity of opinions within demographic groups, here it is less clear that representation-as-mirroring will lead to the same decisions as would have been made by the whole people themselves.

In contemporary debates, support for demographic representation is generally based on two arguments. On one hand, it is seen to symbolize full and equal citizenship for the groups represented; implicit in this is a direct link between interest or opinion and group membership, and the idea that decisions will be made on the basis of competition in which power (reflected in the number of legislative votes) will be decisive. On the other hand, descriptive representative may be supported on the theory that there is something about the lived

experiences of women or minorities that can only be represented by members of those groups themselves; implicit here is the idea that decisions will be made in the common interest based on the interplay of ideas, so that an effective voice is more important that a strictly proportional voice.

Whichever rationale is accepted, however, at least three questions remain to be answered. First, what groups are to be represented? On the one hand, this means specifying the dimensions of difference to be taken into account. In racially or linguistically divided societies, these categories almost always are considered relevant, as increasingly is gender. But what about age or social class (the latter having been widely considered relevant in the early decades of the twentieth century, but much less so in the twenty-first)? Moreover, are dimensions such as race and gender to be considered independently (i.e., black versus white and male versus female) or must they be considered jointly (black male versus black female versus white male versus white female)? Second, does demographic representation require proportionality (as suggested by the argument concerning equal citizenship and the term mirroring), or does it require adequacy (as suggested by the "politics of presence"), even if this means that some small groups would require *more* than their proportionate share of the representatives?

The third question is how, institutionally, demographic representation can be furthered or assured. Most directly, this can be done through the use of reserved seats (e.g., for Maori in New Zealand or "scheduled castes and tribes" in India) or quotas for nominations, whether applied in law (e.g., Belgium or France) or by internal party decision (e.g., Sweden). In closed list proportional representation systems, not only is the number of "minority" nominees crucial but also their placement on their party's list. With regard to women, some quota systems go beyond simple proportions, instead requiring "zippering"—the alternation of men and women on the list.

Beyond these "direct actions," the choice of electoral system more generally can have an impact on the degree of demographic representation. This impact, however, depends on the kind of group involved. Provided that the parties decide that they want demographic representation, closed lists are more effective than open lists; if parties are merely paying lip service to representation, however, open lists may be superior. Having large legislative districts with many representatives for each is generally conducive to representativeness, because it allows parties to present more "balanced" lists, but if a minority is geographically concentrated, single member districts may be advantageous.

Détente

Détente, a French term meaning "the easing of strained relations," was used by Henry Kissinger to describe the Richard Nixon and Gerald Ford administrations' (1969–1977) goals for American-Soviet relations. Détente would result from a revised foreign policy that recognized the limitations of American power; addressed relations with other countries based upon their foreign policy behavior rather than their ideology, domestic institutions, or treatment of their citizens; and attempted to entwine the Soviet Union and the People's Republic of China in the Western-dominated international order. In short, America would engage its adversaries unsentimentally and privilege international stability over the promotion of human rights and democracy abroad to reduce tensions.

Détente's architects recognized that the Soviet Union had achieved rough parity in strategic nuclear capabilities while retaining a quantitative advantage in conventional military forces, yet its leaders craved recognition as equals, required trade and credit from Western countries, and were becoming estranged from their Chinese allies. The United States desired the Soviet Union to halt its military buildup, recognize Western rights in Berlin, facilitate American withdrawal from Vietnam, and establish principles for managing conflicts in the third world. The Nixon and Ford administrations engaged the Soviet Union in substantive negotiations that addressed these issues simultaneously, linking progress in one area with progress in others so as to maximize leverage and generate qualitative changes in East-West relations.

Détente achieved many of its goals. The United States and Soviet Union concluded two strategic nuclear arms control agreements: The Strategic Arms Limitations Treaty (SALT) froze the number of deployed intercontinental ballistic missiles (ICBMs) and submarine launched ballistic missiles (SLBMs) for five years, and the Antiballistic Missile (ABM) Treaty limited each country to two batteries of 100 defensive missiles (soon reduced to one) deployed to protect their national capitals or an ICBM field. An agreement effectively tying West Berlin to the Federal Republic of Germany and guaranteeing western access removed a constant irritant from East-West relations. The parallel warming of relations with both the Soviet Union and the People's Republic of China facilitated American withdrawal from the Vietnam War and reset the geopolitical

stage for American foreign policy. And Nixon's official visits to Moscow and Peking, firsts for an American president, were symbolic of—and drove—superpower cooperation.

Détente did not secure lasting cooperation, however. Domestic critics, such as Senator Henry Jackson, emphasized the concessions granted in these agreements, downplayed the benefits, and demanded better terms while also rejecting the notion that the United States should negotiate with a totalitarian enemy without explicitly linking progress on international issues to changes in the treatment of its citizens. Such pressure for increased demands, along with the loss of presidential power caused by the Watergate scandal, Nixon's resignation, and subsequent legislation, eviscerated the ability of the executive to threaten sanctions or promise inducements in its dealings with the Soviets and thereby undermined détente. Although presidents Ford and Carter continued the policy, seeking further arms control agreements and the atmospherics of superpower summitry, U.S.–Soviet relations soured. The Soviet Union took advantage of the situation by promoting third world allies, culminating with its deployment of Soviet forces to support its client in Afghanistan in 1979, which effectively ended the policy of détente.

Deterrence

Deterrence usually refers to "deterrence by punishment" (where an attacker might be able to take over a territory but is dissuaded by the prospect of suffering retaliatory damage at home), rather than "deterrence by denial" (where the aggressor is dissuaded from attacking simply by the knowledge that his attack would fail—would be repulsed by the local opposing defenses). This kind of deterrence is often assumed to be tied to the invention of nuclear weapons and the means to deliver them over the top of any battlefield, as the winner on the land or sea would still suffer horrendous damage to its cities, inflicted by the losing side's airplanes or missiles. But there were some similar discussions of such deterrence as early as the aftermath of World War I (1914–1918), when it was assumed that conventional air raids would soon be catastrophic enough to be a deterrent. And the emergence of global oceanic commerce had even earlier suggested that naval forces could impose significantly deterrent punishment on any adversary that had become dependent on commerce.

COMPONENTS OF AND PROBLEMS WITH DETERRENCE

One crucial ingredient of deterrence is that such punishment has to be sufficient on "second strike," that is, that the missiles or bombers or other means of inflicting this "countervalue" retaliatory destruction have to be able to survive all the "counterforce" attacks an adversary has inflicted in a first strike. If an attacker were able to blunt all the means of retaliation in the first strike, there would not be a deterrent.

The process of deterrence is based on a rational choice model and is sometimes thus attacked as presupposing a rationality that may be difficult to find in human decision makers. But such criticisms may overstate the problem. For deterrence to work, one must simply have national leaders who are normal enough in their motives to be averse to having their own cities destroyed and who are normal enough in their cognition processes to understand that an attack on an enemy's home cities or home territory can bring about such retaliatory destruction.

Most national leaders, but not all, would be "rational" enough to satisfy these conditions. It is sometimes conjectured that a national leader driven by a great confidence in the afterlife might be difficult to deter, because such a leader would not enough mind the retaliation that could be brought to bear in this life. Much more concern might apply to nonstate actors, the leaders of various terrorist groups, or other players who do not already govern cities and hence have nothing that can be threatened with retaliation and therefore cannot be so easily deterred.

One major concern about the deterrence mechanism has always pertained to the immorality of such approaches, since they depend substantially on the punishment of civilian targets. If the innocent are being threatened as a means of deterring the leaders who might be guilty of contemplating aggression, this conflicts with a Western or global morality that has tried to limit military attacks to military targets. The irony of deterrence is that potential attacks on civilians tend to reinforce deterrence and peace, while options for attacking military targets might undermine such deterrence and make war more likely. If a missile is aimed at the missile forces of the other side, it poses the threat that a first-strike attack could preclude retaliation. When the same missile is aimed at the cities of the other side, it reinforces the deterring prospect of retaliation. What is moral by traditional standards is thus a threat to the reliability of mutual deterrence, and what reinforces mutual deterrence is a challenge to morality.

A different problem with deterrence pertains to whether it can be extended, that is, whether the threat of massive retaliation can be utilized to deter attacks not only on one's own cities but on the cities or territories of one's allies. By a certain logic, this would not be possible, because the massive retaliatory threat would have to be held in reserve as long as

one's own homeland had not yet been attacked. But the cold war showed many instances of the United States seeking to shield Western Europe and South Korea by such "extended nuclear deterrence," utilizing a variety of ploys to couple such exposed locations to the prospect of American retaliation. The effectiveness of such extended deterrence was much debated. In the net, a great deal of conventional war may have been deterred and avoided, but many risks of nuclear war may have been accepted in the process.

DOES DETERRENCE WORK?

Assessing the efficacy of deterrence has always produced a fair amount of dispute. It is difficult to prove the cause of something that did not happen. How do we know that any adversary was actually contemplating an aggression and hence was deterred? And it is difficult to establish counting rules for success or failure. If West Germany was protected by American deterrence from 1945 to 1990, does this count as one success, or as many?

Thomas Schelling presented an important distinction in 1966 between deterrence and "compellence." In the former case, an adversary is dissuaded from an aggression that has not yet been undertaken. In the latter case, an adversary is induced, by the threat of punishment, to stop some hostile activity that is already under way. Cases in the latter category of compellence are easier to count and to sort for success or failure. A foreign regime is threatened with punishment unless it eliminates apartheid, terminates ethnic massacres, or meets some other criterion, and one watches to see whether or not the regime gives in.

This distinction between deterrence and *compellence* is particularly important when one considers the possibilities of *economic deterrence.* Rather than deterring war by threats of nuclear retaliation, perhaps the same deterrent impact can be achieved by the threat of economic sanctions and a cutoff of trade. Optimists about such economic deterrence might point to the cold war cases of West Berlin and Hong Kong. Pessimists about such economic threats sometimes cite a low success rate for sanctions, as low as 30 percent. But such low scores are derived only from the attempts at compellence, which are, as noted, easier to count but inherently more difficult to achieve, as compared to deterrence.

Deutsch, Karl W.

Karl Wolfgang Deutsch (1912–1992) was a social and political scientist, born in Prague, Czechoslovakia, who became a naturalized U.S. citizen. He earned degrees from the Deutsche Universität and Charles University in Prague and a doctorate from Harvard University in 1951. After teaching at the Massachusetts Institute of Technology and Yale University, Deutsch returned in 1967 to Harvard, where he became Stanfield Professor of International Peace. He was elected president of the American Political Science Association in 1969, the International Political Science Association in 1976, and the Society for General Systems Research in 1983. Deutsch was a member of the U.S. National Academy of Sciences and the academies of sciences of Austria and Finland. He received honorary doctorates from seven universities in the United States, Germany, and Switzerland, and the Commanders Cross Order of Merit, with star, of the German Federal Republic.

Deutsch's dedication to social science was linked to a moral passion for improvement in the world. His dissertation and first book, *Nationalism and Social Communication,* sought to explain the impact of the process of "social mobilization," an expression that he coined, whereby people become uprooted from their traditions and become available for new patterns of communication and behavior. Deutsch analyzed literacy, mass media exposure, urbanization patterns, language usage, religious belief, and other indicators, preferring quantitative analysis. Social mobilization, he argued, was likely to accelerate the fragmentation of states whose peoples did not already share the same language, traditions, and basic social institutions, but it would increase the likelihood of political integration among peoples in states whose people did so share. Published in 1953, this research helps us understand the forces that contributed to the decomposition of the Soviet Union and the unification of Germany.

In *The Political Community and the North Atlantic Area,* Deutsch sought to specify the background conditions for the political integration of what he called "security communities" in the North Atlantic world through a series of conditional hypotheses, which he sought to test with empirical qualitative evidence. He introduced the concept of "security communities" to describe relations between states where war had become unthinkable notwithstanding a history of severe interstate conflict. From that concept, he derived empirical propositions to be tested on the historical experience of peoples on both sides of the North Atlantic, though especially to understand political integration in Europe. This analysis, in fact, pertains to international politics worldwide.

Deutsch's *Nerves of Government* was a more theoretical work. In his own prospectus for this book, he noted that he based it on "the comparative study of many systems of communication and control, ranging from electronic computers to biological and nervous systems, and to human organizations and societies." The book aimed, he wrote, to reorient "political thought toward a greater interest in seeing government and

politics as potential instruments of social learning, of social and economic development, and of intellectual and moral growth."

He was an early proponent of the use of quantitative methods in political science and also of the utility of making large-N data sets freely available to other students and scholars, whoever they were and wherever they worked, in order to foster replicability of research findings and launch new scholarly projects to advance the frontiers of social science knowledge.

Development, Economic

Economic development is a multifaceted concept with no universally agreed-upon definition. It broadly refers to a process of economic transformation leading to increased levels of prosperity in a region or country. While increased prosperity is typically associated with increases in per capita income in the region or country of interest, development is considered to encompass more than income. Because of the insufficiencies of a simplistic definition of development based solely on income per capita, new approaches such as "human development" or "capabilities" have been envisioned. Despite these critiques, per capita income level remains the most popular metric for economic development, as it is highly correlated with other indicators commonly believed to characterize development. Thus, even if usefulness of income per capita as a proxy for economic development is often challenged, it continues to be the indicator most frequently used by scholars, policy makers, and international organizations.

Economic development became a major concern in the post–World War II (1939–1945) era following the process of decolonization that led to the emergence of many countries with low living standards; these countries were categorized as "underdeveloped" or "developing" countries, in contrast to "advanced" countries. Although the general tendency has been to lump these countries together in the same "developing countries" category, the World Bank disaggregates this category into "low-income," "lower middle income" and "upper middle income" categories. There is substantial variation amongst these countries with respect to their resources, sociopolitical structures, and institutional arrangements. These differences, in turn, lead to varying outcomes regarding economic development.

Since the post–World War II era, there has been notable cross-country variation in development outcomes: Some countries, especially those in East Asia, have almost converged into the category of advanced countries, while many in Africa, Latin America, and Southeast Asia have lagged behind.

Theories of economic development were initially set forth by economists in the subfield of development economics, which emerged in the 1950s. Undermining the differences between developing countries, these theories aimed to explain causes of underdevelopment while offering models of development. For many years, the field of political science largely viewed economic development as an exogenous determinant of political institutions and processes. A dominant perspective was that economic development was causally prior to democracy. For the last three decades, however, political scientists have increasingly studied factors explaining variation in the levels of economic development and increasingly focused on political and institutional determinants of economic development.

There has been considerable interaction between development strategies implemented by developing countries and the scholarly debate on development. Changes in development thinking and shifts in policy making are usually reflected in and affected by international organizations such as the United Nations (UN), the International Monetary Fund (IMF), and the World Bank.

FIRST WAVE OF DEVELOPMENT THINKING AND PRACTICE

In the post–World War II context shaped by the conditions of the cold war and decolonization, the dominant belief was that the newly emerging nations were different from the developed nations in their social and economic institutions, and economic development needed to be stimulated. Dominated by economistic approaches, the prevalent perspective in this era was the "big push," or "take-off" for economic development. Formulated by Rosenstein-Rodan in the 1940s, the big-push thesis suggested synchronized investment in key sectors in order to overcome indivisibilities and external economies and trigger a momentum for growth. A similar argument was developed further by Nurkse (1953), who underlined a vicious cycle of low saving, low investment, and low income in developing countries. Nurkse suggested a theory of "balanced growth" and pinpointed foreign aid to close gaps of savings, foreign exchange, and skills. According to Rostow's (1960) view of take-off, developing countries would replicate what the advanced countries had done in order to take off from a traditional society to an industrial one, which would bring about a massive structural transformation of both economy and society. The Rostowian view substantially influenced policy making regarding both project design in developing countries and aid programs offered by the advanced countries.

These views were closely affected by the Keynesian growth models, the most influential of which was the Harrod–Domar model developed in the 1930s and 1940s. Originally developed for conditions of growth in industrial economies, the Harrod–Domar thesis argues that aggregate

supply and demand need to increase simultaneously at the same rate in order to maintain full employment and price stability. Hence, in order to sustain investment, if the private sector cannot grow fast enough, the public sector needs to compensate for this weakness, and this has an important policy implication about the role of the state in development. As capital accumulation and industrialization were considered prerequisites of economic development, the Harrod–Domar thesis was applied to developing countries.

Triggering the industrialization process became a major concern for scholars and policy makers alike, signified by the models of Rosenstein-Rodan's (1943) big push, Nurkse's (1953) balanced growth, Hirschman's (1958) unbalanced growth and linkages, Rostow's (1960) take off, and Gerschenkron's (1962) great spurt. These models influenced policy making and helped structure *import substitution industrialization (ISI)* strategy, which was based on the production of consumer goods for the domestic market by using import and exchange controls and reliance on state intervention and planning. Implemented in most developing countries between the 1950s and the 1980s, the ISI regimes were dominated by export pessimism, justified through Bruno and Chenery's (1962) two-gap model. The big-push and take-off models have been critiqued on several issues, most important of which is their—implicit or explicit—association with state intervention and central planning that, in practice, triggers the push, giving rise to major coordination failures.

The Marxist perspective on economic development also offered inward-looking models for less developed countries (LDCs). It argued that the issue of capital accumulation could not be divorced from the country's links with the international economy and that the main culprit behind underdevelopment was the structure of international trade. A theory that later came to be known as the Prebisch–Singer thesis was that deterioration of less-developed countries' terms of trade vis-à-vis advanced countries caused perpetuation of underdevelopment. This view suggested that economic dependence caused by colonization and/or incorporation of nonindustrialized countries into the world economy impeded growth in the LDCs. The dependency view was developed in the 1950s and 1960s by leading experts at the UN's Economic Commission for Latin America (ECLA) and its Conference on Trade and Development (UNCTAD), such as Singer, Prebisch, and Myrdal.

The UN has been active through its respective agencies in development-related areas since the 1950s. The ECLA affected development thinking substantially in the 1950s and 1960s by initiating and spreading the dependency approach and inward-looking development strategies. UNCTAD was established in 1964 to accelerate economic development in the LDCs and triggered the formation of G77 (a loose coalition of seventy-seven nations) as a lobbying group of the LDCs, which challenged the hegemony of the advanced countries in making the rules governing the international economy.

Early waves of the development thought underlined "market failures" in developing countries, which provided a rationale for the state's active involvement in planning to overcome these failures. This rationale being strengthened by arguments over issues such as structural weaknesses and limited entrepreneurship, recommendations for development were centered around state action. The state, then, would ignite industrialization and facilitate structural transformation by take-offs, great spurts, big pushes, or balanced growth. This emphasis on the role of the state in development coincided with the postwar consensus in advanced countries about the state's role in economic activity with respect to Keynesian demand management and regulation of markets.

SECOND WAVE: "GETTING THE PRICES RIGHT"

The second wave of development thinking was dominated by neoclassical analysis. Shortcomings of central planning and state intervention to correct market failures were delineated as early as the late 1960s and early 1970s, as empirical evidence accumulated that there were crises in planning. Then the focus of critiques shifted toward government failures signified by bureaucratic weaknesses, coordination failures, and mislocations. Critiques of the ISI regime referred to high costs of protectionism, rent-seeking activities, deadweight losses, aggravating unemployment, and foreign exchange crises. Neoclassical critique of the first wave of development thinking underlined government failures that distorted the prices, and "getting the prices right" became the new motto. Timmer (1973) asserted that getting prices right would not necessarily guarantee development, but getting them wrong would call for the end of development. Hence, rather than structural conditions, policy making became the center of analysis to explain variation in development. Challenging the distortions in incentive mechanisms in addition to prices, Krueger (1986, 62) stated that the market failures resulted from "inappropriate incentives rather than nonresponsiveness."

Neoclassical resurgence in development thinking was coupled with the shift to supply-side economics in advanced countries, which entailed a substantial critique of Keynesianism. It was furthered by the emergence of the debt crisis in the 1980s, which was perceived as the indicator of the ISI's failure. The so-called East Asian miracle based on export-oriented development provided empirical evidence for critiques of inward-looking strategies. The new policy recommendation, then, became export promotion, liberalization of foreign trade regime, and privatization.

Starting from the 1980s, international organizations' policy advice for the LDCs reflected the neoclassical resurgence in development thinking. Initiated in 1979, the World Bank's structural adjustment programs (SAPs) aimed to provide loans for structural change in LDCs, with strict conditions: The loans were to be used to implement stabilization measures required by IMF standby agreements and supply-side measures. Conditionalities attached to funds provided by these organizations played a major role in a sea change in development thinking and policy making, resulting in a major shift from ISI to market liberalization in most of the developing countries. SAPs and their one-size-fits-all

policy prescriptions to developing countries—prescriptions that included liberalization, stabilization, and privatization—have been subject to fierce criticism that they were either ineffective or even aggravated the existing problems in those countries. SAPs have been more effective in countries equipped with better institutional arrangements, which facilitate a better implementation of the suggested policies.

THIRD WAVE: "GETTING THE INSTITUTIONS RIGHT"

Propounding a major critique on neoclassical approaches as undermining institutions and their impact on development, institutional approaches emphasize that free markets are not sufficient for successful economic performance in general and for development in particular. Underlining the need for "getting the institutions right," this perspective analyzes the role of institutions in economic development based on the premise that often the overextended state structures in developing countries are not capable of creating the institutions vital for development, such as property rights.

Since the late 1980s, the institutional perspective has become dominant in development scholarship across disciplines. As the causal priority of institutions became the central emphasis, links between various institutions and economic development have been drawn. New institutional economics (NIE) played a central role in marrying the institutions with economic development. Focusing on microfoundations of institutional arrangements, NIE suggests institutional arrangements determine the structure of opportunities and constraints on individual behavior; they shape the incentives, and, therefore, mold the business climate.

The institutional framework in developing countries tends to be weaker than in advanced countries, indicating "institutional failures" rather than market or government failures. As Acemoglu and Johnson (2004, 2) state, "The question of why some societies are much poorer than others is closely related to the question of why some societies have much 'worse economic institutions' than others." Historically, institutions in developing countries did not follow the pattern that had been followed in early modern Europe; hence, more impersonal and complex institutions did not emerge. Rather, what Bardhan (2001) calls "bad" or "dysfunctional" institutions persisted in developing countries, determining the path of development.

A widespread consensus has evolved about the role of certain economic institutions on development. According to the institutional perspective, markets "must be accompanied by institutions that limit economic intervention and allow private rights and markets to prevail" (North and Weingast 1989, 808). Thus, institutional arrangements that maintain credible constraints on the rulers in order to sanction opportunistic behavior are conducive to economic growth. Comparative historical analyses pointed out the emergence and persistence of institutions that maintained credible constraints and diminished transaction costs, uncertainties, and coordination failures.

Variation among the institutions regarding property rights and contract enforcement help explain the differences with respect to determinants of economic development such as income level and the rate of growth and investment. Additionally, institutions that resolve collective action problems, and those facilitating credible commitments and accountability, are among those most commonly studied and advised for initiating or accelerating economic development. Bureaucratic institutions are also linked to economic growth, as studies show that competent bureaucracies enhance state capacity and facilitate economic development.

A central institutional weakness in developing countries is the inadequacy of financial markets. Institutions of credit were poorly developed, suffered from access limited to few in the society, or could not catch up with the institutional transformation that early modern Europe went through. Development banks were instituted by the states to fill in this gap in financial markets, but they were not as effective in many developing countries as they were in East Asia, where the state enhanced the market rather than replacing it and prevented coordination failures.

A recent focus in the institutional approach is to analyze power relations and distributive conflicts among different groups in the society with respect to shaping institutional arrangements. Studies show that economic growth is fostered by participation in economic activity and relatively equal access to economic and political resources by a broad base of society. Likewise, unequal distribution of wealth and power may impair institutional changes that would be conducive to economic development. Therefore, allocative qualities of political institutions also matter for development outcomes, and this finding has important implications for elucidating the links between democracy and development.

Democracy and its links to economic development have been widely debated. Earlier argument, inspired by modernization theory, was that economic development preceded emergence of democratic institutions. This argument was entrenched by canonical studies such as those of Lipset (1959, 1975), Lipset and Rokkan (1967), and Dahl (1989), who argued that enhanced economic benefits for the masses foster democratic aspirations and, thus, the demand for democracy.

Recent studies, however, question this earlier belief on the causal primacy of economic development to democracy in two different ways. The first suggests that economic development has no causal effect on democracy or authoritarianism but demonstrates that democracy and income per capita are correlated, as the same variables concurrently affect level of development and democracy. The second reverses the arrow between development and democracy—democracy has the causal primacy as it fosters economic development. Olson (1997) argues that democracies can better secure property rights and contract enforcement than autocracies, which are subject to the problem of succession. The links among democracy, allocation of political power, and economic institutions are widely studied regarding their impact on economic development.

Despite the existence of a lively debate on institutions, what is lacking in the current scholarship is an analysis of institutional change. What accounts for the emergence of good

institutions that would foster economic development? Given that institutions are considered "sticky" or persistent, how might the ineffective or dysfunctional institutions in the LDCs be replaced by "good" institutions? What kind of redistributive strategies would resolve existing collective action problems that impair institutional change? What leads to the emergence and spread of informal institutions, particularly social norms?

During the initial wave of market reforms in the 1980s, which were carried out under the auspices of international organizations, institutions were not given much attention. International organizations mostly provided purely policy advice without touching upon institution building. Nor did these organizations take into consideration domestic institutional arrangements and power relations in the countries that were provided with loans and policy advice. But, later, the empirical evidence, particularly the recurring crises, showed that policy change itself was not the panacea for acute problems, and sometimes such change without an appropriate institutional framework aggravated the existing problems. Particularly after the 1997 Asian crisis, the perspectives of these organizations changed considerably, as they came to terms with the understanding that better institutions yielded better outcomes. Hence, a consensus has evolved with respect to the inadequacy of policy change without appropriate institutions.

Since the 1990s, "good governance" has become the buzzword in the international organizations and their development-related advice to LDCs, signifying a dominant belief in not only institutions but "good institutions." Under the impact of institutional schools that pinpointed the limitations of "getting the prices right," these international organizations started replacing conditionalities that used to be merely based on policy advice with those related to governance.

Parallel to the institutional resurgence in the 1990s, the UNDP also put particular emphasis on democratic governance and aimed to build local capacity for accelerating development. Having challenged the simplistic definition of development based on income per capita, the UNDP launched a new concept: "human development." With this goal, since the 1990s the UNDP has been publishing the Human Development Index (HDI), the successor to the Physical Quality of Life Index (PQLI) of the late 1970s. The HDI takes into account life expectancy, knowledge, and education in addition to income per capita. It shows that countries that have similar income per capita levels may differ regarding life expectancy and literacy. Nevertheless, HDI indicators show a high correlation between income per capita and other indicators of "human development," which makes it an uneasy substitute for the conventional definition of economic development.

The UN's Millennium Development Goals set rather ambitious targets, of which eradicating poverty is the most pronounced. The UN seeks to consult with other international organizations to assign responsibilities to advanced countries with respect to acute problems, such as removal of trade barriers against LDC exports, abolishing explicit and "disguised" protectionism, and eliminating the debts of the poorest countries. Neither the goals nor the assignments have yet been met.

Development, Political Economy of

The political economy of development looks into the fundamental question of why some countries and regions of the world are rich and others are poor. A variety of competing schools of thought seek to explain the main reasons for underdevelopment and how to overcome development challenges. The political economy of development deals with economic considerations, but it also includes political dimensions as key factors for development prospects of countries and regions.

Defining and measuring development and underdevelopment are crucial for the political economy of development. As a rule, development indicators are used in an attempt to measure levels of poverty. Traditionally, gross domestic product and related growth rates were used almost simultaneously to define development. In the 1980s and especially the 1990s, various efforts were made to define development in a much broader sense. Such new indicators and indices as the Human Development Index (HDI) were developed.

Explaining underdevelopment and development through different theories and approaches has a long tradition that can even be traced back to early research on different levels of industrialization in Europe. Especially since the 1960s, a number of schools have been established to explain development and underdevelopment. One of the main features of these schools has been their universal approach. Influential debates were sparked by Walt Whitman Rostow's model of the five stages of growth. He tried to explain the stages of economic development that are needed before high mass consumption is reached. Other schools were looking at structures of global exploitation. The Independencia schools, originating mainly in Latin America, were influential in this context, especially

in the 1970s and 1980s. These and other theories implicitly or explicitly consider explanations to be found in or outside developing countries. New concepts are engaged in the analysis of the impact of globalization on developing countries. In general, theories of the political economy of development can be subdivided into (1) approaches developed by political scientists (e.g., Samuel Huntington) that focus on governance issues and historical development conditions, and (2) approaches developed by economists (e.g., Jeffery Sachs; see below) that focus on specific production models and the dominance of economic conditions for development prospects.

Since the early 2000s two distinct schools of thought have emerged during the development debate: The first, a "poverty trap" (standing for a number of concepts) identified by Jeffery Sachs, is assumed to be a function of a low savings ratio combined with high population growth, a situation that leads to stagnation in capital accumulation and prevents economic growth from triggering a self-sustaining dynamic. Sachs sees such factors as high transportation costs and low-productivity agriculture as principal structural causes. The poverty trap approach sees a need for a broad-based counter-strategy through a "big push." A massive increase in foreign aid is therefore necessary.

Critics of an approach of this kind point to the long tradition of the big-push idea and strategies based on external funding. Neither, it is claimed, has proved reasonable or appropriate. Counterarguments have been advanced, especially from a governance perspective. Therefore, the second set of schools of thought, the governance schools, ascribe underdevelopment mainly to governance weaknesses in the shape of insufficient legitimacy, a nonfunctioning monopoly of power, inefficient institutions, and inadequate basic government services. It is, in other words, not primarily a lack of financial resources but deficient governance structures that prevent development successes. This applies inter alia to countries affected by violent conflict or fundamental governance problems. Furthermore, it is claimed that although a number of countries have substantial income (e.g., from oil revenues), the problem is that income is not put to productive use.

Against the background of these debates, the specific links between different development dimensions are being increasingly examined. Research is, for example, focused on the influences of good governance on economic growth and vice versa and on analyzing the relationship between foreign aid and development. Particularly important in this context are the negative effects of aid (e.g., on governance structures in developing countries or on a country's own revenue efforts) and the conditions needed for positive impacts.

Development Administration

Development administration became a strategic concern in American social sciences and to policy makers during the late 1950s, with Walter Rostow's *The Stages of Economic Growth: A Non-Communist Manifesto.* Western development literature tried to identify the noneconomic conditions for accelerated and orderly economic growth. Development administration was understood as a mechanism contributing to economic growth, stability, and systems maintenance, along with its traits of efficiency, stability, and legitimacy for nation and state building. It offered an institutional framework to convert inputs of objectives, capital, and know-how into developmental outputs. Even after the idea flagged in the West in the 1970s, it left its imprint in the lesser-developed countries of the Middle East, East and South Asia, Africa, and Latin America. These were countries either emerging from decolonization, seeking to secure the benefits of bilateral and multilateral aid for of economic and social development, or both.

Development administration so conceived emphasized the formal and technical aspects of government machinery. Developmental goals were assumed to be self-evident and, therefore, agreed on by local Westernized elites. These goals were broadly defined as nation building and socioeconomic development. Authors like Irving Swerdlow identified two interrelated tasks in the development process: institution building and planning. Still others emphasized numerous development oriented activities, such as the management of change, establishing an interface between the "inner" environment and the larger intra- and extrasocietal context, and mobilization of human and physical capital for development objectives and related democratic politics.

During the 1970s and 1980s, worldwide prosperity increased, especially among the industrialized nations. It was expected that by applying modern technology, developing nations would overcome the challenges of poverty and lack of development that lay at the heart of instability, insurgency, and the appeals of communism, and this belief was reinforced by the strong evidence of successful rapid post–World War II (1939–1945) reconstruction. The approach was essentially clothed in pragmatism in the vein of scientific management. The assumption was that problems, whatever their nature, lay

with and *at* the periphery. By contrast, the solution to all problems was always in the developed world.

The developmental creed that emerged posited that to attain development, a country's administrative structure needed to be overhauled and revamped to conform to the standards of the most advanced industrial societies. The issue thus consisted in the reorganization of the existing traditional machinery into a new entity. This process was known as *administrative development:* the modernization of the public service machinery through exogenous inducement, including the transfer of technology and the training of local staff by foreign experts. For this task, there was already a prescriptive bureaucratic model to be found in Western traditions: the administrative state. This administrative state was based on the dichotomy between politics and administration, a pyramidal hierarchy, unity of command, political neutrality, recruitment and promotion based on merit, public service accountability, objectivity, and integrity. In reality, a parallel value system encompassing these traits often coexisted in those parts of the world where Western models were set up that operated concurrently with traditional cultures, economies, and markets. The principles of development administration were generally accepted at face value by the indigenous elites, especially in those countries in Asia, Africa, and the West Indies, where a relatively peaceful transition to nationhood had taken place.

The postindependence political and bureaucratic elites rapidly moved to replace colonial administrators. Western education was widely perceived to be the vehicle both for personal advancement and for acceptance into the global community of Western-trained professionals, and these postcolonial administrative systems continued to be imitative and ritualistic. Practices, styles, and structures of administration generally unrelated to local traditions, needs, and realities succeeded in reproducing the symbolism—but not the substance—of British, French, or American administrative traditions. Even where a relatively large contingent of trained functionaries existed, as in India, Pakistan, Sri Lanka, Kenya, Nigeria, or Ghana, the old "law-and-order" colonial administrative culture prevailed. For most of the local elites, technical solutions and formalism appeared more palatable than the substantive political options needed to bring about real socioeconomic change. Reorganization and rationalization soon became ends in themselves, displacing the developmental features of development administration.

FROM HOPE TO GROWING DOUBTS

The early euphoria of the 1960s soon gave way. With energy and debt crises bringing two decades of prosperity to a rather abrupt close, the foundations of development administration were shaken. Its usefulness for the third world was called into question, and an intellectual crisis spread among students of development administration in Western countries. The gap between the center and the periphery was widening rather than narrowing, in both relative and absolute terms. Instead of development and nation building, turmoil and fragmentation proliferated throughout the "other" world, including urban

crises, drastic cessation of growth, unemployment, breakdowns of public institutions, and decline of civic probity.

During the subsequent third and fourth development decades of the United Nations, the New International Economic Order (NIEO) advanced by the nonaligned movement became an important new symbol in the development arena. Its demand for a basic realignment of the world economy and substantial changes in trade, aid, and technological transfers was generally ignored by the richer donor nations. There was no consensus concerning NIEO objectives, and some commentators felt that it might even harm certain countries. While the World Bank and the International Labour Organization (ILO) endorsed this discourse, the monumental change demanded by the NIEO did not occur. In the absence of shared strategies, the NIEO soon went the way of earlier concepts.

By the end of the 1980s, two other major and interrelated events changed the parameters of the existing global order. These were the dissolution of the Eastern bloc and the related entry of former communist states into the realm of third world nations and the accelerated process of globalization.

The collapse of communism in Eastern Europe coincided with a revival of ultraconservative ideologies in the West. First, the rise of Margaret Thatcher and later Ronald Reagan (and similar events in Canada, Australia, and New Zealand) added a powerful impetus to a new administrative discourse: *new public management (NPM)*. NPM dominated the scene during the 1980s and well into the 1990s. It emphasized drastic reforms predicated on a number of standard prescriptions: (1) accent on results, both in the planning and in the evaluation of programs and personnel; (2) treatment of the public and citizens as customers; (3) delegation of authority as close to the action level as possible; (4) empowerment of "clients" (devolution); (5) greater attention to cost through comprehensive auditing, contracting out (outsourcing), and introduction of competitive practices into the public space; and (6) private sector techniques intended to motivate employees, such as merit/performance pay, mission statements, and quality circles. Other key operational principles included budget restraint and downsizing bureaucracy. NPM also introduced market-driven language and the notions of corporate management and corporate culture. This paradigm was based on the premise that by reducing bureaucracy and monopolistic practices, corruption would decline, and that by narrowing down the scope of government activities, an efficient, transparent, and accountable system of governance would necessarily emerge.

For the following two decades, NPM became a fixation in the Anglo-Saxon world as well as in some important international financial institutions. The greatest charge against the type of managerialism promoted by NPM was its reductionism and lack of imagination. It tried to encapsulate a complex prismatic phenomenon into a single model drawn from an idealized version of the private sector that, in reality, existed in only a limited number of capitalist countries.

The strategy accompanied the programs of structural adjustments with which development agencies sought to address the needs of countries in the third world. As one–size-fits-all solutions, NPM recipes seldom availed the countries for which they were intended. Poorer nations ceased to be treated truly as recipient countries; they were compelled to make net transfers of their meager resources to the West. Led by the World Bank and the International Monetary Fund, a new economic and financial orthodoxy (called *structural adjustment*) resulted in severe setbacks to development and living standards in poorer nations. To service their debt, several countries came close to bankruptcy, and their governments became receiver states. Despite exhortations for "freer" trade, restrictive global trade practices and biases prohibited poor nations from really taking advantage of the so-called comparative advantages. The problem was further compounded by commodity prices falling to their lowest level in fifty years, while the prices of manufactured goods from rich countries, as well as foreign debts, kept rising. In this context, it is not surprising to see that poverty, inequality, repression, and despair continued to rise in the southern hemisphere.

As had happened with the calls for a new international economic order in the 1970s, the new expanding global inequity brought about a growing awareness of the need for reform, as displayed at the Earth Summit in 1992 and the Millennium Summit at the United Nations in New York in September 2000, which resulted in the Millennium Development Goals. Both events affirmed the imperative for greater solidarity worldwide and shared responsibility in meeting and addressing the challenges confronting all countries and all peoples in this twenty-first century.

A BACKWARD GLANCE AT THE FUTURE

The field of development administration was largely contingent on a seemingly inescapable dependence on exogenous models and ideas. Yet a critical mass of third world scholars and researchers has emerged questioning the foundations of the common wisdom under which they were trained. This second generation of intellectuals has emphasized the interdisciplinary and cultural dimensions of the study of comparative and development administration. These individuals have also been critical of ethnocentricity of the new public management surrogate.

Devolution

Devolution refers to the transfer of power from a central government to subnational units of government. The term, which is derived from the Latin word *devolutio,* is often used interchangeably with *decentralization* in political science literature. The concept of devolution originated in the modern era and drew increased interest during the late twentieth century.

Historically, devolution followed a long period of centralization that began with the political development of nation-states during the Renaissance (1300s to the 1600s) throughout Europe and continued through the era of colonialism (1400s to the 1800s), with its transformation of national economies. The development of complex economic, societal, and governmental organizations increased, sustained, and institutionalized the highly centralized power that defined the modern nation-state. Ultimately, the centralized nation-state governments faced increased complexity and interdependence that obscured accountability and introduced inefficiencies, which in turn led to demands for decentralization, or devolution.

DEVOLUTION IN THE UNITED STATES AND THE "DEVOLUTION REVOLUTION"

An essential precursor to devolution in the United States was the centralization of power. As the U.S. national government developed greater administrative capacity and established greater policy authority, the centralization of power increased. The balance of federalism ultimately became weighted, with ever greater permanency, toward the supremacy of national authority. There exists broad consensus that nationalization of policy authority and achievement of national administrative capacity were realized in the early twentieth century, though the effects, causes, constitutionality, and beneficence are extensively disputed. On the one hand, government scholars such as Theodore Lowi assess the significance of the change as the "death" of the original constitutional system, which left in its place a much more nationalist "second republic" with greater centralized powers. On the other hand, scholars such as Samuel Beer argue that the increased national authority is part of the constitutional plan of the country's founders and represents the realization of the national ideal. Regardless of

the divide over the interpretation of the nationalization, it was a crucial development for the political system and a necessary precursor for modern devolution.

Public administration scholar John Gaus was among the first to consider the value of devolution for American federalism. He saw federal bureaucratic organization as limited, because "it creates new problems of control which the central organization must solve if the devolution is to be successful." The latest phase in the evolution of American federalism has been called the "devolution revolution" by Richard Nathan, and the idea behind it is simple: reduce the size and influence of government by cutting taxes and spending and by sending federal responsibilities to the states.

The election of Ronald Reagan marked the beginning of the devolutionary era in the United States. Reagan launched his 1980 presidential campaign with a promise to return power and responsibility to state and local governments. The promise partially came to pass in 1996, when the devolution revolution achieved the reform of public assistance.

DEVOLUTION AND THE INTERNATIONAL COMMUNITY

The centralization of states across the globe increased in the postcolonial era, and, with the proliferation of nation-states, regulation and complexity also grew at an exponential rate. Although states were eroding in their traditional sovereignty, the increased complexity of their intergovernmental systems paralleled the growth of their administrative capacities. In *Comparative Federalism in the Devolution Era* (2002), Neil Coleman McCabe summarized the recent period of devolution by noting that

> developments included the collapse of the Soviet Union and the creation of the new Russian Federation, the breakup of Czechoslovakia and Yugoslavia, devolution in the United States and the United Kingdom, decentralization in Mexico, separatism in Canada, the reunification of Germany, and the establishment of new constitutions for South Africa and the former Soviet satellite nations. Many of these developments were characterized by a shift of power from larger to smaller units of government and called into discussion theories of federalism and devolution.

The effects of globalism and interdependence have brought increased salience for devolution and decentralized systems of governance across the international system.

THE FUTURE OF DEVOLUTION

Some have viewed devolution as a natural occurrence in the evolution of governments and believe that as the state dissipates, subnational governments will be the choice for popular governance because of their enhanced responsiveness. The twenty-first century has witnessed an increase in threats to nation-states from a broad array of networks of organizations. These threats and the reactions to them across the international system encourage the implementation of centralization policies even though they are countervailing the inertia of

the devolutionary era. For example, after the attacks on the United States on September 11, 2001, law enforcement, security, and military resources were brought under the umbrella of federal oversight as part of a concentrated attempt to ensure the continued protection of American citizens. Also, the global economic recession beginning in 2008 saw many subnational governments requesting federal assistance and a synchronized international effort to combat its effects. The future of devolution will be determined by multiple forces of complexity and interdependence, though the controlling factor will likely be security issues for nation-states and the potential for global conflict.

Dewey, John

John Dewey (1859–1952) was a leading American psychologist, philosopher, educator, and political activist. The central focus of his work is *epistemology,* or the "theory of knowledge." His seminal contributions in this area provide the inspiration for numerous movements in social and philosophical thought, including functionalist and behavioralist psychology, empiricism, naturalism, pragmatism, and humanism.

Dewey was born in Burlington, Vermont, on October 20, 1859. He completed his undergraduate studies at the University of Vermont in 1879 and received his doctorate from Johns Hopkins University in 1884, under George S. Morris, an adherent to the ideas of German philosopher Georg Wilhem Friedrich Hegel. Dewey started his career as an instructor in the philosophy department at the University of Michigan in 1884, where he joined Morris. During his nine years at Michigan (1884–1888, 1889–1894), Dewey expressed his commitment to Hegelian idealism while beginning to explore a synthesis between Hegel's idealism and experimental science.

These philosophical explorations appeared in his first two books, *Psychology* (1887), and *Leibniz's New Essays Concerning the Human Understanding* (1888). While at Michigan, Dewey also formed important professional relationships with James Hayden Tufts, with whom he would later publish *Ethics* in 1908 (revised in 1932), and a promising young scholar named George Herbert Mead.

In 1894, Dewey moved to the University of Chicago to head the department of philosophy, psychology, and pedagogy. During these years, Dewey's idealism fully gave way to an empirically based epistemology that developed in concert with a new school of thought, known as *pragmatism.* This shift coalesced in a collaborative work, entitled *Studies in Logical Theory* (1903). During this period, Dewey also founded the University Laboratory School in 1896, now famously known as the "Dewey School," which was meant to serve as a place for the development, testing, and refinement of educational theories and practices. His experience with the lab school provided the material for his first major work on education, entitled *The School and Society* (1899).

In 1904, following a controversy over the administration of the lab school, Dewey resigned from his post at Chicago and joined the Department of Philosophy at Columbia University, where he would remain for the rest of his professional career. While at Columbia, Dewey developed his theory of knowledge further, publishing important works such as *Pragmatism* (1907), *The Influence of Darwin on Philosophy and Other Essays in Contemporary Thought* (1910), and *Essays in Experimental Logic* (1916). At this point in his career, Dewey openly challenged traditional epistemologies, specifically modern rationalism, for drawing too stark a distinction between thought, the domain of knowledge, and the practical world. He argued instead for a theory of knowledge that begins with a consideration of knowledge as an adaptive human response to environmental conditions. This new approach radically challenged epistemological orthodoxy by positing thought as the product of interaction between an organism and its environment, where knowledge has a practical "instrumental value" in guiding the interaction.

In 1916, Dewey published arguably his most famous work, *Democracy and Education.* Here, Dewey applied his theory of knowledge to education by positing schooling as an extension of civil society. Based on his theory of knowledge, Dewey argued that institutions for democratic governance are not sufficient for the creation and sustainability of democratic society. Rather, for Dewey, democracy flows from the inculcation of democratic habits within the populace. Schooling, then, has an integral role to play in the formation of these habits, preparing students and children for the demands of responsible membership within the democratic community.

In addition to his enormous influence on philosophy and social science theorizing, Dewey maintained an ongoing political activism throughout his life, including involvement in women's suffrage and the unionization of teachers. From 1919 to 1921, he lectured throughout Japan and China and made numerous educational reports in Mexico, South Africa, Turkey, and Russia.

In 1937, he presided over the Commission of Inquiry into the Charges Against Leon Trotsky in the Moscow Trials. Following his retirement from active teaching in 1930, he continued to work and publish vigorously until his death.

Dexter, Lewis Anthony

Lewis Anthony Dexter (1915–1995) was a Canadian author and professor credited with producing some of the most influential books on political science and sociology of the mid-twentieth century. His particular interests were the proliferation of special-interest politics and the analysis of government and public policy as they relate to business and foreign trade.

A native of Montréal, Québec, Dexter received his undergraduate degree from the University of Chicago in 1935, a master's degree from Harvard University in 1938, and a doctorate from Columbia University in 1960. Over the span of his career, he lectured at more than thirty colleges and universities, including Harvard University, the Massachusetts Institute of Technology, and Johns Hopkins University.

Though his professorial career was undeniably illustrious, Dexter was equally prolific in his research and publications, publishing several well-received books and numerous articles on topics ranging from specialized interviewing techniques to the sociology of the American Congress. One of the books for which he is most well known is *American Business and Public Policy* (with Raymond Bauer and Ithiel Pool 1972), a study of the politics of foreign trade during the 1950s and early 1960s. It was awarded the Woodrow Wilson Foundation Award for making the most significant contribution to the field of political science for the year. In the work, Dexter and his coauthors explore the mishandling of economic determinism; seek to refute myths about how the Congress and government lobbyists operate; investigate the relationships between public opinion, interest-group politics, and the legislature; and examine the nature and processes of congressional legislation. In so doing, the authors paint a picture of American government and politics that ultimately differs substantially from that of popular belief.

Dexter is also recognized for his contributions to the social sciences in terms of his novel approach to nonstandardized elite interview techniques. In *Elite and Specialized Interviewing* (a volume in the series of *Handbooks for Research in Political Behavior,* published in 1970), Dexter offers practical advice and an analysis of specialized interviewing based on his own experiences as well an examination of the existing literature and the published and unpublished experiences of fellow social scientists. Though his treatment of the topic is practical and pragmatic and addresses topics as rudimentary as securing an interview and whom to interview first, Dexter underscores the fact that an elite interview is a social relationship and that the results emerging from the interview depend in large part on how the respondent perceives the interviewer and his or her purpose. This being the case, Dexter also emphasizes the methodological underpinning of elite interviews and stresses that respondents should be given the license essentially to structure their own information so that the definition of the issues at hand reflect those of the interviewee, not the biases of the interviewer or the interviewer's understanding of a phenomenon.

Dexter published numerous articles and other books, including *How Organizations Are Represented in Washington* (1969), *The Sociology and Politics of Congress* (1969; republished in 1981 as *Representation, Legislation, and Consequences*), and *The Tyranny of Schooling: An Inquiry into the Problem of "Stupidity"* (1964).

Dhimmi

Literally meaning "protected person," *dhimmi* is the term applied in early Islam to Christians, Jews, and others (*ahl al-kitab,* "people of the book") under Muslim rule who were subjected to various restrictions but allowed to practice their own religions and follow their own legal systems. As dhimmis generally did not serve in the military, they had to pay a special tax, the *jizyah* or poll tax. While this exemplified a kind of discrimination objectionable from a modern liberal point of view, and while over the centuries some cases of harsh treatment occurred (belying portrayals of an Islamic utopia), there is widespread agreement that dhimmis enjoyed a kind of toleration that was rare elsewhere in earlier centuries, particularly in the Christian world. In general, various religious communities preferred their status under Muslim rule

to living under any sect other than their own. The relative tolerance of the Muslim invaders of the Byzantine Empire in the seventh century was one factor in their success, as disaffected Jews and non-Greek Orthodox Christians tended to welcome or at least not resist them, while the Greek Orthodox of Constantinople in the fifteenth century preferred conquest by Muslim Turks to coming under Latin Christian rule. Christians and Jews flourished in Islamic Spain, while Jews and Muslims faced persecution and exile following the Christian reconquest.

D'Hondt Method

The *D'Hondt method* is a way of allocating parliamentary seats in a political system with a party-list system of proportional representation. The goal is to allocate seats in a manner that closely resembles the proportion of votes cast for a particular party. It was invented by the Belgium mathematician Victor D'Hondt (1841–1901) in 1878. To use this method, one does the following: (1) Award one seat to the party with the highest number of votes. (2) Calculate a new number of votes for the party just awarded a seat by dividing the number of votes cast for the party by the number of seats awarded so far plus one. (3) Award a seat for the party with the most votes after completing step 2. (4) Repeat until all seats are filled. This system can be used with a single national party list or with subnational multimember constituencies, and with either a closed or an open list system. It is used (with some variations on thresholds for winning seats) by over twenty countries, including Austria, Argentina, the Czech Republic, Finland, the Netherlands, Poland, and Turkey.

Dialectical Materialism

Dialectical materialism is the name given (later, by others) to Karl Marx's method of analyzing history, which combined Hegelian dialectics with a materialist ontology. In dialectics, historical periods are considered to be driven by tension between opposing forces, sometimes referred to as *thesis* and *antithesis.* This tension resolves into a new force (the synthesis), which then defines a new period and arouses its own opposing force. For Georg Hegel, these forces are ideas; for Marx, however, they are material phenomena: opposing social classes, productive forces, and nature.

Marx used this method in *The Communist Manifesto, The Eighteenth Brumaire, Critique of the Gotha Program,* and other works, but more commonly, it is simply an underlying framework that informs Marx's analysis of particular situations. Marx never reduces dialectics to a formula and rarely resorts to the technical vocabulary of "thesis." However, in the hands of Marx's followers—notably Friedrich Engels, Joseph Stalin, and Mao Zedong—the method developed into a formula, then a

dogma, and, ultimately, into a specialized language with which political debates could be conducted and policies could be justified. Engels also claimed that the method applied to the natural sciences as well as to history. This claim has generally been accepted by orthodox Marxists of the Soviet school, though never applied very successfully to actual scientific problems.

The most characteristic use of dialectical materialism was to portray history as a succession of modes of production, each giving rise to the next as its internal contradictions were played out. Primitive communism, in which all shared both work and proceeds, gave rise to ancient society, in which masses of agricultural slaves supported patrician masters. A combination of slave revolts and barbarian invasions produced feudalism; the serfs had more rights than slaves but were exploited in new ways through rents in labor, in kind, and in money. As serfs resisted and fled to towns, the new capitalist era arose, in which free laborers were forced to sell their labor power to capitalists, because they had no other way to survive. Marx believed that the capitalist working class, or *proletariat,* would in turn overthrow capitalism. This time, however, there would be no one left to exploit, and the result would be a classless society, or *socialism*. The sense that socialism was the inevitable result of history, as shown by the science of dialectical materialism, made an important contribution to the popularity of socialism in nineteenth-century Europe.

At each stage of this historical progression, the basic relationship was economic—between a class that did the labor and created value and a class that controlled and exploited such individuals. Each mode of production also had its characteristic political organizations and ways of thinking, but these were ultimately determined by the fundamental economic relationships. This attribution of a determining role to economics was what made the dialectics materialist.

By the time Mao published *On Contradiction,* a pamphlet designed to be used as an introduction to Marxist methods, dialectical materialism had become a formula, according to which the key to successful socialist strategy was to identify the principal contradiction—that is, the two main social forces in conflict—and the principal aspect or dominant force of that contradiction. Dogmatic application of this method had particularly unfortunate results for women and for racial and ethnic minorities both within the socialist bloc and in socialist movements in the capitalist world. The orthodox Marxist position was that gender, race, and ethnicity were secondary contradictions within the working class; in practice, that meant that oppression based on gender and race was ignored in the quest for working-class unity. Similarly, the primacy of the leadership of the Soviet Union within the world socialist movement was justified by the claim that the principal contradiction of the post–World War II (1935–1945) world was between that imperialism and socialism.

As the unity of the Soviet bloc began to unravel following Khrushchev's secret speech of 1956, the Sino-Soviet split, and the Cuban revolution, the orthodoxy of dialectical materialism also began to be challenged, most notably by French communist philosopher Louis Althusser, who argued that economics,

politics, and ideology were relatively autonomous from each other. The subsequent collapse of the Soviet Union by the early 1990s and the restoration of capitalism in most of the formerly socialist countries shortly after greatly reduced the practical relevance of dialectical materialism in world affairs. However, it continues to inspire study, debate, and insight among large portions of the left intellectual world.

Diasporas

The term *diaspora* comes from the ancient Greek διασπορ ("scattering of seeds"), and in its common usage it refers to the process of dispersion of a religious or ethnic community from the original homeland.

EXAMPLES

Classical examples are the Jewish, Greek, and Armenian communities, often referred to as ideal types of diasporic communities. More recently other groups, ethnic (Irish, Italians, Koreans, Chinese) and nonethnic (African Americans), have been referred to as diasporas. In addition, because the term now tends to share meaning with cognate groups ranging from immigrants to refugees and from guest workers to ethnic communities, the world has truly witnessed a proliferation of diasporas. A key problem arising from the increasingly loose use of the term is, according to Rogers Brubaker in his 2005 article "The 'Diaspora' Diaspora," its "dispersion . . . in semantic, conceptual and disciplinary space." The conceptual overstretching implies that if everything—all sorts of communities more or less dispersed—become diasporas, then nothing is distinctively so. The term therefore loses its discriminating power, making it impossible to distinguish diasporic from nondiasporic communities, (im)migrants *in primis.*

CONCEPTUALIZATIONS

Conceptualizations of diasporas can be divided into two broad approaches. On the one hand are those, such as political scientists William Safran (1991) and Gabriel Sheffer (2003), who think of diasporas in a more classical sense, as communities or "bounded entities." Here diasporas can be seen as groups,

and therefore identified, even counted with some degree of precision. A diaspora can be defined, according to Yossi Shain and Aharon Barth in *Diasporas and International Relations Theory* (2003, 452) as "a people with a common origin who reside, more or less on a permanent basis, outside the borders of their ethnic or religious homeland, whether that homeland is real or symbolic, independent or under foreign control."

On the other hand are those that take an antiessentialist approach to the concept. Diaspora becomes an idiom, a stance, a category of practice more than a category of analysis. This does not render the term irrelevant but focuses on the importance and the political consequences of the articulation of an identity as diasporic. In other terms, diasporas matter because of what they do or what is done in their name, rather than because of what they (allegedly) are.

What emerges from the juxtaposition of the two definitions above is a diversity in the approaches to the study of diasporas. The heterogeneity of approaches should not surprise, given the multidisciplinarity of diaspora studies where the fields of enquiry—political science, sociology, and anthropology—are attentive to the evolution of the concept and the study of its empirical manifestations.

The divide in the scholarship between an essentialist and antiessentialist field is also reflected in the way in which the definition of the term is approached. The classical definition of *diaspora* comes from Safran; a community can be referred to as a diaspora if it presents the following six features: history of dispersal, myths/memories of the homeland, alienation in the host country, desire for eventual return, ongoing support of the homeland; and a collective identity defined by this relationship (1991, 83–84). A more recent attempt to redefine the concept in searching for its distinctive features comes from Brubaker, who indicates three core elements as constitutive of diasporas (2005, 5): the experience of dispersion, forced and nonforced; orientation toward a real or imagined homeland, which remains the source of loyalty and values; and boundary maintenance, that is, the preservation of a distinctive identity vis-à-vis the host society.

Even the three criteria above have been subject to heated scholarly debate. The importance of dispersion as a defining dimension of the diasporic experience has been questioned. Originally, diasporas were communities that emerged out of a forced dispersion. While dispersion and the memory thereof still remain central to diasporic identities, two new aspects have enriched the debate. First, dispersion may not necessarily have a traumatic or even forced origin, and second, as a result of the reconfiguration of political spaces in postcommunist Eurasia, dispersion may not only be the result of the movement of peoples across borders, but also the consequence of the movement of borders across settlements—the Russian-speaking communities in the former Soviet space being a clear illustration of this new type of dispersion.

In addition, the very relationship with the homeland has started to be called into question. Homeland orientation (in terms of the memory of the dispersion or the commitment to return) dominated classical definitions of diasporas.

Homeland remained the ultimate source of identity. Diasporas were homeland-centered communities. Especially on the wave of contributions coming from postmodernism, the salience of homeland orientation has been overcome by an approach that critiques the "teleology of return," thus decentering diasporas.

Finally, a strong current in cultural studies has shifted the emphasis from boundary maintenance to boundary erosion. Drawing from the literature on transnationalism, concepts such as fluidity, creority, hybridity, and hyphenated identities have gained ground in diaspora studies, pointing to the creation by and within diasporic communities of nonexclusive forms of communities, identities, and politics. This clearly stands in stark contrast to those arguing that boundaries between the community and the host society are essential for ensuring the preservation of the identity of a collectivity.

CONCLUSION

In terms of the substantive focus of diaspora studies, attention has been paid to various aspects of collective identity transformation; the maintenance of ties with the homeland and the adaptation to the host society; the economic significance of transnational networks (including remittances); and the impact of diasporas on both home and host countries' politics, especially with regard to their influence on foreign policy conduct.

Dicey, Albert Venn

Albert Venn Dicey (1835–1922) was an English constitutional lawyer and ideologue of unionism. Dicey was born in the English midlands and educated at Oxford, where he became a senior law professor in 1882 and remained for the rest of his life. He is known in political science especially for his *Introduction to the Study of the Law of the Constitution* (1885). It went through eight editions in his lifetime, the last with a long introduction relating his constitutional theory to his ideology. Later editions, without the controversial introduction, served as a constitutional law text for law students in the United Kingdom until very recently. In the most important U.K.

constitutional law case of recent times, the judges called him "our greatest constitutional lawyer."

Dicey's two normative principles were expressed as the "rule of law" and "parliamentary sovereignty." The rule of law meant that everybody without exception was subject to the jurisdiction of the ordinary courts and could not be punished except after due process in those courts; furthermore, liberty of speech and assembly was protected by the common law rather than by constitutional entrenchment. Parliamentary sovereignty meant that "Parliament . . . has, under the English constitution, the right to make or unmake any law whatever." From this it followed that the only thing a parliament could not do was bind its successor, because that would "fetter" the future Parliament's ability to exercise its sovereignty.

It is not easy to reconcile Dicey's two principles. The U.K. Parliament could pass a retrospective law. Unlike the U.S. Congress, it is not constitutionally barred from doing so. In that case, Dicey's two principles are incompatible. Also, when the principle of parliamentary sovereignty came to contradict Dicey's ideology, he kept the ideology and jettisoned the principle. Such is English constitutional lawyers' reverence for Dicey that they do not generally accept that his arguments are mutually contradictory.

Dicey was a fervent defender of the union of the United Kingdom. The state was created by the Acts of Union of 1707 and 1800. The first of these added Scotland and the second Ireland to the kingdom. By Dicey's time, the Scottish union was legitimate in Scotland, but the Irish union was illegitimate in most of Ireland. The Irish Party, which had pledged to weaken the Irish union, held a bloc of over 80 seats in the House of Commons and was pivotal in four of the seven parliaments between 1885 and 1918. For Dicey and other ideologues, to weaken the union was to weaken the British empire; therefore, Ireland must be retained at all costs. This violated the principle of parliamentary sovereignty, as Parliament could perfectly properly repeal the 1800 union. Dicey devoted all his energies to blocking that and encouraged the paramilitary revolt in the Protestant parts of Northern Ireland that blocked the enactment of Irish Home Rule between 1912 and 1914. A resolution of Northern Ireland's constitutional status was not reached until the Belfast (Good Friday) Agreement of 1998.

Dictatorship

See *Autocracy.*

Dictatorship of the Proletariat

The *dictatorship of the proletariat* is a key concept in Marxist political theory, in which the state is seen as an institution for class rule, a "dictatorship" of one social class over another. In the course of fighting for socialism, the working class must overthrow and destroy the existing capitalist state and replace it with an instrument for working-class rule—the dictatorship of the proletariat—organized on a radically different basis.

At an early stage in their thinking, Karl Marx and Friedrich Engels formulated the view that the working class would be driven by capitalist exploitation to take state power and implement communist measures: "The proletariat will use its political supremacy to wrest, by degree, all capital from the bourgeoisie, to centralize all instruments of production in the hands of the State, i.e., of the proletariat organized as the ruling class . . ." (*The Communist Manifesto*).

This idea became refined during their observation of the revolutions of 1848, especially in France. Marx developed a highly critical view of the French state, which he saw as a parasitic, military-bureaucratic force, drawing the conclusion that the working class would have to destroy the existing state and create a wholly new form of state structure. His first use of the term "dictatorship of the proletariat" came in 1850 in *The Class Struggles in France,* when he referred to "the class dictatorship of the proletariat as a necessary intermediate point on the path towards the abolition of class differences in general."(Marx 1973, 122)

Marx elaborated on this idea after witnessing the Paris Commune of 1871, which he described as "the political form at last discovered under which to work out the economical emancipation of labor" (Marx 1992). For Marx, the key institutional innovations of the Paris Commune were its abolition of the standing army and its replacement by a popular militia, the assumption of strict control over the police and state officials, and its adoption of measures designed to ensure a close connection between elected representatives and their constituents. Marx's vision of the dictatorship of the proletariat was thus of a state that was a genuine "servant of the people," minimizing repression and bureaucracy, and preparing for the eventual "withering away of the state."

The concept receded into the background in the latter part of the nineteenth century as socialist organizations like the German Social Democratic Party pursued power through electoral means. Those on the right of the movement, like Eduard Bernstein, advocated abandoning it; while those in the centre, like Karl Kautsky, sought to redefine it in a way that made it compatible with a parliamentary discourse. However as political differences within European socialism exploded with the unfolding of World War I (1914–1918), the Russian socialist leader Lenin raised the dictatorship of the proletariat as a point of differentiation between revolutionary socialists and "opportunists," and as a central focus for revolutionary strategy in Russia.

In *State and Revolution,* written on the eve of the Bolshevik-led revolution of October 1917, Lenin emphasized the need to smash the existing state apparatus and replace it with "a state of the Commune type," identifying the soviets (workers' and soldiers' councils) with such a state. After the Bolshevik seizure of power, Lenin used this argument to justify the dismissal of the elected Constituent Assembly, in favor of rule by the soviets. The first Soviet Constitution of 1918 defined the state as "the dictatorship of the urban and rural proletariat and the poorest peasantry," and gave this practical effect by providing for a soviet form of government (with an indirectly elected legislature) and by excluding from the electorate those not engaged in "socially useful labor." The notion of a proletarian "dictatorship" was invoked by the Bolsheviks to legitimate authoritarian treatment of their opponents, and later it provided Stalin with an ideological framework for constructing a permanent regime of repression.

In a sharp exchange with Lenin in 1918, Kautsky argued that the concept should be seen as referring not to a form of government but merely "a condition which necessarily arose in a real democracy, because of the overwhelming numbers of the proletariat."

After World War II (1939–1945), the concept became increasingly marginalized within communist discourse. The Eastern European states created under the influence of the Soviet Union were defined as "people's democracies," most Western communist parties quietly dropped the term, and the Soviet Union redefined itself as a "socialist state of the whole people" in 1977.

Diderot, Denis

Denis Diderot (1713–1784) was a leading *philosophe* and the chief editor of the great monument of the French Enlightenment, *L'Encyclopedie.* A man of letters of extraordinary breadth—philosopher, novelist, dramatist, polemicist, critic,

translator, and prolific correspondent—he was perhaps most famous for his vigorous criticism of the Catholic Church and France's *ancien régime.*

Diderot was born in Langres, France, and he received a Jesuit education. He refused to join the clergy, however, and turned instead to his own philosophical and literary studies. In 1741 Diderot formed a close friendship with French philosopher Jean-Jacques Rousseau, which would last for over fifteen years until they broke with one another in a quarrel. Diderot first gained public notice as a translator of English books, especially his 1745 translation of Lord Shaftesbury's *Inquiry Concerning Virtue or Merit.* His first original work, *Pensées philosophiques* (1746), an anonymous collection of aphorisms that owed a good deal to Shaftesbury's ideas, was burned by the Parliament of Paris for its anti-Christian rhetoric. His *Letter on the Blind* (1749), another important work of his early career, espoused a materialist philosophy and questioned the existence of God, which led to his imprisonment for three months at Vincennes in 1749.

The chief occupation of Diderot's life was his editorship of the enormously influential *L'Encyclopedie* from 1745 to 1772. He initially undertook this project as coeditor with Jean le Rond d'Alembert, a prominent mathematician, but d'Alembert resigned in 1758 due to pressure from the authorities. Diderot saw the project through to completion on his own, evading censors and contributing several hundred articles, especially on philosophy, politics, and the industrial arts. He also procured contributions from the most famous writers of eighteenth-century France, including Rousseau, Francois-Marie Voltaire, and Charles-Louis Montesquieu. The work, which ultimately included seventeen volumes of text and eleven more of illustrations, aimed to collect and disseminate the achievements of human learning in all fields, practical and theoretical. It served as a crucial means of promoting progressive ideas; criticizing the injustices of France's legal and clerical institutions; and supporting secularism, religious toleration, limited government, commerce, the advancement of science and technology, and the freedom of inquiry and expression.

Diderot's editorship of *L'Encyclopedie* did not prevent him from composing several works of his own during these years, including a number of satirical but weighty dialogues such as *Rameau's Nephew* (1762), *D'Alembert's Dream* (1769), and *Jacques the Fatalist* (1773), all of which remained unpublished until after his death. His *Supplement to Bougainville's Voyage* (1771) extolled the religious and sexual freedom found in Tahiti and is often read as an indictment of slavery and colonialism, as are his contributions to Guillaume-Thomas (the Abbé) Raynal's *History of the Two Indies* (1772). None of Diderot's works brought him much monetary profit, and hence he frequently faced financial difficulties until 1765, when he began to receive generous financial support from Catherine II of Russia. In 1773–1774 he traveled to St. Petersburg to thank her personally and to plan the creation of a Russian university, but he returned to France rather disillusioned with the possibilities of "enlightened despotism." Diderot's perennially poor health continued to deteriorate over the next decade, and he died in

Paris, widely acknowledged as one of the pivotal thinkers of the Enlightenment.

Digital Democracy

Digital democracy is one of many terms used to describe the use of information and communication technologies (ICTs) to facilitate and enhance engagement between citizens and government. *E-democracy* and *cyber-democracy* are also commonly used to refer to the same phenomenon. Much of the literature stems from concern over declining levels of voter turnout in many democratic countries. ICTs are seen as a means of reconnecting citizens with their representatives by making government more transparent and accountable and thus inspiring participation.

The link between technology and democracy is not new. In the 1940s, futurist Buckminster Fuller discussed the potential of the telephone as way for people to participate in referendums. Later, in his 1992 bid for the American presidency, Ross Perot advocated the combined use of telephones and television to conduct "electronic town halls" to give people a direct voice in policy development.

TWO VIEWS: THE TECHO-OPTIMISTS AND SKEPTICS

Today, the literature on digital democracy emphasizes Internet technologies. Much of the work, particularly the early literature, is somewhat dichotomous, reflecting utopian and dystopian views. The utopian or optimistic view sees ICTs as the solution to the problems facing modern democracies. Some go so far as to suggest that the technology has the potential to revive Athenian-style direct democracy, questioning the relevance of elected representatives at a time where decisions can be registered easily and quickly from a distance. Other optimists see advantages and improvements to be made to existing structures of representative government where technologies such as email, direct chat, and social networking sites such as Facebook and MySpace provide for an easy direct connection between representatives and the represented.

The dystopian or skeptical view on the other hand does not believe the technology will have a positive impact. Some worry that it might have the opposite effect, harming democracy. Political theorist Benjamin Barber, for example, questions whether the speed associated with ICTs is conducive to democracy, which requires careful deliberation and negotiation. The speed of technology is thought to prompt reaction over

thoughtful dialogue. The anonymous nature of many ICTs may make some more comfortable to become engaged but also may encourage some to drop the civility and accountability associated with face-to-face debate. Some skeptics also point to the *digital divide,* or inequalities in access and ability to use ICTs, as a fundamental problem for digital democracy. However, there have been a number of efforts to bridge the digital divide and to ensure that all citizens have some sort of access to ICTs and the ability to use them.

CONTEMPORARY STUDIES: QUESTIONING THE SIGNIFICANCE OF ICTS

Much of the current work however, has moved beyond this divide and has become increasingly involved in identifying the democratic potential of ICTs, while at the same time questioning their significance and their potential for harm within the confines of existing structures of representative government. Some of the literature examines the ways that legislatures are using technology to engage with citizens, whereas some focuses specifically on the efforts of individual members of parliament and political parties.

Electronic consultations are one of the means used to try to draw people into the policy process that have received attention. The consultations on the U.K. Draft Communications Bill in 2002 are a relatively early and good example. The consultations received a lot of attention and commentary, and policy makers were briefed about the issues being raised online. However, some studies have shown that policy makers are unsure of how to incorporate and make use of the feedback that is received electronically. This can be problematic, as Stephen Coleman and John Gøtze caution in their 2001 book *Bowling Together: Online Engagement in Policy Deliberation:* "Governments should not offer online consultation as a gimmick: They must be committed to integrating evidence gathered into the policy process and being responsive." This warning can be applied to other online efforts to engage citizens as well as people who may be reluctant to engage in future digital democracy initiatives if they do not feel they are being heard.

E-consultations are not yet commonplace, and the wider literature on the use of ICTs for citizen engagement indicates that we are just starting to see the incorporation of such interactive features. Most individual representatives and legislatures, for example, have a basic online presence in the form of a Web site, but relatively few include interactive technologies such as polls, surveys, or blogs.

CITIZEN ACTION

It should be noted that digital democracy does not refer just to the attempts by government to connect with citizenry. It also includes citizens' use of technology to become further engaged. A growing body of literature on cyberactivism discusses such use. (An example is Martha McCaughey and Michael Ayers' 2003 book, *Cyberactivism: Online Activism in Theory and Practice.*) Interest groups are increasingly using ICTs to raise awareness and to attract members. Letter-writing campaigns have been made quicker and easier with prewritten text and the addresses

of public officials more readily available. Coordinating group action is simplified, as studies regarding the "battle in Seattle" (the 1999 gathering to protest at a meeting of the World Trade Organization) and other events have shown.

"DIGITAL" DEMOCRACY?

Some argue that while the Internet does have the potential to facilitate the type of citizen engagement discussed above, the persons keen to make use of such new means of participation are those who would be politically active in the offline environment. In this sense, it is argued, little has changed, and techno-optimists are in effect preaching to the converted. There is still considerable debate over the significance and utility of various ICTs when it comes to the improvement of democracy. However, it is clear that cyberactivism is becoming increasingly common. Legislatures, political parties, and individual representatives are moving toward the adoption of ICTs, and most now have some sort of a basic online presence. Being "digital" is becoming the norm, so much so that some question the relevance of differentiating "digital democracy" from simply "democracy." However, the Internet does pose some unique challenges. Removing geographic barriers for example, does facilitate activism, but representative politics is still very much geographically based, and many representatives find it a challenge to keep up with the growing correspondence being received from both within and outside of their constituencies. Learning how to best incorporate feedback received from citizens electronically also makes digital democracy somewhat unique, and it will continue to be a topic of interest for those interested in the state of representative democracy.

Diplomacy

Diplomacy is conventionally understood to be the practice by which states represent themselves and their interests to one another. However, because something like diplomacy clearly predates the modern European system of states, because other actors in addition to states are increasingly said to engage in

diplomacy, and because, as Hedley Bull notes, most of us have a notion of what it means for people to act diplomatically in everyday life, the exclusive association of diplomacy with the relations of states is untenable and becoming increasingly so.

Answers to the questions "What is diplomacy?" and "Who may properly be said to conduct it?" vary over time and across space. Diplomacy is defined neither by the types of actors on behalf of which it is undertaken nor the status of those actors vis-à-vis one another in the sense of their being sovereign and equal. What all instances of it seem to presume and affirm, however, are the following four assumptions:

- That people live in groups that regard themselves as separate from, yet needing or wanting relations with, one another;
- That these relations are somehow distinctive and different from relations within groups, in that people believe themselves to be under fewer obligations to those whom they regard as others;
- That these relations require careful handling by specialists; and
- That these specialists develop a measure of solidarity from their common experience.

Where these four assumptions are in play, we find relations that we would recognize as diplomacy.

PRESTATE DIPLOMACY

Accounts of diplomacy often imagine its origins in encounters between prehistoric groups of human beings. The accuracy of these efforts is doubtful. Nevertheless, they highlight the problems posed by the presence of strangers in a community and the development of what we would recognize as notions of immunity to address this problem. There seems to be a near-universal value that strangers carrying messages between communities should be protected and well treated, even when relations with those who sent them are not good. The Amarna tablets contain an archive of messages that were sent to Pharaohs Amenophis III and Akhenaten in the fourteenth century BCE from the leaders of their clients in the Levant and from the rival great kings of Babylonia, Assyria, Hatti, and Mitanni. The correspondence deals with attempts to arrange marriages, the exchange of gifts, visits of senior advisors, and appeals for help.

Diplomacy's relationship with commerce is highlighted by the fact that missions traveled along caravan routes. We get

intimations of the importance of prestige and intelligence but less sense of a system of continuous relations incorporating shared values. Diplomacy also can be seen in some of the great religious texts; for example, the Assyrian use of Hebrew, rather than Aramaic—then the language of diplomatic intercourse—in a parlay so that the inhabitants of Jerusalem might hear their fate debated (2 Kings 1:6–7). More recent diplomacy can be read of in the Koran, and between it and the Biblical example above, extensive evidence and records exist of relations between peoples of the ancient empires of the Middle East, South Asia, and East Asia. These accounts culminate in the Greek experience, plural in character and interesting, with its use of locals (*proxenos*) to represent other cities and the rarity of representatives with plenipotentiary negotiating powers. Rome and China are presented as less interesting because of universal ambitions and self-preoccupations that are said to be inimical to both diplomacy and their own well-being.

DIPLOMACY OF STATES

Contemporary developments have rekindled interest in the diplomacy of the ancient world. Nevertheless, the story of states and what is confusingly called *modern, classical, traditional,* or *old* diplomacy remains central to the story of diplomacy as a whole. This began to emerge in fifteenth-century Italy with the decline of the empire's and the papacy's secular power and flourished in eighteenth-century Europe before spreading, while mutating, to the rest of the world. The story is dominated by questions about who is to be represented, how, and with what sort of problems for those representing them. The answer, that it should be sovereigns, and increasingly sovereign states, was more asserted than argued. The sense that it could be something bigger than states receded into a concern with peace and the dilemma presented when sovereigns asked their servants to threaten the latter. This gave rise to a literature on the qualities required by those representing sovereigns, the art of negotiation, and the conditions in which diplomats might be most effective.

The value of this literature has been doubted as anachronistic in its focus on the conduct of gentlemen at court, platitudinous in its appeal to common virtues, and ingenuous in suggesting these virtues actually prevail in effective diplomacy. There is something to all these criticisms, as there is to the rejoinders that "tact and intelligence" remain important, and many contemporary insights, for example on the importance of "ripeness" or body language in negotiations, are not new. As the site of sovereignty shifted from the monarch to the state and the people, this was reflected in discussions of the qualities of diplomats. So too was the emerging sense of diplomats as a distinct class of persons with their own outlook on, requirements in, and priorities for international relations. Concerns about the immunities and privileges needed to protect the work and the reputations of individual diplomats increasingly found expression in terms of how the whole body or corps of diplomats might to be safeguarded and facilitated. By the seventeenth century, this *corps* or "freemasonry" was seen as giving expression to a European republic of shared interests and ways

of seeing the world. By the eighteenth century, the idea of *la raison de système,* serving initially as a descant to *la raison d'état* but eventually taking priority over state interests, had emerged, and it was possible to identify a system of modern European states with a corresponding diplomatic system of bilateral relations undertaken primarily through resident embassies and foreign ministries staffed by personnel animated by a sense of themselves as servants of their respective states and guardians of the society of which their states were members.

Since then, it is generally agreed that this system has been battered by a series of social and scientific revolutions and by the huge expansion of productive, destructive, and communicative capacities in which these resulted, although with consequences that are less clear. This is illustrated by the two great channels that diplomatic thinking about *la raison de système* carved out for itself. The first identified diplomacy with the balance of power. In this view, the main tasks of diplomats was to get those they represented to act with restraint—self-restraint where possible and external restraint by deterrence where necessary. This idea attracted controversy, but nothing in the great scientific and social revolutions at the turn of the eighteenth and nineteenth centuries undermined it in principle. Overstimulated and overendowed national and populist states might suffer restraints on their practical and moral ambitions from diplomats less gladly, but getting them to accept restraints remained important.

However, not all the representation, reporting, bargaining, information dissemination, and intelligence-gathering activities of diplomats can be interpreted in terms of maintaining balances of power. Diplomats always had more to do, and there was always more going on in international relations, a state of affairs made more apparent by the new material and social technologies of the nineteenth century. Sovereigns and their diplomats might travel more easily, embassies might have more and easier access to information than they had in the past, but now and increasingly, so did other people. And in so doing, they also developed a greater say in what international relations were, and ought to be, about. These changes provided impetus for the second great channel in diplomatic thinking about *la raison de système,* seeing it less as a system of states and more as one for regulating them and rendering them less harmful. The principal consequences of this were the multilateral and conference diplomacy that appeared in the nineteenth century and gathered strength after the two world wars. The European congresses of the early nineteenth century sought to improve the great powers' attempts to maintain international order on their own terms. The Hague and Geneva conventions attempted to reduce the prospect of war and its consequences. And the League of Nations and the United Nations sought first to regulate, then to reform the conduct of their members by encouraging multilateral collaboration.

Bilateral diplomacy directed at reconciling the interests of particular states was supplemented by multilateral efforts directed at seeking to ease common problems and improve the well-being of all. The growth of multilateral and conference diplomacy resulted in changes in the status of certain established

types of diplomacy and diplomats. Consular diplomacy, concerned with private citizens, attracted more resources and began to lose the secondary status it had enjoyed when compared to political work. The broadly educated "generalists" gifted at a certain kind of human relations were supplemented by experts who had a grasp of the complex technical issues that increasingly became the subjects of negotiations. And the autonomy and negotiating capacity of the resident ambassador were widely seen to decline as a result of the emergence of the telegraph, the telephone, and air travel. A profession based on information scarcity and the costliness of communications was often presented as facing existential challenges from these innovations that made information accessible, communication cheap, and travel swift.

These changes were not matched by developments in diplomatic theory. The great burst of innovative thinking in diplomacy, beginning in fifteenth-century Europe and developing over the course of the next two centuries, ended with Cardinal Richelieu's *Testament Politique* around 1688, and its practical expression was completed with the codifications of the Vienna *règlement* of 1815 and the modifications of Aix-la-Chapelle three years later. What followed may be broadly interpreted as application (in the form of diplomatic history), exposition (to aid in the training of diplomats), and refinement (in response to critics). Innovations in diplomatic theory and practice came from outside the profession. The construction of international organizations, for example, may be presented as driven by the concerns of politics and political theory with how to escape from anarchy. The concern with commercial diplomacy and economic statecraft can be rooted in the rise of political economy. The focus on how foreign policy is actually made can be traced back to research into individual and group psychology, the operations of complex organizations, and rational choice models, as these have been applied to political behavior. Most recently, attempts to create a more open and representative diplomacy have applied the insights and understandings of marketing and public relations. Diplomatic studies certainly, and diplomacy and diplomats probably, have suffered as a result. Indeed, for much of the postwar period, it was possible to maintain that all three might be in terminal decline. Since the end of the cold war, however, this state of affairs has undergone an almost complete transformation, for reasons that are both surprising and paradoxical. Somehow, as our sense that a states system provides the basic political framework of the world has weakened, interest in diplomacy, diplomats, and the study of both has revived.

DIPLOMACY BEYOND STATES

Diplomacy beyond states may be understood in two senses:

- A temporal sense in which we think of states and their diplomacy fading, and
- A conceptual sense by which we are reminded that diplomacy is not necessarily the exclusive preserve of states or professional diplomats.

Empirically grounded international relations research has develop both senses by testing conventional understandings of how social worlds are believed to work. At the system level, the expectation has been tested and confirmed that states regarded as most important will have the most diplomatic representatives from other countries in their capitals. In the study of diplomacy and foreign policy, positivist approaches have tracked and demonstrated the disaggregation of entities conventionally treated as wholes. The consequences of this kind of inquiry for our understandings of diplomacy have been impressive. We find foreign ministries do not dominate or even coordinate a country's foreign relations. Other branches of government engage in the formulation and implementation of foreign policy and employ people acting diplomatically to represent them. Governments, even understood as loose ensembles of actors and institutions, do not exercise a monopoly on the conduct of the external relations of their countries. Private actors of all sorts are also engaged. Indeed, it becomes difficult to maintain the distinction between internal and external worlds on which the idea of international relations depends.

Investigators have not been sure what to do with these sorts of discoveries. Traditionalists insist that they are the product of category confusions. One cannot get closer to understanding how diplomacy operates as a meaningful social action by tracing behavioral patterns with greater precision. To say diplomats do not actually represent their states or sovereigns in the sense of standing in place of them is to misunderstand the nature of representation. Social worlds cohere despite evidence and knowledge that undermine the assumptions on which they rest, but we are still stuck with knowing that how things appear is not the full story. An alternative to the traditionalist reluctance to accept empirical evidence, therefore, is to use positivist approaches as a basis for critique and prescription. Thus, research has looked at why traditional institutions of diplomacy have been losing influence and why traditional diplomatic activities have become less effective, and it offers advice about how diplomats might become more effective by shifting, for example, from being communicators of positions and policies to becoming the instigators of coalitions of different people seeking to advance shared interests. Such approaches have great practical value but court inconsistencies, especially when governments apply the disaggregative insight to diplomats of other countries but not to their own diplomats and those diplomats' claims to act on behalf of their countries.

Paradoxically, given diplomacy's conventional identification as a conservative and even reactionary social practice, post-positivist approaches have shown the most promise of innovation in diplomatic theory by unhitching it from state practices and exploring what people in different times and places have understood to be diplomacy. The thrust of these arguments can be critical, focusing on the alienation, estrangement, and exploitation that diplomacy may be implicated in reproducing. It can be emancipatory, emphasizing the virtues of conventional diplomatic attributes like ambiguity and imagination for improving human relations. And it can be whimsical, examining the more banal and human aspects of diplomatic life to demonstrate the tyrannies of circumscribed thought and

action that closed and archaic social structures can impose upon those trapped within them. These approaches have introduced diplomatic studies to the constructivist and constitutive approaches to explanation and understanding in the broader field of international relations. They have also demonstrated how modes of thought associated with diplomats and diplomacy can enrich our accounts of international and social realities in general. Diplomats have long been familiar with the extent to which social realities are constructed, in the sense of being produced and reproduced with varying degrees of self-consciousness by the ways in which people live and the necessarily ambiguous consequences of this being so.

Far from fading, therefore, at a time of great change, we should expect diplomats, diplomacy, and diplomatic theory to prosper as new constellations of actors and new identities seek to establish the terms of their own existence and recognition of them as such, just as they did in fifteenth-century Europe. This is illustrated by the emergence of the "new public diplomacy." Previously regarded as poor diplomacy of low standing or propaganda, because it violates the principle of nonintervention, public diplomacy in its "new" iteration is presented as reempowering everybody (including states) and transforming international relations into a genuine dialogue of peoples and people. A major research effort has developed, with the funding to support it, exploring how to make public diplomacy more effective and evaluate it. The enthusiasm for this effort is prompted by the need for economic competitiveness and the need to manage the cultural and civilizational dislocations engendered by globalization, especially since the 9/11 attacks on the United States. In America in particular, agencies like the U.S. Advisory Commission on Public Diplomacy (www.state.gov/r/adcompd/) and the U.S. Information Agency/U.S. Public Diplomacy Office (http://dosfan.lib.uic.edu/usia/) have been strengthened to address this latter challenge. The success of the campaigns to ban landmines, to press banks to provide debt relief for poor countries, and to persuade others to reduce the carbon footprints of their economies demonstrate elements of a global civil society already talking to one another and acting to make their own contribution to what happens in international relations. "Outsiders," as traditionalists point out, may have always been engaged so. What is novel and important, however, is the high importance attached to these activities by nearly everyone in the study of diplomacy.

Ever since Burke anglicized the term *diplomatique* in 1796, diplomacy has been a practice characterized by oppositions: universal yet specialized, commonsense yet esoteric, in decline yet in short supply, admired yet distrusted, and important yet neglected. In one sense, it involves representations to one another of collective identities that are necessarily ambiguous. In another, it merely refers to the state of affairs that arises between people who wish to live separately and maintain their own identities but who want or believe they must have relations with each other. Either way, general interest in diplomacy, diplomats, and how to act diplomatically always increases when, as now, the tensions between the pluralist and solidarist aspirations of human beings, on the one hand, and

the pluralist and solidarist demands of the ways they actually live, on the other, weigh heavily upon them.

Direct Democracy

The term *democracy* is derived from two Greek words (*dêmos* and *kratein*) meaning "power of the people." The most common form of democracy is an indirect democracy or republic in which unassembled voters are confined to examining the qualifications of candidates and casting ballots to elect officers to represent the citizenry, and occasionally to decide referendums questions. Direct democracy is viewed in theory as the most democratic form, as voters in an assembly make all political decisions.

Direct democracy dates to the age of Pericles in fifth-century BCE Athens in present-day Greece. A number of philosophers at the time, expressed fear that a citizen legislative assembly would develop into mob rule, and some, such as Plato, favored rule by philosophers. In contrast, Pericles viewed the citizen assembly as limiting the power of the government, thereby providing for individual freedoms.

Direct democracy was revived in the *Landsgemeinde* in Canton Appenzell in Switzerland in 1378. Subsequently, the canton split into two half-cantons. Today, this form of direct democracy is found only in the Swiss canton of Glarus, the half-canton of Appenzell Innerrhoden, and in New England open town meetings and school district meetings in the United States. The early Athens meetings occurred in a sovereign city-state in contrast to the meetings in Swiss cantons and contemporary New England towns and districts with open meetings.

An important form of direct democracy employed in many nations in modern times is the referendum, which allows unassembled voters to make certain political decisions and assumes many forms. In the Republic of Ireland, for example, the national parliament or the president, with the approval of the Council of State, may place questions on the referendum ballot. In other places, such as the State of New York, certain questions automatically appear on the ballot periodically in accordance with constitutional requirements. Voters in certain jurisdictions in Switzerland, in twenty-four U.S. states, and in numerous municipal governments in the United States may use initiative petitions to place on the referendum ballot policy propositions and proposals to repeal recently enacted laws. Eighteen state constitutions and numerous local government charters in the United States authorize voters to place proposals to remove elected officers from office on the referendum ballot.

THE NEW ENGLAND TOWN MEETING

The New England Town meeting, a form of decision making by assembled voters, serves as the hallmark of democracy in the United States and dates to the early 1630s, following the settlement of the present-day Boston area by the Massachusetts Bay Company, a joint stock commercial company chartered by the British Crown in 1629.

The Puritans, persons of wealth who sought to purify the Church of England of Roman Catholic features, emigrated to Massachusetts Bay to establish a new commonwealth. The colony was governed in accordance with the Crown charter providing for a governor, deputy governor, and eighteen assistants empowered to hold a General Court, admit freemen, elect officers, and enact laws governing the colony. Freemen were the original male settlers and later included men admitted as freemen by the General Court, provided they were members of the church (Congregational). They constituted a small percentage of the adult male population. The charter contains no provision for town meetings, and the General Court did not authorize the first ones.

A *folkmoot,* an extralegal and informal assemblage of freemen, made decisions on town matters including construction of a church, employment of a minister, admission of new residents, land divisions, and other essential matters. This early noninstitutionalized stage of town meeting government functioned without elected town officers, and meetings were held as needed.

Residents soon discovered the town meeting needed to be supplemented by officers. The emergence of selectmen, the plural executive, and other officers resulted in less-frequent town meetings, and in most towns only an annual meeting was held to elect officers, levy taxes and appropriate funds, and act on proposed bylaws.

THEORIES OF ORIGIN

Late nineteenth-century historians engaged in disputes relative to whether the Massachusetts Bay town was indigenous in origin, a descendant of the ancient Anglo-Saxon *tun,* or derived from English institutions adapted to conditions in the New World. Evidence is lacking to support the theory that the town developed spontaneously as a new political institution. There are certain similarities between a town meeting and the primordial field meeting of farmers in southern Germany to distribute land and regulate crops with village

elders as the forerunners of the town constable and selectmen. Stronger evidence supports the third theory, as there are a number of similarities between town meeting government and churches in England, including vestry meetings of parishioners to make decisions relative to supporting the church and to elect churchwardens, who were in charge of church property. The Charlestown records of 1630 note the Court of Assistants appointed justices of the peace with "like power that justices of the peace hath in England." Direct democracy in the form of the town meeting emerged shortly after the founding of the first towns.

PROCEDURES OF OPEN TOWN MEETINGS
Today, the selectpersons call the annual and special town meetings by issuing a warrant, a fixed agenda, warning citizens a town meeting will be held on a specified date and hour to act upon warrant articles. Voters by petition may add articles to the warrant, elect town officers, and act on articles. The moderator, who may be elected at the start of the meeting or for a term of one to three years, is in charge of proceedings, decides points of law, and declares all votes. The moderator's duties are established by statute and bylaws. The latter may include a quorum requirement.

Articles normally are considered in the order listed in the warrant. A motion is made and seconded prior to debate. Amendments to articles may be proposed, seconded, and decided. The finance committee and the planning board play important roles in providing guidance to attendees.

Attendance depends in part on the presence of controversial warrant articles and in part on the size of the town, with a generally inverse relationship between the attendance percentage and the population size. There has been a secular decline in attendance by registered voters in all but the very small towns, and participation may be lower than 10 percent in towns with large populations. This decline has led a number of the larger towns, commencing in Boston in 1822, to adopt city charters or modify the town meeting.

MODIFICATIONS
The open town meeting generally is entrenched in small towns, but since 1822 has been replaced by a city charter, a town charter providing for a mayor and a council, a representative town meeting (RTM) or limited town meeting, or a referendum town meeting when the population has reached a point that makes it impossible to conduct an efficient town meeting.

Brookline, Massachusetts, had experienced a large increase in population by the early part of the twentieth century that created problems in conducting meetings, yet the town desired to keep the meeting format. Alfred D. Chandler developed the RTM and persuaded the General Court to authorize its adoption by Brookline voters in 1915. The only change in the traditional meeting is the confining of the right to vote at town meetings to elected town meeting members; all other citizens may attend and speak. Forty-one other Massachusetts towns, nine Connecticut towns, one town in Maine, and one town in Vermont have adopted the RTM.

Sixty-eight Vermont and fifty-three New Hampshire towns have adopted the referendum town meeting, where voters go to the polls to act on the warrant. In theory, this meeting type should increase voter participation, but the change has increased voter participation only to a limited extent in most towns. Voter turnout averages approximately 29 percent.

THE REFERENDUM
The referendum activates the key of democratic theory—that sovereign authority resides in the unassembled electorate. The referendum dates to the *Landsgemeinde* in Switzerland in the fifteenth century, and it allows national, state, regional, and local voters to provide advice to officers or to make policy decisions at the polls. The referendum in the United States can be viewed as an extension of the town meeting and was first employed in the Massachusetts Bay Colony in 1640. Today, the referendum is used in many nations to amend the national constitution and regional or state constitutions in federal nations, and to make certain other decisions, such as whether the Republic of Ireland should ratify a European Union treaty and whether the term limit on the office of president of Venezuela should be removed. Some parliamentary democracies decided all decisions should to be made by the government (cabinet). The United Kingdom historically followed this policy, but more recently it has allowed referendums in Scotland and Wales.

Referendum questions may be placed on the general election ballot or on a special election ballot (1) by the legislature, (2) automatically at periodic specified times, and (3) by the initiative that permits the electorate by petition to place a question on the ballot. The recall, a type of referendum, allows voters by petition to place on the ballot the question of the removal from office of an elected officer prior to the expiration of the term of office.

Referendums are classified as follows:

- A *constitutional referendum* involves a new constitution or an amendment.
- A *statutory referendum* involves a proposed law.
- An *acceptance referendum* allows local government voters to decide whether to adopt a state law.
- An *automatic referendum* question appears on the referendum ballot at specific times.
- A *mandatory referendum* must be held to initiate an action such as the borrowing of funds.
- A *market basket referendum* provides voters with a choice of one of several local government charters.
- An *opt-out referendum* allows local voters to opt out of a state law.
- A *protest referendum* authorizes voters by petition to suspend a recently enacted law until a referendum is held on the question of its repeal.

Proponents of referendums are convinced the voters will make superior decisions on issues (compared to a legislature beholden to special interests), facilitate governmental reform, make elected officers more responsive to the wishes of the

people, promote voter interest in public affairs by reducing alienation, and educate citizens. Opponents argue that referendums weaken representative democracy and may lead to tyranny of the majority. According to the opponents, problems are as follows:

- Many voters are uninformed and overburdened by the number of questions and officers to be elected.
- The process may produce a long ballot and voter fatigue.
- A small minority often decides the issue.
- Special interest groups can repeal laws.
- Innovative leaders are discouraged from seeking election, because their decisions can be overturned readily by referendums where the initiative and protest referendum are available.

The weight of the evidence favors the referendum. There is a general agreement that proposed constitutional and local government charter changes should be subject to the sovereign will of the people, but there are exceptions as noted above. Although the initiative, the protest referendum, and the recall have been controversial, it is apparent that, lacking such devices, many reforms would not have been adopted; many unpopular laws would have remained on the statute books; and a significant number of elected officers guilty of malfeasance, misfeasance, and nonfeasance would have remained in office.

The process of enacting important laws should reflect the views of citizens, interest groups, elected representatives, and bureaucrats. The referendum actualizes the views of the citizens, fulfilling a need for a policy-making theory inclusive of elements of the theories of representative democracy and direct democracy.

DIRECT DEMOCRACY

Plato's fears have not materialized, but citizen apathy results in the town meeting becoming a de facto representative democracy with attendees casting ballots representing nonvoters. Town meeting participants, with the exception of very small towns, are a minority of the voters. Nevertheless the meeting, based upon equality and openness, welcomes all citizens, scrutinizes town administrators, and has a high rate of participation when controversial articles appear in the warrant. The meeting has its shortcomings, but voter participation compares favorably with participation in city council elections, and the quality of its decisions is as high as the quality of city council decisions.

A similar criticism is leveled at the referendum, as a minority of the voters may cast ballots, and participation is dependent upon the degree of controversy involving the question.

Dirigisme

Dirigisme is an economic term used to describe a state-directed economy in which economic planning and other kinds of government intervention work to regulate and coordinate the production and allocation of resources. Dirigisme comes from the French word *diriger* (to direct), and economies that operate under such conditions are referred to as *dirigiste*. As an economic policy or a description of an economic state, it is the opposite of laissez-faire.

Unlike a centrally planned economy, where the government controls the production and distribution of resources, a dirigiste economy has mostly private ownership of the means of production. Nonetheless, dirigisme implies a prominent degree of government regulation and structure to direct the workings of both publicly and privately owned companies. Most economic systems contain at least some aspect of dirigisme. A government contract that subsidizes specific scientific and technological research is one particular example of dirigisme.

As an economic theory, dirigisme is most commonly associated with the economic recovery of post–World War II (1939–1945) France and the center-right governments of Charles de Gaulle and Georges Pompidou. When Francois Mitterand attempted to introduce more state intervention into the French economy in the early 1980s—moving away from dirigisme and toward socialism—the resulting economic downturn prompted the French government to reject

dirigisme as the country's main economic policy, a decision that subsequent governments have continued.

Disability Rights

The *Oxford English Dictionary* defines a *disabled person* as someone whose "physical or mental condition" limits the person's "activity, movement, sensation, etc." Relative to labels such as *crippled* and *handicapped, disabled* is considered to be less derogatory, and it is now the preferred way of identifying individuals who have restrictive conditions.

However, underlying this change in labelling is a more profound shift in social attitudes toward the disabled. Historically, in both Western and non-Western societies, the disabled were typically seen as dysfunctional human beings who should either be treated as despicable outcasts or as helpless victims of fate. Consequently, contempt and pity were the two most commonly expressed social attitudes toward the disabled, rendering them isolated and marginalized.

Against this background, the United Nations (UN) first identified the plight of the disabled as a human rights cause that warranted global attention with the Declaration of the Rights of the Disabled in 1975. Just over 30 years later, the Convention on the Rights of Persons with Disabilities was adopted in 2006. Hailed as a major landmark in international law, this convention obliges signatory states to ensure that the disabled have the full range of human rights afforded to able-bodied persons and to remove any discriminatory practices, both official and customary, against the disabled.

However, the momentous shift that set the normative groundwork for the current rights-based approach to disability was the adoption of "The World Programme of Action Concerning Disabled Persons" in 1982, which considered disability a social rather than a biomedical condition. Building on the definition of *handicap* used by the World Health Organization, which emphasizes the term's contextual dimension, the UN identified a handicap, in General Assembly Resolution 37/52, as first and foremost "a function of the relationship between disabled persons and their environment." Consequently, a handicap is not the equivalent of a permanent physiological condition. Rather, a handicap occurs when there is a breakdown in what should have been an interactive relationship.

By far the most common and concrete form of this breakdown is when the disabled "encounter cultural, physical, or social barriers which prevent their access to the various systems of society that are available to other citizens." A handicap as such represents a "loss or limitation of opportunities" for the disabled "to take part in the life of the community on an equal level with others." This characterization of disability as a sociopolitical issue meant that the disability movement became fundamentally about the restoration of social justice to a group of individuals who share the experience of oppression and marginalization. The movement has evolved to such a point that some of its advocates are starting to use disability as the basis for positive identity. Accordingly, for the first time in the history of the movement, the rights of the disabled are defended on cultural grounds, based on the claim that the disabled constitute a minority whose identity is forged by a shared history and culture of living the life of the disabled.

Cultural and otherwise, disability rights are generally claim rights that necessarily entail legal obligations to provide for the claimants. Disability rights have therefore opened all kinds of doors for the disabled in the last two decades. Taken literally, this means that wheelchair ramps that facilitate accessibility of physical space are fast becoming the global standard. Less visible and more controversial are measures that oblige employers to modify work conditions for the disabled, making workplace accommodations that go beyond physical accessibility.

It is these kinds of accommodations that perhaps pose the most challenge to the advancement of disability rights. According to the UN, chronic unemployment among the disabled is a global problem. It is estimated that in developing countries, about 80 percent to 90 percent of the disabled, who are otherwise of working age, are unemployed; in developed countries, the figure is between 50 percent and 70 percent. These are significant numbers given that by UN's count, there are about 650 million disabled persons in the world. They, therefore, constitute about 10 percent of the world's population, making them the largest minority group, 80 percent of which live in the developing world. These figures suggest that the disabled are far from being full participating members of society. Among other things, their right to work, which is guaranteed by both the Universal Declaration of Human Rights and the International Covenant on Social, Economic, and Cultural Rights, is being consistently violated.

The disabled, therefore, stand a much higher chance than the general population of being caught in the vicious cycle of unemployment, poverty, and dependency. Against this reality, it is unclear how the living condition of the disabled can be improved by the growing grassroots movement to represent the rights of the disabled as the cultural rights of a minority. This political trend is arguably the result of the move to demedicalize disability. Yet by emphasizing the unique identity of the disabled, the advocates of this position may run the risk of ghettoizing the disabled even more.

Disaster Relief

Disaster relief is the assistance provided to individuals, families, and communities to help them cope with disruptive, disorienting events. These events can be caused by natural hazards, like hurricanes, earthquakes, wildfires, or tornadoes, or they can be triggered by humans, such as nuclear accidents, health epidemics, or terrorist attacks. Thus, the scope of disaster assistance has expanded to encompass a wide variety of emergency situations.

DISASTER RELIEF PROGRAMS

Governmental institutions play a key role in the development and implementation of disaster relief in contemporary societies. Governmental involvement is necessary, because many disasters cannot be addressed through private efforts. As a result, most countries have created a set of policies and procedures to guide their governmental operations. These policies identify when government will become involved and the types of assistance it will provide.

In most nations, governmental disaster relief policies cover four primary areas: mitigation, preparedness, response, and recovery. Mitigation programs are designed to reduce the potential damages of a disaster. These programs are undertaken before a disaster occurs, and they include such activities as building up coastal areas to better withstand storm surges and flooding, establishing stricter building codes in earthquake-prone communities, and using immunization programs to prevent the spread of infectious diseases.

Preparedness programs are also initiated in advance of a disaster, but they tend to focus more directly on ensuring that emergency management organizations are ready and able to respond to disasters. They also strive to inform individual citizens and prepare them for potential hazards. Preparedness programs include the establishment of emergency operation plans, the activation of early warning and alarm systems, the development of public education programs, and the use of simulations and exercises that replicate emergency situations.

Response programs are designed to address the immediate problems of disaster situations. The objectives of these programs are to save lives, minimize damage, and help facilitate the recovery efforts that will follow. If possible, officials activate warning systems, issue evacuation orders, and set emergency response plans into motion even before a disaster strikes. However, most response activities focus on those operations that take place after an event has occurred, for example, opening relief shelters, providing medical care and essential services, reestablishing power and communication systems, and clearing debris. Once the hazardous conditions have subsided, response activities often evolve into efforts to assess the extent of the damages and to initiate longer term relief.

Recovery programs are undertaken to restore communities to their prior conditions, or in some cases, to actually improve their situation. These include operations to help repair damaged property and provide more permanent housing as well as broader programs aimed at stimulating economic development. Many recovery programs focus on helping individual citizens, but they can also provide assistance to entire neighborhoods, communities, and economic sectors.

MODELS OF DISASTER ASSISTANCE

In the majority of nations, disaster relief is implemented in a fairly centralized manner, from the top down. That is, the national or central government is primarily responsible for developing and administering emergency aid. Subnational governments (e.g., those of villages, towns, states, or provinces) may also be involved be the process, but their actions are guided by national-level directives. In countries with centralized structures, the national government would be in charge of the nation's disaster relief operations—from mitigation and preparation through the response and relief operations. This structure of disaster relief is most prevalent in unitary political systems like those of France, China, and Great Britain.

In federal systems with more decentralized governmental structures, the process operates quite differently. Instead of a top-down pattern, disaster relief is supposed to work from the bottom up. Municipal and county governments are expected to be the first responders and deal with emergencies that occur within their jurisdictions. If they are unable to handle the situation, they can ask for outside assistance from the state, provincial, or national governments. But the basic assumption is that most disasters will be handled at the local level with little involvement by higher level jurisdictions. This bottom-up approach is evident in countries like the United States, Canada, and Australia.

COMMONALITIES OF DISASTER RELIEF SYSTEMS

Regardless of structural differences, there are similarities in the disaster relief policies of contemporary political systems. Perhaps the most striking characteristic is the key role that governmental agencies play in this process. These organizations have a variety of different titles (e.g., emergency preparedness, disaster relief, civil affairs, homeland security), locations (some are free-standing units, others are housed within military departments, and a few are spread across multiple agencies), and capabilities (e.g., some can act on their own, while others have to be called into service). But, they all provide the glue that ties together a nation's disaster relief activities.

Another trend is the change that has occurred in the focus of governmental activity. In most nations, disaster relief policies were initially construed to be quite reactive in nature; governments took action only after a disaster occurred, and their involvement was highly limited in scope and time. Current

governmental policies place much greater emphasis on pro-active measures—such as preparing society and specific local communities for emergencies before they arise—and they cover a broad range of operations.

Perhaps, the most common element of contemporary disaster relief policy is the use of an "all hazards" or generic approach to emergency management. Instead of creating a multitude of policies to deal with different types of disasters—for example, one for hurricanes or typhoons, another for earthquakes, still another for terrorist activity, and so on—nations develop a general set of procedures to cover any type of emergency situation. This enables them to respond to a wide variety of situations in a more coordinated and effective manner.

PROBLEMS AND PROSPECTS OF DISASTER RELIEF

Disaster relief is an important aspect of governmental activity in contemporary societies. As the demands on governmental disaster relief systems have increased, so too have the problems with these systems. Recent events—the 2004 Indian Ocean tsunami, the 2005 Hurricane Katrina disaster in the United States, and the 2008 Sichuan Chinese earthquake—demonstrated all too clearly the extreme difficulties that confront governmental disaster relief systems. All governments face the same challenges in this policy area: planning for the next disruptive event, coordinating the activities of those who are involved in disaster relief, meeting the needs of affected populations, and balancing the costs of disaster relief against *other* governmental policy responsibilities.

Discourse Analysis

Discourse analysis is not a theory but rather a method of inquiry and research that seeks to understand the coherence—and sometimes the contradictions—within the discourse (the spoken or written communications) of individuals, groups, and organizations. Materials that may be subjects of discourse analysis include books, speeches, interviews, conversations, debates, articles, literature, TV programs, and even movies or documentary films. Scholars and sociologists using discourse analysis can focus on quantitative elements (the number of occurrences of certain words) or can try to interpret specific

words or constant themes that occur more often than others (or words that the discourse seems to avoid). The study of discourses allows the analyzer to link them to a worldview or to a given ideology. In his book *The Archaeology of Knowledge,* French philosopher Michel Foucault linked discourses with beliefs and social practices. Apart from sociology and political science, a variety of disciplines, including cultural studies, ethnomethodology, psychology, and social psychology use discourse analysis.

Discourse analysis aims to find meanings and hidden trends. For instance, discourse analysis revealed that Leni Riefenstahl's famous documentaries *Triumph of the Will* (1935) and *Olympia* (1938) illustrated the Nazi ideology. In France, sociolinguists Louis-Jean Calvet and Jean Véronis have studied the political speeches of French president Nicolas Sarkozy for two years in order to find his main ideas and ideology.

Discrimination

Discrimination, in its modern usage, means treating someone unfairly or unfavorably and denying individuals or groups of people equality of treatment. International labor organizations; the United Nations Educational, Scientific and Cultural Organization; and various United Nations (UN) treaties define discrimination as any distinction, exclusion, or restriction of preference based on race, color, descent, or national or ethnic origin that has the purpose or effect of nullifying or impairing the recognition, enjoyment, or exercise, on an equal footing, of human rights and fundamental freedoms in the political, economic, social, cultural, or any other field of public life.

Discriminatory practices are those detrimental distinctions that do not take account of the particular characteristics of an individual as such but instead consider only collective qualifications deriving from membership in a certain social or other group such as race, color, religion, or gender. Four forms of discrimination include inequality in treatment, imposing disabilities, granting privileges, and imposing obligations. Discrimination as denial of equality has many faces, including denial of economic opportunities, power, status, access to education, and career opportunities. All of these are naturally reinforcing. People can suffer discrimination at work, school, or college or while shopping, looking for accommodations, participating in public activities, or dealing with authorities.

DISCRIMINATION IN PRACTICE
UN Special Rapporteur Elizabeth Odio Benito notes in her work that manifestations of discrimination, intolerance, and oppression sometimes occur in isolation and sometimes in combination. Michel Banton points out that experimental research in social psychology has established that even meaningless information suggesting that some individuals constitute a group can be sufficient to initiate processes of group inclusion or exclusion. Discrimination, thus, also occurs without anyone intending to discriminate. The international convention therefore defines discrimination as any action or inaction that has either a discriminatory purpose or a discriminatory effect. It is generally believed that since 1949, de jure discrimination has been abolished in most parts of the world. However, the practice continues in most parts of the world, most frequently in the form of racism.

RACIAL DISCRIMINATION
Racism is the combination of the power of one race to dominate other races and a value system that assumes that the dominant race is innately superior. *Race* is an arbitrary and therefore problematic term employed in the classification of human beings on the basis of appearance, and it is a primary determinant of human traits and capacities. Thinking that differences are hereditary and unalterable, one ethnic group or historical collectivity dominates, excludes, or seeks to eliminate another. Its varied usages have resulted in race being seen as an objective biological fact and/or a social fact that operates through independent characteristics. According to studies by geneticists and biologists, racism has no scientific basis.

Racial discrimination operates in different forms and at different levels. It can be overt or covert, personal or institutional. Personal racisms are manifested through the individual expression, attitudes, or behaviors that accept the assumptions of a racist value system. Institutional racism is the established social pattern supported by policies, rules, and regulation that support implicitly or explicitly the racial value system. For example, in many societies, commitment to and investment in the health and welfare of different groups of people is quite disparate. There are also cases of social exclusion and isolation of minority and indigenous groups from access to economic resources and social and political processes.

One regime that continued institutional racism after 1949 was that of South Africa, with its use of apartheid. *Apartheid* was introduced in 1948 by the National Party as a system of social segregations designed to maintain a situation of inequality between whites and the other ethnic and social groups in economic, social, political, and cultural spheres. This ended in 1993.

The practice of racial discrimination continues in many parts of the world in a covert manner, more at personal and social levels than by the state, although in many cases discrimination by the state is also visible. It has been observed that victims are no longer discriminated against in the name of biological inferiority, but instead they are discriminated against socially because of religious or cultural traditions. Racial distinctions have been incorporated into a system of social class distinctions. It is also alleged that in some states, because of historical aspects, economic tensions due to migrations, and alleged terrorist activities, racism is present in various subtle forms. It continually assumes new forms, intensified by conflict over economic resources in developed as well as in developing countries. According to some observers, the process of globalization has also contributed in the resurgence of racial discrimination in some regions.

RELIGIOUS DISCRIMINATION
Somewhat similar to racial discrimination is discrimination based on religion, and the two sometimes overlap. Religious discrimination is valuing a person or group less because of religious beliefs or treating someone differently because of these beliefs.

Elizabeth Benito (1989) quotes Gordon Allport, who argues that deviation in creed alone does not account for the persecution. The discrimination is not caused by the doctrines or teachings of religions. Instead, he argues that there is usually a political or historical reason or a stereotype that fosters religious persecution. Religious intolerance thus occurs when religion and prejudice are merged. Persecution occurs when countries, governments, and individuals use or attack religion to justify the pursuit of power, prestige, wealth, or ethnic self-interest. In many cases, the compulsions to create a national identity and pursue a collective destiny have been murderously homogenizing, with religion playing a crucial violent role. Charges of religious discrimination have been made even against liberal, secular, and democratic states, including countries in the Western developed world.

WORK AND DESCENT
In line with racial and religious discrimination is discrimination based on work and descent. This means discrimination based on vocations associated with social groups or on perceived lower status by virtue of birth, as is the case with lower castes in India, Nepal, and some other countries. Such discrimination is reflected most notably in caste or tribal societies. Its manifestation commonly includes prohibitions on intermarriage, physical segregation of communities, restrictions on access to resources, social prohibitions regarding physical contact (untouchability), restrictions on access to education, segregation in educational facilities, and restrictions on access to religious palaces and participation in ceremonies.

GENDER-BASED DISCRIMINATION
Another common basis for discrimination throughout history has been gender. The International Convention on the Elimination of All Forms of Discrimination against Women (1979) defines it as

> any distinction, exclusion or restriction made on the basis of which has the effect or purpose of impairing or nullifying the recognition, enjoyment or exercise by women, irrespective of their marital status, on a basis of equality of men and women, of human rights and fundamental freedoms in the political, economic, social, cultural, civil, or any other field.

Gender discrimination exists in families, in communities, and in the workplace and can take many different forms. The treatment accorded to women in terms of property rights, rights of inheritance, laws related to marriage and divorce, rights to acquire nationality, and the right to seek employment reflects discrimination both in law and in fact. Many women face additional discrimination and denial of equality because of their race, language, ethnicity, culture, religion, or socioeconomic class. They, thus, suffer compounding affects of discrimination.

OTHER FORMS

In addition to the above well-defined groups, people also face discrimination, particularly in employment, on the basis of language, age, and disability. Gays and lesbians are discriminated against socially and in the workplace because of their sexual orientation. In the present era of globalization in which the global economy has stimulated high levels of migration, complaints of discrimination against immigrants and asylum seekers have also become common. Discriminating police behavior and visible ghettoization characterize many metropolitan cities of Europe and North America.

Concerns about discrimination have been expressed by the international community at various levels, and efforts are ongoing to eliminate it. Particularly since the adoption of Universal Declaration of Human Rights in 1948, the international community has made important strides in the flight against racism. Beginning with the Convention on the Prevention and Punishment of the Crime of Genocide (1948), the UN has adopted a series of conventions and declarations, proclaimed an International Year of Mobilization against Racism (2001), and organized three decades against racism (1973–1982, 1983–1992, 1994–2003) along with two world conferences on the same theme (1978 and 1983). The World Conference against Racism, Racial Discrimination, Xenophobia and Related Intolerance held in Durban (South Africa) from August 31 to September 7, 2001, debated an array of questions reflecting the complex interplay of prejudice and intolerance: political, social, and economic exclusion; migration; human trafficking; and indigenous peoples' and minority rights.

A number of states have also incorporated provisions for equality and prohibitions against discrimination in their constitutions. Steps have also been taken for reparations, which include the concept of *reverse discrimination*. This concept refers to current discriminatory policies or acts that benefit a group that has historically been discriminated against, generally by giving preferences to that group, or discriminating against individuals not in that group or against dominant groups. It is now well recognized that discrimination not only denies groups of human beings dignified existence, marginalizes productive individuals and groups, and depresses their creativity and initiative, it also is a negative manifestation of integrative power. Instead of bringing or holding people together, prejudice and discrimination push them apart. Those discriminated against may find society or the state responsible for the disparities in their lives and may join militant, extremist, or fundamentalists forces justifying even terrorism.

Disenfranchisement

Disenfranchisement refers to the removal or refusal of the right to vote, or the right of suffrage, to an individual or group of individuals. *Direct disenfranchisement* involves explicit, intentional denial of the right to vote, usually through legislative measures. Indirect disenfranchisement occurs when attempts are made to prevent votes from having an impact on the final electoral outcome, as can occur in gerrymandering or stuffing ballot boxes. Entire groups of people have and continue to be disenfranchised purposefully. These groups include women, indigenous peoples, racial and ethnic minorities, and religious minorities, depending on the country and political and/or religious climate. *Felony disenfranchisement* refers to refusal of the right to vote for individuals who are incarcerated or who have prior felony convictions.

Full suffrage refers to the right to vote and run for office. In 1893, New Zealand was the first independent country to give women the right to vote. Australia followed in 1902, but suffrage was provided only for non-Aboriginal women. Women gained the right to vote in Canada in 1917, in the United Kingdom in 1918, and in the United States in 1920, although not all women could vote at these times; full suffrage was granted incrementally. Historically, indigenous peoples have been denied the right to vote longer than any other group.

Disinformation

Disinformation is the deliberate propagation of misleading or false information. The term developed within the world of intelligence and international politics, and the Russian KGB first used the word *dezinformatsiya,* which is likely the origination of the English word. A government engages in disinformation to affect public opinion or another nation's leadership. For example, during World War II (1939–1945), the Nazi party was notorious for disinformative anti-Semitic speeches and writing.

Because it is intentional, disinformation should not be understood as merely false information. In C. S. Lewis's *The Screwtape Letters,* one devil writes to another:

> The fact that "devils" are predominantly comic figures in the modern imagination will help you. If any faint suspicion of your existence begins to arise in his mind, suggest to him a picture of something [fantastical], and persuade him that since he cannot believe in that he therefore cannot believe in you. (2001, 3)

Similar to Lewis's devils, a government can spread fantastical rumors that are easily dismissed, which causes people to disregard accurate reports of the government's real motives or actions as equally unbelievable. Disinformation often succeeds, because it makes a realistic appraisal of one's enemies hard to achieve.

Dissolution

Dissolution is a parliamentary procedure in which a session of a legislature is ended and new elections follow. It is considered one of the most significant aspects of parliamentary systems. Dissolution ensures regular elections, although, unlike systems with fixed electoral dates, there is some discretion on the timing of the next round of polling.

Dissolution usually occurs within a set period of time. For instance, in Canada or the United Kingdom, the House of Commons must be dissolved within five years of its first sitting. Parliaments may also be dissolved following a vote of no confidence in the government, or a motion may be made for a parliament to dissolve itself. Some systems require a simple majority vote for dissolution, while others require supermajorities of up to two-thirds of the members. In some systems, legislatures may also be dissolved by the head of government or head of state. Dissolution commonly occurs in response to a political crisis that undermines political support for an existing government, such as the loss of a coalition partner or a political scandal. Dissolution can also be use as a political tool to build parliamentary majorities. Hence, governments may dissolve a legislature early in order to capitalize on public popularity or to ensure an election before the implementation of unpopular policies.

Distribution of Powers (in a Federation)

Although not all definitions of federalism emphasize the formal distribution of powers between two levels of government as an essential attribute of a federal government, all federal constitutions make reference to the distribution of powers by enumerating the legislative powers and responsibilities of at least one level of government, and sometimes of both levels. In most federations, a supreme or constitutional court is occasionally called upon to interpret the meaning of these powers, either because of jurisdictional conflicts between the two levels of government, or more frequently because an individual or corporate person questions the constitutionality of legislation that is deemed contrary to the interests of that person.

The legislative powers of one level of government may be exclusive, meaning that the other level of government may not legislate at all about the same subjects, or concurrent, meaning that either level can legislate about a subject. In the event of concurrency, there is an explicit or implicit provision that one level of government, usually the central or "federal" level, has *paramountcy,* meaning that its legislation takes priority over legislation by the other level in the event that both levels have legislated and that conflict exists between the provisions of their respective laws. Very rarely, as in the case of old age pension legislation in Canada, there may be a paramountcy rule that favors the lower level of government.

DIVERSITY OF CONSTITUTIONAL DISTRIBUTION OF POWERS

Federal constitutions also contain a rule that one level of government, usually (although not always) the lower level, may legislate about all matters not explicitly provided for in the constitution. This allocation of power over unspecified matters is known as the residual power. In the U.S. Constitution, the Tenth Amendment provides such a rule, assigning residual power to the states "or to the people." Canada and India are unusual among federations in assigning residual power to the central government. Most others, including Argentina, Australia, Germany, Mexico, Russia, and Switzerland, assign residual power to the provinces or states. The significance of the residual power depends in part on the comprehensiveness of the list or lists of enumerated powers.

Constitutional distributions of powers have tended to become more detailed and complex in modern times, as the scope of public policy has broadened. For example, the Constitution of the United States lists only eighteen subjects about which Congress may legislate, while the Constitution of Australia, largely inspired by that of the United States but drafted more than a century later, lists thirty-nine subjects about which the national Parliament may legislate. Neither of those constitutions specifies the legislative powers of the individual states, on the assumption that the individual states retain the residual power and that specification is therefore unnecessary.

Some other federal constitutions include several categories of enumerated powers. For example the constitutions of Canada and India both include separate lists of exclusive federal powers, exclusive powers of the individual states (provinces in Canada), and concurrent powers shared by both levels. The lists are much longer in the Indian constitution, reflecting its more recent origin, than in the Canadian constitution, on which India's is largely modelled. In Canada, as already noted, the concurrent power over pensions is subject to a rule of provincial paramountcy. However, other concurrent powers in Canada, over agriculture, immigration, and the export of natural resources, are subject to a rule of federal paramountcy.

The German constitution has separate lists of exclusive federal powers, concurrent powers with federal paramountcy, and subjects about which the federation may enact "skeleton" or framework provisions, with the individual states (the plural term for which is *Länder* in German) being left to fill in the details. The list of concurrent powers is by far the longest of the three lists. Like the constitutions of Australia and the United States, that of Germany leaves the residual powers of the lower level of government unspecified. The constitution of Brazil follows a somewhat similar pattern, except that the concurrent powers are referred to as "common" powers, and the fields in which federal legislation can only establish general principles are referred to as concurrent.

The constitution of South Africa is unusual in that it includes a list of concurrent powers and a list of exclusive provincial powers but not a list of exclusive powers for the central government.

COMMON FEATURES AMONG CONSTITUTIONS

Although distributions of powers vary from one federal constitution to another, some common features may be observed. Military and naval defense, foreign and interstate trade, currency and monetary policy, and weights and measures are responsibilities of the central government in all federations. Citizenship is normally a federal responsibility, except in Switzerland. Education, health, and municipal affairs are almost always assigned to the states or provinces in federal constitutions, either explicitly or otherwise. Criminal law is exclusively federal in Argentina, Brazil, Canada, Russia, and Switzerland, concurrent in Germany, and left to the subnational governments in Australia. In the United States, most criminal law is made by the states, but Congress has established a number of "federal offenses." Authority over the environment, taxation, transportation, and communications may be allocated in various ways.

In most federal constitutions, it is assumed that executive and administrative powers are divided in the same way as legislative powers, but this is not always the case. In Germany, legislation in the concurrent fields is implemented and administered by the Länder, although mainly legislated at the national level. In Canada, the uniform code of criminal law, legislated at the national level, is administered by the provinces. Another complication is that the making of treaties, an executive power exercised at the national level, may override the legislative powers of the states, as it does in the United States, India, and Australia, but not in Germany or Canada. Canada and India also give the federal executive the power to disallow legislation by the lower level of government, although in Canada this power has fallen into disuse and is not likely ever to be revived.

In practice, the scope of the central government's authority has tended to expand in most federations at the expense of the authority of the states or provinces, particularly, but not only, in times of war or economic crisis. Geographical mobility of the population and the growth of the welfare state have reinforced this trend. In some cases federal authority has been formally increased by amending the constitution. More typically it has been increased by permissive judicial interpretation of federal powers or because central governments have used their greater financial resources to intervene in areas of jurisdiction formally reserved to the states and provinces. Conditional grants to subnational governments have been a particularly effective way to impose federal priorities and policy preferences on them. Allocation of the residual power to the subnational governments, as in the Tenth Amendment to the U.S. constitution, has proved to be almost totally ineffective in resisting this tendency toward greater centralization of power.

Distributive Justice

The term *distributive justice* refers to theories that address the fairness of allocation of economic resources and social welfare within a society. Such theories both criticize and prescribe basic institutional arrangements in society. The term goes back as far as Aristotle, but his use of it does not conform to modern usage. Aristotle saw distributive justice primarily in political terms, as those principles that ensure that deserving people are rewarded in accordance with their merit. Modern conceptions of distributive justice begin from postulates of equality rather than merit or status. Everyone is entitled to a minimum of freedom from need regardless of merit. Theories of distributive justice are also distinct from religious and secular conceptions of mutual aid, compassion, or charity. The former rely on the ethics of care; distributive justice also includes state intervention to remediate the side effects of social and economic inequality.

INFLUENCES OF DISTRIBUTIVE JUSTICE

One source of modern notions of distributive justice is found in nineteenth-century British idealism. Influenced by Georg Wilhelm Friedrich Hegel's philosophy of absolute idealism, British idealism also took up Hegel's notion of development and the positive role of the state and applied it to social philosophy. British philosopher Thomas Hill Green especially argued that the state could play a positive role in the creation of the necessary conditions of the good life. Opposing utilitarianism, Green advocated extensive welfare measures such as schools and hospitals.

Marginalist economics was a second influence. The theory of marginal utility referred to the increase in utility of adding one unit of a good. At some point, that addition will have diminished value. The marginalist revolution in economics led by Carl Menger, William Stanley Jevons, and Leon Walras replaced older theories of value with subjective value. Marginalism held that a good, rather than having an intrinsic value, must be scarce and useful to a subject to have value. Neoclassical economics developed a theory that in a competitive market, the self-interested choices of individuals (when aggregated) yield an equilibrium that represents the optimal social welfare arrangement.

Much theorizing on distributive justice was utilitarian (a third source of major ideas). Utilitarianism holds that the morally good is that which is useful. Action should aim at the greatest good for the greatest number. Early utilitarians justified an unencumbered market, but later utilitarians argued that an egalitarian social arrangement produced the greatest good for the greatest number. Utilitarianism is a normative moral theory, but other schools of thought, like marginalist and rational choice economics, claimed to discover "scientific" and nonnormative welfare arrangements. Late twentieth-century utilitarians like John Harsanyi combined both trends. Harsanyi argued, like John Stuart Mill, that the greatest happiness principle meant the more egalitarian maximizing of average welfare among individuals and not total welfare, but he saw these principles of interpersonal comparison as social facts, not value postulates. Individuals were naturally rational decision makers who acted in accordance with an expected utility theory.

JOHN RAWLS'S PRINCIPLES ON DISTRIBUTIVE JUSTICE

The most celebrated theorist of distributive justice, John Rawls, began his career more sympathetic to utilitarianism and marginalism. By the time he published *A Theory of Justice,* Rawls had incorporated strong normative Kantian elements, including Immanuel Kant's postulate of equal respect for persons, superseding any calculation of utility. Questions of social justice could not be solved through "science" but were normative in nature. Utilitarian theories, however, fell short in Rawls's view. An account of justice based solely on self-interested individuals could never generate the moral reciprocity that Rawls found central to extensive equality and liberty.

Rawls's theory of justice began from a Kantian outlook. In the "original position," individuals were to decide basic social arrangements behind a veil of ignorance—a position in which they were presumed to be autonomous, free, and equal, but to have no knowledge of any particular characteristics of their own lives or others. In *A Theory of Justice,* Rawls employed a "thin theory of the good" to indicate those basic needs (rather than wants) that all individuals must have met for any plan of life that all could know. In this way, their decisions take place under conditions of reciprocity in which individual self-interest does not play a central role. Rawls held that under these conditions of justice, inequalities in wealth, power, status, or life chances could only be justified if they harm no one and provide net benefit.

Rawls' two basic principles of justice are as follows:

1. *Principle of Equal Liberty:* Each person has an equal right to the most extensive liberties compatible with similar liberties for all (egalitarian).
2. *Difference Principle:* Social and economic inequalities should be arranged so that they are both (1) to the greatest benefit of the least advantaged persons, and (2) attached to offices and positions open to all under conditions of equality of opportunity.

The first principle is a version of Kant's principle of equal respect for person; the second is an interpretation of Italian economist Vilfredo Pareto's optimality used in welfare economics. Pareto's improvements refer to a condition in which a change in the allocation of goods makes one person better off without making others worse off. Pareto optimality is reached when no new allocation can make anyone better off without

making others worse off. Inequalities are not justified simply by their contribution to the greater good, but because these inequities benefit everyone, especially the least advantaged. Rawls contended that utilitarian calculation of social needs isn't compatible with basic reciprocity. The cost of helping the poor would always be too dear in strict economic terms to justify. Rawls's position justified a very strong version of welfare state liberalism with extensive equality and redistribution of wealth and power.

Rawls argued those who are better endowed or who have a more advantageous social position are so not by merit alone. Rejecting this position, and Rawls's defense of the welfare state, Robert Nozick, in *Anarchy, State, and Utopia,* challenged the notion of distributive justice on libertarian grounds. Reviving the neoliberal idea of the watchman state, Nozick held that the state should only be concerned with safety and security of citizens and that much taxation was illegitimate. He rejected equality for a conception of desert: One deserves what one achieves through one's own effort. Inequalities that are a result of lack of effort or ability are fair and just, because they are deserved.

Other important critics of Rawls include Susan Moller Okin, who criticized Rawls for his neglect of gender and the family, and communitarian Michael Sandel, who criticized Rawls for employing a Kantian conception of the abstract individual, a purely cognitive subject without substantive qualities. Sandel held that this separates the right from the good. We cannot make sense of questions that Sandel argued without reference to our situated set of values and sense of the good. Economists like Kenneth Arrow and John Harsanyi criticized Rawls's "maximin" principle on the grounds that it was designed to yield the principles Rawls desired, was circular, and that it otherwise prejudged outcomes.

While Rawls himself saw his theory as neutral in the contest between capitalism and socialism, there was lively debate whether Rawls's conception of justice could in fact be applicable to a socialist order or whether it was more limited. Marxist critics like C. B. Macpherson argued that Rawls's presumption that class-divided societies are inevitable limited the scope of distributive justice.

Rawls attempted to answer these critics and modify his position somewhat in series of essays later published as *Political Liberalism.* There he attempted to argue, for example, that the use of the original position was not metaphysic (and hence separating right and good) but was instead a political device for making decisions and that it has weakened the terms of the veil of ignorance. In so doing, he hoped to show that the subject of his theory of justice is a social one.

While drawing on earlier criticisms, analytical Marxists such as John Roemer, G. A. Cohen, and John Elster have extensively criticized Rawls's approach to distributive justice for being insufficiently egalitarian. G. A. Cohen for example argues that Rawls's egalitarianism should not apply simply to the basic structure of society but to the whole of society. It requires an egalitarian ethos among citizens. Even a just basic structure will not eliminate all the inequalities, nor are there

inequalities that do not hurt the worst off. Roemer has tried to recast equality of opportunity so as to eliminate the contingencies of circumstances and allow equal effort to yield equal outcomes. Roemer is an instrumental egalitarian. Equality is not an intrinsic good but a means to bring about a reasonable quality of life.

Districting

There are two stages to the process of determining the boundaries of electoral districts. In the first, the number of districts in a legislative assembly is established. In the United States, this phase is referred to as *apportionment* or *reapportionment*; in countries with a Westminster–style parliamentary system, it is generally known as *redistribution.* For federal countries such as Germany, India, and Canada—but not for unitary states such as New Zealand and the United Kingdom—an essential part of the first stage is the allocation of districts to their lower house of parliament according to the share of the nation's population of their respective *Länder,* states, or provinces. Once the number of districts has been established (as a result of either a governing statute or, in rare instances, a constitutional provision), the second part of the process gets under way. This is known as the *districting, boundary readjustment,* or *boundary delimitation* stage.

Statutory law is commonly used to establish the total number of seats in a legislative assembly. That is the case in the United States, where 435 districts in the House of Representatives has been a fixed number since 1929. In other countries,

the size of the assembly is variable. It may change from one reapportionment to another because of population growth or movement (Canada and the United Kingdom) or expansion to include additional population or territory (Germany following reunification in 1990).

Apportionment of legislative or parliamentary seats does not take place in political systems that have no need for territorially defined electoral districts. In Israel, for example, proportional representation is used to elect the 120 members of the Knesset, with the entire country serving as a single electoral district. By contrast, in countries that elect their assemblies by way of a first-past-the-post system (the U.S. House of Representatives), single transferable vote (the Republic of Ireland's *Dáil*), or additional member (Germany's *Bundestag*) system, geographically bounded districts must be constructed.

The frequency of boundary delimitations varies from country to country. In Australia, redistributions are triggered after a period of seven years, but they occur more often if the distribution of population requires a change in the number of members of the House of Representatives allocated to a state or territory or if more than one-third of a state's federal districts (called "divisions" in Australia) deviate from the average divisional population of that state by more than 10 percent. India, on the other hand, undertakes the massive job of redistricting its congressional seats less frequently. Thirty years passed between the redistribution of electoral districts for the lower house of parliament (*Lok Sabha*) that followed the 1971 census and the next redistribution early in the twenty-first century. It is anticipated that the next redistribution will not occur until after the 2021 census. The constitution of many countries, including Canada and the United States, requires redistricting every ten years based on the most recent national census.

The allocation of legislative districts and the actual drawing of their boundaries have long played an integral and highly partisan role in politics. Politicians of all stripes have traditionally seen the districting process as a way to try to advance their own party's chances of electoral success. The time-honored practice of government parties manipulating district boundaries for their own benefit has come to be known as *gerrymandering*.

In many countries, partisan gerrymandering has given way—largely over the past few decades—to commissions that work independently of legislatures and political parties. Canada, for instance, in 1964 followed the pioneering lead of New Zealand and Australia in turning over to nonpartisan commissions the task of designing the districts for its House of Commons. Once a decade, three-member nonpartisan commissions chaired by a judge are named for each of the ten provinces. The governing statute calls upon the commissions to design federal constituencies with population equality of electoral districts as the principle objective, subject to such practical considerations as community of social and economic interests and geographic integrity. In varying degrees, such principles are common to all countries that assign boundary delimitation to nonpartisan commissions.

With the exception of a few states in the United States where nonlegislative commissions are named to carry out the redistricting of the state legislature, the process at the federal and state levels remains highly politicized. Once the 435 seats have been apportioned among the 50 states, the responsibility for drawing district boundaries for the House of Representatives falls on the state legislatures. Partisan control of the legislative and (for veto purposes) executive branches is highly desirable to try to ensure that the districts have been designed in such a way as to favor the majority party's interests.

District Magnitude

District magnitude refers to the number of representatives elected in a single electoral district, riding, or constituency. Equal district magnitude occurs when the same number of representatives is elected to each electoral district and ensures that proportionality is the same from one district to the next. Variable district magnitude allows for differing numbers of representatives per electoral district and is often based on geographic representation and population size, but it can result in lower proportionality in some districts. The average district magnitude is determined by dividing the number of representatives to be elected by the number of electoral districts.

Along with electoral formula and ballot structure, district magnitude is one of the three most important components of an electoral system. District magnitude also varies among electoral systems. For instance, first-past-the-post, alternative vote, and two-round systems each has a district magnitudes of one, with only one representative elected to each riding.

The single non transferable vote, block vote, party block vote, and limited vote electoral systems have district magnitudes of more than one, while all proportional representation electoral systems require the election of more than one representative per district. District magnitude is the most important factor in determining proportionality, with larger numbers of representatives in an electoral district producing more proportionality and lower numbers producing less proportionality.

Divided Government

Divided government exists when one political party controls the executive and the opposition party controls one or both houses of the legislature, which can occur at both the state and national levels. The existence of divided party control of government institutions is a phenomenon that captured the attention of academics, the media, and average citizens in the 1990s. Although it is not a new occurrence in American politics, divided party control of the legislative and executive branches was increasingly blamed for the stalemate and gridlock that seemed to handicap the federal government, especially in the 1990s.

Since the end of World War II (1939–1945), the existence of divided government has been an almost persistent feature of the American political system. From 1952 to 1992, seven elections produced unified government, and thirteen elections produced divided government. The gridlock associated with divided government is not only representative of periods in which divided partisan control exists but can also manifest itself during periods of unified government as well. Nonetheless, academics have spent considerable time and energy in determining the effects, if any, that divided government has on relations between the executive and legislative branches and the nation as a whole.

The return of unified government with the election of Bill Clinton as president initially witnessed legislative acceptance for presidential proposals; however, with time, the Democratic Party–controlled Congress became a vocal opponent of the president, thereby casting doubt on whether unified government was much different than divided government. Divided government derives from the manner in which the legislative and executive branches function and are constituted. Different constituencies and terms of office and the separation of the branches, which are evaluated at separate times, produce conflict and division. Introducing different partisan controls of the presidency and Congress further exacerbates the situation.

This, however, should not preclude the possibility that presidents and Congress can reach agreement during both periods of divided and unified government. Divided government happens to be just one of a host of factors that may create gridlock in the legislative process. For instance, policy-making gridlock can be blamed on the overall design of Congress and the actual trajectory legislation takes. Congress is a complex institution that is disjointed in its functions and influenced by several entities, including committees, individual members of Congress, and interest groups. All of these may disguise or even exaggerate the effects of divided government.

Some argue that divided government is an undesirable outgrowth of the separation of powers inherent to the American political system. Several scholars openly challenge the deleterious effects of divided government. David Mayhew in *Divided We Govern* argues that whether the government has been unified or divided has not made much difference. Several scholars even suggest that the manifestation of divided government provides notable benefits. Divided government adds an element to the legislative equation that, in many cases, fosters greater debate and further exemplifies the deliberative nature that the founding fathers envisioned for legislating. The disagreement that is inherent in divided government produces debate and, as a result, is a healthy component of democratic governance.

Divine Right of Kings

The *divine right of kings* was a political-theological doctrine that emerged from the conflicted distinction of temporal and spiritual power during the medieval period. It is an important theoretical foundation that is a basis of the modern constitutional and legal doctrine of sovereignty. As a constitutional doctrine, it had its origins in antiquity, but as modern nation-states emerged during the Renaissance, political discourse increasingly centered on the importance of royal versus representative foundations of government. Among the most important contributors to the divine right of kings theory were James I of Great Britain and Sir Robert Filmer. These seventeenth-century theorists were reacting to new modern theories of the state by social contract theorists such as Thomas Hobbes and John Locke.

James I became king of England in 1603. Prior to ascending the throne, he wrote *The True Law of Free Monarchies* in 1598. In it, he argues that kings have authority over their subjects just as fathers have authority over their children. James utilizes biblical authority to establish the kingly right to rule as equal to that of God's rule over his earthly subjects. The monarchy has authority just as does the church, because both are divine in origin. As James stated, "As the Father of his family is duty

bound to care for the nourishing, education, and virtuous government of his children, even so is the King bound to care for all his subjects." James made his 1616 speech in the Star Chamber to assert the political realization of royal authority and the regal policy prerogative, which he had written about theoretically. But for James, the practice of divine right proved more complex than the theoretical clarity of the doctrine.

Probably the greatest theoretical statement on the divine right of kings was made in 1680 by Sir Robert Filmer in *Patriarcha: A Defense of the Natural Power of Kings against the Unnatural Liberty of the People.* Filmer utilized a biblical foundation for his theory similar to that of James I and placed the authority of the divine right of kings as equal to the family and society. Divine royal authority was combined with the duty of passive obedience by Filmer to describe the natural political order. This stands in opposition to contract theories and theories of consent. John Locke's *First Treatise* is the most famous critique and counterpoint to Filmer's theory.

The divine right of kings built on previous theories of the monarchial form from Aristotle to John of Salisbury. The influence of this constitutional line of royal authority created a modern foundation for sovereign prerogative powers that is still evident in modern executives with such doctrines as the executive pardon power and sovereign immunity.

Doctrines

Foreign policy doctrines are broad articulations of interest and objectives that serve both to guide the domestic formulation of policy and to communicate a state's policy intent to other actors in the international system. The doctrines contain principles to guide actions rather than specific prescriptions for action. It has become customary to name doctrines after the national leader that promulgates the guidelines, although some countries simply identify doctrines by number. For instance, one of the oldest continuous doctrines is the 1823 Monroe Doctrine, named after U.S. president James Monroe. Its aim was to halt European colonization of the Western hemisphere, and it asserted that the United States would not interfere with existing European colonies or countries. Other prominent U.S. doctrines include those named after presidents Harry Truman, Dwight Eisenhower, and Ronald Reagan, all of which were designed to contain the spread of Soviet influence. Meanwhile, the 1968 Brezhnev Doctrine affirmed the

right of the Soviet Union to utilize force to maintain satellite states. The 2002 Bush Doctrine embraced preemptive war and was used to justify the Iraq War (2003–). Several policy doctrines originated in Latin America. The Betancourt Doctrine of Venezuela forbade recognition of governments that seized power through nondemocratic means, while the Estrada Doctrine, discontinued by Mexico in 2000, called on states to offer recognition of regimes without regard to state behavior. Some doctrines, such as the 1868 Calvo Doctrine, have been applied universally. (The doctrine asserted that jurisdiction in international financial disputes belonged to the country in which the controversy originated.)

Domino Theory

President Dwight Eisenhower described *domino theory* in a 1954 press conference on the importance of U.S. involvement in Indochina. Eisenhower, engaged in a containment strategy to limit expansionist ambitions of the Soviet Union at the height of the cold war, explained that Soviet goals of spreading communism and absorbing client states had to be countered. China "fell" to the Communists in 1949, North Korea invaded South Korea to "unify" the country under the Communist banner, and the Soviets and Mao's China sought to stir up revolution throughout Europe and the third world. Mao's revolutionary fervor appeared especially virulent, and Laos and Vietnam appeared vulnerable to Communist takeover. Eisenhower wanted these countries kept out of Communist hands, for fear that, if the United States failed to act, these and other states would fall like dominos.

This fear and doctrine, which gained metaphoric fame during Eisenhower's tenure, actually evolved from Harry Truman's containment policy intended to prevent the expansion of Soviet influence. The doctrine motivated presidents from Truman (who wanted to defend "free peoples" threatened by communism) to all cold war presidents (who wanted to prevent Vietnam from precipitating further dominos) and to Reagan (who wanted to overturn Communist victories to inspire a reverse domino effect in the third world). Presidents from Clinton to Obama have referred to another reverse domino notion (democratic enlargement) to convey the hope that increasing numbers of "democratic" states would cascade into free states everywhere. While responsible for U.S. overextension on occasion, the original domino theory also provided an American explanation or rationalization for the necessity of intervention to contain global communism.

Droop Quota

In single transferable vote systems that allow voters to rank order their preferred candidates, the *Droop quota* establishes the minimum number of seats necessary to be elected. In this electoral procedure, once a candidate meets the minimum number of ballots necessary for election (the Droop quota), any excess votes are transferred to other candidates. The system was created by Henry Richmond Droop in 1868 as an alternative to the existing Hare quota, which was criticized for its ability to return results in which the largest voting groups elected only a minority of seats. The Droop quota is usually expressed as number of votes (V) divided by number of seats plus one (S+1) plus one, or $[V/(S+1)] +1$. The resultant number from the quota is rounded upward as a whole number, or the fraction may be ignored, depending on the system. For instance, if an election is held for four seats, and there are 100,000 votes, the Droop quota would be $[100,000/(4+1)] +1$ or 20,001. Any candidate receiving more than 20,001 votes would be automatically elected, and excess votes would be transferred to the next leading candidate until all seats are filled. Countries such as Australia, Ireland, and Malta use the Droop quota.

Drug Cartels

In modern commercial usage, the term *cartel* draws from the German word *Kartell*, which has earlier uses derived from Latin, French, and Italian. In the conventional sense, a cartel refers to formal agreements among business associations, or firms, to control production, fix prices, limit competition, and/or segment markets (by product, clientele, or territory). Cartels are often considered to be illegal because of antitrust laws and regulations that seek to restrict monopolistic practices.

The term *drug cartel* is frequently used to describe organized crime syndicates involved in the production, distribution, and sale of psychotropic substances—including heroin, cocaine, marijuana, and synthetic drugs—that have been prohibited in many countries since the early twentieth century. While such organizations, also known as drug trafficking organizations (DTOs), have existed in multiple contexts, the term *drug cartel* came into vogue primarily in reference to Latin American DTOs in the later part of the twentieth century. Such DTOs typically employ their substantial capacity for corruption and violence to advance their goals.

Among the earliest DTOs to earn the cartel label were two major trafficking organizations based in the cities of Medellín and Cali in Colombia. The Medellín cartel, for example, achieved such power and wealth that Pablo Escobar, its main leader in the 1980s, was elected as an alternate in the federal legislature in 1982 and was named by *Forbes* magazine as one of the world's ten richest men (#7) in 1989.

After Escobar's death in 1993 and the Medellín cartel's subsequent downfall, the Cali cartel rose to prominence in the 1990s. The Cali cartel was developed by Gilberto Rodríguez Orejuela and José Santacruz Londoño, who operated their organization through independent groups or "cells." Each cell had specialized functions related to some specific aspect of the organization, such as production and distribution, finance and money laundering, protection and enforcement, or legal and political influence.

As the Medellín and Cali cartels fell into decline, other cartels began to develop elsewhere in the region, with substantial transnational supply chain networks. Among these were organizations that rose to prominence in major cities in Mexico, notably the Guadalajara cartel in the 1970s and 1980s; the Juárez cartel, the Tijuana cartel, and the gulf cartel in the 1990s; and the Sinaloa cartel (also known as "the Federation") in the 2000s. Substantial trafficking organizations also developed in Brazil, where Luiz Fernando da Costa operated a major DTO within a larger gang network known as the Red Command (*Comando Vermelho*) until his capture in 2001. Like several other well-known drug kingpins elsewhere, da Costa continued orchestrating criminal activities from his jail cell until he was extradited to the United States in 2008.

In reference to DTOs, many experts avoid the use of the term *cartel,* because DTOs demonstrate significant differences from cartels in the conventional business world. Notably, despite their frequent efforts to limit the entry of new competitors, most DTOs do not deliberately conspire to maximize prices. Moreover, while DTOs frequently engage in other cartel-like behaviors, such as negotiating territories, such collusion requires substantial organizational coherence. Cooperation among DTOs is especially difficult to achieve in the face of intense competitive pressures, shifting market trends, and law enforcement efforts.

Drug Policy

Drug policy covers an extensive range of governments' responses to the problem of illegal drugs. This entry will identify the drugs in question, explain the origins of national drug policy, examine the development of international drug policy, and identify the range of policies employed. As illegal drug cultivation, production, and consumption can occur on different continents, international cooperation took hold in the twentieth century to curb supply and disrupt movement of drugs to market.

DRUG USE AND REGULATION

Drug is a generic term. It is used to describe over-the-counter remedies, like aspirin; prescription medicines, like antibiotics; and psychoactive substances that effect our moods and perceptions; these may be unregulated, like coffee; regulated, like alcohol; or prohibited, like heroin. It is this last group that forms the subject matter here. These drugs are prohibited by three United Nations (UN) conventions: the 1961 Single Convention on Narcotic Drugs, covering opium and its derivatives, coca and its derivatives, and cannabis; the 1971 Convention on Psychotropic Substances, covering amphetamine-type stimulants (ATSs) such as ecstasy; and the 1988 Convention against Illicit Traffic in Narcotics and Psychotropic Substances.

Drugs transform human behavior, and this attracts the attention of authority. Since time immemorial, authorities, both secular and sacred, have tried to control and restrict the use of drugs. Use of indigenous drugs has tended to be tolerated and regulated. Alcohol, for instance, is easily produced from fermented grain and fruit, and its use has been widely accepted in Europe, although since the seventeenth century it has been increasingly regulated. But when tobacco was brought to Europe, it was regarded as threatening and was prohibited. In many countries today, morality reinforces state drug prohibition: Drugs are bad; they corrupt the individual and threaten the security of the state and stability of society. In other countries, drug use is regarded as an ordinary consequence of human nature but one that creates problems. These positions are not mutually exclusive, but they do reinforce two different drug policies: One emphasizes the wickedness and punishment of users and dealers, and the other emphasizes minimizing the social harm caused by drugs.

INTERNATIONAL DRUG POLICY

International drug policy developed in the twentieth century. The United States played a leading role in persuading other countries to adopt a prohibition regime. It began at the Shanghai Conference in 1909 and now incorporates the comprehensive UN Conventions. Drug policy was internationalized, because the drug trade is international in scope. Colombia, for example, produces 62 percent of the world's cocaine.

There is a market for prohibited drugs just as there is for any legal product. Markets operate on the basis of supply and demand. The aim of international drug policy is to free the world from drugs, largely by intervening in the market. Domestic drug policy focuses on the demand side. Governments use education to persuade people not to try drugs and often provide treatment for addicts. These policies are reinforced by deterrence: the prosecution and punishment of those who continue to use drugs and who turn to acquisitive crime to support their habits.

International drug policy works primarily on the supply side. It attempts to reduce supply so that prices will rise to a point where users stop buying. It employs a whole repertoire of policy instruments to prevent the cultivation, manufacture, trafficking, and dealing of drugs. In principle, this approach has a lot to recommend it. Drugs are much more visible in the fields than on the street. Crop eradication, for example, persuading or coercing farmers not to grow coca or opium, is the favored policy. Eradication will have only a temporary effect if farmers have no source of alternative income and if drug barons continue to bribe and intimidate the farmers back into drug cultivation. Eradication is, therefore, often combined with alternative development, whereby farmers receive subsidies to encourage them to grow legal crops. These policies are reinforced by interdiction, which is used against all kinds of drugs, including ATSs. Interdiction covers a range of activities designed to keep drugs from reaching the market, including destruction of processing plants, the prosecution and imprisonment of drug barons, and seizure of drugs at state borders. Drugs that do get through borders may still be incepted at street level. Long prison sentences and seizure of assets are designed to deter both traffickers and dealers.

Drug policy involves the cooperation of different countries' governments with the international community to reduce drug trafficking through the use of market forces backed up by the full force of state coercion and moral persuasion. Drug policy remains high on the domestic and international political agendas. The Mexican government is confronting a wave of violence in response to its determination to curb its drug cartels, while Afghanistan struggles with the Taliban insurgency, largely funded by the illegal opium crop.

Dual Citizenship and Dual Nationality

Dual citizenship describes the status of individuals holding citizenship status in more than one country. The status suffered severe historical disfavor. In recent years, however, dual citizenship has become increasingly common. A majority of countries now accepts the legitimacy of dual citizenship.

Dual citizenship results from the interplay of national rules relating to the acquisition of citizenship. Individuals can be

born with dual citizenship where their parents hold different nationalities or where they are born in a country other than that of parental nationality. Many countries now allow individuals to retain citizenship after acquiring the citizenship of another country through naturalization. A nontrivial number of individuals hold citizenship in more than two countries, giving rise to a phenomenon more accurately described as plural citizenship.

Recent acceptance contrasts with difficulties historically provoked by the status. During the nineteenth century, European states refused to recognize the naturalization of their subjects in the United States. This resulted in competing claims over immigrants and serious bilateral controversies, including the War of 1812 between the United States and Great Britain. Immigrants to the United States who visited their homelands often faced harassment by governments seeking to extract military service notwithstanding permanent relocation.

Because of the frictions triggered by dual nationals, states attempted to suppress the status. States were never able to eliminate dual nationality, because they were unwilling to harmonize nationality laws. However, they did adopt mechanisms to reduce the incidence of dual nationality. Many countries required individuals born with dual nationality to choose one or the other at age of majority (a so-called election requirement). By the end of the nineteenth century, most European states were terminating original nationality upon naturalization elsewhere. For instance, after 1870, British subjects who acquired citizenship in the United States lost their British nationality as a result of U.S. naturalization. Because dual nationality often resulted in duplicative national obligations (especially regarding military service), individuals also shared an interest in avoiding the status.

Dual nationality remained the object of scorn through much of the twentieth century. The status was often compared to bigamy. The mid-nineteenth-century American diplomat George Bancroft observed that states should "as soon tolerate a man with two wives as a man with two countries; as soon bear with polygamy as that state of double allegiance which common sense so repudiates that it has not even coined a word to express it." Teddy Roosevelt called dual nationality "a self-evident absurdity." Public perception of the status assumed the undesirability of divided allegiance and diminished loyalty. Although there were no notable cases of dual-national saboteurs, dual nationality conjured up the specter of shadowy fifth columns.

These associations were slow to dissipate. Massive migrations at the end of the twentieth century once again set up the possibility for a greater incidence of dual citizenship. In contrast to earlier periods, however, dual citizens no longer posed a particular threat to interstate relations. States grew more tolerant of the status, and transformed conceptions of national solidarities diluted the former identification of the status with disloyalty. This diminished the incentive for eligible individuals to avoid the status. As states grew less demanding in terms of obligations extracted from citizens, moreover, individuals could reap concrete and sentimental benefits from maintaining formal ties with more than one country.

Indeed, some states have moved beyond mere toleration of dual citizenship to full embrace. It is increasingly viewed as a tool for cementing diaspora populations. This is true among such established historical diasporas as the Irish and Italians, the homelands of which have loosened citizenship rules to allow for the nationality of third-generation emigrants. Many Americans have on that basis reclaimed the citizenship of their grandparents, reaping the travel, educational, and employment benefits that come with citizenship in European Union member states. Those who returned to Central and Eastern Europe after the fall of the iron curtain typically retained citizenship in their adopted homelands, in many cases while assuming leadership positions in newly democratized states. Such immigrant-sending states as Mexico, Turkey, and the Philippines have also moved to encourage the status as they look to draw on the economic prosperity of emigrant communities and to mobilize them politically in their new states of residence.

Some important countries continue to buck the trend toward acceptance of dual citizenship, especially East Asian and African states. But there are now many millions of individuals who openly hold nationality in more than one country. Plural citizenship appears almost certain to emerge an irreversible incident of globalization.

Dual Executive

Among democratic political systems across the world, three models of organizing relations between the executive and legislative branches of government exist: parliamentary, presidential, and dual executive systems. In a *parliamentary system,* the executive consists of a cabinet that is headed by the prime minister and arises directly from the legislature. The cabinet is responsible to the legislative majority, which can dismiss the executive by means of a motion of no confidence. In *presidential systems,* on the other hand, a popularly elected president appoints and directs the cabinet. The executive and the legislature have separate popular mandates, and they are mutually independent for their survival in

office. *Dual executive systems* combine the central features of parliamentary and presidential systems by dividing executive authority between a popularly elected president and a cabinet that stems from, and is responsible to, the legislature.

In dual executive systems, there are two centers of executive power, each with its own popular mandate, although in the case of the cabinet, this runs indirectly through the legislature. Dual executive constitutional design occurs across the globe but is especially common in central and eastern Europe, where it was adopted on a large scale after the breakdown of communism. Contemporary examples of governments with dual executives are those of France, Portugal, Russia, Poland, Slovakia, Bulgaria, Romania, Mali, and Peru.

The distribution of power between the president and the cabinet varies considerably across dual executive systems. A president's constitutional role may be limited to the signing of international treaties and a weak presidential veto of legislation. However, there are also presidents who possess a much broader constitutional basis for interfering in executive affairs. But these constitutional differences explain only part of the actual power relations in a dual executive system. Custom and political circumstances may affect the balance of power between presidents and cabinets at least as profoundly and can produce variations through time. The nature of the parliamentary majority is especially important in this respect. Being dependent upon support from the legislature, the cabinet's position vis-à-vis the president may be stronger when the assembly majority is opposed to the president. On the other hand, if the legislative majority is supportive of the president, the latter's executive influence generally increases at the expense of the cabinet. Such shifts in power within otherwise stable constitutional systems are possible because of ambiguities in many dual executive constitutions.

The precise scope of presidential influence is often unspecified in dual executive constitutions, which means that the actual distribution of executive tasks between presidents and cabinets is dependent upon party politics and may become the subject of intraexecutive competition. These features make dual executive constitutional design flexible, yet at the same time prone to political instability, personal ambitions, and power concentration. The academic debate on the appropriateness of dual executive constitutional design is therefore unsettled.

Du Bois, William Edward Burghardt

William Edward Burghardt Du Bois (1868–1963) was a scholar, a political activist, and the leading African American thinker of his generation. Born in Great Barrington, Massachusetts, Du Bois spent most of his long career in the United States, but he moved to newly independent Ghana in 1961, invited by President Kwame Nkrumah to become editor of the *Encyclopedia Africana,* a project Du Bois had first proposed in 1909. After the U.S. Department of State refused to renew his passport, Du Bois became a Ghanaian citizen in the last year of his life. He died on August 27, 1963, on the eve of the march on Washington.

Du Bois graduated from Fisk College in 1888 and earned a second BA from Harvard University in 1890. He spent the years 1892 to 1894 in doctoral studies at the University of Berlin, returning to the United States to receive his PhD from Harvard in 1895. He taught briefly at Wilberforce College and then at Atlanta University from 1897 to 1910.

Du Bois's achievements include a share in founding the Niagara movement in 1906, its successor the National Association for the Advancement of Colored People (NAACP) in 1909, and the Pan-African Congress in 1919. He edited the NAACP magazine *The Crisis* until 1934, building its circulation up to 100,000. His dissertation, *The Suppression of the African Slave Trade to the United States of America, 1638–1870* (1896), and his sociological study *The Philadelphia Negro* (1899) are still considered landmarks of scholarship.

Du Bois's best-known book, *The Souls of Black Folk* (1903), is a collection of essays, ranging from personal memoir to sociological study. It combines a rich evocation of the life and culture of the African American South with a masterfully orchestrated polemic against the political ideas and leadership of Booker T. Washington. Du Bois argued, contra Washington, for three key strategic points: that African Americans should demand the right to vote, resist the imposition of social segregation, and insist on access to a high-quality liberal arts education for the community's future leaders (those to whom he referred elsewhere as the "Talented Tenth"). His declaration that "the problem of the twentieth century is the problem of the color line" and his description of himself as "an American, a Negro; two souls, two thoughts, two unreconciled strivings; two warring ideals in one dark body, whose dogged strength alone keeps it from being torn asunder" did much to define African American political consciousness.

Other notable books—among many—include *Black Reconstruction in America* (1934), which portrayed the Reconstruction era as a struggle by the freed slaves, rather than an imposition by the North on the South; *Dusk of Dawn: An Autobiography of a Concept of Race* (1940), which describes the development of his thinking about African American liberation; and *Color and Democracy: Colonies and Peace* (1945), which articulated his Pan-Africanist vision.

After World War II (1939–1945), Du Bois grew increasingly disillusioned with the chance for change in America and saw

the Soviet Union as the bulwark of anticolonial struggle. He was indicted as a foreign agent but acquitted in 1951, denied a passport from 1952 through 1958, awarded the Lenin Peace Prize in 1959, and joined the Communist Party in 1961, when he was 93 and living in Ghana.

Due Process

Generally speaking, *due process* of law constitutes the normal course of legal administration through the courts or some other adjudicatory mechanism with the appropriate safeguards in place to protect individual rights. At the heart of due process is a framework of principles and rules that structure legal proceedings; this framework has been established over time and functions to ensure that private rights are shielded from improper infringement by the state or other private parties. The steady realization over time of the rule of law and the accompanying due process protections in liberal polities constitute two of the most important features distinguishing such polities from authoritarian regimes and otherwise illiberal governmental systems. Due process is a critical constraint and restriction on the ability of governing elites to run roughshod over fundamental liberties of individuals within a free society. It helps to ensure consistent and fair application of the law by minimizing the potential influence of capriciousness or arbitrariness on the part of government officials on such matters.

PROCEDURAL DUE PROCESS

An essential element of understanding due process is consideration of what procedures, at a minimum, are necessary to guarantee proper protections. A constituent aspect of due process is the presence of a valid tribunal with the jurisdictional authority to hear and resolve the dispute in question, be it a criminal prosecution or a civil litigation. As mandated in two provisions of the U.S. Constitution, any legal proceeding that involves potential deprivation of life, liberty, or property necessitates due process of law protections. The Fifth Amendment lays out this requirement for the federal government, and the Fourteenth Amendment does the same for state governments.

The U.S. Supreme Court has engaged this very question of what level of process is due and sufficient in any given set of circumstances (e.g., a criminal prosecution, a civil litigation, a hearing on the continuation or termination of government benefits for an individual, an adjudication on the legality of a government employee being dismissed). The two major cases in this area are *Goldberg v. Kelly* (1970) and *Mathews v. Eldridge*

(1976). These two cases emanate from the administrative law context, but they have been drawn upon in subsequent court decisions as guiding precedent in other areas of the law where adjudicative procedures come into play.

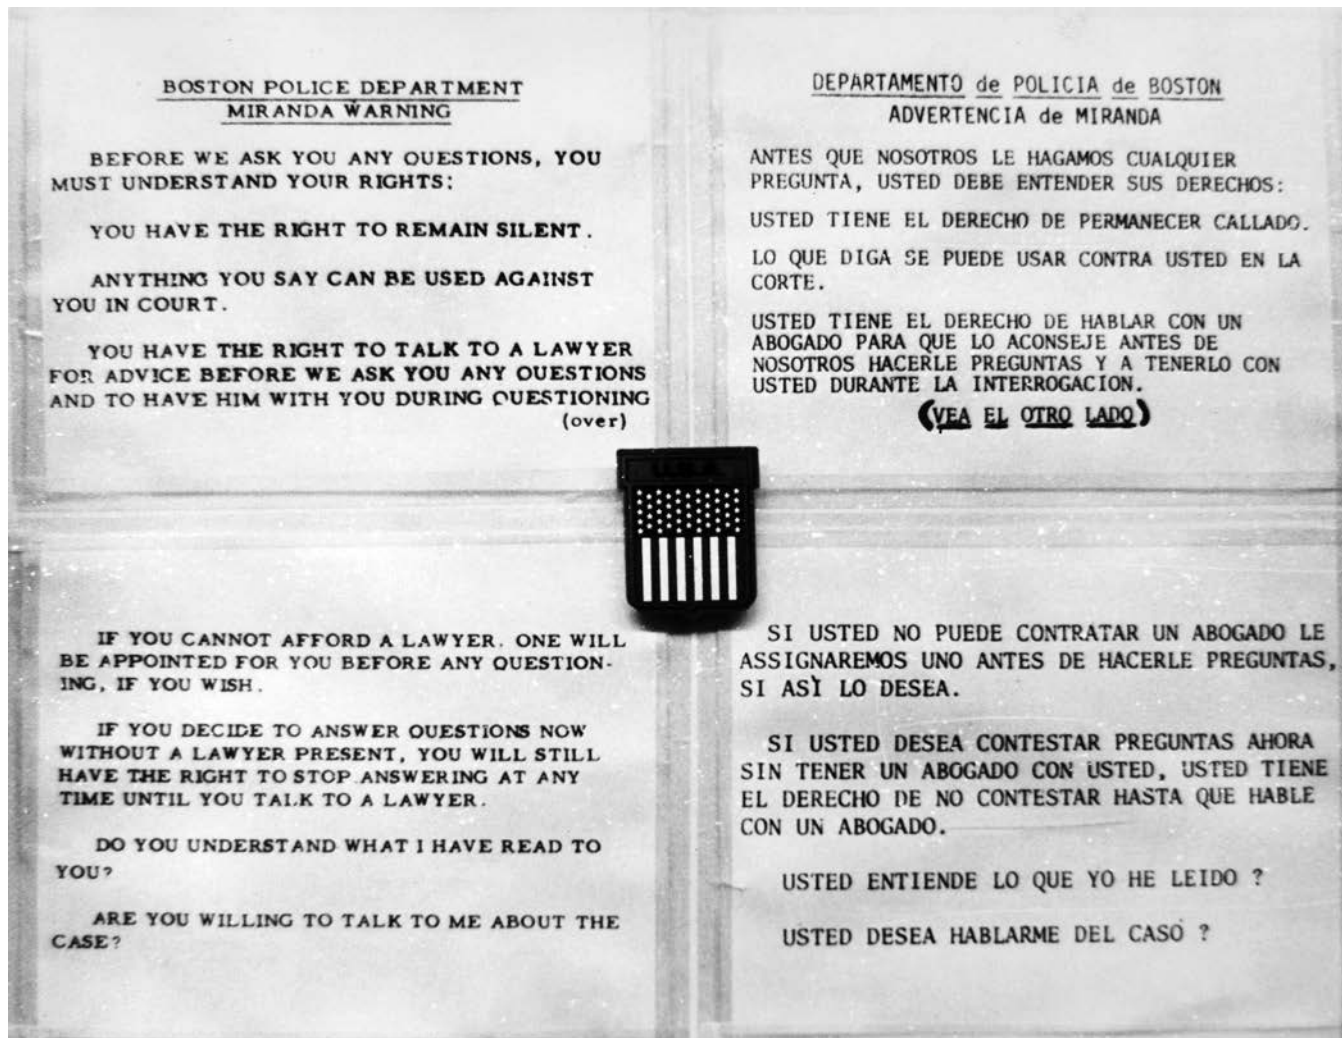
In *Goldberg,* the Court laid out the prominent components of due process, and they are as follows: Persons who will be directly affected by a tribunal's decision will

- Be present at the tribunal's proceedings
- Receive timely and adequate notice of the charges against them
- Be able to make an informed decision to contest the legal actions being taken against them or to submit to/accept the actions
- Be able to engage in confrontation and cross-examination of adverse witnesses
- Have an opportunity to present their own witnesses
- Have an opportunity to address the tribunal's fact finder or decision maker (judge or jury) orally
- Have the right to have legal counsel present and to assist as wished.

In addition, the tribunal's decision will be on the record, there will be an explanation of the decision, and there must be an impartial decision maker. For due process to be considered operative, there can be no presumption of guilt or liability by the tribunal decision maker—findings of guilt or liability must be proven by legally obtained evidence, and the tribunal's decision must be sustained by the evidence presented during the proceedings. At the foundation of due process of law is the notion of fundamental fairness, with the result being a resolution of the dispute in question based in true justice.

The subsequent *Mathews* decision built upon *Goldberg,* and it established the three-factor modern rule that governs all determinations of whether the due process provided is sufficient. One must consider (1) the importance of the private interest that will be affected by the official action, (2) the risk of an erroneous deprivation of that interest under the required procedures and the likely reduction of that risk by requiring more or different procedures, and (3) the government's interest in using the required procedure, as opposed to more or different procedures and the burdens those varying procedures place upon the government. The Court's own words at the end of its decision in *Mathews* are instructive:

> The essence of due process is the requirement that a person in jeopardy of serious loss be given notice of the case against him and opportunity to meet it. All that is necessary is that the procedures be tailored, in light of the decision to be made, to the "capacities and circumstances of those who are to be heard," to insure that they are given a meaningful opportunity to present their case.

In other words, the Court in *Mathews* makes a point of moving away from the presumption in favor of judicial-type procedures, as *Goldberg* laid out, and toward a more flexible orientation toward what could constitute a fair procedure, so long as the individual affected had a realistic prospect to attend to the issues at hand.


The Miranda warning informs people of their constitutional rights after being taken into police custody. The warning is one of several measures taken after rulings from the U.S. Supreme Court regarding the due process of law.

Considerations of procedural due process have become particularly salient in the wake of the American war on terror after the 9/11 terrorist attacks on New York City and Washington D.C., with subsequent questions arising over the treatment, interrogation, and prosecution of alleged terrorists. What level of due process is "due" to this type of detainee? This necessarily brings into play a variety of accompanying concerns ranging from ensuring national security to not hindering ongoing military operations to respecting basic human rights to providing fair trials to demonstrating fidelity to international agreements on the treatment of foreign hostiles. This is a challenging question indeed, with the need to weigh and balance competing values and compelling opposing arguments in trying to determine what level of due process protections is warranted. The use of military commissions to try suspected terrorists at the American naval base at Guantanamo Bay, Cuba, is at the forefront of this debate.

SUBSTANTIVE DUE PROCESS

There is a second type of due process, commonly referred to as substantive due process. *Procedural due process,* as presented above, is relatively straight-forward—if certain protocols are followed, then due process is considered to have been successfully followed. *Substantive due process,* in comparison, is less clear-cut conceptually and has a more subjective quality to it than procedural due process, but its implications have had an extraordinarily influential role in the conduct of American law and politics from the late 1800s onward. The creation, decline, and subsequent resurgence of substantive due process speaks to the substantial impact of Supreme Court decisions on the social, economic, and political life of the United States.

At the heart of substantive due process is a focus on the substance of legislation enacted by a state or the federal government. Is that legislative enactment or government action fair, reasonable, and nonarbitrary in its content as well as in its

implementation? If not, according to this type of due process, then the courts need to strike it down as unconstitutional, because it violates the due process clause. So this is a much more expansive and broad view of the constitutional guarantees surrounding deprivations of life, liberty, and property. With substantive due process, there are simply some regulations that the government cannot legitimately engage in, because, by their very nature, they are unfair and arbitrary intrusions into persons' rights to life, liberty, and property. Thus, the Supreme Court has drawn upon the notion of due process to discover or recognize rights that are deemed to be fundamental and that receive very high levels of constitutional protection. The concept of substantive due process was initially launched by the Supreme Court in *Lochner v. New York* (1905), and from then on for several decades, the Court manifested a strong tendency to strike down a variety of state laws on due process and similar constitutional grounds. In *Lochner,* the Court rejected as an abridgment of the "liberty of contract" a New York state law that limited the number of hours bakers could work on a weekly basis—this "liberty" abridgment for the Court was a due process violation.

The *Lochner* era demonstrated the Court's willingness to strike down any number of state laws that impacted economic relationships. This trend abated when the membership on the Court changed in the 1930s, as President Franklin Roosevelt appointed justices who abandoned this orientation toward economic regulation, and substantive due process ended up submerging for a time. It reappeared in the 1960s as a mechanism for the Supreme Court in legitimizing and validating a wide array of noneconomic interests, most notably the right to privacy, as established in *Griswold v. Connecticut* (1965), which serves as the foundation for the Court's decision that abortion rights are constitutionally protected as declared in *Roe v. Wade* (1973). Prominent examples of the continuing impact of the right to privacy are seen in the subsequent and highly controversial cases of *Planned Parenthood of Southeastern Pennsylvania v. Casey* (1992), in which the Court modified the *Roe* ruling but still maintained constitutional protection for abortion, and *Lawrence v. Texas* (2003), where the Court found homosexual conduct to be constitutionally protected. This idea that there are certain fundamental rights that the government cannot intrude upon is constitutionally operationalized through this method of substantive due process. The debate remains highly contentious over the appropriateness of such a mode of constitutional interpretation, with critics arguing that the Court is both fabricating rights that are nowhere mentioned or envisioned in the Constitution and is not showing proper deference to enactments by the elected branches as well.

Duration Model

Duration models explain the longevity of a process or predict when an event will occur. These models are also referred to as *survival, failure time,* and *event history* models by various disciplines. Such models are uniquely suited to address questions about when an event will occur, since originally they were used to study how long light bulbs last, and, therefore, they provide an appropriate set of tools for similar applications. Analysis is based on the estimation of a *survival function*—the probability that a certain process will last at least a certain number of time periods, and a *hazard rate function*—the probability that the process will end at a particular time, given that it has lasted for at least a certain number of time periods.

There are nonparametric and parametric approaches to estimate a survival function. For example, Kaplan Meier's nonparametric estimates of a survival function are derived by writing the survival function for discrete data as the product of the conditional probabilities of surviving in each time period. Duration models in political science are widely used to investigate questions on the duration of a justice's career (American politics), the duration of a militarized interstate conflict (international relations), the survival of a political regime (comparative politics), and many other questions.

Durkheim, Émile

Together with August Comte, Émile Durkheim (1858–1914) is often considered the founder of sociology. Durkheim's significance is also felt in anthropology, philosophy, religious studies, and political science. His four major works are *Division of Labor in Society* (1893), *The Rules of the Sociological Method* (1895), *Suicide* (1897), and *The Elementary Forms of Religious Life* (1912). The principle argument that connects all these books is this: As societies (his Euro-centrist perspective is often criticized) enter into a transition from feudalism to capitalism, what are the social consequences for the individual as well as for society? How can a society afford individuals greater freedom of choice without undermining their attachment to institutions? Hence, integration, and how it is reproduced, is Durkheim's central concern.

Moreover, as religion loses its historic function as the dominant ethical and moral force by which individuals develop as well as receive "social integration," societies are increasingly challenged to develop a secular alternative to religion. To be sure, Durkheim did not think that the emerging modern secular society is any less moralistic than the premodern religious society. However, to the degree to which new integrative mechanisms fail or function insufficiently, the individual and society will have to pay a price. Thus, at the individual level, suicide may increase (as indeed it has), while at the level of society, anomie (normlessness) or the "forced division of labor" (coerced social cohesion or, simply, class conflict) may ensue.

Durkheim is sometimes considered the first "functionalist." *Functionalism* can be described as a school of thought that takes as one premise that societies tend to produce their own equilibrium and that economic, political, legal, and cultural (including here religious) institutions have corrective abilities, perhaps even a mandate, should a society deviate "too much" from its normal state of affairs. Exactly "how much" too much is, or what, exactly, the "normal course" or direction of a society is, Durkheim never states explicitly. However, in *The Division of Labor in Society,* he goes to great lengths to distinguish the "normal" from the "pathological," and in so doing reveals an ontological position not unlike that of, say, late nineteenth-century biology (and its influence on social theorists such as Schäffle).

In the United States, no one has built on Durkheim's work more extensively than Talcott Parsons. Parsons's structural functionalism was perhaps the most influential theoretical paradigm in the social sciences in the 1950s and certainly influenced an entire generation of political scientists. Yet other scholars have taken Durkheim's ideas quite some place else. Philippe Schmitter, for example, was one of the earliest to see useful parallels between corporatism and Durkheim's arguments in *The Division of Labor.* In turn, scholars who found corporatism a useful concept were themselves influencing later scholarship that focused on the breakdown of democracy, and, roughly, a decade later, on the transition to democracy. Durkheim's work has thus proven to be of enduring relevance.

What is more, in light of recent debates around the clash of civilizations, Durkheim's theories on religion and his attempt to establish a "science of morality" invite important comparisons between, on the one hand, late nineteenth-century social theory as an incipient social and empirical science with its own distinct methodology vis-à-vis the established field of philosophy, and, on the other hand, early twenty-first-century debates (as well as searches for common grounds) dealing with the intersection of religion and political democracy (and/or theology and political science).

Duverger's Law

Formulated in 1956 by French political scientist Maurice Duverger, *Duverger's Law* states that the simple-majority single-ballot system favors the two-party system. From this law Duverger derived a hypothesis that the simple-majority double-ballot system and proportional representation favor multipartyism. Both Duverger's Law and hypothesis suggest a kind of "institutional determinism," in which a specific set of electoral rules create a particular party system.

There are two main classical controversies concerning the validity of Duverger's Law. First, political scientists have not unanimously approved the direction of causality from electoral systems to party systems. Second, the sociological perspective postulates that not the electoral system but rather the number and type of social cleavages in a society primarily determine the party system. More recent scholarship has tried to combine the institutional and the sociological perspectives. In heterogeneous countries with cross-cutting cleavages such as Canada, simple plurality rule does not lead to a two-party system at the national level. Yet, at the district level, Duverger's hypothesis generally holds; the large majority of districts in single plurality systems are dominated by two parties. *Strategic voting*—voters might desert all candidates except the two top placed contenders (M+1 rule)—and *elite coordination*—elites may retire hopeless candidacies—account for the better fit of Duverger's Law at the district level.

Eckstein, Harry

Harry Eckstein (1924–1999) was born in Schotten, Germany. Eckstein, who was Jewish, was brought to the United States when he was twelve as part of the exodus from Nazi Germany that became known as the One Thousand Children. This was a program administered by the U.S. government that brought intellectually gifted children to the United States. While his sister, Ilsa, eventually escaped from Germany, the rest of his family perished in the Holocaust.

Eckstein spent his adolescent years in Columbus, Ohio. He then attended Harvard University, where he received his bachelor's degree (1948, summa cum laude), master's degree (1950), and doctorate (1953) in political science.

He began his teaching career at Harvard University as an instructor and then as an assistant professor (1954–1958). Eckstein then moved to Princeton (1959–1980), where he became the IBM Professor of International Studies in 1969. In 1980, he moved to the University of California, Irvine, where he taught until his death in 1999.

His dissertation was published as *The English Health Service* (1958). He followed this with his study of the British Medical Association, which was published as *Pressure Group Politics* (1958). In *A Theory of Stable Democracy* (1961), Eckstein presented what he called "congruence theory," which states that governments perform well to the extent that their authority patterns are congruent with the authority patterns of other units of society. Later works include *Internal War* (1964), *Division and Cohesion in Democracy* (1966), *Patterns of Authority* (1975), *Regarding Politics* (1992), and *Can Democracy Take Root in Post-Soviet Russia?* (1998). Eckstein's contributions to the field of political science include his work on interest groups, his work on civil strife, and his use of case studies to explain comparative politics.

Eckstein was a political scientist who argued that the authority patterns in a society were a critical variable in determining whether democracy would succeed in a nation-state.

Ecological Analysis

Ecological analysis is an effort to incorporate environmental and natural science notions into traditional political analysis. It is based on the premise that the study of government and societies can be enhanced by progress in understanding the planet's ecology. Ecological analysis argues that most existing political ideologies are based on the acquisition and exploitation of natural resources to improve the standard of living of the ideologies' respective societies or to increase their military or economic security. Because of the drive to gain resources, groups developed stratified societies in which elites established control over, first, agricultural production and, later, industrial production. As agriculture spread, there was a concurrent expansion in the population. Some scholars trace ecological analysis to the work of Thomas Malthus, who blamed population growth on poverty and impoverishment. The result of these aggressive, resource-exploitive ideologies was highly stratified societies, even among political philosophies such as Marxism and Leninism, which sought egalitarianism. Elites were able to gain control of surpluses and use those additional resources to bolster their political and economic power. In contrast, political structures based on sustainable development and environmentally friendly practices will result in more egalitarian and balanced societies.

Ecological Fallacy

The ecological fallacy is a concept first introduced in 1950 by William S. Robinson in a paper published in the *American Sociological Review.* Through a statistical analysis of the relationship between immigration and literacy rates, he illustrates that we cannot extend patterns found at the aggregate level to make inferences about individuals. He finds that being foreign born correlates positively with a lower literacy level. At the aggregate level, however, he finds that the higher the population of immigrants in a state, the higher is the literacy rate in that state. His analysis illustrates that if we extend the findings at the aggregate level to the individual level, we would incorrectly conclude that a given foreign-born individual would be more literate rather than less literate.

In *Designing Social Inquiry: Scientific Inference in Qualitative Research,* Gary King, Robert Keohane, and Sidney Verba warn against the dangers of the ecological fallacy and suggest that in general, if one is seeking to draw conclusions at the individual level, one ought to look at individual-level data. However, they do note that there are circumstances in which obtaining and analyzing data at another level of aggregation is useful, for example, when individual-level data are not available and when our theory has implications at more than one level of analysis. In these circumstances, they suggest, we can best determine the reliability of our theory by obtaining as much information as possible, at all levels of analysis. Gary King's later (1997) path-breaking work deals with the problems of the ecological fallacy in more depth. In his book, *A Solution to the Ecological Inference Problem: Reconstructing Individual Behavior from Aggregate Data,* King demonstrates the inability of previous statistical models to accurately capture the impact of aggregate-level variables and introduces a new statistical model that is able to overcome some of the methodological problems associated with ecological inferences. King continues to argue (as he did with Keohane and Verba in 1994) that more information available to the researcher is better (at all levels of aggregation) as it can help to increase the robustness and reliability of our findings.

Economic, Social, and Cultural Rights

Rights in moral philosophy and political theory are understood as justified claims. A right is an entitlement of a person or group to some good, service, or liberty. Rights create correlative obligations or duties, usually on the part of the state, to secure or to not interfere with the enjoyment of that entitlement.

Human rights are a special class of rights—the rights one has by virtue of being a human being. Human rights are predicated on the recognition of the intrinsic value and worth of all human beings. As such, human rights are considered to be universal, vested equally in all persons regardless of their gender, race, nationality, economic status, or social position. Cumulatively, human rights represent the minimum conditions for a decent society.

Economic, social, and cultural rights encompass the economic, social, and cultural benefits, services, and protections that have received widespread acceptance as legal entitlements. The Universal Declaration of Human Rights, adopted by the United Nations General Assembly in 1948, enumerates two categories of human rights: (1) the civil and political rights with which most Americans are familiar and (2) economic, social, and cultural rights. Subsequent international and regional human rights instruments based on the provisions of the Universal Declaration of Human Rights are legally binding on countries that ratify them. The countries thus become states parties bound by their provisions.

BASIC HUMAN RIGHTS

The International Covenant on Economic, Social and Cultural Rights is the major international human rights instrument setting forth internationally recognized economic, social, and cultural rights. Relevant rights incorporated in the covenant include the following:

- the right of all peoples to self-determination through freely pursuing their economic, social, and cultural development (article 1.1) and controlling their natural wealth and resources (article 1.2);
- the right of everyone to the enjoyment of just and favorable conditions of work (article 7), specifically fair wages and equal remuneration for work of equal value; safe and healthy working conditions; and equal opportunity for promotion;
- the right of everyone to form trade unions and the right of each person to join the trade union of his or her choice (article 8), which includes the right of trade unions to function freely and to strike;
- the recognition that the widest possible protection and assistance should be accorded to the family (article 10), encompassing special protection to mothers before and after childbirth, including paid leave or leave with adequate social security benefits and measures to protect children and young persons from economic and social exploitation;
- the right to an adequate standard of living (article 11), including adequate food, clothing, and housing and the improvement of living conditions;
- the right of everyone to be free from hunger (article 11.2), which directs states to improve methods of production, conservation, and distribution of food by making full use

of technical and scientific knowledge, reforming agrarian systems, and ensuring an equitable distribution of world food supplies in relationship to need;

- the right to enjoyment of the highest attainable standards of physical and mental health (article 12), with a mandate that states take measures to provide for the reduction of infant mortality; the prevention, treatment, and control of epidemic, endemic, occupational, and other diseases; and the creation of conditions that would ensure medical services and medical attention to all in the event of sickness;
- the right to education (article 13), which states that primary education shall be compulsory and available free to all and that secondary education in its different forms shall be made generally available and accessible—article 13 also requires states parties to respect the liberty of parents and legal guardians to choose for their children schools other than those established by the public authorities—and
- three types of cultural and scientific rights (grouped together in article 15): the right to take part in cultural life; the recognition of the moral and material rights of authors, scientists, and artists; and the right to the benefits of scientific progress and its applications.

Acknowledging that it may not be possible for all states parties to realize immediately the full provisions of all of these rights, the standard the covenant uses is "progressive realization." Article 2.1 of the covenant directs states parties to take steps, individually and through international assistance and cooperation, to the maximum of their available resources, with a view to achieving progressively the full realization of the rights recognized in the present covenant by all appropriate means. Nevertheless, progressive realization over a period of time does not eliminate states parties' obligations to fulfill these rights. The United Nations Committee on Economic, Social and Cultural Rights, an expert body that reviews the performance of states parties, interprets the provisions of the covenant to require states parties to have a specific and continuing obligation to move expeditiously and effectively toward full realization of all the rights enumerated in the covenant. The committee also interprets the covenant to impose various obligations that have immediate effect, including core obligations related to each specific right.

PROTECTING HUMAN RIGHTS

The following is a list of the major international and regional human rights instruments that enumerate economic, social, and cultural rights, with the years they came into force:

- International Covenant on Economic, Social and Cultural Rights (1976);
- International Convention on the Elimination of All Forms of Racial Discrimination (1969);
- Convention on the Elimination of All Forms of Discrimination against Women (1981);
- Convention on the Right of the Child (1990);
- American Declaration on the Rights and Duties of Man (1948);
- European Social Charter (Revised; 1965); and
- African Charter on Human and Peoples' Rights (1986).

The constitutions of many countries also have provisions modeled on the economic, social, and cultural rights enumerated in the international and regional instruments. Some are in the form of directive principles of state policy that set forth goals rather than enforceable rights. Others, particularly more recently drafted constitutions such as the 1996 South African constitution, have bills of rights that recognize a broad array of socioeconomic rights.

Virtually all countries have ratified at least one international and/or regional human rights instrument that enumerates some economic, social, and cultural rights, and many also have constitutional or legal provisions stipulating rights protections and entitlements. However, in most states these rights are only partially implemented for a variety of reasons: insufficient resources, lack of political will, global economic pressures and commitments, and weak political institutions. Nevertheless, the existence of these rights commitments provides a normative framework for enlightened political actors and a basis for political mobilization and legal action. It is sometimes observed that human rights are claimed through mobilization from the bottom and not granted from the top, and that certainly is the case with regard to economic, social, and cultural rights.

Economic Development, State-led

State-led economic development is an institutional approach to development emerging from cold war–era debates about how poor countries can achieve economic development. Drawn largely from the experiences of successful developing

countries in Asia, state-led development is now a more coherently defined approach that late-developing countries draw on as they navigate the post–cold war era of economic globalization. Situated between the theoretical assumptions of laissez-faire economics and centrally planned command economics, the concept of state-led economic development begins with the claim that effective state institutions and deliberate policy interventions can contribute to a country's capitalist-based development by guiding markets to achieve particular economic goals. Two assumptions underpin the philosophical justification of this claim: first, on one end of the economic spectrum is a basic mistrust of self-regulating free markets to achieve developmental goals; second, on the other end of the spectrum is a conviction that states are incapable of efficiently allocating production through a centrally planned mechanism and must rely on market incentives.

For proponents of state-led strategies, economic development (as distinguished from economic growth) is viewed as the expansion of the economy to increase the aggregate welfare of society and improve the standard of living of a country's population. State intervention in capitalist markets through deliberate planning and responses to market changes—or what political scientist Atul Kohli (2004) refers to as a state's "market-reinforcing behavior"—is therefore the central concern of a state-led approach to overall economic development. State-led economic development is thus more than Keynesian-style macroeconomic management. It includes a measured role by the state to develop industrial policy and regulate trade and investment for the economic benefit of domestic firms and producers. Close ties between government and big business are a crucial feature of such state-led strategies, as is the close management of labor politics by the state.

IN THEORY AND PRACTICE

The ideas of Alexander Hamilton and nineteenth-century German philosopher Frederich List are considered early influences on theories of state-led economic development. The post–World War II rise in the liberal international trading system among industrialized countries, which viewed that state intervention is inimical to market-based development, and the rise of neo-Marxist dependency theory across the developing world, along with its emphasis on class influences rather than state autonomy, led to a decline in scholarly interest in the study of state-led economic development until the emergence of Asian economies in the 1970s and 1980s. Theorists have since used analytical approaches from comparative political economy, historical institutionalism, and statist (i.e., state-theoretical) approaches to advance literature on the subject.

In practice, state-led economic development is most closely associated with the successful economic development of Japan and the newly industrialized countries of Asia, including post-1979 China, where state leaders have employed gradualism in transitioning from central planning to state-led markets. It is also correctly associated with the experiences—and more mixed results—of other developing countries such as Brazil, Mexico, and India, where attempts have been made under conditions of less state autonomy. Many development failures

in the resource-based countries of sub-Saharan Africa are also attributed to bungled attempts of state-led economic development. Among economically advanced countries, forms of state-led economic development have evolved somewhat organically as social partnerships between state, business, and labor grew to define the political economy of European welfare states such as France, Sweden, and more recently Ireland. Japan's economic downturn in the 1990s and the 1997 Asian Economic Crisis dampened enthusiasm for state-led development strategies, but mixed economies still prevail globally. Multilateral provisions established by the World Trade Organization in the 1990s now inhibit the use of certain policies associated with state-led strategies, however. In particular, the agreements on Trade-Related Investment Measures and the General Agreement on Trade in Services target specific practices states have used to favor domestic producers over foreign interests.

State intervention in the economy, involving close ties with big business, creates political hazards. In some cases, institutions and policies have been fashioned to benefit state elites at the expense of other groups and overall development. Where state autonomy is especially weak, or where economies are based heavily on natural resources, state-led approaches often succumb to rent-seeking, patrimonialism, and predatory behavior. Even in economically successful Asian countries, a consequence of state-led economic development has been ongoing revelations about high-level corruption among state officials collaborating with private-sector cronies. Politically destabilizing public corruption scandals involving presidents, prime ministers, and major political parties punctuate the recent political history of South Korea, Taiwan, Indonesia, and Thailand, for example.

INSTITUTIONAL DETERMINANTS OF SUCCESS

With respect to the state, theorists of state-led development do not view the state as a unitary actor but rather as a set of institutions embedded in history, culture, and various context-specific influences. In observing the multiple contexts in which state-led development strategies are attempted, scholars vary in identifying the specific factors that push leaders to pursue a state-led approach. Some scholars, including Kohli, argue deeper historical factors, colonial experience, and cultural context influence the trajectories of states, whereas others, such as Stephan Haggard, identify more proximate factors, the "critical historical junctures" such as domestic economic crises and international economic shocks, as the key stimuli inducing a "politically motivated choice" by leaders to shift toward greater state intervention in the economy (Haggard 1990, 3–4).

Greater consensus exists among scholars on the significance of institutional arrangements in determining the success of state-led development strategies once they are adopted. Among the range of approaches taken by states, some form of indicative planning generally characterizes state-led involvement in markets. State authorities, intending to complement market forces and influence both the macroeconomic and

the microeconomic environments, use indicative planning to facilitate more rational decision making among leaders of the private and public sectors in the pursuit of agreed-on national goals. The success of state-led economic development thus hinges on how the politics of a state is organized and how state power is used, or in other words, on the patterns of state authority that influence the economic context within which private economic decisions are made.

State planning, however, is not enough to determine successful development. In a multiauthored study dedicated to the question of successful development strategies titled *In Search of Prosperity: Analytic Narratives on Economic Growth* (2003), Dani Rodrik and colleagues demonstrate how the type and quality of institutions also influence the success of state-led development. The foundations of long-term growth, according to the study, are tied to how well economic incentives are aligned with social costs and benefits, a state's bureaucratic capacity, the quality of its regulatory structures, property rights enforcement, law and order, and conflict management. The study's findings also emphasize how "good institutions" must enable social and political stability, be "highly specific to a country's circumstances," and deliberately generate market-oriented incentives for current and future investors (Rodrik 2003, 10). Thus, the quality of institutions, not simply their creation or presence, influences the success of state-led economic development strategies in the long term.

Economic Interdependence

Economic interdependence is a concept from the international political economy area of study, and it relates to the level of interconnectedness between two nation-states. The idea of political economy dates back to the birth of liberalism in the seventeenth century and is further discussed by eighteenth-century European philosophers Immanuel Kant, Baron de Montesquieu, and Adam Smith. The modern discussion of economic interdependence dates primarily to the 1970s. States may be dependent on each other for trade and investments but may also be sensitive and vulnerable to events and trends in the global economy. The world financial crises of 1997 and 2009 are contemporary evidence demonstrating the large degree of economic dependence between states and the global economy, as these financial crises spread like a contagion from state to state. States today are typically economically interdependent on other states, although the degree of dependence varies across states. North Korea is relatively isolated and is the least economically dependent state in the global economy, whereas small export-based economies, such as Singapore's, rank as highly dependent on other states.

Robert O. Keohane and Joseph S. Nye's *Power and Interdependence* (2001) discusses two dimensions of interdependence: sensitivity and vulnerability. Some nation-states may be sensitive to events or trends in other states and thus alter their domestic and foreign policies in response. However, states that are highly interdependent economically may be vulnerable to shifts in the global economy and the specific economic actions taken by sensitive states. As such, the level of economic interdependence between states may not be symmetric. For example, one state may be highly dependent on and thus vulnerable to another state for energy, such as Ukraine has been vis-à-vis Russia in recent years. In this situation, Ukraine is vulnerable to any fuel embargo by Russia, which provides political leverage for the latter.

HISTORICAL OBSTACLES TO THE CONCEPT

The conception of economic interdependence was obstructed first by imperialism in the nineteenth and early twentieth centuries and then by the Great Depression in 1929 and the cold war from 1945 to 1991. Levels of economic interdependence between states were extant but low leading into the twentieth century. There was hope by economic and political liberals such as Norman Angell (1933) that economic interdependence would bind states together peacefully, but this hope was dashed by the onset of World War I (1914–1918) and the Great Depression, followed by World War II (1939–1945). Still, policy makers in the leading capitalist states, particularly the United States and the United Kingdom, identified the lack of cooperation between liberal states in the face of economic interdependence during the Great Depression. As World War II was coming to a close, the existing liberal economic regime, led by the United States, the United Kingdom, and the Allied nations was established to manage the postwar world. Key western leaders and policy makers had come to the conclusion that World War II was potentially incited by the breakdown of economic cooperation among major European nations.

In addition, the Great Depression was exacerbated by the major global economic powers' raising tariffs against each other in the hope of obtaining external revenue to fix their own economic problems, which led to a collapse in international trade. Therefore, the postwar Bretton Woods system devised by representatives of the forty-four Allied nations

fostered global monetary and financial coordination through the International Monetary Fund, reconstruction and development through the World Bank, and free trade through the General Agreement on Trade and Tariffs. These three multinational corporations helped to dramatically increase the level of international trade and investment worldwide and thus increased economic interdependence worldwide.

While the new postwar economic policies and practices led to much higher levels of economic interdependence between global states, the concept of economic interdependence remained unnoticed or irrelevant by many political scientists during the cold war for two reasons. The first is that the specter of nuclear holocaust and the cold war arms race drew attention to policies related to military strength, acquisition, and security. The second is that because Marxist-Leninist theory and rhetoric provided a connection between economics and politics, the discussion of this nexus became stigmatized as radical and class based. However, the Vietnam War from 1959 to 1975 demonstrated military prowess did not equate to economic immunity as the oil crises, discontinuation of the gold standard to back currencies, hyperinflation, and the economic stagnation of the 1970s led to a renewed recognition that even the military powers of the world were sensitive and vulnerable to trends or fluctuations in the global economy.

CONTEMPORARY ECONOMIC INTERDEPENDENCE

At the beginning of the twenty-first century, the concept of economic interdependence is intermixed with the term *globalization*. While the economic dependence of states has grown in the past sixty years, so have the global connections between people as a consequence of significant increases in direct foreign investments, portfolio investments, trade, telecommunication technologies, and foreign travel. This growth in economic interdependence is a by-product of classical liberalism, emphasizing free economic markets and trade with limited government oversight, returning to the economic theories emerging in the eighteenth century, and moving away from the broader theoretical perspectives of realism and Marxism in international relations theory at times witnessed in the twentieth century. Thus, the General Agreement on Trade and Tariffs was replaced by the member states in 1995 in an effort to improve the enforcement of international free trade through the creation of the World Trade Organization. Furthermore, the emergence of economic integration treaties and regional organizations as characterized by the 1993 European Union model reinforces modern liberalism concepts. While the European Union created a single common market for goods, labor, and investments contributing to prosperity, it also provided a means for the once war-prone European states to form common preferences and negotiate peace terms. Similarly, examples of geopolitical organizations are the Gulf Cooperation Council, formed in 1981, and the Association of Southeast Asian Nations, formed in 1967. The Gulf Cooperation Council continues to seek to strengthen economic cooperation among its six member states in areas of agriculture, industry, investment, security, and trade. The Association of Southeast Asian Nations aims not only to accelerate economic growth across its ten participating countries but to serve as a platform to jointly settle domestic instability or foreign political intervention. However, there is still debate about whether the growth in economic interdependence in particular and globalization more generally are beneficial.

Current debates about economic interdependence surround issues relating to world peace, prosperity, and democratic stability. Recent U.S. leaders, such as Presidents Bill Clinton and George W. Bush, and some international scholars argue economic interdependence contributes to world peace by making military conflicts between states too costly. In contrast, realists tend to argue that current patterns of economic interdependence reinforce the power of the major power states in the world and the prospect for future wars is not reduced. Marxists point out that although there have been increases in total wealth in the world economy, there is still a gap between the rich and poor states of the world because of exploitation by multinational corporations, including the World Trade Organization and the International Monetary Fund. Last, some academics and policy makers debate whether economic interdependence makes some states, specifically third world or developing nations, more politically unstable and/or unable to sustain democracy by their vulnerability to global economic and market trends.

Economic Policy Formulation

In the Western democracies, following World War II (1939–1945), there emerged rather rapidly a consensus among most governments that the general reliance on market forces, which historically had dominated processes of economic policy formulation, would need to be replaced by approaches to economic governance that would incorporate much more active and systematic state economic intervention. This shift

in policy orientation was for the most part driven by the desire to avoid a return to the kinds of economic conditions that prevailed during the Great Depression of the 1930s—conditions that for many could be attributed in large part to prevailing laissez-faire policy orientations. Widespread citizen support for more government economic intervention was notably revealed by the dramatic increase in electoral support enjoyed by parties of the left in many countries in the immediate postwar period. Of note here was the impressive victory in Britain by the Labour Party in the general election of 1945. For Labour—and other like-minded parties in the capitalist democracies—the adoption of new strategies for state-managed capitalism seemed to have become both appropriate economically and viable politically. At issue of course was the question of which specific types of policy strategies would be adopted given the new state commitment to economic interventionism. It is here that the theoretical work of the great British economist John Maynard Keynes would prove critical.

THE KEYNESIAN CONSENSUS

The policies advocated by Keynes proved quite popular for the working-class parties in the 1950s and 1960s. As a system of economic governance, Keynesianism, when implemented, seemed to address effectively free market capitalism's periodic recessionary tendencies (which for Keynes generated unnecessary individual economic hardship and instability) while leaving largely intact the central values of entrepreneurial capitalism, most notably its reliance on private ownership of the means of production. For Keynes, governments could manage capitalism and promote continuous economic growth through the effective, systematic utilization of a variety of fiscal and monetary policy instruments. Particularly crucial here was Keynes's suggestion that governments could counter the initial stages of downward cycles by using public funds on socially beneficial projects. Such spending would stimulate private-sector economic activity such that high levels of aggregate effective demand and hence full employment could be rapidly reconstituted.

Politically, Keynesianism would effectively legitimize permanent, systematic state management of the capitalist economy. This left many analysts to conclude that Keynesianism represented a new form of democratic capitalism through which democratically elected governments could use Keynesian demand-management policies to promote increased economic prosperity for all societal classes.

The economic prosperity associated with the three decades following World War II throughout the industrial democracies is attributed by many to the widespread and successful implementation of Keynesian policies. The massive growth allowed for the creation of generous social welfare systems in many countries as well as an unprecedented level of employment security for middle- and working-class constituencies. Meanwhile, capitalists were placated by the maintenance of economic conditions that were conducive to consistent profitability and low inflation.

This general contentment is reflected in the political science and economics literature of the era. Authors such as Harold Wilensky, Anthony Crosland, and Andrew Shonfield shared the view that a Keynesian consensus—one characterized by a widespread acceptance as legitimate of Keynesian economics and welfare statism—had emerged and that the social conflict characteristic of prewar capitalist societies was rapidly declining. In short, most scholars, by the early 1970s, were of the assumption that a process of convergence in economic and social policy formulation was well under way.

This convergence theory and widespread optimism concerning the future of advanced capitalism was of course short-lived, as the oil shocks of the 1970s created a sustained period of economic stagnation coupled with relatively high rates of inflation. This stagflation proved difficult to counter with traditional Keynesian policies. Indeed, by the end of the decade it seemed clear to governments and scholars alike that Keynesianism, at least on its own, was no longer viable as a system of economic governance. The 1980s, then, witnessed widespread and significant shifts in state economic policy strategies. Of note here was the distinct lack of consensus concerning what the most appropriate post-Keynesian policy solutions might be. This period of general economic decline, and the divergent state policy responses to it, generated an unprecedented level of interest among political scientists in issues related to economic policy formulation in both industrial societies and developing nations.

POLICY AND THEORETICAL DIVERGENCE

In the current post-Keynesian era, government economic policy strategies have tended to be guided by one of three general economic management theories: monetarism, supply-side economics, and industrial policy. Monetarism focuses on containing inflation through tight monetary policies and strict controls on government spending. It is believed that by keeping inflation intact, governments can create an economic environment most suitable for long-term, sustained, market-led growth.

Supply-side theory, meanwhile, advances the notion that by lowering tax rates, particularly for wealthy individuals and corporations, governments can encourage increased private-sector investment in such things as plants and equipment and stimulate higher levels of consumer spending. Another key component of the supply-side doctrine is governmental deregulation. By reducing regulatory burdens on business, governments can act to promote still further investment.

Unlike the distinctly market-based orientations of monetarism and supply-side economics, industrial policy advocates using a myriad of government policy instruments—tax credits, low-interest loans, subsidies, direct grants, administrative assistance, indicative economic planning—to achieve state-established economic policy objectives. While sharing with Keynesianism the notion that governments have a legitimate role in managing capitalism, industrial policy is notably microeconomic in focus. Whereas Keynes believed that individual economic actors would act in accordance with macroeconomic stimulus policies, industrial policy is geared toward developing specific objectives and using specific policy instruments for individual firms or industries depending on their unique needs or circumstances.

Political scientists, as suggested, became increasingly interested in the issue of economic policy formulation as governments scrambled to implement policies associated with one or more of the above economic management theories following the collapse of the Keynesian consensus. Much of this interest has been reflected in the theoretical work produced to explain the specific policy options that individual governments have eventually chosen. This literature has tended to focus on those variables that have been most influential in shaping these eventual choices. Some scholars, such as Francis Castles, have focused on the significance of political parties, noting, as an example, that the political ascendance of business parties in such countries as Britain and the United States during the 1980s allowed for the adoption of monetarist and supply-side strategies, respectively. Meanwhile, where left parties retained political power, Keynesian policies were more likely to be augmented with industrial policy instruments.

Other political scientists have focused on what is said to be a critical relationship between interest group structures and economic policy choices. Among others, Peter Katzenstein's work has been seminal in this regard. Katzenstein has shown how the corporatist policy-making systems (which are characterized by the direct, formal participation by labor unions and business associations in economic policy making) of Western Europe's smaller democracies allowed these states to develop successful industrial policy solutions in response to the economic consequences of globalization and economic transformation. More broadly, some scholars have noted how the political institutional frameworks of governments in general are crucially linked to policy choices. Japan's comprehensive and successful industrial policy system, for instance, is seen by many to be a consequence of the unique set of relationships that the state's bureaucracy has with members of Parliament as well as key actors in the business community. Here, the work of such state-centered authors as Peter Evans and Theda Skocpol has been important in getting political scientists to understand the significant relationship between political institutions and public policy outcomes.

Finally, recent scholarship has paid close attention to the relative power position of trade unions and the working class in general vis-à-vis capital and the state. Here, the emphasis has been on identifying the level of political leverage and economic influence enjoyed by national labor organizations. Alexander Hicks, for example, has shown that trade union strength has clearly had an impact on the ability of governments to alter economic and social policy orientations in many industrial societies.

Economic Systems, Comparative

Economic systems are popularly classified into various ideological types, with supplementary modifications for stages of economic development and productive structure. Until recently, the great ideological divide counterposed capitalism and socialism, each with subtypologies. Communism was given pride of place as an important socialist variant.

Development divided the world into advanced and backward categories, allowing scholars to debate whether the gap between rich and poor was narrowing or widening. Productive structure served as an indicator of modernization. The economies of advanced countries once were highly industrialized, but as of the late twentieth century have stressed high-tech services. Agricultural economic systems for the most part were viewed as premodern.

These taxonomies are becoming increasingly obsolete as ideological concerns fade, displaced by concepts such as globalization, which imply that all economic mechanisms will be more or less the same in the future, characterized by state-supervised competitive markets and harmonized by international institutions such as the International Monetary Fund and the World Bank. Also, many less-developed nations now possess advanced industrial high-tech sectors with cosmopolitan enclaves. Backwaters of the colonial type are vanishing. Globalization, however, should not be conflated with the reality of world government and a common economic mechanism. Systems remain diverse, but the cultural, political, and institutional forces distinguishing them have become more subtle.

CORE SYSTEM MODELS

There is no consensus of categorization for the new comparative reality. Two obvious criteria are political governance and civic liberty, but there is a reluctance to treat authoritarianism and civic repression as ingrained to important systems like those of China and Russia. Likewise, while it is widely understood that national markets are heterogeneous, there is a tendency to suppose that the distinctions are secondary. For example, although Chinese economic efficiency is handicapped by its ban on freehold property, imposed in accordance with communist doctrine, few analysts acknowledge that communism still matters.

Systems, nonetheless, remain important. They affect productivity, income, wealth, sustainable growth, inequality, social justice, and economic welfare. The best way to appreciate the nuances is to trace the evolutionary trajectory. There were three globally dominant economic systems in 1985, when Mikhail Gorbachev was installed as the last general secretary of the Soviet Communist Party: reform (1) communism, (2) American free enterprise, and (3) European Union (EU) social democracy (collectivism). Soviet, east European, Chinese, North Korean, Vietnamese, Laotian, and Cambodian communism all featured state ownership of the means of production, the criminalization of private business, and command planning, supplemented with various bonus incentive mechanisms. The adjective *reform* refers to this latter aspect, not reliance on leasing property and markets.

American free enterprise in 1985 was a system that paid lip service to laissez-faire while being strongly affected by huge state programs, intrusive regulation, and social transfers. It was often mischaracterized as a welfare state, suggesting that government expenditures were genuinely in the public interest rather than the consequences of political rent granting.

EU social democracy cloned the American model, with three differences. First, welfare was conceptualized in socialist terms, stressing income equality; free basic public services such as health, housing, and education; and civic participation. Second, state ownership of portions of the means of production was commonplace, and third, it discouraged entrepreneurship whenever change threatened the social welfare status quo.

The year 1985 was a watershed because it marked the onset of a worldwide liberalization movement to foster efficiency and growth by denationalizing state assets, expanding market scope, and strengthening the forces of market competition. Communist nations switched from reform to market communism, culminating in the destruction of the Soviet Union and the accession of most former east and central European communist states into the EU. But these negative results (from a communist perspective) were partly compensated by the economic invigoration of China, Vietnam, and more recently Laos. Liberalization, including state outsourcing, was pressed under Republican and Democratic presidential administrations in the United States as well as throughout the EU. In the process, all three systems declared their rhetorical support for civic participation, individual empowerment, and social justice while simultaneously adopting policies that increased income inequality and privatized aspects of the social safety net.

States everywhere reduced their role as affordable providers of basic services, preferring to act instead as indirect providers of outsourced services, market regulators, and social transfer agents. This convergence has blurred the lines among the core models. All now possess markets with professed progressive social missions and stress individual empowerment that is harmonized with social justice. All have legalized some types of private property, although communists still primarily rely on asset leasing. The differences that remain, however, are essential.

SYSTEM DIFFERENCES

Communism not only is wary of freehold property but insists on one-party political control (autocracy), privileged-party rent granting in the state and private sectors, and civic repression wherever social action jeopardizes party rule. The model installs the rule of men over the rule of law. Laws, including private contracts in communist countries, are predominantly instruments of state/party administration rather than universal principles to which the regime itself is held to account. Communist regimes reject democracy, the common law, and free markets in favor of insider rent granting and party rule with or without the facade of balloting, embellished with the rhetoric of prosperity, harmony, and social justice. The model is internally inconsistent and corrupt, with inferior long-run potential after advantages of economic backwardness in nations like China are exhausted.

The EU economy, by contrast, is a democratic, open society that prioritizes workers' and minorities' rights and empowerment, a broad social safety network, and soft power. It tolerates some individual liberties that conflict with this agenda but tends to restrain private ownership, business, and entrepreneurship whenever they limit social justice and political discretion, including rent-granting insider privileges. The net result has been what is often called "Eurosclerosis": feeble economic growth, converging toward stagnation. The repercussions of the 2008–2009 global financial crisis and depression are likely to exacerbate the tendency.

The administration of Barack Obama, for a multiplicity of reasons, is pushing the U.S. free enterprise system toward EU collectivism, especially with regard to old-fashioned state-provided basic services such as health care. The comparatively feeble influence of trade unions and the working class in American politics, coupled with a stronger tradition of private-sector entrepreneurship, however, continues to make the two systems distinct. Long-term economic growth in the United States is apt to outpace its EU rival.

SYSTEMS OUTSIDE THE CORE MODELS

Beyond these fundamentals, it should be noted that economic arrangements in many nations throughout the globe fall outside the market communist, EU social democratic, and U.S. free enterprise paradigms. Japan has a communalist system that stresses team sharing, consensus building, and mutual community support. Individual utility seeking and profit maximizing are subordinated to communal concerns, violating all the fundamental axioms of classical Western market theory. Acquiescent satisficing, rather than individualistic utility seeking, prevails.

North Korea continues to rely on a pre-reform, terror-control, communist command model with forced penal labor that causes tens of thousands annually to die prematurely. Russia has had a Muscovite model in place since the time of Ivan the Great that relies on authoritarian rent granting, revocable property rights, and the antidemocratic rule of men. Thailand, under the guidance of the crown and influenced by Theravada Buddhism, is experimenting with a sufficiency economy that

subordinates material acquisitiveness to spiritual and ecological pursuits.

Thus, despite the homogenizing effects of market communism and global liberalization, national and transnational economic systems continue to diverge and flourish, with distinct agendas, property rights regimes, and regulatory mechanisms governing the public, private, and civic sectors (all aspects of rational economic choice making). Leaders no longer seem interested in perfecting archetypes such as democratic free enterprise, privilege-free social democracy, participatory democracy, or Marxist-Leninist communism. The evolution of the core transnational models instead is being diversely driven by deep-seated cultural forces and political expediency.

Economic Theories of the State

According to an economic theory of the state, the state is best understood as the outcome of voluntary individual action. Its methodological foundations are individualistic as the preferences of individuals are taken as the basic starting point from which subsequent actions and institutions are to be theorized. It combines a self-interested view of human behavior with an account of how and when individuals will choose to collaborate and act collectively. The state is seen as a collection of rules and institutions created by individuals for the purpose of acting collectively, as opposed to individually, to realize some benefit. The state itself is theorized as a form of cooperation, or as the outcome of cooperative behavior. Individuals are able to produce numerous types of benefits acting collectively that they cannot achieve acting alone, and the rules and institutions of the state are theorized as mechanisms for securing the ongoing production of this sort of benefit.

The economic theory of the state can be contrasted with other theories of the state. It is in contrast to organic views of the state that theorize the state as an autonomous entity that exists prior to and beyond the individuals that compose it, exemplified by the relationship between bees and their beehive. Its notions of voluntarism and cooperation distinguish it from conflict views of the state, which theorize it as an instrument of class domination. Also, the idea of its instrumental value with respect to individual interests contradicts the view of the state that theorizes its purpose as realizing a collective ideal or public interest beyond the individual well-being of its members.

STATE ORIGINS AND PROVISIONS

The economic theory of the state provides explanations for both the origins of states and the range of its functions in a political society. Acting individually, in a state of nature, persons are unable to secure numerous goods in which they have an interest in producing. Perhaps the most basic of these is achieving peaceful reconciliation of competing claims to scarce resources. This is done by the state by creating property rights and rules for resources' use and exchange, which are enforced by the coercive capacity of the state.

Upon achieving basic security of the person and property, individuals will make further use of collective mechanisms to produce cooperative benefits. One such benefit is the coordination of activities that allows for orderly social living, such as basic rules concerning traffic direction and so forth. This type of strategic interaction imposes no costs on individuals in the production of cooperative benefit and thus is free from the collective-action problem of free riding.

The problem of free riding explains why states are required for the provision of public goods beyond simple coordination functions. A public good is defined by being nonrival, meaning that its consumption by one individual does not lessen its availability to others, and by being nonexclusive, meaning that once it is provided, others cannot be excluded from it. A lighthouse in a harbor is an example of a public good. Public goods are prone to underprovision when left to private production because there are strong incentives to free ride on provided public goods. Self-interested individuals would prefer to consume a good without contributing to its production and be unwilling to produce a benefit that others can enjoy without contributing to it. In this case, it is mutually advantageous to cooperate through public provision.

Another cooperative benefit that the state secures is the reduction of uncertainty and exposure to natural and social risk. Acting alone, individuals will be unable to adequately limit uncertainty and secure against risk. While private insurance markets will arise to address many forms of uncertainty, the state will be required to address market failures in its provision. These include moral hazard and adverse selection resulting from information asymmetries between buyers and sellers as to the level of risk, causing heightened costs and incomplete or exclusionary coverage. State-run insurance has further advantages over private provision, such as reducing administrative costs, economies of scale, and equity in cost of coverage for high-risk, low-income groups.

Other examples of market failure that create incentives to collectively provide goods through the state include monopoly power and negative externalities. Producers with monopoly powers are able to charge inefficient prices, and a possible

remedy is to place the industry in public ownership. The state is also able to internalize the full costs of an economic activity in the producers; without its regulatory capacity, the costs could be imposed, or externalized, onto the population at large. The pollution resulting from industrial production is an example of a production cost that can be externalized onto society without state action.

CRITICISMS OF ECONOMIC STATE THEORY

Economic state theory is criticized in both its explanatory and prescriptive dimensions. Descriptively, the provision of public goods as an explanation of the origins of states is widely called into question. Without the institutions of the state, persons are unable to successfully cooperate because of the lack of coordination and free rider problems. The state in this view is called on to secure the benefits of cooperation. However, the state itself is also theorized as the outcome of cooperation, such that persons are supposed to have produced a public good for the purpose of producing other public goods they were unable to achieve without the state. By way of response, rather than explaining the origins of states, the provision of public goods accounts for the ongoing support for states and as an explanation of the functioning of the public sector.

Economic state theory is also criticized for justifying an overly narrow range of functions for the state. Because the state is justified as a mechanism for promoting individual interests in a mutually advantageous manner, it rules out redistributive policies that lessen the advantage of some citizens for the sake of improving the condition of the disadvantaged. The political economists James M. Buchanan and Gordon Tullock, for example, argue that the principle of mutual advantage in an economic theory of the state leads to the requirement of unanimity in support of legislation, effectively granting a veto to those who gain from market exchanges. In addition to normative concerns regarding the resulting inequality that would result, there are further questions as to the potential stability of a state that is limited to the principle of mutual advantage.

Eco-terrorism

Eco-terrorism is a type of terrorism directed at changing environmental policy. Terrorism, by definition, is a violent or forceful act that targets civilians to create fear and motivate political change. Theoretically, this fear creates political pressure on governments to change policy. Eco-terrorists create situations in which the costs of pursuing an environmental policy outweigh the benefits of that policy. Eco-terrorists may target states, but many eco-terrorist organizations also target private firms. Eco-terrorism and environmental terrorism are two different ideas. Eco-terrorist groups aim to protect the environment through terrorist actions against firms and states. Environmental terrorism describes a terrorist attack whose target is the environment. Terrorist groups engage in environmental terrorism when they attack a state's natural resources. For instance, terrorist attacks on a country's water supply and setting fire to national forests are both acts of environmental terrorism. Generally, eco-terrorists do not engage in environmental terrorism. Eco-terrorist organizations work to protect the environment, and therefore deliberately harming the environment is against their raison d'être.

The term *eco-terrorist* is contested by groups defined as eco-terrorists. Members view themselves as activists rather than terrorists. Eco-terrorist groups engage in activities similar to those of other activist groups. Eco-terrorists conduct peaceful demonstrations and civil disobedience with marches, sit-ins, and protests. Furthermore, eco-terrorist groups serve as information providers, describing the effects of the state and firms on the environment. They lobby governments and businesses to change their operations to end environmentally harmful activities or adopt other sites for programs to protect animal habitats. However, what separates eco-terrorists from regular activist groups are violent acts against people and property. Eco-terrorist organizations destroy property and threaten people to pursue political goals. Furthermore, members of eco-terrorist groups justify destruction caused by their organizations as a small price to guard against larger environmental destruction. Eco-terrorist organizations claim that they are inappropriately labeled terrorists to undermine their cause. The label "terrorist" diminishes their public credibility and legitimacy as organizations.

The theoretical underpinnings of eco-terrorist organizations have their roots in environmental movements. Many scholars cite Rachel Carson's *Silent Spring* as the book that launched the U.S. environmental movement. Members of eco-terrorist groups often espouse deep ecology values, either explicitly or implicitly. Deep ecology is a system of values that at its base claims each living being has equal value. Deep ecologists object to a hierarchy evaluation of animals, making the normative claim that each animal has an equal value. While many deep ecologists are peaceful, the philosophy of deep ecology has been used to mobilize and galvanize support for eco-terrorist movements. Eco-terrorists are distinct from other environmentalists in their commitment to violence to achieve political goals and their dissatisfaction with mainstream

environmentalist movements. Eco-terrorists will seek peaceful means to pursue government or firm policy change, but they will also conduct violent acts.

Eco-terrorists have gained support, membership, and notoriety since the 1970s. Emerging from the juncture of the environmentalist movement and other social movements in industrialized nations, eco-terrorism is a relatively new phenomenon. Members of eco-terrorist groups belong to different social classes. The organizations themselves may be loosely coordinated, bound by common goals and some minimum communication. The U.S. government has named several eco-terrorist groups threats to national security. The Animal Liberation Front was founded in the United Kingdom in 1976. While the Animal Liberation Front claims to protect all animals, some of its methods threaten human life. The Earth Liberation Front was founded in the United Kingdom in 1992 and now has cells in many states, including the United States. The Coalition to Save the Preserves is an eco-terrorist group that surfaced in the American Southwest to protect forests north of Phoenix, Arizona.

Eco-terrorists engage in many methods to defend the environment. A popular tactic to defend forests from logging is tree spiking. Eco-terrorists insert metal spikes in the trees themselves to dissuade loggers from chopping them down. This metal either damages the chainsaws of loggers or becomes lethal shrapnel in a lumberyard. Eco-terrorist groups have also threatened to cut the brakes of trucking firms' trucks and have attacked universities doing biogenetic research. Eco-terrorist groups also engage in arson, cutting of fishing lines, and sabotage of machinery. Eco-terrorist groups seldom assassinate leaders of firms or states. Casualties from eco-terrorism are generally the result of sabotage or arson aimed at disarming threats to the environment.

Edelman, Murray J.

Murray J. Edelman (1919–2001) integrated insights from linguistics, rhetoric, semiotics, psychology, and philosophy into the discipline of political science in the United States. Edelman was born in Pennsylvania, received his bachelor's degree from Bucknell University in 1941, his master's degree from the University of Chicago in 1942, and his PhD from the University of Illinois in 1948, where he subsequently taught until joining the faculty of the University of Wisconsin–Madison in 1966. In 1971 Edelman was awarded an endowed chair, which he named for the social psychologist George Herbert Mead (1863–1931). A recipient of many awards during his career, including visiting professorships, Fulbright awards, and fellowships from the Guggenheim Foundation and National Endowment for the Humanities, Edelman retired from teaching in 1990 and continued to publish until his death.

Edelman was critical of the logical positivism and empiricism that dominated mainstream political science because it neglected the subtle ways in which subjective realities were shaped, manipulated, and reinforced by symbols, rhetoric, and language. In the now-classic *The Symbolic Uses of Politics* (1964), he argued that popular participation by citizens was "largely symbolic" (p. 4) and that public policies thought to benefit the general public were beneficial only to small groups. His other publications include *Politics as Symbolic Action* (1971), *Political Language* (1977), *Constructing the Political Spectacle* (1988), *From Art to Politics* (1995), *The Politics of Misinformation* (2001), and numerous articles.

A major theme of his research was that political language had the power to reveal as well as to conceal. Language, he argued, can conceal the inner workings of power by naturalizing power relations or by manipulating, distracting, and deflecting the attention of citizens to trivial matters that are falsely labeled important. Political language magnifies the trivial and minimizes the serious to gain the quiescent acceptance of the status quo or to mobilize support for public policies that too often benefit only elites. For Edelman, language was not a neutral vehicle for describing an objective reality but was itself a tool for shaping meanings, manipulating hopes and fears, constructing realities, framing interpretations, rationalizing unequal distributions of resources and power, and even shaping the identity of the speaker. Whether symbols are icons or words, they have multiple meanings: a flag can invoke pride and hope, fear and hatred, or nostalgic longing depending on the social and material situation of the observer. While Edelman's scholarship might read as despairing and cynical because it portrays politics as deceptive and manipulative, it contains a strong belief in the ability of citizens to decipher spectacles and resist manipulation.

An eclectic scholar who borrowed insights from George Orwell, Jacques Ellul, Harold Lasswell, Jacques Derrida, and George Herbert Mead, Edelman's own contributions continue to shape the study of politics through his influence on scholars such as George Lakoff and Lance Bennett. In a media-saturated age, given the power of officials, campaign advisors, advertisers, and strategists to mold images, manipulate symbols, and deploy language to mobilize support or opposition to causes or persons, Edelman's groundbreaking scholarship remains insightful and significant.

Education Policy

Education policy in the United States is divided into two areas: (1) elementary and secondary education and (2) higher education. Elementary and secondary education policy has historically been handled by local government, according to state guidelines and with funding from state and local taxes. Federal involvement began with the effort to desegregate schools in the landmark 1954 *Brown v. Board of Education of Topeka* case, and continued in a series of desegregation cases in the 1960s and 1970s that followed passage of the Civil Rights Act of 1964. Federal funding of elementary and secondary education increased through the Elementary and Secondary Schools Act of 1965, the Individuals with Disabilities Education Act of 1971, and the No Child Left Behind Act (NCLB) of 2002. Higher education policy has largely been handled as a mix of privately run colleges and universities that are paralleled by state systems of higher education. The federal government has had some involvement in higher education policy making, beginning with the Morrill Act of 1862, which set aside lands for state universities. Federal involvement grew in the post–World War II era with the significant funding of university research, provision of education grants, and creation of the guaranteed student loan program. Affirmative action policy, in particular Title IX, helped to expand access to higher education by women and minorities.

ELEMENTARY AND SECONDARY EDUCATION POLICY

Elementary and secondary education is delivered at the local level, through school districts administered by elected school boards that are responsible for overseeing school district hiring, curriculum, and finances. In many states, school boards must conduct periodic levy campaigns to raise local property taxes to support increasing costs and new services. States are responsible for setting and enforcing standards for teacher and administrator certification, setting curriculum guidelines, and providing financial aid to supplement districts that are unable to completely fund operating with local taxes.

States typically provide supplemental funding either through foundation formulas that calculate a statewide per-pupil cost for education and then supplement local districts to bring their spending up to the per-pupil average or through set grants-in-aid that are not dependent on raising all districts to similar per-pupil spending averages. State court challenges to state systems of funding, beginning with the landmark *Serrano v. Priest* (1971) in California, led to increases in state spending on education in the 1980s and 1990s, although funding formulas that relied on property taxes remained largely unchanged. Total spending on primary and secondary education in the United States was $536 billion in 2005. Of this, 45.6 percent came from state funds, 37.1 percent from local taxes, 8.3 percent from federal support, and 8.9 percent from private sources (primarily tuitions paid for private schooling.) The national average per-pupil spending for 2004 was approximately $9,000, according to the U.S. Department of Education (DOE; see www.ed.gov/about/overview/fed/10facts/edlite-chart.html#5).

Federal education policy, administered through the DOE since its creation in 1978 out of the former Department of Health, Education, and Welfare, has created mandated standards for curriculum, teacher certification, and implementation of accountability through testing in NCLB. Prior to NCLB, the federal government provided supplemental funding, primarily for districts with high poverty rates, and for special education services. Poverty service funding included Title I funds for supplemental educational enrichment services and the free and reduced lunch program. Special education funding resulted from federal court mandates and the subsequent passage of the Individuals with Disabilities Education Act of 1971. The federal government was also very involved in pushing local school districts to desegregate, using the Civil Rights Act of 1964 to initiate court action, threaten withholding of federal funding, and provide oversight of desegregation orders.

Calls for reform of public education in the 1980s and 1990s were highlighted by the 1983 *A Nation at Risk* report issued by the National Commission on Excellence in Education and in the *Goals 2000* report issued in 1991 by the National Governors Association. States responded with stricter standards for teacher certification, increased pay for teachers (particularly in Southern states), and experimentation with proficiency testing.

NCLB OF 2002

President George W. Bush campaigned for increased accountability of schools for student performance, in particular, the performance of students of color living in urban districts. His plan for accountability resulted in the creation and passage of NCLB. NCLB added new requirements to maintain eligibility for federal funding. These involved mandatory tests of students at different grade levels to measure proficiency in math, reading, and writing as well as subject area tests in science and social studies. NCLB requires public notification of the test results aggregated by individual school building. School districts are rated on a set of standards called Adequate Yearly Progress, which measures the degree of improvement of test scores over the prior year. Districts are also required to report student attendance rates, graduation rates, and incidence of violence. Schools deemed at risk receive additional federal funding to be used to improve student performance. If Adequate Yearly Progress scores do not improve during the following two years, the DOE can require the school district to reorganize or close the school or risk losing federal funding. States are required to align their curricula with testing standards as well as align teacher certification requirements with guidelines stipulated by the DOE.

HIGHER EDUCATION POLICY

Higher education policy at the federal level is largely concerned with two areas: research funding and student financial aid. Federal student support is provided through the Pell Grant and Stafford loan programs, as well as through the guaranteed student loan program, in which banks provide education loans to students at lower interest rates and the federal government pays the difference in interest and guarantees payback of the loans. Recent developments in policy include the use

of federal student loan eligibility as an enforcement tool to require colleges and universities to provide access to student records for military recruitment and to closely monitor adherence to visa requirements for foreign students. The federal government also stimulated expansion of two-year community colleges through the Higher Education Act of 1965.

Affirmative action policies implemented by higher education to increase enrollment of minorities and women have been gradually narrowed through Supreme Court decisions, beginning with *Bakke v. California Board of Regents* (1978), which excluded the use of quotas. In 2003, a pair of cases (*Gratz v. Bollinger; Grutter v. Bollinger*) challenging the admissions policies of the University of Michigan resulted in a 5–4 decision by the Supreme Court that banned the use of a point system to advantage students based on race but upheld the use of race as a factor in admissions to achieve diversity.

Education Policy, Higher

Higher education (HE) policy varies enormously among countries, reflecting a broad spectrum of provision and politico-economic disparity. In some countries, policy is driven solely by economic imperatives; in others, by tradition and culture. In Europe, systemic diversity is decreasing as social and political interdependence grow. In other areas, such as the developing markets of Asia, diversity of provision is increasing in line with economic growth. Everywhere, HE has become so important to the development of knowledge economies that it has become more directive, more encouraging of the practical and commercial exploitation of research, and more accountable.

EUROPEAN UNION
Policy in the European Union and in countries allied to the European Cultural Convention is driven by the Bologna Declaration, a voluntary agreement aimed at harmonizing HE architecture across Europe. Further intergovernmental meetings—in Prague (2001), Berlin (2003), Bergen (2005), London (2007), and Louvain (2009)—have reaffirmed the Bologna process, which currently has forty-six signatories. The basic three-tier framework aligns mainland European and American HE—although in many ways it represents a subordination of the former—and is closely allied to the World Trade Organization General Agreement on Trade in Services—too closely, in the minds of critics. The process has

been implemented concurrently with other reforms, including the introduction of tuition fees in the United Kingdom and the internal reorganization of universities in France under the Universities' Freedoms and Responsibilities law. This has encouraged opposition, but central government control is still dominant across the sector.

UNITED STATES
In contrast, HE in the United States is not regulated directly by central government. There are a wide variety of institutions; some are among the most prestigious in the world, and others are little more than degree mills. According to the United Nations Educational, Scientific and Cultural Organization (UNESCO), the United States has the second largest number of HE institutions after India, and 82 percent of the population of tertiary age are HE students (compared with 59 percent in the United Kingdom, 22 percent in China, and 75 percent in Australia). Universities are large by European standards, and those that are not private are operated by individual states. Tuition is charged everywhere, although public universities have lower fees and most have considerable endowments. In policy terms, capacity remains an issue as demand increases during and immediately after recessions, and states such as California are prioritizing the development of appropriate policies in the face of likely legal challenges. An allied issue is that of undocumented students, those who are not U.S. citizens or legal residents, who receive free secondary education but face legal and financial barriers when trying to access HE.

UNITED KINGDOM
Like those in the United States, universities in the United Kingdom enjoy an international reputation, largely because of Britain's imperial history and its leading role in the Industrial Revolution. Universities are usually established by royal charter or act of Parliament and are state financed and centrally controlled. Policy in the sector, and in education generally, is characterized by tinkering, mostly in relation to funding and inspection. In the 1980s, per capita funding dropped sharply as student numbers rose, and the system has never fully recovered. The 1997 National Committee of Inquiry into Higher Education, the Dearing Report, heralded the abolition of free university education, and the government introduced tuition fees to replenish university coffers. Today, except in Scotland, undergraduates pay tuition up to a certain maximum, but funding still falls short of what is required to maintain the system against international competition and meet domestic access targets. Funding-related policies remain the preoccupying issue across the sector.

CHINA
Funding is not the major issue in China, which has more than two thousand universities and colleges and fifteen million students. The university system was developed at the end of the nineteenth century to take advantage of China's growing engagement with Western techno-scientific advances, but the system incorporates an older Confucian philosophy. The Cultural Revolution devastated the sector as student numbers and standards plummeted, but in 1977, the HE entrance

examination, the GaoKao, was reinstated alongside other reforms that brought improvement in provision, management, and investment. The government has since moved away from Stalinist-style micromanagement toward a more strategic role, and local decision making is common. The stated aim is to make elite universities, such as Peking and Tsinghua, world class, and the government has funded them accordingly with aid from UNESCO and the World Bank. Yet China is having difficulty meeting the needs of its students. While China spent 13.0 percent of government funding on education, compared with 14.8 percent in the United States, 11.9 percent in the United Kingdom, and 13.3 percent in Australia, only 1.9 percent of China's GDP consisted of education spending, compared with the United States's 5.7 percent, the United Kingdom's 5.6 percent, and Australia's 5.2 percent (UNESCO Institute for Statistics 2009; China's figures are from 1999, and the others are from 2006). Although HE continues to play a leading role in the country's hyperdevelopment, and this is recognized in government policy, issues remain around regulation, opportunity, and the need to improve the quality of staff.

AUSTRALIA

HE in Australia, China's "Western" neighbor, also dates from the nineteenth century and is not surprisingly modeled on the British system. There are more than forty universities, all but two of which are public bodies in receipt of central funding under the Higher Education Support Act. The federal government has primary responsibility for policy, while governance is shared with individual states and the institutions themselves, which have a high degree of autonomy. During the 1970s, tuition fees were abolished, but a decade later they were reintroduced through the Higher Education Contribution Scheme, which, like the current UK system introduced twenty years later, enables students to defer repayment until they gain meaningful employment. More recently, government policy has sought to encourage collaboration with industry, but inconsistent funding mechanisms and poor governance has meant that results have been mixed. Far more successful has been Australia's role in the burgeoning Asian HE market and the huge overseas fee income thus generated, but serious structural and policy issues remain, including the lack of niche institutions such as the Massachusetts Institute of Technology (United States), École Normale Supérieure (France), and London School of Economics (United Kingdom); a dearth of high-quality research academics; insufficient funding; and as the Bradley Review indicated, widening participation. Proposed funding innovations, such as the Melbourne model, a shift to U.S.-style generic undergraduate degrees followed by postgraduate professional degrees, seem more like circumventions than solutions. However, government policy to align with the Eurocentric Bologna process seems sensible because the attractiveness of Australian universities to overseas markets would otherwise be compromised.

CONCLUSION

Despite differences in HE policy around the world, some common themes emerge as a result of globalization, including the importance of quality assurance and the fair targeting of government funding (e.g., the Research Excellence Framework in the United Kingdom, the now defunct Research Quality Framework in Australia, and various U.S. bibliometric exercises), the need to benchmark excellence to internationally agreed-upon standards across disciplines (e.g., Jiao Tong, Quacquarelli-Symonds, and Cybermetrics indices), a diminishing margin of appreciation regarding the importance of HE to economic success and the funding required to maintain that influence, and the undesirable effects among academics of increased administration as managerialism supplants scholarship across the sector.

E-governance, E-voting, E-democracy, E-politics

The Internet has permeated the business of politics in society, and the various activities within government undertaken by political actors, including citizens, politicians, journalists, and activists, fall within the realm of e-politics. One of these activities is voting online, or e-voting. Beyond the act of voting, other activities such as paying taxes, registering motor vehicles, obtaining driver's licenses, completing forms, and obtaining materials from the government via the Internet constitute what is known as e-governance. Should the Internet become successful in the democratization of political systems it can be said that electronic democracy, or e-democracy, has been instrumental in such a process.

The marriage of politics and the Internet was brought about by the desire to bring efficiency to governmental operations and provide transparency in what government does. By streamlining and computerizing operations, government agencies as well as individual actors are provided convenience in obtaining information as well as greater interaction.

E-GOVERNANCE

E-government—short for electronic government but also known as e-gov, digital government, online government, or transformational government—refers to the use of information and communication technology to provide and improve government services, transactions, and interactions with citizens, businesses, and other agencies of government. As early as 2000 some of the most visited Web sites were in the governmental realm, including the Internal Revenue Service, the U.S. Postal Service, the National Aeronautics and Space Administration, the National Institutes of Health, and the Census Bureau.

The U.S. federal government, starting with the White House under Bill Clinton, encouraged the use of the Internet as early as 1993 as a means of providing information. Congressional sites for both the U.S. House of Representatives and the Senate provide biographies of members, press releases, legislation sponsored and cosponsored, floor speeches, recent legislation, the status of legislation, and newsletters. Individual officeholders have a Web presence to facilitate and promote fund-raising, continuous campaigning, and constituent interaction. Information on the Supreme Court site includes court cases, rulings, and opinions. The major, and even minor, political parties have their own Web sites that encourage partisans to contribute funds, no matter how small, and engage in activities, no matter how trivial, to bring the party's and candidate's name out in the general public. This was the method used by the Obama campaign to obtain the involvement of millions of people in its call for change.

In the United States state and local governments have also gone online to varying degrees. Numerous groups and organizations, such as the National Association for the Advancement of Colored People and the National Organization for Women, and magazines such as *Government Technology* are dedicated to, and have undertaken the monitoring and measurement of, what is going on in the use of information technology in the states and in government. Since 1997 *Government Technology* has undertaken a digital state survey. In the 2008 survey Utah came in on top, followed by Michigan, Virginia, and Arizona.

At the international level, countries use the Web to inform the world about themselves, to entice those who have the money and the curiosity to visit them, or to facilitate communication with the rest of the world formally by government-to-government transactions or informally by citizen-to-citizen exchanges of e-mails and the sharing of audio and video. Although the state of a country's technological development measured by the Globalization Index or the E-Readiness Index may provide insight into the usefulness of the Internet for delivering basic needs to its citizens, the digital divide is a constant reminder that the gap between the wealthy and the poor prevents billions of people from utilizing the advantages of connectivity.

Nevertheless, efforts are constantly being made to bring government connectivity to constituents. Various activities that constitute political connectivity, including e-voting, e-campaigning, and e-fund-raising (found in the articles about voting and blogging), have captured the attention of those who study progress in engaging the citizenry with the functions of government in a democracy.

E-VOTING

Electronic voting, or e-voting, has become quite controversial among those who favor it and those who want to hold on to old ways of participation in the political choice of leaders and representatives. The U.S. states of Oregon and Arizona have paved the way in experimenting with the use of electronic voting. Aside from people's reluctance to trust a computer to accept their vote—at times without a paper record of that vote—there is also the fear associated with the reliability and validity of using the Internet for choosing a nation's leaders. Surveys in the late 1990s indicated that about 51 percent of surveyed netizens favored online voting as long as it was safe, while 42 percent disagreed with online voting. Younger citizens who are more tech savvy may be more inclined to, and more comfortable with, voting through a computer or the Internet.

E-DEMOCRACY

The online activities of governments have led to a debate about the ability of this medium of political communication to bring about greater and better democracy. Political life online may seem to be a mere extension of political life offline; however, being linked through the Internet provides an additional medium through which individuals can pursue the privileges and obligations of citizenship. It is a good way of communicating one-to-one, one-to-many, and many-to-many and improves on the conventional ways of dealing with government. This direct democracy brought about by Web connectivity has been billed as what will connect citizens to mass decision-making processes, such as the election of Barack Obama to the U.S. presidency. Obama's Web presence mobilized millions of Americans to campaign and fund-raise. Politicians have been using, and will continue to use, online formats to maintain and enforce their existing power. They cannot help but be more responsive to citizen demands since it would be difficult to withhold information as well as censor information in an open society where information is available online. Misinformation, deception, and manipulation can still come about, but overall, proponents of government presence on the net see it as a factor in the revitalization of democracy everywhere.

When evaluating e-government from a balanced perspective, it is true that as of the early twenty-first century there exist many gaps in online government service delivery, some of which are the result of security issues. The Internet is merely another mode of delivery and participation; despite

the existence of blogs, discussion groups, instant messaging, various social networking platforms, and assorted types of communications delivery methods, the Web does not give power to the powerless unless they take that power into their own hands.

Einaudi, Mario Luigi

Mario Luigi Einaudi (1905–1994) was an Italian scholar of political theory and European comparative politics. He married Manon Michels, the daughter of German sociologist Robert Michels, in 1933. After completing a dissertation about British philosopher Edmund Burke, Einaudi spent two years at the London School of Economics. His ecumenical character was already evident as he grew close to exiles from Fascism such as Catholic priest and politician Don Luigi Sturzo and Socialist historian and journalist Gaetano Salvemini. From 1927 to 1929, Einaudi attended Harvard University, conducting research on the U.S. Supreme Court. He returned to Italy, only to lose his first job, at the University of Messina, for refusing to sign the Fascist oath. Harvard gave him refuge before he was appointed at Fordham University.

Einaudi joined the Government Department of Cornell University in 1945 and was the Goldwin Smith Professor. He chaired the Department of Government from 1951 to 1956 and again from 1959 to 1963. In 1960 he founded the Center for International Studies with a mission to support academic efforts to deal with economic, social, and development problems around the world. In 1964 he founded the Fondazione Luigi Einaudi educational institution in Turin, Italy, in honor of his father, Luigi Einaudi, Italy's first postwar president.

Throughout his career, Einaudi was fascinated by the rise of modern liberalism in eighteenth-century France. Three central tenets of his work were that the study of politics must be embedded in history, that Europe and the United States have much to teach each other about the practice of democratic politics, and that the study of contemporary democratic states should not be divorced from the classics of political theory. These themes were embodied in his first book in English, *The Physiocratic Doctrine of Judicial Control* (1938), in his 1959 book *The Roosevelt Revolution,* and in his introduction of European scholars like François Goguel and Raymond Aron to the United States.

After Einaudi's retirement in 1972, with the help of the Italian government he raised the funds for the Luigi Einaudi Chair in European and International Studies at Cornell. In 1991 the university's Center for International Studies was renamed the Mario Einaudi Center for International Studies. Cornell's board of trustees honored Einaudi for his long dedication to the university and for being a "tireless proponent of clear and critical thinking, democracy, and ethics in politics; and a firm believer in the power of human values to transform the world."

Mario Einaudi died in 1994 in the family home in Dogliani, Italy, in the hills of Piedmont.

Elazar, Daniel J.

Born in Minneapolis, Minnesota, Daniel J. Elazar (1934–1999) was a leading American political scientist specializing in the study of federalism and federal political systems and arrangements. He was also a scholar of political culture and the Jewish political tradition. Throughout his career, he attempted to link the study of politics and public policy with its practice and has served as a consultant to numerous governments throughout the world.

While studying at Wayne State University, Elazar worked as a librarian at the United Hebrew Schools. In this capacity, he and his brother developed a system for cataloguing Judaica, which they published in 1968 as *A Classification System for Libraries of Judaica.* Elazar's Jewish roots both informed and influenced his study of politics.

Elazar next studied at the University of Chicago, earning a master's degree (1957) and a doctorate (1959). Under the tutelage of Morton Grodzins, Elazar's understanding of

federalism was developed. His dissertation was awarded the American Political Science Association's Leonard D. White Award for best dissertation in public administration in 1959 and was later published as *The American Partnership: Intergovernmental Cooperation in the Nineteenth-century United States* (1962). In this volume, Elazar took issue with the prevailing interpretation that "dual federalism" characterized the American political system in the nineteenth century. He demonstrated that a significant degree of intergovernmental cooperation occurred. For Elazar, the relationship between the federal and state governments had always been a partnership.

This concept was fully developed in Elazar's seminal work *American Federalism: A View from the States* (1966). Written when the concept of states' rights was often equated with racism and discrimination, Elazar's text provided a theoretical framework that discussed and assessed the central role of state governments in the American federal system. Elazar outlined his theory of American political culture and identified three subcultures—the individualistic, moralistic, and traditionalistic—that were brought to and reinforced by the various immigrant groups arriving in the United States. These subcultures shaped local political structures and practices and were spread across the country as immigrant groups pushed farther west.

During this same period, Elazar initiated a unique longitudinal study titled Cities of the Prairie because of his dissatisfaction with the limited nature of the individual community studies conducted during that time that provided only a snapshot description and analysis of local power structures. The Cities of the Prairie project was an ongoing multigenerational, comparative study of ten medium-sized civil communities located in the Midwest. In this work, Elazar also expanded on Frederick Turner Jackson's thesis that the frontier was a determining factor in American politics by describing how a series of succeeding frontiers have opened throughout American history and have shaped local and national development.

During the 1980s and 1990s, Elazar turned his attention toward federal developments worldwide. His 1987 book *Exploring Federalism* presented a comprehensive interpretation of the way in which federal arrangements inform, shape, and define civil communities throughout the world. Elazar was also the founding president of the International Association of Centers for the Study of Federalism, a coalition of academic research centers focusing on federal political systems.

Election Commission

Election commissions are a special category of electoral management bodies emerging after World War II (1939–1945). They also appear in the form of a department of elections, an electoral council, an electoral unit, or an electoral board. A precise definition of electoral commissions is elusive because they are institutionalized on a wide spectrum, for example, a government-administered body (like Zimbabwe's before 2008), a board of judges managing the election (as in Turkey), an independent electoral commission (IEC) of civil society members (as in India or South Africa), and a commission mainly concerned with managing campaign financing (as in the United States).

DEFINITION

The International Institute for Democracy and Electoral Assistance defines an electoral management body as "an organization or body which has the sole purpose of, and is legally responsible for, managing some or all of the elements that are *essential for* the conduct of elections and of direct democracy instruments—such as referendums, citizens' initiatives and recall votes—if those are part of the legal framework" (quoted in Alan Wall et al.'s *Electoral Management Design* 2006, 5). It may be a stand-alone institution, or it may be a distinct unit within a larger body, which also may have nonelectoral responsibilities. The essential tasks of electoral commissions are to determine who qualifies as a voter, specify all the aspects of the nomination procedure, conduct the polling, count the votes, and tabulate the votes.

Shaheen Mozaffar and Andreas Schedler, in "The Comparative Study of Electoral Governance—Introduction" (2002), and Robert Pastor, in his essay "A Brief History of Electoral Commissions" (1999), draw a distinction between established and new democracies regarding electoral management. Mozaffar and Schedler observed the tendency in established democracies to overlook the importance of electoral governance in securing the credibility and continued legitimacy of elections. According to Pastor, these systems are characterized by high levels of administrative competence, and therefore little suspicion arises regarding the government's management of elections. In new democracies, on the other hand, the need to focus on electoral management is much more pronounced. It is exacerbated by a lack of administrative capacity in the governance institutions and continuing deep-rooted suspicion between different parties and interests in the emerging democracy. Hence, an independent body is needed to level the electoral playing field.

HISTORY OF ELECTION COMMISSIONS

The election commission, as a permanent institution, first emerged after World War II. Turkey established its Supreme Election Board, the YSK, after its 1946 election. It is a board of judges that oversees elections. The board has the status of a supreme court, but its decisions cannot be appealed.

The earliest conventional electoral commissions were those in Costa Rica and India.

After a fraudulent election in Costa Rica in 1948, a new constitution introduced a novel institution, the Supreme Electoral Tribunal, to administer all aspects of the following election. The Electoral Commission India was established in 1950. The new Indian constitution stipulated that the commission was responsible for "the superintendence, direction, and control of the electoral rolls for, and the conduct of all elections to parliament and to the legislature of every state and of elections to the offices of President and Vice President." Originally it consisted of one commissioner, but since 1989 two additional members have been appointed. They are appointed by the national president, and they can be removed through impeachment by Parliament. The Electoral Commission India has advisory jurisdiction and quasi-judicial functions, but its decisions are subject to judicial review.

In the case of an established democracy, the Watergate scandal had a profound effect on electoral management in the United States. It prompted the creation of the Federal Election Commission by Congress in 1974 as an independent regulatory agency to administer and enforce campaign-financing legislation. Its six members are appointed for six-year terms by the president and confirmed by the Senate. The Federal Election Commission does not play the conventional role of an election commission with respect to the essential tasks mentioned earlier.

FORMS OF ELECTORAL MANAGEMENT BODIES

Electoral management is institutionalized in four forms, namely,

1. an IEC;
2. a governmental electoral body;
3. a mixed form of the first two, including a governmental management body supervised by a judicial institution; and
4. a multiparty election commission.

The IEC form is normally used in situations in which government institutions are not impartial enough to allow for a fair election or they do not have the necessary management capacity to do so. IECs are also used for first elections or transitional elections as part of confidence building in a peace process or democratization. They are institutionally independent and autonomous of the executive. They are in most instances

accountable to the legislature, the judiciary, or the president. Commissioners are not involved in government but are nonpartisan members of civil society. Examples of IECs are those in Armenia, Australia, Canada, Costa Rica, India, Indonesia, Liberia, South Africa, Nigeria, and Thailand. In the March 2008 presidential and parliamentary elections in Zimbabwe an IEC (the Zimbabwe Electoral Commission) was used for the first time, although its independence is still questionable.

A variation on the IEC form is a transitional model. It is used as a temporary measure established by an international or regional organization to facilitate transitional elections. Some transitional models are part of a United Nations– or European Union–facilitated peace package, such as those used in Timor Leste (2000), Cambodia (1993), Bosnia-Herzegovina (1996), and Namibia (United Nations Transition Assistance Group—1990).

The governmental management body—the second form—is used when the executive branch is responsible for electoral management. It is directed by a minister or a senior civil servant and is answerable to the government. Examples of governmental management bodies are found in Denmark, New Zealand, Singapore, Tunisia, the United Kingdom, and the United States.

The mixed form of electoral management combines an independent body (responsible for policy, monitoring, and supervision) with a government department or local authority (responsible for the election's operations). This type of commission is used in France, Japan, Spain, and most of Francophone West Africa. A multiparty election commission is not entirely independent, because of the political party representatives. An example is Angola.

As part of the third and fourth waves of democratization—especially in Africa and Latin America—independent election commissions have become a standard requirement for elections. Established democracies, on the other hand, still find it difficult to adopt such a concept.

Election Monitoring

Election monitoring is the process by which external or non-interested actors evaluate the legitimacy of balloting. Credible elections are central to democracy, and election observers aid in the acceptance of polling as relatively free of manipulation or free and fair. Among the benefits of election monitoring are acceptance of the results by both domestic and international audiences and validation of democratic efforts. International observers can also provide training and technical assistance to local populations and thereby strengthen the internalization of democracy in transitioning states. Both international and domestic monitoring usually involve the deployment of observers six to eight weeks before balloting, although some missions arrive up to a year prior to elections. The observers assist with the development of electoral laws, voter registration, and oversight of balloting, including the creation of independent voter tallies. Monitors must be perceived as neutral by the parties participating in the polling. Favoring one candidate or party over others is one of the greatest potential flaws in the system. Another is that monitors may not be deployed early enough to identify all corrupt practices, including media manipulation or problems with voter registration.

Election monitoring may be conducted at either the international or the domestic level. International monitoring occurred in 1857 when Austrian, British, French, Prussian, Russian, and Turkish observers assessed plebiscites in Moldova and Wallachia. These efforts accelerated in the aftermath of World War II (1939–1945) and during the rise of international organizations such as the United Nations, the Organization of American States, and the European Union, and the concurrent period of decolonization. Election monitoring emerged as one of several strategies in conflict resolution efforts and was often part of peace agreements and international peacekeeping operations. The end of the cold war and the subsequent wave of democracy led to a dramatic expansion of the use of international election monitoring as advocates, such as former U.S. president Jimmy Carter, championed the practice as a means to legitimize new regimes and new democracies. Typically, election monitors are invited by host states to supervise polling or are deployed as part of a peace agreement in post-conflict states. Between 1989 and 2009, international monitors oversaw balloting in more than ninety emerging democracies or countries in transition. The widespread use of monitors reflects both efforts to secure international acceptance of regimes and the trend by which donor states and international organizations tie aid to successful elections. Among the organizations most commonly involved in monitoring are the Organization for Security and Cooperation in Europe, the European Council, and the African Union. For instance, since 2000, the Organization for Security and Cooperation in Europe has sent more than three thousand monitors to supervise fifteen separate elections.

Domestic monitoring has existed in various forms since the 1800s but became formalized only in the mid-twentieth

century as nongovernmental and religious groups observed elections in areas of the U.S. South and unaffiliated groups specifically formed to oversee balloting emerged in other countries. The United Nations and other international bodies have undertaken numerous initiatives to train domestic observers in transitional states. For instance, prior to balloting in 1993, the United Nations trained more than fifty thousand Cambodians to assist in electoral monitoring. Even in mature democracies, including the United States and Western Europe, domestic groups often monitor balloting.

Electoral Administration

As a topic for political science, electoral administration is a relative newcomer. While democratic theorists such as nineteenth-century British philosopher John Stuart Mill were interested in electoral systems, they had little interest in the administrative underpinnings of democratic elections or what was needed to make them free and fair in practice.

GROWTH

All this changed in the last quarter of the twentieth century, when there was a tripling of the number of democracies in the world. The introduction of competitive elections required the development of electoral authorities that could be trusted to administer elections impartially. At the same time, electoral administration was acquiring a more professional and independent status in many established democracies, and a new premium was being placed on expertise in the field. Internationally there was increased networking and sharing of knowledge in addition to the provision of election assistance.

Bodies such as the Stockholm-based International Institute for Democracy and Electoral Assistance (IDEA) and the Washington-based IFES (formerly the International Foundation for Election Systems) have played an important role in the development of international standards and the dissemination of good practice models. IDEA is an intergovernmental body launched in 1995, while IFES is a nongovernmental organization dating from 1987. Together with the United Nations and some national election bodies, they have joined in sponsoring the Administration and Cost of Elections Project. The Administration and Cost of Elections Electoral Knowledge Network provides comparative resources and data, practitioner networking, and capacity building. While the focus of international work on electoral administration has tended to be on assisting new democracies, the criteria that have been generated for assessing good electoral administration can be applied to any democracy.

Electoral administration covers all the steps in the electoral process: determining electoral boundaries; determining and registering those eligible to vote; registering political parties and handling candidate nomination processes; applying rules relating to the campaign period, including regulations relating to campaign finance and other aspects of campaigning; conducting elections; counting the votes; and finalizing the results. These functions may be performed by one or more election-related bodies, disputed returns may be adjudicated by special courts, and parliamentary bodies may provide multiparty oversight. The degree to which an electoral management body has control over electoral processes will be determined by the way it is authorized—whether through constitutional provisions or parliamentary legislation.

PRINCIPLES AND CHARACTERISTICS

In *Electoral Management Design: The International IDEA Handbook* (2006), Alan Wall and his colleagues identify basic principles and characteristics that form standards for electoral administration: respect for the law; fairness, impartiality, and neutrality; equity; integrity; voting secrecy; transparency and accountability; effectiveness; service-mindedness; sustainability; and accuracy and efficiency.

Wall and his colleagues further identify three basic models of electoral administration: independent, institutionally independent from the executive; government, within or under the direction of a minister and department; and mixed, a combination of the first two models with a degree of institutional independence, but under the direction and control of the government of the day. To determine where an electoral administration belongs, seven criteria are used: institutional arrangement, the relationship between the agency and the government; implementation, the level of autonomy the agency has in developing and implementing policy; formal accountability, whether it is accountable to the government executive, Parliament, or head of state; powers, the ability to develop the regulatory framework; composition, whether the agency is led by government members or persons selected from outside of government; term of office, security of tenure; and budget, the level of control it has over its own budget.

Another method of categorizing electoral authorities is focusing on who is appointed to head the agency. Louis Massicotte, André Blais, and Antoine Yoshinaka, in *Establishing the Rules of the Game: Election Laws in Democracies* (2004), differentiate between the appointment of multiple commissioners representing a diversity of political views and therefore balancing partisan views, a government minister's being in charge of the electoral process, and the appointment of a single, independent commissioner (or commissioners).

DIVERSITY

Examples of a single body's managing most aspects of national elections include the Australian Electoral Commission and Elections Canada. These bodies differ in the manner of appointment and tenure of the chief electoral official

(in Canada it is Parliament rather than government that is responsible for the appointment, which is to age sixty-five), but in both cases their independence from partisan influences is jealously guarded. Australia has been a pioneer in the development of professionalized and independent electoral administration since the invention of the Australian ballot in the mid-nineteenth century.

A more fragmented administrative arrangement can be found in the United Kingdom, where local government authorities have traditionally been responsible for voter registration and the conduct of elections. In addition, the Electoral Commission, established in 2000, is responsible for party registration, oversight of rules relating to party finance, disclosure of campaign donations and expenditure, public education, and policy advice. Separate again are Boundary Commissions and, since 1947, a Committee on Party Political Broadcasting, which brings together broadcasters and political parties to decide on the allocation of broadcast time. Paid political advertising is not allowed.

The United States has had the most extreme case of decentralized electoral administration for its national elections. The Federal Electoral Commission is responsible only for the regulation of campaign finance and is an example of a bipartisan rather than a nonpartisan electoral body. Its members may have active party links, as do electoral officials in the fifty states and forty-six hundred local authorities who are responsible for the actual conduct of national elections and voter registration and have very different approaches. One result of partisan involvement in all levels of U.S. electoral administration, including redistricting, can be a lack of trust in the outcomes; another is that all aspects of the electoral process become subject to litigation.

European and Latin American countries tend to have a national register of their citizens, and this is used for the compilation of the electoral register. This means that the electoral management body does not have responsibility for registration, and the updating is done instead by the body responsible for the civil register—in Sweden, for example, it is the National Tax Agency. Such arrangements greatly reduce the cost of voter registration, but in countries where distrust of government is high, the idea of such centralized databases may prompt fears of inappropriate data sharing.

CAMPAIGN FINANCE

Campaign finance is a major issue in terms of a level playing field for elections, and many democracies have moved to tighten control over the source and level of donations to political parties and candidates. Canada has recently banned all corporate or union donations, while the United Kingdom has tightened its disclosure requirements. One fear on the part of electoral management bodies is that through the auditing of political party and third-party finances, the electoral management bodies will be drawn into partisan controversy, hence undermining public confidence in the integrity of electoral administration. This is but one of the many dilemmas that arise within electoral administration; all models have both strengths and weaknesses that deserve greater attention from political science.

Electoral College

The College of Cardinals, which meets in Rome to elect the pope when the papacy is vacant, is probably the oldest electoral college. In 1787 the framers of the U.S. Constitution adapted the concept to create the electoral college, a body of electors chosen to elect the president and vice president of the United States. The decision to use presidential electors was a compromise that took into account the difficulties inherent in a direct election and attempted to balance power between large and small states. The system is intended to protect elections from mass hysteria by relying on wiser minds. The electoral college consists of 538 electors: 3 for the District of Columbia, 2 for each of the fifty states, and 435 divided among the states, equal to the number of their representatives in the House of Representatives. The candidate who wins each state's popular vote typically receives all of the state's electoral votes (unit rule).

Article II, Section 1 of the U.S. Constitution makes provision for choosing a state's presidential electors, which allows for a number of electors equal to a state's number of senators and representatives in Congress. None of these electors can hold office in the U.S. government. Electors vote in their respective states. The votes are then sent to Congress to be counted by the president of the Senate in the presence of a joint session of the House and Senate on January 6; if that date falls on a Sunday, the votes are counted on the next day.

Electoral Cycles

An electoral cycle is the period of time between two elections. Subject to specific electoral laws, electoral cycles are usually four or five years in length. Important components of an electoral cycle are the honeymoon, the period right after

the election; the midterm, the period between elections; and the campaign period, or time approaching an election. Very often, governments reach their highest levels of popularity during the honeymoon period, while experiencing a sharp decline in popularity afterward as the campaign period and next election approach. Popularity functions such as these are considered the outcome of an electoral (economic) cycle. Two types of studies have emerged exploring electoral cycles: the first focuses on the effect of the cycle on economic policies, while the second type looks at how economic conditions and performance prior to an election affect electoral outcomes. The latter research strategy has produced a series of forecasting models that are relatively successful in predicting electoral outcomes.

One line of research on electoral cycles examines the variations in government spending at different points in an election cycle. These studies argue that governments introduce popular policies to maximize their electoral support by increasing spending during the campaign period when voters are called to decide on their future. Empirical evidence has confirmed the above hypothesis, suggesting that government spending was increasing during the election year. This conclusion was also confirmed by a series of analyses of various electoral cycles for Western democracies (United States, United Kingdom, and Germany), where governments appeared to target increases in spending (toward specific groups) during election years. However, when controlling for objective measures of economic conditions (e.g., GDP), the results reported above lost their robustness, and other scholars reported a series of results uncovering that government spending was not related to electoral cycles. Finally, another group of scholars reached a conclusion that falls in the middle, arguing that electoral cycles are important but their substantive effects on government spending are relatively small. Thus, there is no wide consensus on the effects of election cycles on economic policies. Different scholars look at different types of budgetary spending, different types of governments, and different periods in time. Unsurprisingly, the reviewed results relied heavily on various sources of heterogeneity.

Another line of research examines the effects of economic conditions on voting behavior. Models of voter accountability suggest that electorates reward or punish government performance based on economic conditions. Incumbents are capable of directly influencing economic conditions and consequently the voters' well-being. Governments will tend to introduce popular fiscal policies before they enter the campaign to win the election. Following the assumption that voters decide by looking at past performance, incumbent parties will attempt to manipulate the economy to maximize their probability of winning. The theory predicts that objective economic conditions bring about prospective and retrospective evaluations about the state of the economy. This involves sociotropic and egocentric perceptions (i.e., perceptions about the prospective or retrospective general state of the economy and perceptions of personal finances) that mediate final subjective perceptions of the economy. Voters who think that the incumbent has performed

well are likely to reward the government responsible for their pocketbook or sociotropic prosperity. Building on that schema, politicians will seek to introduce popular economic policies in the final period of the electoral cycle to sway the electorate with the goal of establishing the feel-good factor among voters to enhance their likelihood of being reelected. This may be accomplished by introducing changes in key economic indicators such as inflation, unemployment, interest rates, and taxation. While the vast majority of the economic voting literature suggests that the economy is the focal determinant of electoral behavior, the importance and the stability of this effect seem to vary across nations and across time.

As a summary, both accounts of the electoral cycle discussed above are building on three foundations. First, incumbent governments are office-seeking actors. Second, they have the ability to manipulate national economic conditions. Finally, they will tend to manipulate the economy based on a long-term electoral cycle strategy. The first line of the reviewed research seeks to explain government spending, assuming that strategic spending is related to specific time points within the electoral cycle. The second group of scholars seeks to explain voting behavior in response to macroeconomic conditions. On these accounts, the electoral cycles are considered given, and researchers seek to find patterns of association between objective and subjective measures of the economy and the actual vote.

Electoral Formulas

Electoral formulas determine the allocation of representation to candidates or parties, given the tally in an election. They can be simple, with the candidate receiving the most votes winning the seat in a single-member district, or complex, with an elaborate mathematical formula in multimember districts. Indeed, because seat allocation is so straightforward in plurality systems—the candidate with the most votes in a given district wins the seat—the term *electoral formula* is generally used with respect to proportional representation systems.

The simplest element of an electoral formula is the threshold of votes required to qualify for at least one seat, although some formulas do not set a threshold. For example, in state primary elections to allocate delegates to the 2008 Democratic National Convention, the body that formally nominated the Democratic candidate for president of the United States, 15 percent of the state primary vote was required to earn delegates from that state. Where thresholds are set, they typically vary with the number of seats allocated. In elections for the European Parliament, which use variants of proportional representation from country to country, thresholds vary from none to 5 percent.

There are two major families of electoral formulas: highest-averages and largest-remainder methods. Under highest-averages methods, the first step after votes are tallied is to calculate a quotient for each party with the numerator equaling the number of votes received by that party. The formula for the denominator varies across specific methods. For example, in the D'Hondt formula, a highest-averages method used in most European systems, the denominator for each party is the number of seats already allocated to that party plus one. Initially, all parties start with zero seats allocated and a denominator equal to one. The first seat is assigned to the party with the highest quotient; then its quotient is recalculated using the new denominator (two). The second seat is assigned to the party that now has the highest quotient, which could be the party with the first seat if it received more than twice as many votes as its nearest competitor but otherwise will be the party with the second-highest vote total. The quotient is again recalculated, and the process is repeated until all seats are allocated. An alternative to D'Hondt is the Sainte-Laguë formula, for which the denominator equals two times the number of seats already allocated, plus one. This variation makes Sainte-Laguë more favorable to smaller parties than D'Hondt.

The key element of the largest-remainder method is the quota. In wide use are the Droop quota $\left(\frac{votes\ cast}{seats\ to\ allocate\ +\ 1}+1\right)$ and the Hare (or simple) quota $\left(\frac{votes\ cast}{seats\ to\ allocate}\right)$. Each party's vote tally is divided by the quota, and the result is a whole-number quotient plus a remainder (it is possible for a party's remainder to equal zero). Each party receives, at a minimum, the number of seats equal to the whole-number quotient. Unallocated seats are then awarded sequentially to the party with the largest remainder. As with the denominator of a highest-averages method, the choice of a specific quota in a largest-remainder method can alter the seat allocation. To wit, the Hare quota enhances the representation of smaller parties more than the Droop quota.

Electoral Geography

Electoral geography is the presentation and analysis of geographic information related to elections. Electoral geography can be both descriptive and analytical. Political scientists can use geographic units to display differences in political behavior (such as election results presented on a map of the states), and they can use geographic information to test theories about election behavior. Tools used can range from simple color-coded maps to computerized geographic information systems.

Elections everywhere in the world take place in a geographically definable space, and electoral geography is about how that space affects and responds to elections and the interests, incentives, and results they create. At the simplest level, elections take place in nations. Since national elections are contests that determine political outcomes for the geographically defined nation, summary electoral information can be displayed on a map. For example, a map could be constructed that shows the number of female elected representatives in each of the countries in Latin America or that shows the percentage of support for European Union membership in referenda in various countries in Europe.

Geography at the subnational level can also be used to present electoral information. Presenting candidate support by region, federal districts or states, or administrative governmental units can show where a candidate's support lies as well as suggest reasons for candidate success or failure. Such presentations can rely on states to show where a presidential candidate's support lies, or they can rely on smaller units such as counties or even voting precincts to display more detailed variations in candidate support, perhaps demonstrating that a candidate generates support more effectively in cities than in rural areas.

ANALYZING ELECTORAL GEOGRAPHIC UNITS

As suggested above, political science researchers are often interested in the display of electoral information by geographic units, but they are also interested in making inferences

from geographically referenced information. Knowing that a candidate does well in Western states might be interesting, but it is more interesting if that finding has implications for theories of electoral behavior. It is possible, for example, to predict that candidates will do well in the West if they use particular campaign strategies. Finding predicted spatial patterns related to this theory would tell us more about elections than one particular candidate's support in an area and could contribute to the understanding of electoral behavior more generally.

It should not always be assumed that governmental subunits are fixed in the analysis of electoral information. Many subunits are created as a result of political processes, some with the intent of having an effect on elections. Legislative electoral districts, for example, determine which voters participate in which particular elections for legislative office. Districts can be drawn in such a way that one group is advantaged over another. In the United States, extreme cases of the geographic manipulation of electoral districts are often called "gerrymanders," after a nineteenth-century Massachusetts governor (Elbridge Gerry) whose party was thought to benefit from a famous instance of what is now known as gerrymandering. The manipulation of electoral districts is not, however, exclusively a U.S. phenomenon. In a 2008 book chapter, for example, Alonso Lujambio and Horacio Vives document how Mexican electoral districts have been manipulated and how the process has been reformed to guard against gerrymandering. Election districts, then, are often studied by political scientists to determine the extent to which they influence election outcomes. Other geographic units can be drawn with different consequences for elections. City boundaries, for example, can expand to include certain populations, which can affect the outcomes of subsequent municipal elections.

ELECTORAL BOUNDARIES

Electoral boundaries can influence electoral outcomes in several ways. Candidates running for political office, for example, can be expected to pay close attention to the geography of their districts and to structure their behavior to accommodate the geographic realities of their districts. In *Home Style* (1978), political scientist Richard Fenno notes that candidate behavior depends to a great deal on the layout of election districts. Sprawling, rural districts demand a different sort of attention than do geographically smaller urban districts. Suburban districts require different sets of candidate behaviors than do districts made up of older, more established communities.

Voters also can be expected to react to electoral boundaries. Some of these reactions may follow from candidate behaviors, but several scholars suggest that boundaries themselves can influence the attitudes and behavior of voters. Boundaries can conform to other geographic structures in a voter's environment, which in a 1985 article, Bernard Grofman argues gives the voter the ability to "think about" the district. John H. Ely (1997) expects that voters can recognize when a district has been drawn to the advantage of one group and disadvantage of another, which can affect the voter's interest in participating in the election. In a 2005 article, Richard N. Engstrom finds that electoral district boundaries have an effect on voters' ability to identify the candidates running for office in their districts, depending on the degree to which the electoral districts conform to the location of local media markets.

The extent to which the drawing of electoral boundaries can influence elections has led many who study legislative redistricting to conclude that rules should be put into place to regulate those who draw electoral boundaries. Some states enforce what are called "traditional districting principles" that require districts to be geographically compact and contiguous and to contain preexisting political communities. These requirements have led those who study electoral geography to construct measures of these concepts. Different U.S. states have adopted different districting rules, many of which draw from the concept of traditional districting principles.

An alternative to establishing redistricting rules is to create politically neutral (or at least balanced) boundary commissions, which would presumably draw boundaries that are electorally unbiased. Boundary commissions are commonly used in democracies around the world to determine the geographic configuration of election districts. Boundary commissions exist in the United States, but almost always as part of a system to accommodate the failure of a state legislature to draw the districts.

The inclusion of geographic information in the study of elections is an important tool in political science's efforts to understand elections and electoral behavior. Although the display of information on maps is a straightforward approach, modern geographic information system technology gives researchers the ability to take an analysis further. The distance between voters and public resources, or the density of populations in different parts of election districts could well have implications for how citizens vote, and geographic information system technology can assess just this sort of information.

Electoral Quotas

Electoral quotas has two distinct meanings. The first refers to the number of votes required in an election to ensure that a party or candidate will win under a proportional representation electoral system. There are four types of quotas under this rubric. The Hare quota, the simplest of the measures, is determined by dividing the number of votes cast by the number of seats for election. The Hagenbach-Bischoff quota requires that the number of votes be divided by the number of seats plus one. Under the Droop quota, the number of votes is divided by the number of seats plus one, but one is also added to the quotient, or final result. The Imperiali quota is determined by dividing the number of votes cast by the number of seats plus two.

Electoral quotas can also refer to the proportional representation of a particular group—such as women or ethnic minorities—on party lists, for constituency nominations, or as representatives in legislatures or other elected bodies. The purpose of this type of quota is to ensure the nomination, election, and representation of a minimum number or percentage of candidates from the designated groups. This quota is most commonly used to promote the participation of women in politics. It has been successful to varying degrees around the world through various mechanisms, including constitutional entrenchment and legislation; in electoral models; and through voluntary use, through party quotas.

Electoral Reform

Electoral reform is the change of some element of an electoral system, including suffrage rights, the size or number of seats in the assembly, the magnitude or number of seats in the districts, the formula to allocate seats or make a winner, and the ballot form permitting or restricting the voters' choice of parties and candidates. In the long term, major electoral reforms have expanded suffrage rights, replaced indirect elections with direct elections by majority rule, and done the latter with mixed systems and proportional representation rules.

Traditional electoral systems based on plurality or relative majority rule in multiseat districts were used in traditional compact communities in late medieval and early modern times. They are still used in a significant number of local government elections in which it can be presumed that citizens share some clearly identified, broad common interest. However, single-seat districts were diffused during processes of building or reforming large-scale parliaments in large states with more heterogeneous societies and accompanying the broadening of suffrage rights. Specifically, single-seat districts were widely introduced in Scotland and Wales, and in lower proportions in England, during the eighteenth century, and they became a general norm for the British House of Commons by the end of the nineteenth century. They were also introduced in the U.S. state of Vermont by the late eighteenth century and gradually expanded to the rest of the country, especially for the election of the House of Representatives, by the mid-nineteenth century. In Canada, France, and India, single-seat districts also became the only formula for all of the seats in the lower chamber of Parliament during the second half of the twentieth century.

The creation of new parties trying to politicize new issues and the emergence of new political demands in newly complex societies may make results with majority rule dissatisfactory for both voters and candidates. Proportional representation rules were invented with the aim of including varied minorities in the assembly and facilitate the formation of an effective political majority to legislate and rule. To establish fair representation of political parties, each party may be given a portion of seats corresponding to its votes. In a number of countries, the introduction of proportional representation rules in the early twentieth century ran in parallel with the expansion of suffrage rights and the subsequent demands from different social, political, and ethnic groups for representation, as in Belgium, Denmark, Finland, the Netherlands, Norway, Switzerland, and other west European countries.

In general, political parties tend to choose electoral rules with the expectation that they will give them some advantage to promote their aims. Specifically, they tend to follow the so-called micro-mega rule, by which the large prefer the small and the small prefer the large. A few large parties tend to prefer small assemblies, small district magnitudes (the smallest being one), and rules based on small quotas of votes for allocating seats (the smallest being simple plurality, which does not require any specific threshold) to exclude others from competition. Likewise, multiple small parties tend to prefer large assemblies, large district magnitudes, and large quotas (like those of proportional representation), which are able to include them within.

Since the nineteenth century, there have been eighty-two major reforms of the assembly electoral system in forty-one countries with more than one million inhabitants. More than 80 percent of these reforms have been in the direction of more inclusive formulas. Single-seat districts have been supported in countries with a single dominant party; two parties frequently alternating in power, typically a conservative and a liberal party (or a Republican and a Democrat, as in the United States); or in more recent times, a conservative and a socialist party (as in Britain). Nowadays, they are used for assembly elections basically in a number of old democratic regimes in former British or French colonies. In contrast, multiseat districts and proportional representation are usually favored in multiparty systems both by traditional incumbents, such as conservatives or liberals, under threat of losing their dominant position and by minority but growing opposition parties, as was historically the case with socialist, Christian, ethnic, and other parties. Today proportional representation rules are used in most democratic regimes across the world.

Electoral Rules

Electoral rules are criteria to transform votes into collective decisions. They are generally inspired by one of three main principles: unanimity, which requires maximum consensus; majority, which makes a decision supported by half the voters valid; and proportionality, which gives every group a share of representation for further negotiations and broad agreements. Different electoral rules can be used for different purposes, involving both mass political elections and small-group and committee voting and decisions, because they induce the formation of different alternatives and different agendas and may produce diverse results, as will be discussed below.

UNANIMITY

Election of delegates and approval of proposals by unanimity are almost instinctive procedures in simple, homogeneous gatherings and assemblies with easily identifiable common interests and priorities. Families, groups of friends, urban gangs, neighborhood meetings, corporation partners, and club members tend to make collective decisions under conditions of general agreement. In the ancient world, the Justinian code of Rome established the principle that "what concerns similarly all ought to be approved by all," which was adopted by the Christian Church in the fifth century as the following: "He who governs all should be elected by all." In medieval Europe, consuls were elected by traders, bishops by priests and believers, magistrates by citizens, and so forth, on the basis of large consensus. Many medieval assembly regulations established that decisions should be made by "consensus and acclamation," "approval and consent," with "no discrepancy" or "no contradiction," by "free veto," and so on.

However, the requirement of unanimity made it difficult to reach many decisions, especially as communes and countries became more open and socially heterogeneous, which provoked conflicts and schisms. A variety of medieval institutions provided procedures to create unanimity where it did not exist, including silent acquiescence; shouts of commendation or acclamation; murmurs in favor of or cries against the proposer; explicit acceptance of the elected by the dissidents; preliminary voting followed by formal, public expression of the decision by all the community members; and acceptance of elections or decisions made by a qualified part of voters to whom the other voters would submit. Certain Italian communes adopted less-than-unanimity rules, such as those requiring two-thirds, four-sevenths, or other supermajorities or qualified majorities, together with indirect elections in several stages and other devices. The elections of the Christian pope since the twelfth century, as well as those of several central European kings and the German emperor from the fourteenth century on, were redesigned along similar lines. But certain assemblies, such as the Aragonese and Catalan parliaments and the Polish Diet, were reluctant to abandon the requirement of unanimity. As late as the early nineteenth century, even in the British House of Commons most decisions were still made by acclamation, which implied near-unanimous consent.

In both ancient and medieval political institutions and in modern private communities and companies, forcing explicit acquiescence of the dissidents to unanimous consent is a means to ensure that they will respect the elected, obey the collective decisions, or contribute with their duties in spite of previous disagreements. Similar features can be found in a number of international organizations, such as the United Nations General Assembly and the Council of the European Union, where it is assumed that each party is sovereign and has a veto right. Despite their many differences, all these institutions—whether they are ancient, medieval, or modern; private or public; local or international—have the following basic elements: corporate or government (not individual) suffrage, decision making that is limited to those issues in which a general common interest can be presumed, the search for near-unanimous consensus, distribution of burdens in proportion to contribution of resources, and offices that are held by turns or lots.

The unanimity rule has some good properties. Unanimous decisions correspond to the efficiency criterion associated with the name of Italian economist Vilfredo Pareto. A collective decision is said to be "Pareto-superior" if it improves the situation of some participants and does not worsen the situation of others. Also, decisions by the unanimity rule give a positive response to changes in voters' preferences. Specifically, under the unanimity rule, an increase in voters' support for the incumbent or the status quo will not result in its replacement. Similarly, a loss of support for an alternative candidate or proposal will not make it the winner—a property also called "monotonicity" that is not fulfilled, in contrast, by several procedures based on majority rule.

However, unanimity decisions may be impossible to make if voters' preferences can be located along a single dimension, such as the left-right axis or any other issue or ideological dimension on which the participants have consistent preferences. Any voter can veto a move of the status quo away from his or her preference. Advantaged voters, or in spatial terms, those whose preferences are closer to the status quo, can consolidate their advantages. The collective outcome will remain stable independent of the existence of alternative candidates or proposals that are able to reduce the aggregated distance from all individual preferences and thus increase collective satisfaction.

With the introduction of new issues or new values of judgment creating a multidimensional space, several unanimous decisions within the Pareto set, or the set of decisions fulfilling the Pareto criterion, can be made available. While new candidates or proposals may be placed at a larger distance from some voters' preferences than the status quo on one issue or value, they can also be closer to them on other issues or values and become globally more satisfactory and acceptable. But each one of the possible new winners by unanimity will give different voters different degrees of satisfaction of their preferences. Only when the initial status quo is very unsatisfactory, that is, very distant from the voters' preferences, can a new socially efficient decision be made by unanimity. In contrast, if the initial status quo is relatively less unsatisfactory, some voters will veto alternative candidates or proposals, thus causing mediocrity to endure.

MAJORITY

The majority principle was first introduced in medieval Germanic law and the Christian Church's canon law as a consequence of failures in making decisions by unanimity. When dissident members or minority groups were sufficiently large or determined and could effectively resist the imposition of the dominant group's will, there was a strong incentive to adopt a less-than-unanimity, typically majority, rule. With the formation of two or more fractions or parties, decisions made by acclamation were replaced with more formal procedures requiring counting votes and the achievement of a majority threshold. In contrast to the unanimity-based organizations mentioned above, majority rule usually requires individual suffrage and implies that the winner takes all.

It has been argued that the majority principle is the only one that satisfies these few reasonable criteria: (1) decisiveness, but only if there are no more than two alternatives (candidates, parties, or policy proposals) to choose from; (2) anonymity or voters' equality; (3) neutrality with respect to issues, not giving advantage to the largest group or to the status quo (in contrast to unanimity rule, for instance, as discussed above); and (4) positive response to changes in voters' preferences or monotonicity (but only if one alternative obtains an absolute majority support based on voters' first preferences).

In practice, different procedures have been invented to try to make the majority principle viable in real elections. Two late-eighteenth-century French academics made sophisticated proposals. Marquis de Condorcet proposed that the winner in an election should be the alternative (candidate or proposal) preferred by a majority against every other alternative, which may require multiple rounds of voting or comparisons between pairs of alternatives. When the alternatives are located along a single issue or ideological dimension, exhaustive pairwise comparisons or the Condorcet voting procedure makes the median voter's preference the winner. By definition, the median voter, that is, the voter whose preference is located in an intermediate position with less than half of voters on both sides, is always necessary to form a consistent majority on a single dimension. Since the median voter's preference minimizes the sum of distances from all other individual preferences, it can be considered a socially efficient outcome. But in a more dispersed set of alternatives forming multiple dimensions, the Condorcet procedure may not produce a winner, thus lacking decisiveness. A variant gives the victory to the alternative that wins a higher number of times (as divulgated by the Catalan philosopher Ramon Llull in the Middle Ages).

In turn, another eighteenth-century French academic, Jean-Charles de Borda, proposed a rank-order count procedure by which the voter should order preferences and give zero, one, two, and successive points to the alternatives; the winner should be the one with the highest sum of points (the German philosopher Nicolas of Cusa had also proposed this procedure a few centuries before). A more traditional procedure, also with medieval precedents, is approval voting, which allows voters to vote for all those alternatives that they consider acceptable, from a minimum of one to a maximum of all minus one; the alternative with the highest number of votes becomes the winner. There has been much discussion about how different results may be produced by these different procedures, depending on voters' distribution of preferences and their degree of homogeneity. But as has been shown recently, in most real-world settings, exhaustive pairwise comparisons, rank-order count, and approval voting tend to select the same winner.

In mass political elections, relatively less-demanding procedures are more frequently used. With a simple plurality rule, the winner is the candidate supported by only a relative majority, that is, by a higher number of voters than any other candidate but not requiring any particular number, proportion, or threshold of votes. In practice, this makes it possible for generally binding decisions presumably decided by the majority to actually be won with the support of only a minority of voters. In fact, in mass parliamentary elections by plurality rule, a single party has received a majority of seats on the basis of a minority of votes in about two-thirds of the cases in the United Kingdom and some former British colonies (out of 126 democratic elections in Canada since 1878, the United Kingdom since 1885, New Zealand from 1890 to 1993, and India since 1953) as well as in about one-third of the cases in the U.S. House of Representatives since 1828. In presidential elections, plurality rule has given the victory to minority-vote candidates in about two-fifths of the cases in the United States (through the plurality-based electoral college) and in more than two-thirds of the cases in eight countries in Latin America (out of 54 democratic elections during several democratic periods from 1945 on in Argentina, Brazil, Chile, Colombia, Ecuador, Peru, Uruguay, and Venezuela).

In contrast, majority runoff requires an absolute majority (more than half) of votes at the first round, while in a second round of voting the choice can be reduced to the two most-voted-for candidates to secure majority support for the winner. A variant requires the voters to rank all candidates and proceeds to several counts of votes (instead of several rounds of voting) until a candidate obtains the most preferences, as in the majority-preferential vote (also called "alternative vote" or "instant runoff").

With both plurality and majority-runoff or majority-preferential voting, the median voter's preference can be defeated or eliminated. The nonmedian winner by any of these procedures could be defeated by another, losing candidate by absolute majority if the choice between the two were available; that is, he or she might not be the winner by Condorcet procedure (preferred by a majority against every other alternative). This has been the case, for instance, in five of eight presidential elections by majority runoff in France since 1965. Under plurality rule, the winner can even be the Condorcet loser or the most-rejected candidate by a majority of voters, as has happened, for instance, in several presidential elections in Latin American countries, including Brazil, Chile, Ecuador, and Peru, with disastrous political consequences.

In general, the most usual procedures of majority rule just discussed are dependent on irrelevant alternatives; that is, they are highly vulnerable to manipulation since the winner may be an indirect consequence of the merge or split of other, nonwinning alternatives. If a new, nonwinning candidacy splits the votes of the winner, a different winner can be created. This may happen even if the new winner has not gained larger support (thus not fulfilling the monotonicity criterion mentioned above). Majority-rule elections thus encourage strategies aimed at altering the number of alternatives, such as divide and win and merge and win, as well as nonsincere or strategic votes in favor of a less preferred but more likely winning alternative.

PROPORTIONALITY

Proportional representation rules allocate different numbers of seats to multiple parties competing in an election on the basis of the votes received. They were invented with the aim of reducing single-party sweeps and exclusionary victories and preventing actual minority winners with the previously existing rules. As mentioned, majoritarian electoral rules had been widely used in contexts of simple societies with rather homogeneous electorates dealing with local issues. But the expansion of suffrage rights, the emergence of new political demands, and the creation of new parties trying to politicize new issues in newly complex societies made traditional results with majoritarian rules increasingly dissatisfactory for both voters and candidates. The winner-takes-all character of majority rule and the frequency of actual minority winners were at odds with increasing political and social pluralism. In a number of countries the introduction of proportional representation rules in the early twentieth century ran parallel to the introduction of other regulations favoring citizens' participation and fair competition, such as more reliable electoral censuses, the written ballot, secret vote, and an independent electoral authority validating the results.

The basic mathematical formulas that would make the principle of proportional representation operable were invented in the late eighteenth century for apportioning seats in the U.S. House of Representatives among the differently populated states. But they were reinvented in Europe in the late nineteenth century for the allocation of parliamentary seats to political parties with different numbers of votes. A proportional representation formula defines a quota of inhabitants or votes worth a seat. The "simple" quota (as devised by both eighteenth-century U.S. politician Alexander Hamilton and nineteenth-century English lawyer Thomas Hare) is the divisor between the total number of inhabitants or votes and the total number of seats. But since inhabitants or votes are not distributed in exact multiples of the quota, it usually requires an additional criterion to allocate some of the seats, most commonly to the largest remainders after the quota is used. In contrast, the smaller "highest average" or "distributive number" (as devised by both eighteenth-century U.S. politician and president Thomas Jefferson and nineteenth-century Belgian law professor Victor d'Hondt) is sufficient to allocate all seats. This quota can be calculated after the election by several procedures, including using trial and error, using a series of divisors, or lowering the simple quota until fitting all the seats to be allocated. Variants include the so-called major-fractions formula (proposed by both nineteenth-century U.S. politician Daniel Webster and twentieth-century French mathematician André Sainte-Laguë) and others. The "fixed" quota is an absolute number of votes established a priori as worthy of a seat (as proposed separately by nineteenth-century French mathematician Joseph-Diaz Gergonne and nineteenth-century U.S. activist Thomas Gilpin). Although rarely used in mass political elections, it may encourage turnout and work with uniform criteria in all districts, even if it does not permit the establishment of a previously set number of seats.

Proportional representation rules can be used with closed-party lists, permitting the voter to choose categorically only one alternative. But they are also used with other ballot formulas, including open lists or preferential votes, permitting the voter to select one or a few candidates within a party list (as used in Scandinavian countries); the double vote, requiring voters to choose both a closed-party list and one individual candidate (as used, e.g., in Germany); the open ballot, permitting the voter to vote for individual candidates from different parties (as in Switzerland); and the single-transferable vote, requiring voters to rank all individual candidates (as used in relatively small districts in Ireland).

In comparison with the majoritarian rules discussed above, electoral systems with proportional representation rules are more inclusive of several groups. They encourage multiple parties to run separately according to their own profiles, that is, not to withdraw or merge. They tend to facilitate the election of members of ethnic minorities and women representatives. Political and ideological minorities can be included in the system and have an influence on collective decision making according to their popular support to form an actual majority for institutional decision making. Proportional representation, by placing electoral contests in large districts, may also encourage the development of political parties promoting broad interests and the provision of large-scale public goods, in contrast to more frequent focuses on narrow local interests, private goods, and clientelism in individual elections in single-member districts. With proportional representation, since most

votes count to elect seats, voters are encouraged to promote a more sincere revelation of preferences. Electoral participation tends to be higher in elections with proportional representation rules than in single-member districts.

The degree of proportionality between votes and seats for each party produced by different rules can be measured with several indexes, which are all strongly correlated. With conventional measures, the deviation from proportionality may take values from as low as less than 2 percent (as in Germany, with a simple-quota proportional system) to up to 20 percent overrepresentation in favor of the larger parties (as in the plurality-rule system in the United Kingdom).

While plurality rule may fabricate a single party's absolute majority of seats on the basis of a minority of popular votes (not necessarily including the median voter, as previously mentioned), multiparty parliaments based on proportional representation tend to produce multiparty coalition governments based on a majority of seats and popular votes. In practice, there is a paradox: majoritarian electoral systems often create governments with minority electoral support, while proportional representation rules, which are praised for the inclusion of minorities, tend to produce governments with majority electoral support. In plurality-rule electoral systems, a small change in the total of popular votes can provoke a complete alternation of the party in government. With proportional representation, since some parties may have opportunities to share power with different partners, in the long term we should expect relatively more policy stability.

Nowadays, plurality rule is used for mass political elections, mostly in a number of old democratic regimes in former British colonies (as well as in most fake noncompetitive elections in authoritarian regimes). Proportional representation rules began to be used in the early twentieth century in relatively small but socially or ethnically complex countries in Western Europe, when they introduced new regulations of universal male suffrage, including Belgium, the Netherlands, Switzerland, and the Scandinavian states. Today they are used in most democratic regimes across the world.

Electoral Systems

Electoral systems, often referred to as voting systems, systematize the election of candidates for public office. Inherent in these systems are explicit rules for executing the voting process. These rules govern voting eligibility requirements for the populace, tabulation of the results, and voting methods. The electoral system specifies the type of ballot, the size of permissible votes, and the method for tabulating votes. These specifications are what distinguish one electoral system from another. Thus, elections in countries will vary as a result of the adopted electoral system.

Electoral systems can differ with regard to the manner in which individuals articulate their voting preferences. This mostly concerns the structure of the ballot. Electoral systems can be considered single-winner systems and multiple-winner systems. Single-winner systems elect a single person for an elected office, whereas multiple-winner systems produce elections that generate multiple winners. Several methods exist for achieving a single-winner system; the most popular are as follows. Voters participating in a ranked ballot system will rank order their preference for candidates from most preferred to least preferred. This method allows each voter to express his or her opinion about all public office candidates as a result of rank ordering. Alternately, range voting allows voters to rate or score each candidate individually along a prespecified range articulated by the voting system. The scores for each candidate for public office are tabulated, and the candidate with the greatest

score is proclaimed the winner. Plurality voting, or first past the post, is most commonly used in the United States, Canada, India, and the United Kingdom. This voting form specifies that the proclaimed winner is the candidate who wins the most votes, regardless of whether the vote is a majority of the votes. A variation of plurality voting exists in France, which specifies that if no candidate receives a majority vote, a second election occurs (a runoff election) between the two top vote-getting candidates to choose a winner. The most common methods used by single-winner systems are plurality and runoff voting.

Multiple-winner systems usually characterize elections for legislative bodies. In this instance, the concern is not necessarily which individuals get elected but how many seats the political party is able to secure. Therefore, the emphasis tends to be on the political party's composition of the legislative body, whereas in single-winner systems the emphasis is more on the individual seeking election. Many multiple-winner systems seek the distribution of political power on the basis of proportional representation. Several methods exist under multiple-winner systems. These elections can be characterized as nonproportional, semiproportional, and proportional representation. Nonproportional elections are illustrated as elections by list in which voters cast their votes for a list of candidates and the list of candidates that receives the majority of votes wins all the contested seats. Ecuador uses such a system in allocating seats in its legislature. Alternatively, semiproportional elections strive to achieve proportional results; however, there is no guarantee of this result. This is illustrated by single nontransferable votes in which each voter casts one vote for a candidate but more than one position exists; the candidate with the highest number of votes wins the office. The result can be proportional but may also result in nonproportional representation. Jordan, Thailand, and Indonesia use this method for allocating seats. Last, proportional representation guarantees proportional results by employing a party list system in most cases. Voters cast votes for parties rather than individual office seekers. Proportional representation attempts to achieve comparable results between the percentage of votes for a list of candidates and the actual percentage of seats they receive.

The candidate lists for which voters cast their votes can be either open lists or closed lists. Open lists allow voters to determine which candidates on the list win the open seats, whereas closed lists do not offer voters the same flexibility because the parties assign candidates to the seats on a predetermined basis. Nations that allocate seats based on proportional representation usually have more political parties, and it is difficult for a single party to achieve majority status; therefore, coalition government is common. An example of a country that uses a system of proportional representation based on party lists is Israel.

Electoral Systems, Comparative

A huge variety of electoral systems in the world have been established along with the diffusion of democracy and the formation of political parties. In traditional local assemblies with rather homogeneous electorates until the nineteenth century, relatively simple electoral rules were used. A typical electoral system was composed of (1) multimember districts, that is, the election of more than one representative in each district; (2) open ballot, in which people could vote for their preferred individual candidates without the restrictions of lists or groups; and (3) plurality or majority rule, by which the candidates with the higher numbers of votes were elected. This type of electoral system was able to produce a consensual representation, especially in small communities with high economic and ethnic homogeneity. However, in new contexts of relatively complex and heterogeneous electorates, once lists of candidates to be voted in bloc were formed, there were incentives to search for new electoral systems able to give representation to multiple parties. Virtually all the new electoral rules and procedures that were created since the mid-nineteenth century can be understood as innovative variations of the originating system presented above. They can be classified in three groups, depending on whether they changed the above-mentioned district magnitude, the ballot, or the rule.

The first group of new electoral rules implied a change of the district magnitude from multimember to single-member districts, that is, the split of the previous large districts into smaller ones in which only one representative was elected. With smaller, single-member districts a candidate who would have been defeated by a party sweep in a multimember district may be elected. Thus, this system tends to produce more varied representation than the previous system. Single-member districts with plurality, or relative majority, rule were broadly introduced in Scotland and Wales and in lower proportions in England during the eighteenth century, and they became the general norm for all of Britain in 1885. They were also introduced in the U.S. state of Vermont in 1793 and gradually expanded to the rest of the country, especially for the election of the House of Representatives in 1842. France also replaced multimember districts with single-member districts by absolute majority rule with a second round of voting for the first time in 1820, oscillated between

both formulas during long periods, and has reestablished single-member districts since 1958.

The second group of new electoral rules implied new forms of ballots favoring individual-candidate voting despite the existence of party candidacies while maintaining multimember districts and majority rules. By limited vote, the voter can vote for fewer candidates than seats to be elected in the district. One party can sweep as many seats as the voter has votes, but it is likely that the rest of the seats will be won by candidates of different political affiliations. The earliest experiences of limited vote in multimember districts took place in Spain, first in the form of a single nontransferable vote, that is, with only one vote per voter, from 1865 on, and giving each voter two votes in three-seat districts from 1878 on. Limited vote was also introduced in previously existing multimember districts in brief experiences in Britain in 1868 and in Brazil in 1875. The single nontransferable vote was used for long periods in Japan during the twentieth century.

Finally, the third group of new electoral rules implied the introduction of rules of proportional representation, which give each party list a number of seats in proportion to its votes. The early, British-style formula of single transferable vote is used in multimember districts with individual-candidate voting, although it requires each voter not only to select but to rank candidates. Other formulas of proportional representation, such as double vote and preferential voting, although they imply party lists, may be compatible with some degree of individual-candidate voting. The first wave of proportional electoral systems started in Belgium in 1899, closely followed by Denmark, Germany, Norway, the Netherlands, and Switzerland around World War I (1914–1918). The development of multiparty systems led these and other west European countries to reestablish or for the first time introduce proportional representation electoral rules at the end of World War II (1939–1945).

Currently, the vast majority of countries employing single-member districts with plurality rule are former British colonies. They include the United Kingdom and the United States as well as Canada, India, and a number of small countries in Africa and the Caribbean. France and a few former French colonies use single-member districts with absolute majority rule, which is also used in Australia with majority-preferential vote.

In the rest of the world, the increase of both the number of countries and the number and the proportion of democracies has developed together with increasing political pluralism within each country. While the number of political parties tends to increase as a consequence of the emergence of new political demands, politicization of new issues, and would-be leaders' initiatives, there has been a general trend in favor of adopting rules of proportional representation.

A recent development is the emergence of mixed electoral systems in which both majority and proportional representation rules are used for electing different sets of seats in the same assembly. Most mixed systems currently existing were established to replace previous dictatorships or plurality-rule electoral systems with single-party dominance when higher levels of political pluralism had developed. While most of these experiences are still recent, some have been short-lived and placed within a general trend toward democratization and higher pluralism.

Most electoral system changes since the mid-twentieth century have been in favor of greater proportionality. Nowadays, only about one-fifth of democracies in countries with more than one million inhabitants use electoral systems with majority electoral rules. During the third wave of democratization, which started in 1974, no new democracy established in those countries has adopted the old British formula of parliamentary elections in single-member districts by plurality rule.

Electronic Voting

Electronic voting may be described as the use of a specific system that allows members of Congress or other legislatures to cast their votes on roll calls on the floor from their seats or other specific locations. The results may be seen on a panel as "yes," "no," or "abstention." Names appear with indications of party and state or another configuration according to the member's desire. Representatives' names and votes may be displayed if the voting is open. If the voting is secret, only the final result appears. There are two main advantages to using electronic voting systems in parliaments. The first is accountability: constituencies and civil society may have immediate direct access to their representatives' positions related to legislative bills. The second is speed: single votes do not need to be counted by hand, which also precludes counting errors.

Electronic voting is also used in general and parliamentary elections in several countries. Electronic voting machines

were developed to improve accountability, increase the speed of ballot counting, and help illiterate voters cast their ballots for candidates or parties by displaying photographs or numbers instead of phrases or names. Brazil is a good example: in the 2006 general elections, more than 125 million votes were counted in less than thirty-six hours, with no counting errors. Electronic voting machines are not completely reliable, though, and may malfunction as they did in U.S. elections in the early 2000s. Electronic voting systems are being adopted in more than sixteen countries worldwide, including Venezuela, India, and the Netherlands. Eventually constituents may be able to cast their electronic ballots via the Internet or telephone. Some experts express concern about the possibility of fraud and the security of electronic votes.

Elite Decision Making

Elite decision making refers to those choices made by the intellectual, educational, and political elites in a given society. Various models of elite decision making exist. Most such models emphasize the individual level of analysis because attention remains focused on how and why particular leaders make the choices they do. However, some models of elite decision making also focus on group decision making among elites. The most prominent of these group-based models has been groupthink.

Theories concerning elite decision making have focused on both personality and situational explanations for behavior. These theories can be applied in either domestic or foreign policy contexts, although it has traditionally been more common to apply elite decision making models in foreign policy domains because American leaders typically have more freedom of action in this area. In domestic political arenas, explanations for elite decision making often contrast with models designed to explain mass public opinion.

Theories of elite decision making that focus on personality historically took the form of psychobiography, or the attempt to explain a particular leader's political actions in light of his or her personal drives and needs. This tradition, begun by Harold Lasswell, was further developed by many others including James David Barber, Fred Greenstein, and Alexander George. This approach often, but not always, drew on psychoanalytic theory to examine the relationship between childhood experiences, personal history, and political outcome. Other incarnations of this work include models that purport to locate political behavior in particular personality traits, whether those traits revolve around risk taking, authoritarianism, or some other relevant trait. Early theories of the authoritarian personality developed by Adorno and colleagues, for example, reported relationships between anti-Semitism, ethnocentrism, and political and economic conservatism. Although this work came under methodological criticism, it was widely applied

to both elites and individuals in mass publics. Recent versions focus on right-wing authoritarianism. In one particularly prominent variant of the personality model, David Winter drew on earlier work by David McClelland and others to investigate how leaders' particular motives and drives affected their performance and appeal.

Some work on personality has focused on the impact and importance of emotional motives and feelings in influencing decision making. Early work in this area stressed the ways in which emotion could bias decision making in detrimental ways. Certainly, the groupthink paradigm provides an example of a model wherein too much emotional attachment between people can lead to premature consensus without appropriate analysis or sufficient criticism. However, more recent work indicates that emotion often can provide an effective and efficient basis on which to make fast and largely accurate decisions. Most likely, the relationship between emotion and performance follows the familiar inverted u-shaped function: too much gets in the way, while too little impairs functionality as well.

Some approaches to elite decision making also attempt to take into account the particular historical circumstances and demographic background of leaders. This kind of analysis focuses on how elites are influenced by, and reflect, their particular social, ethnic, religious, political, or class backgrounds. The goal in this work is to explore the relationship between these forces and later political behavior.

Some models of elite decision making focus on the situational and environmental determinants of choice. In this regard, prospect theory provides a preeminent model of decision making under conditions of risk. In this paradigm, environmental factors structure the choices that elites and other individuals make when confronted by risky prospects. Many other models drawn from psychology, behavioral economics, and decision theory can be applied to elite decision making as well.

Many models of elite decision making are criticized for similar reasons. In particular, such models come under scrutiny for their failure to take sufficient account of other factors judged to exert a greater influence on political outcomes than personality, such as political incentive structures, large-scale social and political forces, and other historical and institutional pressures. One of the most important rebuttals to such arguments rests in the obvious impact that particularly powerful leaders have had on their times, both for good and for ill. Charismatic leaders retain the capacity to shape the events of their time, and such effects are hard to examine outside of a framework of individual models of elite decision making and choice.

Elite Interview

Elite interviewing is a method of obtaining information about a specific sample considered to be elite members of society who may be politicians or civic, economic, social, cultural, military, and intellectual leaders. The classic work on the topic of elite interviewing was written by Lewis Anthony Dexter in 1970. One example of elite interviewing is Harriet Zuckerman's detailed interviews with Nobel laureates who won prizes from 1907 to 1972 and were living in the United States at the time.

A researcher should ensure that the information about and from this sector of society cannot be obtained elsewhere before embarking on elite interviewing so as not to waste time and effort. Elite interviewing requires being well prepared for the interview. Direct verbal interaction between individuals is used when face-to-face contact is imperative, when immediate responses are desirable, and when such use is feasible, meaning that there is a small sample, adequate financial support, and an availability of well-trained interviewers.

In elite interviewing, the usual interviewing rules do not apply. Because elites are used to being the focus of attention, standardized questions that are not tailored directly to them should not be asked. The interviewer(s)—an individual, a team of two or more interviewers, or a group—should do their homework, memorize the questions, and ask them in whatever order the conversation allows, letting the questions drive them to the heart of the research question. Elite interviewing allows the researcher flexibility to deviate from the set pattern of questions and probe areas of interest or vagueness. The greater communication between the interviewer and interviewee permits immediate checking on information, thus ensuring the reliability of the content by using rephrased questions or asking questions again.

There are certain drawbacks of the elite interviewing method, including cost in terms of time and money, problems determining the worthiness of the information obtained and the truthfulness of that information, and problems that arise from the interviewer's bias and subjectivity.

Elite interviewing entails taking down quick keynotes to capture core issues because writing down answers during the interview process may be viewed as a discourtesy and a distraction that takes away from the flow of the interview. The interviewer therefore should jot down a few key terms and transcribe those notes immediately after the interview. Taping (audio or video) becomes acceptable as long as the interviewee is sure of the purpose and is guaranteed confidentiality. The key to a successful elite interview is making sure that nothing in the process is threatening or damaging to the interviewee's self-esteem. A good elite interview benefits not only the researcher but also the respondents when they are able to speak to a good listener, reflect on their thoughts on various issues, reminisce about past experiences, get stimulated intellectually by thinking about issues not often considered, and express views candidly without fear of the consequences. In this sense a good interviewer can obtain much information by watching out for body language and recognizing that silence can be expressive.

Suggestions for a successful elite interview include having a clearly defined objective; using terms that are operationally defined and explained to the interviewer and interviewee, and preferably pretested; and training interviewers via simulations and apprising them of the need to be ethical and to maintain confidentiality. Likewise, it is best to ascertain the optimum time for an interview, not too long, leaving both parties tired and bored, but not too short, resulting in one's missing out on important information.

Elites, Political

In contemporary social analysis, the term *political elites* refers to the segments of national elites—the groups of powerful individuals influencing the political outcomes on the national level in a systematic and significant way—that control the government and other political institutions of the state. In liberal democracies they typically include political leaders, top parliamentarians and government officials, and leaders of the major political parties. Their power and influence reflect control over political power resources concentrated in the state as well as mutual access and the capacity for solitary action. Members of the political elite are typically identified as holders of the top power positions in government and the key organizations of the state, by involvement in making key political decisions, by reputation among their peers, or finally, by a combination of the three methods. Political leaders are typically placed at the apex of national elites (the latter including also elite groups heading business, mass media, military, trade union, and other organizations). At the other end of the power spectrum are the masses (or nonelites).

In democratic regimes, political elites operate electoral systems in which their members compete for leadership (top

executive position in the state) by mobilizing popular electoral support. They also collaborate and compete peacefully with other elite groups (administrative, business, media, trade union, military, religious, etc.), including political opposition. In liberal democracies, such as the United Kingdom, the electoral competition for leadership is free and fair. In nonliberal regimes, such as Russia, the competition is highly skewed. Dominant elite groups monopolize political leadership, and they restrict competition by intimidating political rivals. Intraelite conflict and warfare are trademarks of nondemocratic and unstable polities.

The centrality of political (as well as other) elites as the key social actors was highlighted by Vilfredo Pareto, Gaetano Mosca, Robert Michels, and Max Weber at the turn of the nineteenth and twentieth centuries. Those classical elite theorists insisted that political power is necessarily and increasingly concentrated, and they criticized as ideological both Marxists, who foresaw a triumph of egalitarian socialism, and the advocates of participatory democracy. In contrast with both, the classical elite thinkers suggested persistent and inescapable power concentration in the hands of political elites who controlled large organizations, especially modern states. Revolutions, including socialist revolutions, claimed elite theorists merely reconstituted elites, and they did not narrow down the elite–mass power gaps. Democracy simply tamed and regulated elite power competition—the point subsequently elaborated by Joseph Schumpeter (in his definition of democracy as elite electoral competition for political leadership) and by contemporary elite theorists.

POLITICAL ELITES AND RULING CLASSES

Political elites are sometimes conflated with ruling classes. The latter are typically circumscribed in terms of ownership of capital and land. Class theorists of Marxist persuasion treat political power as derived from property ownership, and they see political elites as executive arms of the ruling/ownership class(es). Some students of elites, such as William Domhoff, combine the class and elite perspective and depict elites as socially anchored in the dominant ownership class(es). The classical and contemporary elite theorists, by contrast, point to the autonomy of political (power) elites, as reflected in elites' capacity to dominate or even expropriate the owners (e.g., in revolutions).

Contemporary elite theorists see the bases of elite power in command over the resources of the state (including the military might), organizational capacities, and intra-elite cohesion. C.W. Mills analyzed the emerging "power elite" in post–World War II America as firmly anchored in the national government, the military directorate, and the largest business corporations. Elite cohesion, according to him, did not preclude the possibility of temporary intra-elite divisions on specific policy questions. However, when faced with political challenges, the power elite acted in unison. Other contemporary students of political elites stress that the elites' grip on power is strengthened by their influence over the mass media, their alliances with nonelite social forces—dominant classes, strata,

movements, and politically organized groups—and their control over political succession.

MODERN ELITES

Robert Putnam provided a comprehensive overview of modern elites, including political, administrative, and business. He highlighted elite anchoring in social and institutional structures and saw elite conduct as heavily circumscribed by ideologies (revolutionary elites) and by national legal-constitutional frameworks (liberal elites). John Scott studied modern corporate elites and edited a major sociological overview of modern elites that stresses the importance of power networks. Other contemporary elite theorists, such as John Higley and his collaborators, surveyed contemporary elites in stable democratic regimes. They linked political stability and democracy with elite consensus on the rules of political rivalry. By contrast, Eva Etzioni-Halevi identified effective "coupling" of political elites with lower/working classes as a key condition of democracy.

More recently, there has been a shift in elite research that can be summarized in four points:

- The emergence of transnational power networks and elite alliances: while nation-states remain the most important institutional loci of power, other (and more diffuse) power concentrations emerge in the process of globalization. Faced with increasingly transnational/global problems (e.g., terrorism, environmental degradation, climate change, declining oil supply, water shortages, drug trade, uncontrolled migrations) state political elites consult, collaborate, and form ad hoc and lasting, typically regional, alliances (e.g., Coalition of the Willing, Asia-Pacific Economic Cooperation).
- Widening elite autonomy and prodemocratic orientations: the arguably most momentous events of the twentieth century, such as the dissolution of the USSR, the collapse of Soviet communism in Eastern Europe, and the subsequent democratization of regimes in Eastern Europe and East Asia, have been engineered predominantly from above by political elites, often with only halfhearted support of mass populations.
- Increasing focus on strong political leaders combined with a heightening of this focus by electronic media: these trends reinforce each other and change the physiognomy of liberal democracies to leader democracies.
- The declining impact of ideologies: Western political elites engineer and cultivate mass support in a pragmatic, opportunistic, and ad hoc manner, often through media spin and campaigns focusing on the personalities of the leaders. This reflects the fact that the support constituencies of Western elites are more fickle and less anchored in specific classes, ethno-segments, racial minorities, or religious groups.

Elite Theory

Although the elite concept is often employed broadly and diffusely, it best refers to persons who are able, by virtue of their strategic decision-making positions in powerful organizations and movements, to affect political outcomes regularly and substantially. At the national level in modern polities elites number a few thousand people spread across the tops of all important sectors—politics, government administration, business, trade unions, the military, pressure groups, major mass movements, and so forth. Holding that such power concentrations are inescapable, elite theory seeks to explain political outcomes principally in terms of elite conflicts, accommodations, and circulations.

The theory's origins lie most clearly in the writings of Italian political scientist Gaetano Mosca (1858–1941), Italian economist and sociologist Vilfredo Pareto (1848–1923), and German-Italian sociologist Robert Michels (1876–1936). Mosca emphasized the ways in which tiny minorities outorganize and outwit large majorities, adding in *The Ruling Class* (1923/1939) that "political classes"—his term for elites—usually have "a certain material, intellectual, or even moral superiority" over those they govern. Pareto postulated that in a society with truly unrestricted social mobility, elites would consist of the most talented and deserving individuals but that in actual societies they are those who are most adept at using the two modes of political rule, force and persuasion, and who usually enjoy important advantages such as inherited wealth and family connections. Pareto sketched alternating types of governing elites, whom he likened, following sixteenth-century Italian political philosopher Niccolò Machiavelli, to lions and foxes. Michels rooted elites ("oligarchies") in the need of large organizations for leaders and experts to operate efficiently; as these individuals gain control of funds, information flows, promotions, and other aspects of organizational functioning, power becomes concentrated in their hands. Emphasizing the inescapability and also the relative autonomy of elites, all three men characterized visions of fully democratic and egalitarian societies as utopian.

The writings of Mosca, Pareto, and Michels provide a paradigm from which a general theory of elites and politics might be derived. However, efforts to produce such a theory have not been conspicuously successful. Linking elites causally to major regularities in politics remains elusive; there is no accepted typology of elites and no accepted specification of the circumstances and ways in which one type of elite is replaced by another type; interactions between elites and non-elite populations are captured only piecemeal. Nevertheless, political scientists pay much attention to the key roles played by elites in democratic transitions and breakdowns, revolutions, regime functioning, mass movements, globalization, and many other political phenomena.

ELITES AND REGIMES

What would a general theory of elites and politics look like? The principal regularities that it might seek to explain are the characteristics of political regimes. Regimes can be conceived as structures of elite rule whose basic forms and functioning accord closely with the characteristics of the elites who create and operate them. Regimes manifest the prevailing mode of elite interaction, the disposition of elites to rule preponderantly through force or persuasion, and the political formula that elites use to justify their rule. Economist Joseph Schumpeter's "competitive theory of democracy" illustrates this approach. It conceives a democratic regime as an institutional arrangement in which elites and leaders compete periodically for voters' mandates to rule. Elites and leaders are thus the vital actors in a democracy. However, Schumpeter offered no explanation for why elites and leaders in a few polities act in this way while those in most do not. Nor did he specify dynamics of the elite competitions that produce democracy, simply assuming that they are always restrained and circumspect—a sanitized view to say the least.

To capture elite variation and its consequences for political regimes, a general theory would need a cogent typology of elites. One of its dimensions might be the extent of elite structural integration: the relative inclusiveness of formal and informal networks of communication and influence among members and factions. Another dimension might be the extent of elite value consensus: the relative agreement among members and factions about norms of political behavior and the worth of existing governmental institutions. Extensive but mostly informal integration and a mainly tacit consensus about norms and institutions denote elites that operate stable and liberal democratic regimes; extensive but mostly formal integration in a single party, social movement, or religious sect and a uniform profession of its official beliefs denote elites that operate totalitarian, theocratic, or rigidly authoritarian regimes; sharply segmented integration and little agreement about political norms denote elites that operate unstable dictatorial regimes and illiberal democracies.

A general theory would need to specify how transformations from one elite type to another occur. Revolutions, through which, Pareto cynically observed, one ruling elite is merely replaced by another, are the most obvious

transformations, although they rarely occur. Equally rarely, warring elite camps may enter deliberately into a sudden but lasting settlement of their most basic disputes. It is possible, too, that deeply opposed elite camps may, in propitious circumstances such as widespread prosperity, gradually moderate their oppositions and converge toward a live-and-let-live modus operandi that proves lasting. Whether elite transformations take still other forms, such as implosions like that of the Soviet Union's elite during the late 1980s, is an important question.

ELITES AND NONELITES

Interactions between elites and nonelite populations are the most difficult hurdles a general theory faces. Pareto tried heroically to conceptualize changing asymmetries between elites and nonelite populations regarding their rational interests and nonrational sentiments ("residues"). When these asymmetries become great, he contended, a basic circulation of elites impends. But this happens infrequently because elites are normally able to co-opt the most talented nonelite persons and devise ideologies ("derivations") that pacify nonelite populations and legitimate elite rule. However, Pareto's sweeping but exceedingly abstruse account of nonrational residues has proved inhospitable to practical application, and no more usable scheme has gained wide acceptance. A general theory must probably rest on a strategic conception of nonelite interests and orientations as constituting parameters within which elites can safely and effectively act; elites who violate these parameters risk coming to grief. But nonelite parameters for elite action are quite wide, leaving elites with a range of choices, and their choices are normally decisive for political outcomes.

Emergency Powers

Emergency powers generally refers to the temporary suspension of the normal rules and proceedings in an organized political system and the provision of special discretionary authorities to a specific agent to respond to extraordinarily dangerous situations that threaten public safety. Such situations may include foreign invasion, internal rebellion, economic depression, or a severe natural disaster. Examples of emergency provisions include the curtailment of individual rights such as speech, press, and assembly; suspension of the writ of habeas corpus; imposition of curfews and restriction of movement; unrestrained search and seizure of private property; central government management of the economy; and use of military forces alongside or in place of civilian legal and public safety institutions. Central to the concept of emergency powers is that they are legally invoked, temporarily assigned, intended to achieve immediate decisive action in response to specific circumstances that threaten the survival of the political entity, and designed to restore the political order to status quo ante.

INVOKING EMERGENCY POWERS

Autocratic governments do not require emergency powers since, as political scientist Clinton Rossiter notes, it is not necessary "to suspend rights that do not exist or augment powers that are already absolute." Therefore, these powers are associated mostly with liberal democratic regimes that have a prominent deliberative lawmaking body and a commitment to the protection of individual rights and the rule of law. In times of extreme danger, these governments may need to concentrate power, consolidate decision-making authority, and curtail individual liberties to manage the crisis to ensure the survival of the political order. In other words, they may need to become more autocratic to survive. Since the normal legislative process can be too slow, inflexible, and cumbersome to respond adequately to a dangerous situation, the executive is often the empowered political entity who can make and enforce decisions swiftly to meet the demands of the crisis.

Ideally, once the crisis subsides, the emergency powers expire, the authority accumulated by the executive is relinquished, and the normal precrisis political order resumes operations. Since emergency powers concentrate authority in one or a few individuals during the crisis, attention must be given to erecting safeguards to prevent or complicate the corruption and abuse of power, specifically the continuance of emergency powers after the crisis is over. Should the extraordinary powers not be relinquished, precrisis constitutional order could be transformed into tyrannical and arbitrary rule, thus defeating the original purpose of having emergency powers: to preserve the precrisis constitutional regime. History abounds with examples of emergency powers' leading to the usurpation of power, the institution of a state of permanent emergency, the creation of an emergency regime, and the indefinite suspension of the constitutional procedures and individual rights. Perhaps the most infamous abuse of emergency powers occurred in 1933 Germany, when Adolf Hitler, as chancellor, exploited the

emergency provisions of article 48 of the Weimar Constitution to suspend that constitution indefinitely and usher in the National Socialist regime.

One of the most important safeguards is that those political actors empowered by the implementation of emergency powers are not the same authority to decide when such powers should be initiated or terminated. In most modern democracies, the legislative branch has the authority to declare and terminate the declaration of an emergency situation, while the executive is the agent who will be empowered. Another safeguard includes the establishment of a separate authority to determine whether the political agent wielding emergency powers abuses his or her authority and to hold him or her accountable after the crisis has been met. This likely would be the legislative or judicial branch of government, which would hold a trial after the crisis to make such determinations. The German political theorist Carl Schmitt challenged many liberal democratic assumptions regarding emergency powers by suggesting that emergencies are the normal state of affairs and that the locus of sovereign power in a government rests with the one who has the authority to decide when a crisis begins and ends and which powers need to be utilized. In doing so, he justified autocratic rule in modern government.

HISTORICAL FOUNDATIONS OF EMERGENCY POWERS

The constitutional dictatorship of the ancient Roman republic is perhaps the most famous, and clear-cut, example of emergency powers. When the survival of the republic was threatened, the Roman senate would name a citizen the "dictator" and grant him extensive military powers for six months for the sole purpose of acting decisively to meet the demands of the crisis. In addition to initiating and terminating the dictatorship, the senate also checked the abuse of the extraordinary powers by maintaining control over the republic's finances.

MODERN EMERGENCY POWERS

Republican Rome's constitutional dictatorship has influenced the conceptual development of emergency powers in modern democracies. Most modern democracies contain some form of emergency powers either explicitly or implicitly in their constitutions or have adopted legislation to enact such powers in times of crisis, such as the U.S. National Emergency Act of 1976. The institutions of the state of siege (*état de siège*) in civil-law countries and martial law in common-law countries are based on the British legal tradition. Although derived from different legal systems and constitutional frameworks, the emergency institutions of state of siege and martial law consist of many similar measures and principles including the curtailment of civil rights and the use of the military and military courts for civilian use.

These are the most prominent and extreme forms of emergency powers, however, as they can be more limited in scope and extent. For instance, local and territorial governments may employ some form of emergency powers in response to local crises including natural disasters that require the use of some military forces and the suspension of some individual liberties such as imposing quarantines, forcing evacuations, and implementing curfews.

The global threat posed by modern terrorist organizations and the legal and military measures that governments have attempted in response, including military tribunals to prosecute suspected terrorists and increased surveillance on domestic populations, have brought emergency powers in liberal democracies to the forefront of recent scholarly debates. However, this debate is at least as old as the Roman republic and illustrates the perennial tension between rule of law and the preservation of the political order in times of danger.

Emerging Democracies

Democracy's practically uncontested status as the single legitimate regime type conceals how extraordinary an achievement its emergence has been. Emerging democracies face the task of institutionally redistributing power and of normatively legitimizing a people's self-government. They need to reconcile the urge to individual freedom and the hope for equality by ensuring that the exercise of power in the people's name becomes accountable and transparent. This emancipation of the people into a political subject implies complex social and institutional, but also ideational and symbolic, transformations. Turning the poor, the many, or the low into masters of their own affairs raises the question of the availability and the role of models in shaping institutions and moral-normative values.

MODELS OF DEMOCRACY

The ancient Greeks had no model of democracy to inspire them. Neither the Founders in the United States nor the French revolutionaries had dispositions toward the establishment of a representative democracy in its contemporary guise. Only the prolonged political stability, economic welfare, and moral purpose of freedom in the Western hemisphere after World War II (1939–1945) shaped democracy as a model in

a bipolar world. The collapse of Soviet communism turned representative democracy into a normative goal—with the possible exception of the Middle East and North Africa—on a global scale. While earlier studies theorized the socio-economic origins of democratic regimes, more recent approaches emphasized externally assisted regime changes by multilayered efforts of democracy promotion. These interrelated but diverse approaches interpreted emerging democracies with regard to technical assistance, knowledge transfer, and the rational design of democratic institutions. Structural approaches postulate a set of habitually accepted interdependent arenas such as an existing state bureaucracy, the rule of law, and civil, political, and economic society as preconditions for the consolidation of democracy. Process-oriented approaches highlight causal mechanisms by which trust networks are transformed, public politics is insulated from categorical inequality, and autonomous power centers in states are removed. Considered a globally appearing order to come, the challenges of emerging democracies have been framed in the lines of a capitalistic logic, focused on rational self-interest of autonomous political elites, not on the social spirit of the people.

THE FALLACY OF PRECONDITIONS

Such interpretations derive normative ideas and institutional practices regarding democracy from some imagined status quo of democratic values, institutions, or practices, which transcends the social and cultural context of the emerging democracy concerned. Yet values do not emerge independently from existential facts. It is questionable, for instance, whether any established Western democracy had any prodemocratic preconditions in place at its foundation. The focus on institutional design underestimates that, in its core regions, democracy has been a dramatic, messy, and contingent process, riddled with conflict, violence, and regression. Old, antidemocratic regimes were replaced by waves of democracy following violent revolutions or world wars, while creating the demos in colonial settings required ethnic cleansing of the indigenous population. An apparently strong democracy such as the United States could be undermined by the inverted totalitarianism of managed democracy (with its main aim to increase profits of large corporations) and superpower (with its focus on imperialism and militarism).

The contrasting examples of the breakdown of new democracies in the 1930s and the successful southern European (in the 1970s) and postcommunist waves (in the 1990s) proved the importance of a supportive international environment for democracy promotion. However, the focus on empiricist procedures and causal mechanisms depoliticizes the experiences that underlie democracy. Concerns for conceptual distinction require definitions of what political democracy is. Yet such essentialism may turn democracy into an ideological force that becomes politically nonnegotiable. Operational and pedagogic models for the goal of developing democracies may thus be culturally biased and potentially disregard the truly political element in their emergence.

INITIATING THE SPIRIT OF THE PEOPLE

This evidence suggests that emerging democracies require more attention to individual paths and experiences than liberal monism is ready to accept. The focus on expected or desired political outcomes risks eluding historical continuities and anthropological dimensions in emerging democracies. Institutions are like medicines. Their success depends not only on their quality or dosage but also on whether, in the long term, the body accepts the cure. Rather than to predetermine the shape of emerging democracies by importing values from outside (such as constitutionalism, structural preconditions, or assumptions about the strategic rationality of actors) it is more adequate to engage with the social body's background conditions, under which meaningful claims for people's self-government emerge.

Etymologically, *emergence* refers to rising from a liquid by virtue of buoyancy. Combining the Latin *ex* ("out") and *mergere* ("to dip, sink"), *emergence* suggests that the new has been contained by the old, from within which it rose. While democracy clearly has a global appeal at the semantic and conceptual level, the concrete methods and meanings of transparency, accountability, and the modalities of rule are embedded in cultures of democracy. According to Thomas Paine, the American constitution was not an act of government but a people constituting a government. During the French Revolution (1789–1799), the Abbé Sieyès claimed that the French nation's will was the supreme authority but that the constitution givers were fundamentally unconstitutional. In other words, the people may be unified as a political principle, but as a social reality, they remain unstable, malleable, and volatile.

Democracies, like individuals, actually emerge and come of age through processes of transition. Such transitions are not simply about connecting the dots. They are liminal moments, when people find themselves confronted with an authority vacuum, in-between the dissolved authoritarian power structures and a hypothetical future. Feelings of belonging to a political association arise from events and experiences in which many of the taken-for-granted essentials of democracy such as sovereignty, rule of law, or freedom not only are not given but are substantially threatened. The initiation into democracy thus requires attention to moments of enchantment, predemocratic imaginaries, and rituals, which all influence the symbolic transfer of meaning toward the people as the master. The myth of the people's collective will is a myth, but without this myth democracy is not possible.

Alexis de Tocqueville's recognition that Americans were born equal and thus did not require a democratic revolution did not refer to a predetermined set of sine qua non preconditions. Citizenship, for instance, was not a right but a daily practice grounded in preconstitutional ways of life, social practices, beliefs, and cultural representations. Memories of a common past, for instance, are crucial for the building of ties of solidarity, belonging, and affective association. From Athens to the United States, Spain to South Africa, commemorations of those who died for the cause of the community, in internal conflicts but also defending against external enemies,

forged collective memories of belonging and affective bonds between citizens. In Eastern Europe, communism was not only an antidemocratic legacy but also a social organism in gestation, where dissident movements articulated the power of the powerless by translating memories of humiliation, national self-affirmation, and ethic individualism into democratic aspirations. Despite the lack of a European demos and a collective memory of a European past, the recognized democracies within the European Union aspire to a new form of European democracy. Emerging democracies thus thrive on a utopian bent where ideas of inclusiveness, equality, freedom, and popular sovereignty are sustained not only by institutional arrangements but also by myths, symbols, and social imaginaries.

Emerging Democracies, Political Parties in

Emerging democracies are countries that experience a peaceful transition to democratic rule despite a history of authoritarianism or civil conflict. Political parties in emerging democracies are difficult to classify as unitary entities since emerging democracies often have little in common due to differences in their geography, history, culture, religion, previous regimes, and transition process to democracy. Even when their party systems have common traces, the parties are often quite different. Nonetheless, these countries have some interestingly similar common ground. When facing the democratic transition, most political parties in emerging democracies form around a few leaders, unions, associations, or even clandestine terrorist organizations. Some of these organizations become so strong as political parties that they are able to elect the majority of congress members—as it happened to Hamas

in Palestine—and even presidents—such as Lech Walesa in Poland and Luis Inácio Lula da Silva in Brazil. In Brazil, President Lula's party, the Partido dos Trabalhadores (Workers Party), was one of the first political parties to emerge from the country's transition to democracy in 1979. The party was formed from workers' unions, student organizations, and small underground political groups and organizations.

In most emerging democracies, people are not easily drawn to political parties due to religious reasons that drive women and other minorities out of the political process; cultural barriers that prevent people from believing that their participation in the political process matters; a lack of confidence in the new regime, based on previous unstable political and economical governments; a focus on alleviating immediate basic needs over long-term economic development; and a feeling that those currently in power are not in any manner different from those parties and groups that ruled in the former regimes.

Some emerging democracies had political parties during their dictatorial or nondemocratic periods. Some countries had only one party, while others had two or more parties that alternated in power. An important characteristic of these parties was that they did not oppose the regime in power to any significant extent. The reluctance of some in emerging democracies to see politicians and political parties as a break from previous regimes can be significant. In some emerging democracies there simply were not ruptures between old and new politics. The scenario depicted so far has as a major consequence a communication gap between political parties and society. Because of communication gaps between political parties and the population generally, some emerging democracies' political parties cannot perform classical functions, such as articulation of interests and representation. That happens because these parties are linked to personalities or charismatic leaders instead of driving their programs to the needs or interests of the people. In this sense, parties have a political program or agenda, but few really implement it when they are in power. This fact shows that there are still ideological issues that have to be controlled when dealing with political parties from emerging democracies.

There is a belief among international organizations that deal with democracy strengthening that emerging democracies are better off with a small number of political parties so that the system can be efficient to aggregate interest in society and bring those interests to the legislature. Yet one finds that most emerging democracies do not follow this model. In Africa some emerging democracies have only one political party, like Mozambique, or two, like Namibia; in Asia some have many parties, but one or two keep power for successive long terms, both in the legislature and in the executive offices; in eastern and central Europe an abundance of parties exists, and the same coalition is almost permanent; and in the Middle East the political parties are formed and disappear frequently. In Latin America, with minor exceptions (Venezuela, e.g.), there are multiparty systems without a majority political party in the legislature. In this case, the president's party does not have the majority in the congress, so the president has to

rely on a governmental coalition formed with many parties with different ideologies and perspectives. When this happens, it creates a situation of instability in the political system since the coalition is built over political interests, not common ideological grounds. Despite all the political problems and inconsistencies that might occur with political parties in emerging democracies, their presence is extremely important to consolidate democracy in their countries.

Emotions in Politics

The role of emotions in politics is pervasive. In political psychology, a number of studies show that emotional reactions have an impact on the way citizens organize information, learn facts about politics, form impressions, and make political decisions. Parallel lines of work have developed in political sociology, examining macro-level emotions in social processes such as traumas, collective action, social movements, rituals, and institutions. Cognitive studies in psychology also make explicit the affective content of social information, concluding that cognition and affect are interdependent in such a way that virtually all things people think about have an affective reaction linked to them. Neuroscience provides similar evidence challenging the traditional dichotomy of feeling and thinking. Affective reactions are basic and inescapable, and there can be no decision making without emotions.

DEFINITION OF EMOTIONS

Research on emotions has not settled on a commonly accepted definition of the term that is used loosely and interchangeably with terms such as *feelings, sentiments, affect, mood,* and *passions.* The word *emotion* originates from the Latin *emovere,* which means "to excite, to move, to agitate," and in common language we refer to emotions such as love, hate, anger, fear, hope, and pride. *Feelings* refers to experiences or sensory impressions such as warmth, cold, or pain or more general affective states such as desire, boredom, or depression. Because every person experiences and interprets the world differently, feelings are personal and biographical interpretations of sensations. Emotions are displays of feeling, and because they are expressions, they can be bound to social expectations and can be genuine or disingenuous. Emotions have intentionality; they are in other words about something, and they can

be behaviorally disorganized at extreme states such as terror, panic, and rage. Emotions are also acute and momentary, and as such they are distinguished from sentiments, which indicate a complex disposition originating from feelings, involve an attitude or judgment, and imply action. Emotions result from appraisals and evaluations of the environment and are not habitual or cyclical. Therefore, they are differentiated from *moods,* which refers to pervasive and emotional states or states of mind. Affect is an abstract, nonconscious experience of stimulation comprising physiological responses aroused by the environment, which determines the intensity of feelings. Affect precedes consciousness and will, connects our bodies with the environment, and influences awareness. It is often regarded as one of the three areas of human mental functions, together with motivation and cognition. *Passion* is also often contrasted with reason and refers to the deeply stirring and intense feelings, convictions, affections, and desires that are often uncontrollable. The word originates from the Latin *pati,* which means "to suffer," but in political science it often refers to anger, love, or fear.

DIFFERENCES OF KIND: THE FLAVORS OF EMOTIONALITY

While positive emotions are experienced in a very similar fashion, negative emotions are differentiated into the dimensions of aversion and anxiety. *Aversion* signifies an internal negative reaction, a dislike for something, whereas *anxiety* refers to an unpleasant emotional state with qualities of uneasiness, apprehension, and distress, which often originates from indefinite sources. As Jennifer Lerner and Dacher Keltner (2001) argue, individuals respond with aversion and anxiety under different conditions. Feelings of aversion and frustration are activated in familiar but punishing environments. The counterpoint to aversion is enthusiasm and satisfaction, generated by familiar but rewarding environments. Anxiety and unease are produced when something unexpected and unfamiliar takes place to which the individual cannot effectively respond. When the response is effective, it generates feelings of relaxation.

THE STUDY OF EMOTIONS IN POLITICS

In political science, research on emotions has been gaining increasing attention. Robert Abelson and his colleagues (1982) provide survey evidence that positive and negative emotional responses to political leaders, such as hope, enthusiasm, anger, and fear, shape their electability, after controlling for candidate traits and party identification effects. Donald Kinder (1994) shows that these emotional reactions are prevalent not only among sophisticated voters but also among the inattentive public. Dennis G. Sullivan (1996) explores emotionality in different countries. Their experimental studies find that citizens distinguish happiness, anger, and fear when observing facial displays of political leaders in a very similar fashion. For example, citizens in the United States distinguished correctly the emotions expressed by image-only videos of former president Ronald Reagan, separating happiness from anger or fear. Gestures of happiness, anger, and fear were also identified correctly by

French citizens when they evaluated facial displays of former French president Jacques Chirac.

Emotions also have significant effects on political judgments, starting from the style in which citizens process information all the way to how political decisions are made. George E. Marcus and his colleagues (2000) study affective intelligence, the dynamics between feeling and thinking, and their interaction to produce thoughtful and attentive citizens. While responses to familiar political objects such as candidates, parties, and issues are habitual, responses to novel stimuli are provoked on the basis of an unconscious learning system stimulated by anxiety. Their evidence shows that mild levels of political anxiety can inspire learning and information seeking and diminish reliance on prior opinions and stereotypes. Along the lines of this paradigm, Richard Lau and David P. Redlawsk (2006) use dynamic process tracing in political campaign environments to demonstrate how feelings of anxiety, anger, or enthusiasm toward preferred political candidates shape the processing of information and influence learning. As a side note, affective intelligence should not be confused with Daniel Goleman's (1995) psychological theory of emotional intelligence, which studies the ability of individuals to perceive and express emotion accurately, to use emotion when thinking, and to manage it appropriately for their personal or professional growth.

Studies of motivated reasoning examine the role of affect in the elaboration and organization of political information. In a series of experiments, Milton Lodge and Charles Taber (2000) show that people receive emotional cues from social stimuli that they automatically process as subjective evaluations. Individuals react cognitively and affectively to cues such as a leader's performance, political issues, natural disasters, or crisis events. These findings are in line with Robert Abelson's (1963) "hot cognition" hypothesis. All social and political concepts are laden with affect as a positive or negative tag that is stored in memory independent of its cognitive content and comes to mind effortlessly and automatically. When citizens are asked to provide an evaluation, "how do I feel?" heuristics are activated, and their feelings toward the object come automatically to mind, influencing the judgment process.

Turning to the consequences of emotionality, Leonie Huddy and her colleagues (2002) study the role of anxiety and anger under the threat-generating context of a terrorist attack. They find that fear prevents cognitive processing of information because attention is focused on the threatening source instead of other aspects of the environment. In addition, threat shapes personal behaviors designed to minimize personal exposure to terrorism. Ted Brader (2006) studies political communication in the context of emotionality, focusing on the enthusiasm and fear stimulated by visual and audio cues of political advertising. His experimental and content analysis data demonstrate a significant impact of the affective content of political advertising on participation and electoral choice. Tereza Capelos and Joshua Smilovitz (2008) extend the study of emotions in the context of international mediation, showing that perceptions of negative emotionality among disputants influence the tactics that mediators use.

ON THE MEASUREMENT OF EMOTIONS IN POLITICS

The accurate measurement of emotional reactions to political stimuli is not an easy task. Political scientists often work with subjective reports of affective reactions where direct physiological measures are not possible. As W. Russell Neuman and his colleagues (2007) explain, early survey sampling studies adopted a discrete terms approach and asked open-ended questions about likes and dislikes to approximate emotionality. Affect checklists of the basic emotional reactions identified by Ira Roseman (1984) in his structural theory of emotion were also used to select the basic items of anger, fear, pride, and hope that have been present in the American National Election Studies since the 1980s. A second group of studies adopt valence models. They treat emotional reactions as a single valence system with a positive or negative evaluation on an approach-avoidance continuum and use feeling thermometer items to record overall evaluations. Circumplex models offer a third alternative by adding an arousal dimension to the bipolar positive-negative continuum. The three approaches are not mutually exclusive, but since they rely on self-reports they share a limitation: they can identify the evaluative content but not the physiological changes or unconscious emotional experience, which cannot be verbalized.

New studies combine the traditional measures with measures of reaction time and also psychophysiological measures such as galvanic skin response, measures of heart rate, functional magnetic resonance imaging, and facial electromyography. While these techniques do not provide information regarding the processes that are responsible for the emotion generation, they can provide a good indicator of emotional intensity. Traditional and new methodological perspectives add to the systematic study of this complex and challenging topic and provide opportunities for analysis and reflection of the neurological, personal, group, and societal levels of emotionality in politics.

Empire and Democracy

Social science debate is now refocused on an old concept, that of empire. In the decades following the end of the cold war and the collapse of communism, some scholars, notably Chalmers Johnson, suggested that the empire theory best characterizes the rise of the United States as the hegemonic economic and military power in the post–cold war era. The influential authors Michael Hardt and Antonio Negri maintain that the American "empire" now equates with the global spread of capitalism, both as an idea and as sets of power relationships. They say that the triumph of Western liberal capitalism has coincided with democracy's decline in the United States and certain of its close allies, such as Great Britain, and paradoxically the rise of democratization in the rest of the world.

Other writers, most notably Niall Ferguson, argue that there are strong parallels between the British empire at its zenith at the end of the nineteenth century and the United States at the end of the twentieth century. The twin commitments to free trade overseas and democracy within are common features. Ferguson warns that in the same way that the free trade phase of British imperialism collapsed dramatically after World War I (1914–1918), the underpinnings of the United States's international power are equally vulnerable. The link between the British and the American centuries was explicitly made by that notable defender of imperial values, Rudyard Kipling, whose invitation to "take up the white man's burden" was issued to the U.S. Congress at the turn of the twentieth century. Based on that type of comment, the question must be raised as to whether empires are necessarily exclusionary.

Debates about empire have become intertwined with the emerging controversies about globalization. The empire theory has as its core the concept of hegemony or control, has tended to place a premium on structure rather than agency, and ignores unintended consequences. Globalization theory, in contrast, has too often spoken about more nebulous and benign flows of ideas and cultural exchanges while ignoring the iron fist in the velvet glove. Some analysts of globalization theory, for example, Joseph Stiglitz, have also discussed democratization, arguing that neoliberalism has promoted free markets and democratization. Most writers on globalization, however, such as Zygmunt Bauman and David Held, have been staunch critics of globalization, arguing that it has narrowed life opportunities for most, has weakened the nation-state, and is an entirely new phenomenon.

The empire and globalization models are essentially dichotomous in nature, understanding reality in terms of winners and losers (globalization) or centers and periphery (empire). It is suggested here that the processes of globalization and of empire are contradictory and paradoxical. In contemporary times the unfettered processes of globalization, according to some—such as Stiglitz—have also generated market failures domestically in the United States. To put it another way, the invisible hand of the market has created problems domestically and internationally, and the visible hand needs to be reinstated. Calls for a third way between unfettered capitalism and state socialism have gained greater force since the economic recession of 2008. Whereas in the late twentieth century the third-way approach was specifically related to the political programs of specific labor parties, especially the Labour Party in the United Kingdom under Tony Blair, in the early twenty-first century the third-way model is linked with the project of democratizing international agencies, such as the International Monetary Fund.

Arguments around the implications of imperialism were prefigured by the dependency theorists of the 1970s, notably Andre Gunder Frank, who argued that imperialism necessarily stifled future industrialization and economic growth, and postcolonial scholars who maintain that imperialism stifles political developments. And in the same way as research has discovered economic growth and industrialization under British and other nineteenth-century imperialisms—such as in valuable work on the political economy of the Commonwealth Caribbean—political research on Australia, Canada, and New Zealand has discovered that political experimentation flourished in those colonies, often to be exported back to the so-called mother country of Britain.

Another example of the paradoxical nature of empire at the political level is the uneven experience of politics that continues into the twenty-first century. For the settler fragments, the process of settlement created an enhanced democratic experience; this was not usually so for the indigenes of those places according to scholars such as Nira Yuval-Davis. British imperial processes also created political and constitutional experimentation, whether through new models of federalism, early enfranchisement of women, proportional and fairer electoral systems, and in some places, new types of political rights for indigenes.

Empiricism

Empiricism is an epistemology, or theory of knowledge, that claims that the foundation of all knowledge is ultimately located in the human sense experience of the world. Invariably, empirical theories offer a method for distinguishing between those forms of experience that are valid, reliable, and fundamental and that represent how the world really is from those forms of experience that tend to mislead us about the world. In addition to being a form of foundationalism, empirical theories of knowledge have tended to essentialism as well. Essentialism is the idea that there is a single quality or set of qualities that define an object, phenomenon, or experience, that is, that constitute the phenomenon as it is most essentially.

Empiricism is often contrasted with rationalism. Rationalist theories of knowledge claim that the foundation of all knowledge is ultimately traceable to the ability of human reason to identify the essential truth of the world by pure reason alone. In other words, the foundations of knowledge, as Rene Descartes tried to prove, are knowable a priori, prior to experience. It is important to keep in mind that empiricists do not deny the usefulness of human reason. They claim only that pure reason alone cannot identify what is most foundational in knowledge. Similarly, rationalists do not deny the usefulness of empirical observation. They do insist that observation does not represent what is most essentially true about the world.

MODERN EMPIRICISM

Modern empiricism begins with the work of John Locke. Locke argued in his *An Enquiry Concerning Human Understanding* (1690) that when human beings enter the world, their minds are blank slates, void of any ideas or understanding. Through contact with the world by means of the senses, the human mind becomes inscribed with experience of the world around it. In recording this experience, or sense data, the human mind often reflects on it, combining or dividing various sensations, examining those sensations from a variety of perspectives or in light of other sensations. But the human mind cannot provide anything new to the collection of sense data with which it is inscribed.

David Hume, a Scottish philosopher, offered a more thorough account of empiricism. Hume argued in his similarly titled 1766 *An Essay Concerning Human Understanding* that all statements that claim to embody knowledge can be divided into two categories, statements about relations between ideas (e.g., logic or mathematics) and statements of fact about the external world that could be tested for their truth and error. Statements of fact were tested relying on sense impressions, which themselves are organized in the human mind by three principles of association. Associations of resemblance cause us to connect sense impressions that resemble one another. Associations of contiguity enable us to connect sensations of objects or experiences that are in close proximity to one another. But most important are associations of cause and effect. Our experience of the world leads us to recognize that some events are always or very often preceded by other events. In such cases we are led to associate the first with the latter, which is understood as the cause of the former. This, for Hume, was what was most important in science, the accumulation of experience based on causal relationships.

In the twentieth century, empiricism was updated in the work of logical positivists. Logical positivists claimed that many of the traditional problems of knowledge, including empiricism, were problems related to language. Drawing on both Hume and Immanuel Kant, they argued that all meaningful statements are of two types: analytic or synthetic. Analytic statements are those that are true by virtue of the meaning of the terms (e.g., all bachelors are unmarried). Synthetic statements are those that claim to tell us something substantive about the world and are open to verification. Logical positivists argued that statements that fall into neither category are meaningless because they have no cognitive value; they convey no factual information about the world. Among those statements that they deemed to be meaningless are statements of ultimate principles concerning values, ethics, religion, politics, aesthetics, and morality.

THE BEHAVIORAL REVOLUTION

In the post–World War II period, a new generation of political scientists called behavioralists, adopting the logical positivist criteria for meaningful and meaningless statements, attempted to establish an empirical, scientific approach to the study of politics. Behavioralists argued that the traditional study of politics had relied too heavily on an examination of the power and authority of formal institutions and on the history of political thought. Moreover, the traditional approach was often preoccupied by normative questions related to morality and ethics rather than to offering a scientific description of the political world. A more robust scientific approach would focus on the behavior of political actors including voters and informal institutions, such as interest groups and political parties, as well as the actual behavior of those who occupied positions within formal institutions, such as legislators and judges. It would also divest itself of normative questions that had traditionally preoccupied political philosophy.

The ideal that drove what became known as the behavioral revolution was adopted from the natural sciences. If a

single, theoretical perspective could be adopted by the entire profession of political science, including fundamental, shared concepts, then political science could become a cumulative science in much the same way the natural sciences had become. Toward that end, behavioralism stressed the importance of the operationalization of the terms of political discourse. This required that concepts be defined in ways that allowed investigators to use them to describe precisely the political world. As such, they had to demonstrate two qualities: reliability and validity. *Validity* refers to the idea that a concept actually describes what it claims to describe. *Reliability* refers to the idea that a concept can be used to achieve the same results by a range of investigators. For example, in physics, Force = Mass · Acceleration ($F = ma$) would be an example of a term that both is valid (it measures force rather than some other quality such as momentum) and is used by physicists throughout the world. By the late 1960s behavioralism had become the dominant theoretical perspective in the profession of political science. Despite the substantial presence that it had, however, several reservations remained, and competing theoretical perspectives emerged to challenge behavioralism and the empiricist philosophy of science on which it relied.

COMPETING PERSPECTIVES

First, no sooner had logical positivism established itself as a dominant theory of knowledge than it was challenged internally. Specifically, Willard Van Orman Quine argued that the analytic-synthetic dichotomy that was the basis for distinguishing between meaningful and meaningless statements was linguistically unsustainable. One implication of this is that a dichotomy between facts and values, between descriptive and normative discourse, is similarly unsustainable. Moreover, the assumption that truth claims can be reduced to statements in a neutral vocabulary about an independent, objective world is similarly unsustainable, according to Quine. Adding to this line of argument, Wilfred Sellars argued that empiricism was mistaken in assuming what he referred to as the "myth of the given." This is the assumption that the knowable world exists prepackaged in ways that our language can merely represent. In effect, both Quine and Sellars were challenging the very foundations of empiricism. These and similar developments led philosophers such as Richard Rorty to argue that the entire foundationalist and essentialist projects that characterized empiricism needed to be abandoned.

Second, and drawing in part on the work of Quine, Thomas Kuhn argued that the empiricist philosophy of science was inconsistent with the historical record of scientific revolutions. This is because empiricism failed to take seriously enough the ways in which theory determines evidence and disqualifies or ignores those truth claims that are inconsistent with the theoretical assumptions of a given paradigm.

Third, from within the behavioralist ranks, some political scientists argued that the drive for basic science made much of political science irrelevant in addressing pressing problems that the United States faced. David Easton, one of the leading proponents of behavioralism, made a case for what he called postbehavioralism. The latter, while not abandoning the scientific principles that behavioralism embraced, would turn its attention to issues that the United States and the world faced, such as poverty, civil rights, the Vietnam War (1959–1975), nuclear proliferation, and so forth.

Finally, a range of competing theoretical perspectives emerged to challenge the very foundations of behavioralism and its empirical approach to the description and explanation of political life. Rational choice theory, Straussianism, critical social theory, genealogical (sometimes referred to as postmodern) theories, and interpretive or hermeneutic approaches combined to challenge empiricism, and positivism generally, on a number of issues. Among these are the nature of political explanation; the essential contestability of the vocabulary of political science, the fact-value dichotomy; issues of cultural-conceptual imperialism; and the significance of history for the nature of political life. The result has been the emergence of a theoretical and methodological pluralism that contests the older positivist will to a methodologically defined discipline of political science.

Despite these challenges, empiricism remains one of the dominant, if not *the* dominant, paradigm in political science. What remains to be answered is how it will respond to the growing challenges to its preeminence, whether its proponents will pursue an ethos of exclusion of other perspectives or an ethos of engaged dialogue with other perspectives.

Empowerment

Most definitions of *empowerment* refer to the ways in which disadvantaged groups get access to political and social power. If power is conceived in distributive terms, that is, as something such as resources, capabilities, or elected positions that can be obtained and more or less fairly distributed, then *empowerment* refers to the process of transferring resources, capabilities, and positions of power to those groups or individuals who do not have it. Examples of such conceptions of empowerment include access to power structures, for example, political offices. Once power is achieved, then it becomes important to assess the effects of empowerment on the disadvantaged group and its behavior as well as the policies designed to benefit the disadvantaged group.

If power is conceived in relational terms, then *empowerment* refers to the transformation of social, economic, cultural, and political relations and to challenging the structures related to domination and oppression. This perception of empowerment embraces Michel Foucault's concept of power as something that exists "only in action." As argued by theorists such as Iris Marion Young and Amy Allen, empowerment necessitates the destruction of structures that impede self-determination and self-development. It is a process consisting of dialogic relations including relatively powerless persons who come to understand the sources of their powerlessness and who discover the possibilities of transforming the oppressive environment through collective action. According to this perspective, it is important to understand the ways by which powerless individuals can raise collective consciousness, transform social environments, and challenge the hierarchies that perpetuate inequalities.

EMPOWERMENT AS ACCESS TO POWER STRUCTURES

In the United States, literature exploring the access of disadvantaged groups to the political arena analyzes the impact of the civil rights movement on power structures and voter behavior. According to Michael Bonds (2007), "the assumption was that black registration and voting would produce candidates, especially blacks, who would be more responsive to the needs of black citizens." Bonds argues that although there is no consensus on whether an increase in political power directly translates into benefits for the African American communities, there is evidence proving a positive relationship between political empowerment and favorable public policies.

Numerous works focus on specific strategies to ensure the access of disadvantaged groups to power structures. According to the minority empowerment thesis—which argues for electoral strategies to improve minority representation—such strategies increase minority political participation, foster positive attitudes toward the government, and increase identification with those who represent minorities in the government. For example, Jane Mansbridge has described the so-called communicative advantage. She argues that having a representative from the same ethnic or racial group or the same gender may help to break down communication barriers between constituents and their representatives.

Arend Lijphard and other political scientists have explored different electoral arrangements to increase ethnic representation in government. These strategies include the creation of special electoral districts, the use of proportional representation, and the division of the electorate along ethnic lines. The United States, Belgium, New Zealand, and Slovenia, among others, have created electoral arrangements to increase ethnic minority representation. Some theorists have pointed out that although electoral reforms may increase the number of minority politicians in power structures (descriptive representation), they may lead to a backlash from voters and politicians, thus resulting in fewer elected politicians' supporting minority-friendly policies (substantive representation).

Obtaining access to power structures implies a vision of empowerment as a consciousness-raising initiative, focusing on the ways in which social movements help individuals and groups gain access to resources and capabilities. According to Phylis Johnson, mass media, such as radio stations, have a major role to play in raising civic consciousness and fostering political mobilization, resulting in political action to obtain power.

EMPOWERMENT AS TRANSFORMATION OF RELATIONS

The conceptualization of empowerment as transformation of cultural, economic, and political relations is often embraced by critical theorists and feminist analysts. Empowerment is seen both as a process geared to bring about positive change and as an outcome. According to Jane Parpart et al. (2002), "empowerment must be understood as including both individual conscientization (*power within*) as well as the ability to work collectively, which can lead to politicized *power with* others, which provides *power* to bring change."

According to feminist literature, the goals of women's empowerment include challenging the subordination of women, transforming state institutions that have perpetuated gender discrimination and inequality, and identifying and recognizing institutions that support gender equality. This vision of empowerment is more radical than the first one outlined in this article. It implies that achieving empowerment brings about an ability to transform one's environment and power structures instead of merely gaining access to the existing structures of power.

For example, a collection of essays edited by Peter H. Smith, Jennifer L. Troutner, and Christine Hünefeldt outlines some

common strategies of empowerment that have been employed by women's movements in Asia and Latin America. These strategies include large-scale political mobilization, increasing involvement in commercial (economic) activities, and use of governmental economic development policies.

Smith et al.'s volume and other works analyzing the empowerment of women offer an interesting insight. The construction of a women-friendly state apparatus that may include the creation of government positions dealing with women's issues or quotas for women's representation in government usually weakens grassroots feminist movements. Thus, it is not entirely clear whether engineered women's representation in government helps improve the status of all women in a country, including those from lower socioeconomic classes.

Feminist perspectives exploring empowerment raise questions about the roles of international actors and social change. Well-wishing outsiders often believe that they can promote certain empowerment strategies, such as democratic elections, and thus give power to the powerless. However, case studies of women's empowerment draw attention to the importance of local participatory efforts. These efforts, however, need to be supported by national governments and international organizations.

A survey of the important insights of the two perspectives on empowerment suggests that (understood as a process) empowerment may occur at many levels—individual (micro), community, or national (macro)—and that it can be analyzed as a phenomenon with several dimensions—political, social, cultural, and economic. In both cases, the term implies an outcome, not merely a strategy; however, it is very difficult to measure this outcome. Linking empowerment to national and global power structures and relevant institutions instead of trying to address several levels of analysis may be beneficial.

Encuentros

Encuentros, a Spanish-language term for "encounter," is most closely associated with the indigenous rights and alternative globalization movements of the late twentieth and early twenty-first centuries. The term came to international political prominence in reference to assemblies supporting the Zapatista Army of National Liberation in its fourteen-year uprising against the Mexican government beginning January 1, 1994, the date on which the North American Free Trade Agreement was implemented. It has become a regular feature of the parlance of activist and community advocacy groups involved in alternative globalization struggles and opposition to capitalist globalism, neoliberal policies, and free trade. Groups from a variety of backgrounds use this term rather than the term of their native language to describe fora, meetings, and gatherings of alternative globalization groups and/or indigenous rights movements.

In July 1996 approximately two thousand activists from forty-four countries met in Chiapas, Mexico, for the First International Encuentro for Humanity and against neoliberalism. Hosted by the Zapatistas and five indigenous communities, the meetings initiated a global network that would play a significant part in the alternative globalization protests, beginning with the Seattle demonstrations against the World Trade Organization in 1999. A second encuentro was held in Spain in 1997, with almost four thousand participants from countries representing each continent. This gathering was held to express solidarity with the ongoing Zapatista struggles, to develop strategies and tactics for supporting those struggles, and to strategize broader opposition to capitalist globalism.

Encuentros—intended to have a nonhierarchical and decentralized structure—have emphasized the political significance of organizing through networks rather than through the vanguard party model of the Socialist and Communist Internationals. Issues addressed have included indigenous rights, women and struggles against patriarchy, and the relations of activists in the global North with activists in the global South.

The recovered factory movements in Latin America, in which workers take over and self-manage their workplaces, have also initiated encuentros, including the Encuentro Latinoamericano de Empresas Recuperados (Latin American Encounter of Recovered Companies).

Endangered Cultures

Endangered cultures are cultures that are threatened by extinction. Cultures become extinct when few people practice a culture and the number of participants is declining. While cultures have historically changed in size and composition, contemporary anthropologists, cultural community members, and cultural admirers work to restore and preserve endangered cultures. The term *endangered cultures* describes both those who are threatened by systemic changes and those affected by proximal effects.

INTENTIONAL AND UNINTENTIONAL CULTURAL EXTINCTION

Cultures become extinct through both deliberate and accidental means. Governments may deliberately work to extinguish a culture by altering, or prohibiting communities from practicing, their traditions. Military conquerors have attempted to alter the cultures of oppressed people for several reasons. Repressive governments have tried to destroy cultural traditions by killing prominent figures and through acculturation programs aimed at homogenizing a population. For example, governments have historically prohibited a cultural group's language, religion, and other social practices in an effort to weaken the cohesion and identity of that group. Settler populations bring their customs and culture to a new land and propagate old-world cultures in their new territory. However, existing social structures and religions may help maintain cultural differences between the vanquished and the settler population. By erasing cultural cleavages between peoples, a government may be able to weaken traditional centers of power. Without these centers of power, a government is better able to influence the people through culture. Elites from the dominant culture thus deliberately shape the thought and language of the dominated people. For example, creating an official language and a standard state curriculum helps homogenize the history of the people. One illustration of this arose during the French occupation of Algeria (1830–1962). To gain the rights of citizens, Algerian Muslims were forced to accept Christianity, learn the French language, and abide by French law. This assimilation effort failed, and the Algerians eventually defeated the French to win their independence.

Cultures also may become endangered accidentally. Communities may become acculturated by an exogenous source; that is, they may be influenced from exposure to different cultural communities, and individuals may voluntarily adopt cultural practices from other communities. For example, intercultural trade, marriage, and immigration create opportunities for people of different cultures to interact and learn the others' customs. However, cultures also change organically without external stimuli. For instance, migratory people in a new territory may create customs and alter their culture to adapt to the environment. Past cultural traditions may be inappropriate in the new environment. Likewise, if a migratory people encounters a second, culturally distinct people, their traditions may change in several ways. The migratory people may adapt to the cultural traditions of the second population. Also, the second population may adopt the culture of the migratory people. Finally, both peoples may alter their cultures in some new way. For example, as noted by Nigel Spivey in *Etruscan Art* (1997), although the Etruscans of central Italy (approximately 1200–500 BCE) resisted colonization, they did adopt Hellenistic art styles, the Euboean alphabet, and Greek myths.

Another unintentional way cultures may become endangered is through the international spread of ideas. This international spread need not be malicious like that of a repressive government but may be a product of interacting with other communities. Critics of globalization lament the pollution of local, unincorporated cultures because of this international influence. Globalization, that is, the increased intensity of social networks connecting people in different geographic locations, increases intercultural exposure and may asymmetrically change one culture vis-à-vis the other. For instance, American popular culture can be seen across the globe in cinema, music, and dress. This culture may become part of the language and thought of local people around the world. Proponents of endangered cultures worry that local cultures will suffer and change due to the preponderance of the cultures of larger and wealthier states.

Endangered cultures, as well as other cultures, face systemic alteration by their exposure to new opportunities. Expressing language and traditions through new media and environments gives individuals opportunities to celebrate and preserve the traditions, but this invariably affects the culture. Spoken languages and oral traditions may be lost or altered by widely accepted international norms of writing. Oral language traditions may become standardized to be recorded and taught, but the oral facet of that language and the traditional flexibility of the language may be lost. External norms and institutions cause cultures to change by prompting individuals to adapt to international cultural streams.

To many, the growth of one culture at the expense of other cultures is the result of oppressive cultures' diluting and destroying weak ones. This argument suggests that globalism and other forms of acculturation create estrangement by individuals of the extinct culture. Those alienated by the monopolizing, encroaching culture are more likely to act antisocially and reject the dominating culture. However, cultural extinction is not universally accepted as a problem to correct.

STUDIES AND PRESERVATION EFFORTS

Endangered cultures have attracted the attention of the international community as anthropologists, linguists, and individuals strive to maintain and restore threatened cultures. There is a strong normative component to the argument of those in favor of saving endangered cultures. Cultural pluralism and the norm of cultural equality drive many advocates to preserve endangered cultures. In addition, others argue that cultural diversity is objectively beneficial: preserving international cultural heterogeneity promotes critical insight into one's own culture and practices. Endangered cultures may be sources of critical thought about language, institutions, and social and familial relationships. Proponents argue that endangered cultures are oppressed by the spreading culture.

Advocates for the endangered cultures may be insiders or outsiders of that culture. Insiders may continue to practice their culture and language in the face of external pressure to change. However, social divergence inside cultural groups may also arise from within the group. Social group insiders may refine past practices to keep cultural practices attractive and in accord with changing norms. For example, Baganda women, a people in central Uganda, have historically knelt when greeting men. Urban/modernist Baganda have tried to stop this tradition to promote gender equality, while rural/traditionalist Baganda prefer that this tradition continue. Cultural change initiated by insiders is widely thought to be a natural, organic process, and most advocates of the endangered culture recognize that cultures change. Endangered cultures are not threatened by endogenous, organic changes (changes that originate without external influence and by cultural insiders) because these changes are considered to be culturally consistent. This distinction allows cultures to adapt, survive, and respond to social movements without losing local legitimacy and alienating the population.

Communities and individuals outside an endangered cultural group may also make efforts to preserve endangered cultures in several ways. One tangible way pluralists work to support heterogeneity is by preserving local customs. A second way is by preserving local languages. Different groups create local language archives to preserve languages with few remaining speakers. While native speakers might eventually vanish, their language will remain. The United Nations Educational, Scientific and Cultural Organization, the United Nations Works Programme, academic institutions, and many international organizations strive to protect endangered languages and cultures.

Engels, Friedrich

German writer Friedrich Engels (1820–1895) is best known as the life-long friend and sometime collaborator of the revolutionary social theorist Karl Marx (1818–1883), whose ideas produced epochal changes in the way that politics is conceived and practiced.

Engels was born in what is now Wuppertal near Düsseldorf in Prussia. His family were pious Christians who had become moderately wealthy over several generations of factory ownership and commercial trading. His education was terminated at sixteen so he could enter the family firm, and he worked at their enterprises in the port of Bremen and also in Manchester, England. However, young Engels was a rebel and autodidact, sympathizing with liberal resistance to the authoritarian regimes of the German states. While this was confined by monarchical governments to the cultural spheres of literature and philosophy, Engels was unusual in publishing an anonymous exposé titled "Letters from Wuppertal" in a Hamburg journal at the age of eighteen. In this prescient work he detailed, with great sarcasm, the pious hypocrisies of mill owners whose wealth derived from the sufferings of subsistence laborers and whose factories spilled waste into local streams. This outlook permeates Engels's impressive and influential book *The Condition of the Working Class in England,* published in Leipzig in 1845 and praised by Marx. Engels's more theoretical article, "Outlines of a Critique of Political Economy," was accepted by Marx for a radical German-language volume published in Paris in 1844. It clearly influenced the then-obscure Marx, who later wrote *Capital: Critique of Political Economy* (1867).

Together Marx and Engels produced only three major works: the little-read book *The Holy Family* with separately authored chapters, published in Frankfurt am Main in 1845; the voluminous manuscripts written in 1845–1846 and only posthumously published as *The German Ideology* (1932); and the eventually well-known *Manifesto of the Communist Party,* published anonymously in London in 1848. From 1845 onward the two had an intensive political collaboration, a very extensive correspondence, and an important monetary relationship. After 1850 Engels supported the Marx family out of his earnings and pension.

From 1859 Engels functioned as Marx's chief reviewer and publicist, setting a biographical, intellectual, and political frame around Marx's works and ideas. While on occasion Marx provided brief summaries of his outlook and conclusions, Engels's popularizations created a systematizing conceptual structure. This gave currency to the terms that made Marxism a distinctive intellectual system: *materialism, idealism, dialectic,* and *contradiction.* According to Engels's influential accounts, Marx was the equal of German philosopher G. W. F. Hegel because Marx was said to have similarly generated a philosophy of nature, history, and thought itself and of British naturalist Charles Darwin because both were said to have constructed a positive science through which the progressive development of human history could be understood. After Marx's death Engels edited and republished numerous works by Marx with new introductions.

Engels presented his relationship to Marx as that of junior partner or second fiddle. However, this is perhaps somewhat disingenuous and has been under scrutiny almost since his death.

Enlightenment Political Thought

The Enlightenment was a broad movement of reform that swept through Europe and the United States from (roughly) 1690 until the start of the French Revolution (1789–1799) a century later. The intellectual leadership of the Enlightenment came from prominent men of letters (as they called themselves) such as French philosophers Voltaire, Denis Diderot, and Jean le Rond d'Alembert; Swiss writer Jean-Jacques Rousseau; Scottish philosophers Adam Smith and David Hume; German philosophers Moses Mendelssohn, Immanuel Kant, and Gotthold Ephraim Lessing; U.S. politician and philosopher Thomas Jefferson; and Italian politician and philosopher Beccaria (Cesare, Marquis de Beccaria-Bonsan); to name just a few. The best overall expression of the mainstream Enlightenment outlook on religion, history, science, philosophy, and epistemology during the eighteenth century is d'Alembert's *Preliminary Discourse to the Encyclopedia of Diderot,* published in 1751.

Shadowing this high Enlightenment was a low Enlightenment of Grub Street writers and pamphleteers who popularized Enlightenment ideas in lodges, salons, and coffeehouses for a broad and less tutored audience. Also, there were important variations in emphasis and outlook between the Enlightenment's proponents in different national contexts. For example, philosophers of the French Enlightenment such as Voltaire were much more anticlerical than their counterparts in Germany and Britain. Recent scholarship has emphasized this internal diversity within the Enlightenment and made serious scholars much more cautious when generalizing about it. The diverse eighteenth-century proponents of the Enlightenment shared a general outlook and some basic beliefs rather than a commitment to a single project, as many of its contemporary opponents allege.

In English, the expression *the Enlightenment* was not used to designate a specific historical period until the late nineteenth century, long after the movement had ended, leading some scholars (still a small minority) to reject the term as anachronistic. The same is true in French (*le Siècle des Lumières*) and German (*die Aufklärung*), although the nonhistorical use of *enlightenment* as a general term for the process of replacing ignorance with knowledge was used throughout the eighteenth century (and before) in all three languages.

There was little consensus among the Enlightenment's advocates on the ideal form of government. Some, like the skeptical Voltaire, favored enlightened despotism as the best way to elevate the benighted masses, while others (a small minority) were democrats who put their faith in the people, as Rousseau did. A common myth about the Enlightenment is that its proponents were naïve optimists who believed in the inevitability of progress, even though Voltaire, the quintessential Enlightenment figure, openly mocked this view in his popular novel *Candide* (1759). At best, they were cautious optimists about the prospects for improvement with a keen sense of how slow and uncertain it could be. Even so, most believed that things had gradually improved and would likely continue to do so as reason, toleration, and science displaced religion, intolerance, and superstition. Few went as far as the Marquis de Condorcet, whose *Sketch for a Historical Picture of the Progress of the Human Mind* (1795) is the most optimistic statement of the Enlightenment belief in progress.

Contrary to the claims of many of the Enlightenment's enemies, very few of its proponents were atheists. Most, like Voltaire, were deists who attacked established religious institutions and beliefs in favor of a minimalistic natural religion. Faith in natural science as the best means for improving human well-being was very widespread, if not universal, during the Enlightenment. Almost all of its proponents rejected the existence of innate ideas, believing instead that all knowledge is acquired via sensory experience. The locus classicus of this view is John Locke's *Essay Concerning Human Understanding* (1690), which was widely read and universally admired by the Enlightenment's eighteenth-century proponents. The scientific method developed by Sir Isaac Newton and Francis Bacon was taken as the model for the systematic and reliable acquisition of knowledge, in contrast to the obscurity of traditional metaphysics and orthodox religious beliefs, which science had disproved or displaced.

The Enlightenment was tainted by the violent excesses of the French Revolution, which many popular counterrevolutionary writers such as Edmund Burke and Augustin Barruel blamed on the steady corrosion of social and political order under the critical gaze of Enlightenment reason in the decades before 1789. The Enlightenment has continued to attract criticism ever since, from all points of the ideological compass, including reactionary *dévots* such as Joseph de Maistre, feminists such as Sandra Harding, conservative romantics such as the poet Novalis, twentieth-century neo-Marxists such as Theodor Adorno, and liberals such as Isaiah Berlin. Many of the values, practices, and institutions of our present civilization are rooted in the eighteenth-century Enlightenment, so it is not surprising that its legacy continues to be hotly debated today. Many writers such as Michel Foucault have linked the Enlightenment to totalitarianism, a claim that has been strenuously disputed by its contemporary defenders such as the philosopher Jürgen Habermas. A typical recent example of the latter is Tzvetan Todorov's *In Defence of the Enlightenment* (2009).

Entitlements

Although the majority of entitlement programs are dated to the Social Security Act of 1935, the concept of entitlement is of rather contemporary derivation. The development of the concept is a consequence of what Yale Law School professor Charles A. Reich called the "New Property" theory in legal activism in the 1960s. Reich believed that protection of individual autonomy in an "age of governmental largess" demanded recognition of a new property right in governmental benefits. According to the Social Security Act, welfare recipients did not possess the legal right to obtain welfare; rather, states could provide or deny welfare in accordance with federal laws and if the fundamental constitutional rights of a recipient were not violated by the method in which it distributed its generous assistance. Historically, welfare has been largesse from the state to the poor. The rulings of the courts, such as in regard to Aid to Families with Dependent Children, have progressively asserted welfare benefits as more akin to property rights than gratuities that could be withdrawn at will.

In *Goldberg v. Kelly* (397 U.S. 254), states were required to provide a particular recipient with "public assistance payments," which "would satisfy the constitutional command" of the Fourteenth Amendment's due process clause. Justice Brennan delivered the majority opinion of the Court and stated that "such benefits are a matter of statutory entitlement for persons qualified to receive them." His footnote to the opinion reflected his acceptance of the New Property theory: "It may be realistic today to regard welfare entitlements as more like 'property' than a 'gratuity.' Much of the existing wealth in the United States takes the form of rights that do not fall within traditional common-law concepts of property." Determining that the due process clause provides protection to welfare recipients creates a unique dilemma as to the constitutional right of an individual to due process only if the state either hindered or periled the entitlement of the "laws of nature and of nature's God."

According to the Declaration of Independence, "all men are created equal [and are] endowed by their Creator with certain unalienable rights," and any entitlement necessarily involves a consequential condition. The Declaration of Independence entitles every American to employ both property and talents according to choice, and the document also deems it obligatory not to violate the equal entitlements of others. However, there is no requirement to accomplish actions that are positive in nature for the benefit of others. Although the slogan "a chicken in every pot" has been attacked and exploited in the political realm, the statement helps illustrate this false notion of entitlement. The demand for a chicken in every pot would obligate someone else to provide the finances. If one person is entitled to a chicken in his or her empty pot, then one can demand the chicken, and someone else has a correlative obligation to provide such an entitlement.

Entitlement programs are normally operated initially on a limited basis, but they expand rapidly, which results in more federal spending. Entitlement programs are described generally as forming a safety net that must be accomplished through the labor of others. It would seem that entitlement to the pursuit of happiness almost certainly involves a provision for the enabling conditions, but this would not be in the context of distribution of material resources, which often impedes individual initiative and responsibility.

Environmental Policy

Environmental policy encompasses a wide range of governmental actions that deal with environmental quality or the use of natural resources. It includes the traditional focus on the conservation or efficient use of natural resources such as public lands and waters, wilderness, and wildlife. Since

A man in China carts plastic containers to a recycling center. Environmental policies such as recycling aim to protect air and water pollution as well as public health and other aspects that affect people and governments.

ozone layer, limit transboundary movement of toxic chemicals and hazardous wastes, conserve biological diversity, and reduce the risks of global climate change, among other goals. Regional environmental accords also are increasingly common, most notably and successfully in the European Union, which generally has adopted tougher requirements than those found in the United States.

Sometimes governments choose not to adopt formal policies and thus implicitly leave many or most decisions about certain environmental and resource problems (e.g., the level of energy use) to individuals, corporations, and the operations of the free market. Such decisions may be made because policy makers are not convinced that government involvement is needed or legitimate or because the level of controversy over proposals makes agreement impossible. Hence, governments find it easier to do nothing in the short term, an outcome that is common in the international arena when nations cannot come to an agreement on what to do in light of their often-divergent national interests. Governments also may choose to adopt environmental policies that rely heavily on market-based approaches and thus minimize direct regulation of the target activity while maintaining market competition and a minimal government role. For example, so-called cap-and-trade programs are a central component of proposed climate change policies that leave far more discretion to industry than would direct regulation of greenhouse gas emissions.

the 1960s, both in the United States and in other developed nations, it also has included the environmental protection efforts of government, such as air and water pollution control to protect public health. Defined more broadly, environmental policy may include government action at any level, from local to international, that affects energy use, transportation, the design of cities and buildings, agriculture, human population growth, and the protection of the earth's ecological, chemical, and geophysical systems.

Whether defined narrowly or broadly, these government policy actions represent society's collective decision to pursue certain environmental goals or objectives and to use particular tools (such as regulation or financial incentives) to achieve them. Increasingly, environmental policy extends beyond national policies and has included the establishment of major international accords that seek to protect the earth's

THE EVOLUTION OF ENVIRONMENTAL POLICY AND POLITICS

The problems that environmental policies are intended to address have changed substantially over time, as have the set of policy approaches and tools that governments have relied on and the political and institutional context in which policy making and implementation take place. Many students of environmental policy recognize at least three generations of public policies, and some see this evolution as a fundamental shift from one policy epoch to another. During the 1970s, for example, the problems were defined largely as air and water pollution and later toxic chemicals and hazardous wastes. The preferred solution in the United States was federally driven regulation of industry through what became known as command-and-control policies, in which the federal government and the states set environmental quality standards and

enforced them as provided in the laws. These kinds of policies, such as the Clean Air Act and Clean Water Act, achieved many of their objectives over time, but they could not fully deal with the problems. Costs were high, and noncompliance with policy mandates was not unusual. Moreover, the policies as designed could not handle newer problems such as non-point sources of pollution (e.g., runoff from agricultural land and urban surfaces) where regulation was impractical. Those were important weaknesses.

Throughout the 1980s and 1990s, policy scholars and policy makers defined the problems somewhat differently and offered ideas for reform both in pollution control and in natural resources policies. They emphasized the promotion of efficiency and effectiveness through regulatory flexibility, greater cooperation between government and industry, and the use of new policy approaches such as market incentives. Especially in the United States, they also tended to favor devolution of policy responsibilities from the federal government to the states and greater collaboration among stakeholders. Controversy has swirled around many of these proposals from the second generation of environmental policy, in part because environmentalists often saw them as a rolling back of environmental policy goals while representatives from business and some state and local governments argued they did not go far enough to grant them the flexibility they sought to improve environmental performance. Reform of the major statutes from the 1970s also proved difficult because of deep partisan divisions over the issues.

By the late 1980s and into the 1990s, a third generation or era in environmental policy began, with strong roots in the concept of sustainability. It did not replace the first two eras so much as it built on the foundations that they laid and incorporated new ways of thinking about environmental problems, policy goals, and the best means for achieving them. For example, from this perspective much value is placed on comprehensive and integrated analysis of the way in which human activities affect natural systems and, in turn, how society depends on the healthy functioning of such systems, such as purification of air and water or the stabilization of climate. It is in this period that scholars and policy makers began to see that environmental problems had to be considered in relation to population growth, energy use, land use, transportation patterns, the design of cities, agriculture and water use, and many other practices.

In addition, a global rather than merely local, regional, or national perspective emerged as a key element in this view of environmental policy. Global problems such as loss of biodiversity, population growth, climate change, and growing water scarcity emerged at international meetings from the 1970s to the 2000s and helped to build a new policy agenda for the twenty-first century. The most visible signpost of the new outlook was the United Nations Conference on Environment and Development, the Earth Summit, held in Rio de Janeiro in 1992, and its legacy is apparent in the approved plan of action, *Agenda 21*. This broad commitment to sustainable development continued at a follow-up meeting, the World Summit on Sustainable Development, held in Johannesburg, South Africa, in 2002. That meeting drew new attention to the need to improve social and economic conditions in the world's poorest countries while also fostering economic growth and environmental protection, as reflected in the United Nations Millennium Development Goals adopted two years before the meeting. The Kyoto Protocol on climate change, adopted in 1997 and set to expire in 2012 and be replaced by a newly negotiated treaty, is a leading example of these trends in global environmental policy.

NEW DIRECTIONS IN STUDYING ENVIRONMENTAL POLICY

The implications of this shift to sustainability or sustainable development, and to international action on global environmental problems, are profound. They range from the redesign of industrial processes to the promotion of sustainable use of natural resources such as energy. Successful policies are likely to require new kinds of knowledge and new methods of analysis as well as an unprecedented level of cooperation among nations. Political science research already is beginning to reflect interest in sustainability as a concept and the value of the comparative and international study of environmental policy and politics. There is also greater recognition of the importance of interdisciplinary analysis to capture the full range of variables that can affect environmental policy adoption, implementation, and impact at all levels of government.

Other articles in this encyclopedia discuss far more than is possible here, including the use of particular frameworks, theories, and models in political science research. Suffice it to say that scholars in political science and related disciplines employ a rich diversity of approaches in their study of environmental policy and politics.

Environmental Political Theory

Viewed from one perspective, perhaps the most curious thing about environmental political theory (EPT) is that it should exist at all. Environmental concerns—climate change, species and forest destruction, toxic pollution, and so forth—are characteristically viewed as discrete interests or preferences to be weighed against others in the making of policy by liberal pluralist states. One might study public opinion regarding such concerns or examine the influence of interest groups in promoting them within the policy-making process. But from this perspective, there appears to be little place for normative theory. Even from a point of view critical of this liberal pluralism, environmental concerns would not seem to represent anything more than a particular application of a critique to this policy domain.

The very existence of EPT is therefore premised on the conviction that environment is something more than a particular set of issues or interests to be represented in political debate. Yet what this "something more" is has been contested. In the early 1970s, the popularization of the idea of limits to growth provided a provocative basis for this conviction. Perception of impending biophysical limits to human production and consumption highlights human embeddedness within—and dependence on—a larger nonhuman world. An outpouring of early writings, such as William Ophuls's 1977 book *Ecology and the Politics of Scarcity: Prologue to a Political Theory of the Steady State* and Robert Heilbroner's *An Inquiry into the Human Prospect* (1980), supposed that biophysical limits would necessitate the authoritarian imposition of social and political limits on human societies. Yet then and now many others distanced themselves from this supposition, arguing for participatory and democratic approaches to environmental challenges while retaining the conviction that the recognition of human embeddedness required the sort of systematic reflection that normative political theorizing could provide.

The label "environmental political theory" itself, along with such related ones as "green political theory," has been in play only since the 1990s. It is only beginning to become recognized within the broader disciplinary community of political theorists and political scientists. EPT is more than the mere application of political theories to environmental issues. The questions at its core could hardly be more pressing or encompassing: given what we know about the nonhuman world, how should we organize human communities? What is the relationship between the long-standing quest for such human values as liberty and justice, on one hand, and the quest for what has come to be termed "environmental sustainability," on the other? If we accept the urgent need to address far-reaching ecological challenges including global climate change, what sort of political values and institutions can facilitate—or impede—these efforts? Are elite-driven processes required to ensure that authoritative scientific knowledge is the basis for change? Or can democratic values and institutions more effectively meet the challenge? Finally, to what extent do all the previous questions rely on assumptions about the nature of nature itself? The scope of these questions should make it plain just how vital a form of inquiry EPT can be. It also illuminates the ties between EPT and other forms of political theorizing—while the label "environmental political theory" emerged only in the 1990s, many of the questions are at least as old as Aristotle.

To situate EPT, it is helpful to consider its relation to other forms of academic exploration of environmental problems. Parallel to the emergence of EPT has been a growing body of empirical work by political scientists on environmental policies and agreements, environmental movements and organizations, and public opinion on environmental concerns. By contrast, EPT, like political theory in general, emphasizes normative argument and conceptual analysis. Yet unlike some other forms of political theorizing, EPT rarely strays far from the practices that motivate it and often engages in fruitful dialogue with empirically oriented work. As such, theorizing in this field tends toward what political theorist Ian Shapiro characterized in a 2002 article as "problem-driven" political theory.

BEYOND ETHICS AND IDEOLOGY

Seemingly even more closely related to EPT, and sometimes mistaken for it, are two other fields of inquiry: environmental ethics and ecological, or green, ideology.

At times, *environmental ethics* has been used as a term for normative inquiry into environmental concerns per se, thus encompassing EPT. Yet environmental ethics, which exists largely within the discipline of philosophy, continues to be shaped by the particular ways of framing the field as it first emerged in the 1970s. Among the defining questions that have preoccupied environmental ethicists is whether (and if so, how) nonhuman entities—including individual animals, species, and ecosystems—might be recognized as having intrinsic value. Intrinsic value is an attribute that most other ethicists had reserved for human beings, contrasting it with mere instrumental value, which is defined in relation to human purposes. From this emphasis on intrinsic value, environmental ethicists have sought to distinguish between anthropocentrism (a human-centered perspective) and ecocentrism (an ecologically centered perspective rooted in claims to the intrinsic value of nonhuman entities), between weak and strong anthropocentrism, and between subjective and objective attribution of value. Authors have tended to focus on individual convictions regarding these attributions of value, suggesting an implicit confidence that the adoption of new environmental values by enough people would lead to a broader change in social and political order.

Understood in this way, EPT is also distinct from what some have termed a "green" or "ecological" political ideology. The promise of a self-contained worldview or ideology emanating from ecological concerns also relies on a division between anthropocentrists and ecocentrists. In this sense, it shares in the distinctions drawn by many environmental ethicists. If people can be divided in this way, then we might conclude that since all existing political ideologies are anthropocentric, a commitment to ecocentrism would be the basis for a radically new ideology.

Yet if we can draw one uncontested conclusion about recent work in EPT, it is that there is no singular set of political tenets on which authors have agreed (a thorough overview is provided by Peter Hay 2002 in *A Companion to Environmental Thought*). Rather than settle on *the* ecological or green conception of political order, EPT has focused on the character of this order itself, exploring the normative position of both the state and civil society, the role of democratic decision making, the institutionalization of particular forms of rationality or rationalization, the role played by ideas of nature as a source of political authority, and the ways in which dominant political and economic ideas embedded in liberal democracy may both enable and constrain possibilities for social change. The sections that follow offer an indication of the breadth of this recent work.

RECONSIDERING THE HISTORY OF WESTERN POLITICAL THOUGHT

The so-called canon of Western political thought, contested though it is, represents a shared language among political theorists. In this sense, an engagement with these thinkers by environmental theorists should not be particularly surprising. In recent years, entire books have been devoted to an examination of the environmental implications of work by Karl Marx, Jean-Jacques Rousseau, Immanuel Kant, and Henry David Thoreau. Articles and chapters of books have been devoted to these same thinkers as well as Aristotle, Thomas Hobbes, John Locke, Thomas Jefferson, John Stuart Mill, John Dewey, Theodore W. Adorno, Hannah Arendt, Herbert Marcuse, Jürgen Habermas, John Rawls, and Michel Foucault, among others. In addition to their contribution to environmental discourse, such works offer the community of political theorists fresh perspectives and insights about these much-studied figures.

Yet in another sense, this body of work engaging historical texts is more striking because, of course, few if any of these historical figures offer direct commentary on contemporary environmental concerns. Moreover, other environmental writers have condemned the whole of Western thought and civilization as a root cause of environmental degradation. Environmental political theorists typically write neither to bury nor to praise these thinkers. What has attracted the attention of theorists in these works is their discussions of topics including the role of nature as a legitimizer of political authority; human alienation from nature; intergenerational relations; competing conceptions of rationality, ownership, and private property; and the relation of public to private spheres. Yet the very act of engaging these thinkers supposes that in the nuances of their arguments on these vital themes, they can offer a rich resource for critical reflection, for the illumination of important tensions, and for insight into some of the challenges faced by contemporary environmentalists.

POLITICAL CONCEPTS

In his seminal work *A Sand County Almanac,* Aldo Leopold famously writes that a new land ethic could change "the role of *Homo sapiens* from conqueror of the land-community to plain member and citizen of it" (1949, 204). Yet what might such a conception of citizenship look like? Leopold's writing offers few answers. In a similar vein, the past couple decades have witnessed the rise of the environmental justice movement. What might *justice* mean in such a context? Movement activists have rarely paused to offer an explicit definition.

Questions such as these have prompted a number of environmental political theorists to examine key, contested political concepts including justice and citizenship as well as virtue, rights, pluralism, property, place, sustainability, and nature. In some cases, the fruits of their labors have been to bring insights from the works of other political theorists to illuminate environmental topics. In *Defining Environmental Justice: Theories, Movements, and Nature* (2007), David Schlosberg, for example, has drawn on the work of critical theorists Nancy Fraser and Iris Young to show how the normative claims of activists in the environmental justice movement not only are arguments for distributive equity through the redistribution of environmental harms but also are rooted in the movement's demand for recognition of their injuries, identities, and communities. In other cases, environmental political theorists have reconceptualized an idea to capture the character of the challenge posed by ecological concerns. For example, while citizenship is conventionally understood to be closely tied to the political institution of the nation-state, in *Citizenship and the Environment* (2003), Andrew Dobson has developed a conception of ecological citizenship in which obligations transcend the boundaries of the nation-state but do so asymmetrically due to the differential ecological impact (or "footprint") of citizens in rich and poor societies.

Perhaps the most potent term in environmental discourse has also come under extended scrutiny by environmental political theorists—*nature.* Heated debate often exists here, with opposing camps sometimes identified as those adhering to a realist conception, which regards nature as both objective and relatively transparent in its functions and lessons, versus those adhering to a constructivist conception, which highlights the many ways that our understanding of what counts as nature is mediated by culture, ideology, and history. Yet the depth of disagreement should not be exaggerated. Among environmental political theorists, critical scrutiny has focused on whether the claim to know nature can provide a basis for political authority. On this score, even hardened realists might acknowledge that one must be cautious in drawing lessons from nature for political argument, while constructivists can note that their argument applies to the idea of nature and ought not to imply that they regard the nonhuman world itself as infinitely malleable. In this vein, several recent works have sought to navigate between these poles, pursuing "a way of talking about nature that is sensitive to the truth value of both of these positions, but that does not succumb to their logical or political shortcomings" (Andrew Biro 2005, 9).

CHALLENGING THE BOUNDARIES OF THE POLITICAL

As noted above, some forms of normative environmental inquiry emphasize the need for a change in individual

ethic, worldview, or ideology. By contrast, EPT has typically insisted on the inescapability of politics itself. This leads many environmental political theorists to criticize other forms of environmental discourse for their effort to elide or escape the often-messy realm of politics, power, and contention. Timothy Luke captures this argument well in *Capitalism, Democracy, and Ecology: Departing from Marx* (1999), drawing on sociologist Ulrich Beck to argue that contemporary liberal democratic societies have eviscerated the realm of politics by transferring key environmental concerns to the realm that they term "subpolis." In the subpolitical realm, decision making is, according to Luke, "all too often depoliticized by the professional-technical rhetorics of civil engineering, public health, corporate management, scientific experiment, technical design, and property ownership."

When scientists foray into the realm of political action, for example, they frequently characterize solutions in terms of objectively necessary technological fixes derived from nature's authority. In relation to climate change, one prominent author recently wrote of the potential for a "carbon dictatorship." In *Environmental Culture: The Ecological Crisis of Reason* (2002), Val Plumwood has compared such an approach to a supposed need for (borrowing from Plato) an "eco-republic," which she rejects as not only oppressive but ecologically disastrous as well. The eco-republic fails because it does not recognize the centrality of "remoteness" (distance in time, space, consequences, or knowledge) to the genesis of environmental problems. Her alternative requires the expansion of the political sphere to incorporate ecologically vital perspectives of those closest to the problems in all these relevant senses.

When state administrators and policy analysts rely on cost-benefit analyses and rational choice models to calculate collective preferences for environmental protection, theorists have criticized them for relying on an overly narrow conception of rationality. Here, resistance to the narrow politics of state power, especially in an age dominated by the power of global capital, is envisioned as emerging from the vibrant yet dissonant voices present in what Douglas Torgerson has termed the "green public sphere."

LIBERALISM, DEMOCRACY, AND ENVIRONMENTALISM

Seeking to politicize the response to environmental challenges, environmental political theorists often invoke some form of democracy as necessary for the effective redress of these concerns. Yet the record of existing liberal democratic polities in this regard appears to many to be deeply inadequate. Moreover, there is a tension in arguments for a democratic response to environmental concerns that Robert Goodin, in *Green Political Theory* (1992, 168), captures well: "to advocate democracy is to advocate procedures, to advocate environmentalism is to advocate substantive outcomes: what guarantee can we have that the former procedures will yield the latter sorts of outcomes?"

As long as this dichotomy between procedure and substance remains in place, Goodin's characterization of the challenge for environmentalist advocates of democracy seems undeniable. Yet a number of theorists highlight discursive and deliberative forms of participation to imagine a democracy that facilitates environmentally responsible outcomes. This approach, according to Robyn Eckersley in *The Green State: Rethinking Democracy and Sovereignty* (2004, 115), "eschews the liberal paradigm of strategic bargaining or power trading among self-interested actors . . . in favor of the paradigm of unconstrained egalitarian deliberation over questions of value and common purpose in the public sphere." Such radical democratic forms still cannot guarantee particular substantive outcomes, but they are argued to make such outcomes more likely.

THEORY AND PRACTICE

As a problem-driven form of political theorizing, environmental political theorists cannot escape the question of how their ideas might translate into practice. No answer is embraced unanimously, but two distinct models can be identified in recent works. The first envisions the theorist as using his or her privileged opportunity for reflection to clarify the challenges and opportunities faced by activists and policy makers. Here, the theorist can serve as a guide to practitioners if the former is willing to ground his or her reflections in actual cases and real questions posed by these practitioners (cf. de-Shalit 2000). A second model is embodied in those works that seek to develop normative theory out of an analysis of environmental movements and socioeconomic relationships. Here, it is not just the questions but the perspectives, voices, and arguments of activists and other practitioners that become the subject for theoretical insight and reflection.

CONCLUSION

While the contours of EPT are increasingly clear, this must not be mistaken for widespread agreement among theorists. In fact, the recent outpouring of writing in this field has resulted in a proliferation of perspectives. At present, EPT is a cacophonous conversation of increasingly diverse voices. Yet this takes place in an era when the environmental challenges we face require ever more urgent action. To some, this may appear exasperating: EPT is fiddling while the world burns. While EPT strives to remain relevant to practice, however, its success ought not to be measured by its ability to agree on answers. Instead, it offers the promise of all good political theorizing: of calling our attention to the most important questions and of unsettling our assurance that we already have the answers we need. As human societies grapple with the urgent yet complex problems of climate change, biodiversity loss, toxic pollution, and many others, bringing these critical perspectives into the conversation is demanded by both theory and practice.

Equality and Inequality

Ideas about equality have played a central and controversial role in political discourse from a very early time. Plato ridiculed the notion of equality in *The Republic,* and Aristotle, a student of Plato, was similarly critical. Indeed, the weight of tradition in political thought leaned heavily against the view that human beings should be thought of or treated as equals until at least the eighteenth and arguably the twentieth century—although it is important to bear in mind that most of that tradition sprang from or was supported by people who belonged to elite social strata and that dissenting traditions have always existed, from the ancient Stoics and Epicureans to the seventeenth-century Levellers and beyond. For many centuries, Christianity was the principal source in Western political thought of arguments that cast the idea of equality in a favorable light. Yet Christianity was always committed to the view that human beings should be concerned more with life after death than life in this world, especially political life, so Christian thinkers seldom argued for, and often argued against, claims that human beings should be considered equals in any politically meaningful sense. With the advent of the Enlightenment, the idea of equality in this world acquired vigorous intellectual champions. By the end of the eighteenth century, it became a real force driving major legal, political, and social reforms.

We can distinguish politically significant ideas about equality into five families, each of which may be usefully thought of as united by a distinct concept of equality. Some of these families coexist on highly congenial terms; others stand in relations of competitive tension with one another. Some, too, are internally divided by rival conceptions.

The first family is united by the idea of the equal worth of human beings. Against a historical background, the concept of equal worth is controversial. Aristotle forcefully and influentially denied that human beings are equal in worth by nature: some people are intended by nature to be slaves and accordingly have both different abilities and lesser worth than those who are intended by nature to be free; women are by nature inferior in both capabilities and worth to men. Christianity rejected this view with the argument that all human beings are equal in worth because they are equally the creations of a single God. Seventeenth-century English philosopher Thomas Hobbes, too, disputed Aristotle's assumption. Indeed, he rejected the idea of intrinsic worth altogether and argued that political associations should be founded on an agreement by all their members to regard each member of the association as equal in worth by nature to every other member. The differences between Hobbes's claim and the Christian view are considerable—the Christian view endorses the idea of a naturalistic foundation of human worth while asserting a universalistic claim about the equality of that worth, while Hobbes adopts a view of human worth that is conventionalist and therefore at least potentially particularistic—but these differences pale in comparison with their common quarrel with Aristotle, whose opinions were shared by many later thinkers. Neither the Christian nor the Hobbesian conception of equal worth entails equality of any of the more robust kinds discussed below. Nevertheless, the concept of equal worth is critically important in political thought, for it underpins virtually every other concept of or argument for equality of any significance.

A second cluster of ideas is united by the concept of equality under law. The societies of early modern Europe were divided into different orders that were subject to different legal codes and judicial institutions that conferred legal privileges selectively. For example, recognized clergymen enjoyed a privilege called "benefit of clergy" that ensured that those who were accused of crimes would be tried only in ecclesiastical courts by other clergymen rather than in civil courts by laymen. Members of the aristocracy enjoyed similar privileges. A consequence of this patchwork system of legal privileges was that ordinary people were subject to much greater legal jeopardy than those who enjoyed those privileges. If a layperson were accused of a crime against a member of the clergy, the layperson was subject to prosecution in an ecclesiastical court by clergymen, but if a clergyman were accused of a crime against a layperson, the clergyman would be tried only by his peers—by other members of the clergy—who would be likely

to sympathize with his defense. The central point of appeals to equality before the law was to reject this kind of privilege, replacing it with the presumption that within any politically defined territory, all persons should be subject to a single, uniform body of laws that are applied in the same manner to all. This concept was embodied in legal reforms that followed the French Revolution (1789–1799) and spread through Europe and beyond in its aftermath.

The concept of political equality ties together the third family. According to the most widely accepted interpretation, political equality entails that political decision makers—those who wield principal legislative and executive power—should be chosen by elections in which each member of the electorate casts one and only one vote, all votes are given equal weight, and the candidate with a majority or a plurality of the votes cast wins. The degree of political equality achieved in political systems can then be said to vary in extent and depth, where the extent of equality is a function of the extensiveness of the franchise (or conversely of the extensiveness of groups that are denied effective voting rights) and its depth is a function of the importance of voting as a determinant of political decisions. However, voting and elections are not the only processes that embody the concept of political equality. One alternative employed extensively in the classical Athenian democracy was the selection of officeholders by lot. During the English revolution of the 1640s, the Levellers were vigorous advocates of political equality, albeit of limited extent. Democratic transformations that began in the late eighteenth and early nineteenth centuries can be seen in retrospect (much as nineteenth-century French political philosopher and historian Alexis de Tocqueville saw them at a relatively early stage) as the beginnings of a long-range era of growth in the extent of political equality on a worldwide scale. Growth in the depth of political equality during the same period has arguably been far less consistent.

A fourth family of ideas is bound together by the concept of equality of opportunity, which emerged as a political force some two centuries ago in conjunction with the early development of market societies. The principal lines of division within this family are drawn between more and less robust interpretations of the concept, with a general pattern in which increasingly robust interpretations have emerged in succession over time. At the less robust end of this continuum lies the idea that offices and positions that are sources of income should be allocated to applicants based on their aptitudes or skills without regard to their social origins or to any other attributes that are unlikely to affect their performance. According to this interpretation, the concept of equal opportunity applies only at the point of potential entry to a career or job. More robust interpretations apply the concept to earlier stages in the life trajectories of persons, especially to the earlier stages in their formal education. The most robust interpretations insist that access to educational resources and other sources of advantage be equalized for all, and the most radical of these would seek to equalize even those advantages that originate in institutions that are often exempted from political scrutiny and criticism, such as families. The term

formal equality of opportunity is generally used to denote the less robust interpretations of the concept, while *substantive equality of opportunity* denotes more robust interpretations.

A fifth and final family comprises a set of interpretations of the concept of equality of condition. This concept has played an important role in political thinking at least since 1839, when French political writer Louis Blanc formulated the famous principle "from each according to his ability, to each according to his needs." In the recent literature, three rival interpretations of this concept have competed for primacy. Equality of welfare exists when the value to each person of the things that contribute to that person's welfare (whatever these things may be) is equal to the corresponding value of things to other persons. Discussions of this view usually assume a subjectivist interpretation of value like that which has dominated the literature of economics since the late nineteenth century. By contrast, equality of resources exists when the resources available to each person are identical or equal in value to those available to other persons (where the value of resources is determined in some objectivist or otherwise uniform manner). These two interpretations are likely in some cases to lead to widely discrepant judgments about equality of condition because people's values vary considerably. The idea of equality of capabilities constitutes a third interpretation. According to this view, two or more people are equal when the values (or sizes) of their capability sets are equal, where a capability set consists of all the functionings—the activities and states of being—a person is capable of achieving. Each of these interpretations is subject to various objections from both egalitarian and antiegalitarian quarters.

The concept of equal worth is compatible with each of the other concepts of equality sketched above; indeed, most versions of the others presuppose or incorporate this concept. Political equality, too, is compatible with equality of the various other kinds both at the conceptual and the practical level. However, significant tensions exist between the idea of equality of condition on one hand and the ideas of equality under law and equal opportunity on the other, at least when these ideas are considered potential aims of institutional design. The idea of equality under law is a specific version of the more general notion of equal treatment, as is the idea of equality of opportunity. In both cases, equal treatment can be expected, usually, to lead to unequal results, just as competitors in a game that is governed by uniform rules fairly applied usually finish with different results. Yet equal results are just what equality of condition entails.

While each of these five concepts of equality has been controversial at one time or another, some are now far more hotly disputed than others. The claim that all persons should be regarded as equal in natural worth appears to be widely shared, notwithstanding the fact that many people also support the notion that some persons deserve to be much better off than others because of earned differences in worth. The idea of equality under law, too, enjoys widespread general approbation even though many people in the most developed countries, where it is most firmly entrenched as a norm, do not want to

extend its reach to immigrants or to other marginalized groups. The idea of extensive political equality is also now widely accepted, whereas the notion that political equality might also be deep—that the principal decisions affecting a political association should be determined through processes that are essentially democratic rather than through (say) bargaining among elites, many of whose authority has little or no democratic foundation—does not appear to be widely understood. The idea of equality of opportunity, at least of the less robust, more formal kind, is widely esteemed in market societies, where it provides ideological support for labor mobility, a major factor in the efficiency of production. Some of these societies appear quite resistant to more substantive interpretations of equality of opportunity—despite the fact that these interpretations may be even more supportive of productive efficiency—because they challenge social privileges that remain deeply entrenched. The notion that political associations should seek strictly to equalize the conditions of their members is not widely held today. However, a related notion—the most controversial of the politically significant ideas about equality in recent times—that is widely held and indeed has been achieved at least approximately in some places, most notably some of the countries of northern Europe, is that inequalities of condition should be limited rather sharply.

Why should inequality of condition be a cause of concern? The major arguments can be divided into two classes, political and moral.

Political theorists have long argued that sharp inequalities of condition pose a threat to both the stability of political associations and their capacity to sustain a sense of common purpose among their citizens. If some groups perceive that they are consistently at the losing end of competition for resources and other advantages, they may be tempted to "shuffle the deck," as Hobbes puts it, in an effort to improve their chances of success. More positively, some have argued that people who believe that they enjoy an equitable share of benefits will be relatively willing to take the public good seriously and to make sacrifices to sustain it when they are called on to do so. Political philosophers have sometimes argued in response to these considerations that inequalities of condition should be limited so that no citizen possesses more than four times the wealth of any other citizen. However, limitations on inequality of condition are not the only means available to address these concerns. If a society maintains equality of opportunity in a form that is sufficiently robust to sustain significant social mobility—or if it maintains the appearance that significant mobility is realistically achievable—that may be sufficient to maintain a strong sense of loyalty to an existing political and social system, even if that system results in a high degree of inequality in outcomes.

From a moral point of view, two arguments suggest reasons for concern about inequality of condition. One argument is essentially humanitarian, based on the worry that great inequalities of condition would leave some people without sufficient means to lead decent lives. As Harry Frankfurt points out in his 1987 article, "Equality as a Moral Ideal," this argument actually entails only that each person should have enough; no necessary implication about the degree of inequality that is morally acceptable follows from it. Another line of argument, which has been most highly developed by twentieth-century American philosopher John Rawls, originates in the idea that society should be conceived as a fair system of social cooperation. Rawls's thought, borrowed from eighteenth-century Scottish philosopher Adam Smith, is that the principal factor enabling a society to generate large amounts of wealth is its division of labor, which is a collective rather than an individual creation. If that is the case, he reasons, then it follows that the products of that creation should be distributed equitably among all those who play a role in the division of labor.

Many writers have objected to the idea that inequalities of condition should be limited. Eighteenth-century Scottish philosopher David Hume suggested, in contrast to Hobbes, that attempts to render a society more equal would be disruptive of order by calling into question established entitlements, which he saw as the basis of social order. Nineteenth-century English philosopher Herbert Spencer believed that goods should accrue to persons in proportion to their desert, without regard to the degree of inequality to which this principle might lead; American political philosopher Robert Nozick argued similarly that any attempt to redistribute goods for the purpose of reducing inequalities would violate individuals' rights. Austrian economist and philosopher Friedrich Hayek and others have argued vigorously that attempts to implement social justice—to limit inequalities or to bring the distribution of income or other sources of advantage into line with any centrally enforced pattern—necessarily lead to unacceptable concentration of power and ultimately to despotism.

The last of these arguments is the most disturbing. If inequalities of condition could be limited only through great concentration of power—concentration considerably greater than would otherwise be required to maintain effective national defense, to sustain an effective government, to support a productive economy, and to enforce laws—then we would, paradoxically, achieve reduced inequality of condition at the high cost of increased inequality of power. It is reasonable to regard the threat to liberty that would result as unacceptable.

Although many modern writers have accepted the assumption that limits on inequality of condition could be achieved only through considerable concentration of power, this assumption is not compelling. In many cases the degree of inequality can be affected by variations in laws that have no discernable impact on the concentration of power. For example, in the late eighteenth century, nearly every state in the new United States of America adopted legislation repealing primogeniture and guaranteeing the equal division of estates among lineal descendants in cases of intestate succession. The aim of this change was to decrease inequality in property holdings, yet the change involved only the replacement of one law of succession with another, not the imposition of new laws where none had existed before. Similarly, although laws that are designed to mitigate inequalities in bargaining power between contracting parties are sometimes decried as unacceptable intrusions by

the state on freedom of contract, the reality, as nineteenth-century English philosopher and economist John Stuart Mill pointed out, is that the expectation by private parties that the state will enforce contracts itself constitutes a call for state intervention into private affairs. No increased intervention is entailed by state regulations that determine which contracts should be enforced.

Some ideas about equality, then, are now widely accepted; others remain highly controversial and in some cases poorly understood. Even those ideas that are most widely endorsed and deeply entrenched fall considerably short of realization in practice, at least to a degree that corresponds to their acceptance in theory. In the United States, for example, the idea of equality under law, which is endorsed by an inscription over the entrance to the building that houses the U.S. Supreme Court, is compromised by the fact that wealthy defendants in criminal and civil trials are able to hire teams of highly skilled legal counselors, while indigent defendants are often deprived in practice of effective legal representation. Even if we were to set aside controversial claims about the injustice or politically adverse consequences of extreme inequality of condition, much remains to be done to achieve the equalities about which we ostensibly agree.

Equal Protection

The United States of America is considered one of the beacons of civil rights among modern civilized nations. These civil rights are expressed in three documents: the Declaration of Independence, the Constitution, and the Bill of Rights. One of the most important aspects of civil rights involves the concept of equal protection.

SOURCES OF AMERICAN EQUAL PROTECTION LAW

In the Declaration of Independence, the Founders specifically stated that all men are created equal. There were many reasons for the creation of the Declaration of Independence, but primary among them were that the colonists had not been receiving equal treatment, protection, or representation concerning the law and government.

Equal protection of the law is also mentioned in the Fourteenth Amendment to the Constitution. Furthermore, the U.S. Supreme Court has recognized that the Fifth Amendment includes the right of equal protection even though it is not specifically stated. In practice, the U.S. Supreme Court has applied the Fourteenth Amendment and equal protection against the states, while the Fifth Amendment and equal protection has been applied against the federal government.

Many people think of equal protection as meaning that all laws should be enforced identically against all people. Although this appears to be the literal meaning of the phrase, the interpretation and application of the right of equal protection is not so broadly construed, and there are a number of exceptions. Generally speaking, equal protection applies in two situations: when a government act interferes with the exercise of a fundamental right relative to a class of people or when a government classification or category affects the rights of certain classes of people, usually a minority.

FUNDAMENTAL RIGHTS DEFINED

Fundamental right has several meanings, but the U.S. Supreme Court has presented three basic definitions. The first considers whether the right in question is a natural right under the principles of natural law, such as the right of self-defense, as espoused by Sir William Blackstone, a famous English legal commentator, in his *Commentaries on the Laws of England.* The second considers whether the right in question is fundamental to American justice and implicit in the concept of ordered liberty, as recognized in *Duncan v. Louisiana.* The third considers whether the right is implied in the penumbra of

the Bill of Rights, such as the right to privacy, as recognized in *Griswald v. Connecticut*. The second meaning has been the most frequently cited by the American courts. As a practical matter, what is a fundamental right in America consists of the first ten amendments to the U.S. Constitution, as presented in the Bill of Rights, with some exceptions under the Doctrine of Selective Incorporation.

UNACCEPTABLE CLASSIFICATIONS OF MINORITIES

Under the second aspect, equal protection does not prohibit the government from classifying or categorizing people. Rather, it prohibits classification or categorization of people from three perspectives. The first level of classifications or categorizations subject to equal protection analysis includes those that are considered the most suspect. The judicial examination of laws that employ race or nationality as a classification or category are judged under what is called "strict scrutiny." For example, it violates equal protection to classify or categorize a person according to race or nationality unless there is a compelling or overriding government interest at stake. A primary example of this type of prohibited classification and race is the doctrine of separate but equal, recognized in *Plessy v. Ferguson* and subsequently overruled in *Brown v. Board of Education*.

The second level of classifications or categories subject to equal protection analysis includes those that are questionable. The judicial examination of laws that employ gender or illegitimacy as a classification or category are judged under what is called "intermediate scrutiny." For example, it violates equal protection to classify or categorize a person according to gender or illegitimacy unless the classification has a substantial relationship to an important government interest. A primary example of the prohibited use of gender as a classification or category is *United States v. Virginia,* wherein the U.S. Supreme Court found that it violated equal protection to admit only men into the Virginia Military Institute, a previously all-male, state-operated military educational institution. A primary example of the prohibited use of illegitimacy as a classification or category is *Clark v. Jeter,* wherein the U.S. Supreme Court found that it violated equal protection to apply a statute of limitations concerning paternity actions by illegitimate children.

The third level of classification or categories subject to equal protection analysis includes those that are not generally prohibited by the Constitution. The judicial examination of laws that employ economic differences or social welfare legislation are judged under what is called "rational relationship." For example, there will be no violation of equal protection if the law in question has a rational relationship to any legitimate government interest.

In *Griffin v. Illinois,* the U.S. Supreme Court recognized that equal protection in American law is applicable in criminal prosecutions under the principle that all people must stand equal before the courts and receive a fair trial. However, American courts have widely recognized that selective prosecution does not raise a constitutional claim of violation of equal protection unless the difference in prosecution is based on an improper class or motive, such as race. Thus, some discretion in prosecution is permitted even though it appears to violate the strict application of equal protection of the law.

EQUAL PROTECTION IN INTERNATIONAL POLITICS

In the realm of international politics, equal protection and equal rights are frequently advanced principles. In the United Nations Charter (1945), equal protection is mentioned in a number of places as a goal for all people. In article 1, the charter advocates equal rights for all people, and in article 13, it advocates rights and freedoms for all without regard to race, religion, sex, or language. In article 55, the charter advocates equal rights for all people concerning economic and social conditions, which is much more expansive than the American notion of equal protection. However, for the most part, the United Nations Charter is considered a document of aspirational goals and not legal mandates.

In contrast, however, the International Covenant on Civil and Political Rights (1976) expresses the principle that all people have equal rights and are equal before the law, and this covenant is considered binding as a treaty under international law. Although many nations, including the United States, have ratified it, the United States has imposed a number of restrictions on its ratification, so the covenant cannot be enforced in U.S. courts.

In summation, equal protection, in the political sense, means that all people are entitled to the same protection under the law. However, in application before courts of law, equal protection can and does mean something different and is dependent on the jurisdiction enforcing the law.

Equilibrium and Chaos

Equilibrium and *chaos* are terms that enhance our understanding of the dynamics of change in political systems and political phenomena. Historically, *equilibrium* refers to a balance, or

steady state, between competing forces that may minimize tendencies toward political conflict. Competing political parties or nation-states under conditions of equilibrium may reach a stalemate in which conflict is reduced, balance is maintained, and change is minimal. *Chaos* refers to conditions in which political order and stalemates have collapsed, leading to states of disorder in which rapid change with highly uncertain outcomes may occur.

With the advent and expansion of the quantitative analysis of political data in the last half of the twentieth century, *equilibrium* and *chaos* took on more refined and precise mathematical definitions. With the expansion and availability of large sets of data, describing numerous political phenomena, political scientists can now examine these data using sophisticated techniques such as time-series analysis. These techniques allow the analyst to explore how change occurs in political phenomena over time.

Historically, scientists assumed that our world is in a state of equilibrium or balance. This means that the relationship between variables, such as that between income and voting behavior, are stable, linear, and proportional. In the 1990s a growing number of political scientists, such as Courtney Brown, began to understand that these assumptions of balance, stability, and linearity among political phenomena may not be true. What became even more resonant for many political analysts was an appreciation for the nonlinear nature of many political phenomena. When relationships between variables are nonlinear, proportionality may not occur, and instead small changes may have large and highly uncertain effects. This recognition led to an interest in the study of chaotic phenomena.

Chaos describes the long-term behavior of a system in which its descriptive data are not predictable. This means that if chaotic data represent a political phenomenon, be it voting behavior, political attitudes, or superpower conflict, then that phenomenon is subject to unpredictable and surprising behavior. In short, in a truly chaotic phenomenon we cannot predict the next result because the previous result does not serve as a guide.

Studying the mathematics of chaos is very challenging, but studying chaotic dynamics does teach us an important lesson. The world of human affairs is highly nonlinear, unstable, and unpredictable. And if the world of human, and thus political, dynamics is subject to such uncertainty, then these realities may always place limits on our knowledge. Thus, the goal of a science of politics may be an illusion and an unattainable goal.

In many historical periods global political dynamics seem to be in a predictable state of equilibrium. In other periods the political world is dominated by chaos and disorder. It is the recognition, though, that we cannot predict when such chaos and disorder will occur that makes the study of politics such a fascinating, important, and at times daunting activity.

Error Correction Model

An error correction model or equilibrium correction model (ECM) is a dynamic statistical model. Statistical models can be applied to time-series data—chronological sequences of observations—to examine the movement of political variables over time (e.g., public opinion, government policy, judicial court decisions). This allows the analyst to estimate relationships between political variables and test hypotheses. A dynamic model includes past values of the variable of interest as an explanatory variable. This captures the simple concept that what happens today affects what happens tomorrow.

A common dynamic model is the autoregressive distributed lag (ADL) model. In the ADL model, the variable of interest is a function of both past values of itself and current and past values of the independent variables. Any ADL model can be transformed linearly into an ECM without placing any restrictions on the parameters of the model. Other ECMs are equivalent to ADL models with restrictions placed on some parameters (e.g., setting a coefficient to zero). Simply put, the ECM contains exactly the same information as the ADL. The choice of using one over the other is purely a matter of convenience.

Within the context of political science, ECMs offer two advantages. The first is interpretation. ECMs model changes in the variable of interest as a function of the long-term equilibrium between the variable of interest and the independent variables in the absence of exogenous shocks, short-term movements due to exogenous shocks, and the rate at which the variable of interest returns to equilibrium (i.e., the rate of error correction). Explicitly separating the long-term equilibrium relationship from short-term movements is often appealing when fitting a model to theory.

The long-term equilibrium relationship component is the key to the second advantage of the ECM. Standard estimation techniques produce incorrect results if the time-series data violate an assumption called "stationarity." A common violation is integrated data. However, a linear combination of integrated time series may exhibit stationarity; this is referred to as cointegration. This stationary linear combination can be

interpreted as the long-term equilibrium relationship between the variables and incorporated in an ECM. This allows the relationship between integrated variables to be modeled.

Because of these advantages, the popularity of the ECM in political science has been on the rise since the early 1990s, particularly in political behavior and political economy. It also has been put to use in areas such as the study of judicial processes, conflict, and foreign policy. Most of these studies have justified the use of the ECM on the grounds of cointegrated data.

In the application of the ECM, there are two points to keep in mind. First, as the ECM is simply a reparameterization of the ADL model, any concerns about model specification that apply to the latter also apply to the former. These can include endogeneity issues, specifying the correct lag structure, and serially correlated errors. Second, there is more than one procedure for estimating an ECM. Estimation when using stationary data may require a different procedure than when using cointegrated data. The ECM allows certain relationships to be estimated using ordinary least squares, which would otherwise require more advanced procedures, but there are many ECMs that cannot be estimated using ordinary least squares.

Essentialism

Essentialism is a philosophical movement that asserts that objects have certain universal properties that are common (essential) to all members of that group. The concept, however, is associated not only with the identification of groups. Differing perspectives of essentialism are reflected by pragmatists, such as Richard Rorty, who reject the traditional foundationalist theory that knowledge is justified based on foundational beliefs. Ultimately, essentialism is a perspective of different forms of knowledge or understanding that exposes the world and individuals through their essential components, highlighting attributes that are essential to a particular world. These attributes are unchanging and necessary for inclusion in a certain group. Without that particular property, an object or individual cannot be part of the group. There may be other characteristics that can be acquired or lost, but these are not

essential and are classified as accidental. The object can lack accidental properties, but not essential ones. Contemporary essentialism has its roots in the work of early philosophers such as Plato and Aristotle. Essentialism was important in the development of classic humanism as early proponents of humanism believed that there were certain unchanging characteristics shared by all people. Essentialism was criticized by Karl Marx and Friedrich Nietzsche, who argued that humanity did not have unchanging characteristics. Identity politics, including race and gender studies, is generally highly critical of essentialism because of its reductionism and tendency to define groups by biological traits—an approach that scholars such as Edward Said argue principally contributes to fundamental differences in socially constructed perspectives of groups and to a limited or culturally biased conception of what it means to be Oriental or Arabic. Critics instead argue that there is a difference between social attributes and biological characteristics and that groups do not have fixed characteristics or biological determinism.

Estates

The estates were the classifications of the divisions of society that emerged in Europe during the Middle Ages. While there was variation from country to country, in general the estates were the aristocracy (the first estate), the clergy (the second estate), and the commoners (the third estate). In some countries, including France and Scotland, the clergy were considered to be the first estate, and the nobility, the second. There were often subgroups within each of the estates. For instance, the clergy was typically divided between the higher ranks, such as bishops or cardinals, and common priests or monks. Commoners were frequently divided between the small middle or business class (collectively known as the bourgeoisie or the burghers) and the peasants. In Sweden, there were four estates: the nobility, the clergy, the burghers, and the landowners. Serfs and urban dwellers who did not own land or were not free men were not considered part of any of the estates. Early parliaments comprised representatives of the estates, including the French Estates-General and the Scottish Three Estates. These bodies had elected representatives who were summoned periodically to advise the monarch or to approve taxes or levies.

Ethics, Political

"The Prince," Niccolò Machiavelli (1532) famously wrote, "must learn how not to be good," by which he meant, to act in a manner deemed unethical according to the ethical standards of his time. Cynics might claim that this is hardly

something politicians need to learn. Machiavelli is certainly not alone in proposing that politics and ethics do not mix or, at any rate, do not mix well. If political ethics is to be anything other than an oxymoron or a pious wish, then it is necessary to examine critically such an assumption. We can distinguish at least three categories of reasons (there are doubtless many others) underlying the assumption that ethics and politics inevitably part company: The first concerns the prevalence of political corruption in one form or another, self-seeking behavior by public officials that runs contrary to the obligations of their office; the second is the demands of representation; and the third, the demands of governance. The last category is commonly discussed as "the problem" (or "dilemma") of political dirty hands.

Political ethics will be defined, for the purposes of this article, as the principles or criteria by which to judge the morality of the politically relevant actions of political agents (the terms *moral* and *ethical, morality* and *ethics,* will be used interchangeably). In a modern democratic society, political agents range from citizens to elected officials to cabinet appointees to government bureaucrats to lobbyists. The paradigmatic political agent in a modern representative democracy, the focus of most discussions of political ethics, is the politician, the individual who runs for, and is elected to, public office. Hence, my focus will be on the politician, although some of what is said here could clearly apply to all political agents. To focus on the politician as the subject of political ethics provides a useful analogy with other principles of what is termed "role ethics," in particular, professional ethics. Political ethics concerns the principles by which to determine the morality of an officeholder's (or office seeker's) politically relevant actions, just as, for example, lawyers' ethics provides principles by which to judge the morality of lawyers' actions as they relate to their role as members of the legal profession.

Every practice, occupation, or profession is oriented toward the provision of some good: these are the ends of the occupation. In a representative democracy, political offices exist to realize not the good of the officeholder—"the power and glory of princes"—but rather the public good. That this is the end of public office in a representative democracy is reinforced by the fact that this is the reason officeholders are elected in the first place, that is, not for their personal enrichment but to serve the public. Election to office creates a fiduciary duty: the officeholder—the fiduciary—is elected to act on behalf of the public who elects him or her. Hence, it is the role-specific duty of officeholders to work to realize the public good, and the sine qua non of an ethical politician is that he or she will use his or her office for the realization of this good. In a modern, pluralist, democratic society with multiple political parties, it can be assumed that there will exist disagreement as to both what constitutes the public good and the means by which that good can best be advanced. In addition, officeholders may have obligations to different publics—as a member of Congress has obligations to his or her constituents and to the American people as a whole—as well as a range of more specific obligations, which may and commonly do conflict.

SELF-INTEREST VERSUS PUBLIC INTEREST

To talk of the public interest sets up an obvious contrast with the private interest of the officeholder. Few expect public officials to be motivated in all they do, including running for office, solely by the public interest, and whether construed as a desire to wield power and influence or a desire for public recognition, the absence of such motivations cannot be the hallmark of a reasonable political ethics. But this recognition of the mixed motives of most officeholders should be distinguished from the view according to which self-interest is construed as the only possible motivation of political actors, a view not uncommon among students of political behavior. For example, David Mayhew (1974), construing the desire for reelection as a form of self-interest, works with a vision of Congress members as "single-minded seekers of reelection," justified in part on the assumption that "politics is best studied as a struggle among men to gain and maintain power and the consequences of that struggle." Similarly, Anthony Downs (1957) postulates that politicians are motivated solely by the desire "to attain the income, prestige, and power which come from being in office," never seeking office as a way to carry out particular policies but rather as a means to the attainment of private ends, which they can attain only by being elected.

If the function of a legislature is to generate socially beneficial laws, then, in a process analogous to Adam Smith's invisible hand, good laws—laws that advance the public interest—can be seen as the consequence of a self-interested competition for power and office, "in the same sense that economic production is incidental to the making of profits." The problem with this formulation—besides its crudely reductionist view of motivation—is that it ignores the fact that the self-interest of politicians, including their interest in being reelected, can conflict in significant ways with the public good, including the good of the democratic process itself. It is for this very reason that a good deal of political ethics is concerned with so-called conflicts of interest.

Conflicts of interest are especially prominent in politics because politicians are often in the position to advance policies from which they themselves—or their friends or associates—stand to benefit in a self-interested manner, most commonly, although not exclusively, financially. The problem posed by a conflict of interest is that the existence of such a conflict is assumed to interfere with or distort a politician's discharging his or her fiduciary obligations, that is, advancing the public good. Specifically, it interferes with the objectivity or impartiality of his or her judgment. If a politician takes a bribe or receives kickbacks from a company seeking a governmental contract or if he or she holds (or will hold after leaving office) a large financial interest in that company, then the assumption is that his or her support for this particular company is motivated not by his or her impartial and objective evaluation that this is the best company to do the job (i.e., serve the public interest), but rather by self-interest (or the interest of friends or family).

Much that is legal in politics—for example, members of Congress advocating for legislation of dubitable public good

but from which they themselves, or their families or friends, stand to reap considerable financial rewards or hiding special earmarks in funding bills to provide benefits for special interests from which they have received considerable campaign contributions—is simply institutionalized conflict of interest. Unethical practices such as these cannot be justified on the basis of the ends of the institution—serving the public good—since most commonly they subvert that interest.

THE DEMANDS OF REPRESENTATION

To make any sense of the claim that the ethical politician will view the primary obligation of political office as the advancement of the public good, we must say something more about what we mean by *public good* (or in more familiar parlance, *public interest*) and what we mean by *advancement*. Should the ethical politician view the public interest as equivalent to the actual existing preferences of those he or she represents and advancement as the fulfillment of those preferences? Note that in posing this question, we have drawn a distinction between interests on one hand and preferences on the other. Some may find such a distinction objectionable, although it seems obvious that people can have preferences that it is not in their best interest to have satisfied.

The answer to this question goes to the heart of the nature of representation. In attempting to answer this question, most political scientists rely on an influential distinction first set forth by Edmond Burke. According to the delegate model of representation, the ethical representative should act simply as the mouthpiece of his or her constituents, attempting through the political process to satisfy their preferences without letting his or her own views as to the merits of those preferences intervene. According to the trustee model of representation, the ethical representative must exercise a sufficient degree of autonomous judgment to enable him or her to act on behalf of the public interest of those he or she represents, even if this means going against the immediate preferences of his or her constituents. Burke (1999) was unambiguous in his support of the trustee model: "your representative owes you, not his industry only, but his judgment; and he betrays, instead of serving you, if he sacrifices it to your opinion." Against the delegate view, it has often been noted that it may not be clear what a constituency, or even a majority, wants. Most of the individuals who constitute it either do not know enough or do not care enough (or both) about the issues on which their representative must vote to have clear opinions of their own, and even when their opinions are formed, it is unlikely that there will be a majority. Furthermore, perhaps what they want is incoherent, self-destructive, unjust, or shortsighted.

One of the more interesting uses of the trustee model has been to defend seemingly unethical conduct on the part of the ethical politician (i.e., the politician committed to advancing the public interest), specifically lying to his or her constituents to get elected. Carol Stokes, for example, has argued that it may be proper for politicians who want nothing more than to promote the welfare of their constituents to lie in campaigns and then switch upon being elected to unpopular opinions. Sisella Bok (1978) presents an example of this, although it is intended as a counterexample: a big-city mayor running for reelection has read a report recommending the removal of rent control, something he intends to do because he believes it is in the public interest, believing that if he makes his intention known, he will lose the election. At a news conference prior to the election, he denies, when asked, any awareness of the report and affirms his commitment to rent control. He believes that his election is very much in the public interest, as is the rent control policy he intends to pursue, and he may also believe that after the election he will be able to persuade voters of the merits of this policy. This final point is important, for the ability of a representative to engage in one or another form of rational persuasion to change the preferences of his or her constituents is seen as a way of preventing the trustee model from ultimately subverting representation altogether by allowing the representative to completely ignore the wishes of those he or she represents or ultimately act against their interests.

As Bok (1978) notes, "In all similar situations, the sizeable bias resulting from the self-serving element (the desire to be reelected, to stay in office, to exercise power) is often clearer to onlookers than to the liars themselves." Such bias inflates one's estimation of the justifications for the lie, the altruism of the liar, and the rightness of the cause. More important, lying of this sort precludes informed voting on the part of citizens and undermines citizens' trust in the integrity of the political process. Stokes too is aware of this difficulty: ultimately, voters cannot make good choices unless they are informed, and politicians who mislead them about their choices may perpetuate misperceptions.

Yet we may still be left with a nagging doubt: could a politician who eschewed all falsehoods in elections ever get elected when even honest Abe Lincoln voiced contradictory opinions about the issue of white superiority depending on whether he was north or south of the Mason-Dixon Line?

THE DEMANDS OF POLITICAL OFFICE

In a seminal essay, "Political Action: The Problem of Dirty Hands," Michael Walzer (1973) argues that the demands of office are such that occasions will arise in which the ethical political leader must engage in immoral acts to advance the public good. As an example, Walzer presents a variation of the ticking time bomb scenario: a political leader orders the torture of a captured rebel leader (nowadays he would be a terrorist) to discover the location of a number of bombs hidden around a city and set to go off in twenty-four hours. The political leader believes that torture is wrong—in fact, abominable—yet he orders it to save civilian lives. In Walzer's intentionally paradoxical formulation, he has done wrong to do right. The ethical politician will not believe that preventing the deaths of potentially thousands of citizens somehow excuses the moral wrong he committed by licensing torture: he will experience appropriate moral guilt because he has dirtied his hands, albeit for a good end. Were the ethical politician unwilling to dirty his hands, he would not be a ethical *politician,* that is, he would be unable to meet the demand of political office; if he felt no moral guilt at dirtying his hands,

he would not be an *ethical* politician, even though he acted to defend the public interest.

The conflict Walzer presents is not so much a conflict between morality and immorality (or amorality) as between two competing ethical approaches, which are commonly termed "deontological" and "utilitarian." A deontological moral code tells us that certain means are intrinsically wrong, absolutely forbidden, and cannot be undertaken even for the sake of good ends. Utilitarianism tells us, essentially, that sufficiently good ends may justify means that violate deontological prohibitions. Hence, in approving the torture of a prisoner, the political leader violates a deontological prohibition against torture on the utilitarian grounds that torture is justified to save thousands of lives (although there can be equally strong utilitarian arguments made against the use of torture). Were he a thoroughgoing utilitarian, he would be assured that he did the morally right thing and have no reason to feel moral guilt. Were he a thoroughgoing deontologist, he would not have permitted the use of torture in the first place. Hence, the morally right consequentialist outcome does not excuse or erase the deontological wrong.

Many have argued that the proper political ethic should (at times, at any rate) be unapologetically utilitarian (in contrast to Walzer, who might be termed a "guilty utilitarian"). For better or worse, however, utilitarian reasoning is often used to justify political acts that most people, as a matter of everyday morality, would consider immoral, for example, political deceit and manipulation, torture, and the intentional targeting of civilian populations in war. The natural consequence of this focus is that debates concerning the utilitarian prerogative of political action often suffer from the assumption, implicit or explicit, that utilitarianism is not a moral point of view at all, even by those who make utilitarian arguments: utilitarianism is called "political expediency" by those who oppose utilitarian reasoning and "political necessity" by those who support it. And to the defenders of political necessity, deontologists who are unwilling to get their hands dirty are simply more concerned about upholding their own moral purity than protecting their fellow citizens.

Such assertions are merely confusion because one could be a utilitarian moral purist just as much as a deontological moral purist. A politician who was a utilitarian moral purist might well frighten us, for he or she could, in principle, decide that intentionally targeting a civilian population in war was the best way to preserve national security and, being a thoroughgoing utilitarian, have no reason to feel guilty about his or her actions (although there are also good utilitarian justifications as to why this would be the wrong thing to do). Yet a politician who was a deontological (specifically, Kantian) moral purist would be equally frightening, for example, someone who would not tell a lie even if the result would place the lives of thousands of his or her citizens in danger.

This said, is it true that an ethical political leader must engage in acts that most people, most of the time, would deem immoral for the sake of defending or promoting the public good? It is worth pointing out that if the validity of this proposition rests on as contrived a hypothetical as the ticking time bomb scenario, which David Luban (2005, 1425) has rightly called an "intellectual fraud," then it seems doubtful. Perhaps more important, Walzer's ethical politician is a figure of such rarity that if moral governance depends on such people, then it is likely that moral governance can never be achieved (which is certainly a possibility). Those political leaders who condone torture, for example, in violation of domestic and international law, are precisely those who are least likely to feel any guilt about their actions, least likely to publicly disclose them, and above all, least likely to seek to be held in any way accountable (but rather to take all means to avoid accountability). And they are also least likely to employ the powers they have abrogated to themselves wisely or with restraint.

Ethnic Cleansing

Ethnic cleansing is the intentional act of removing by force or threat of force any national, ethnic, religious, racial, or socio-economically homogeneous group from a specified area of land, usually within the borders of a sovereign state, up to

and including genocide. While it can be said that all genocide is ethnic cleansing, not all ethnic cleansings are genocide. Although *ethnic cleansing* may encompass genocide, the term does not mean that the target group is specifically designated for total extermination; rather, the group is targeted for removal from a specific geographical location or expulsion from a population. The target group may be subjected to rape, murder, arson, and torture, among other acts of violence.

Some examples of ethnic cleansing are the Americans' treatment of Native Americans in the eighteenth and nineteenth centuries, the Turkish genocide of Armenians in 1915, the Nazi Holocaust of Jews and Gypsies during World War II (1939–1945), the Balkans conflicts of the 1990s (Bosnia, Croatia, Serbia, and Kosovo), and the conflict in the Darfur region of Sudan. The media often portray acts of violence against specific groups of people as ethnic cleansing to add effect to news stories. This downplays the significance and seriousness of true ethnic cleansing.

Ethnic Parties

The main object of an ethnic party is to serve the interests of a specific ethnic group; however, the party may not represent all members or every preference. The party may be made up entirely of members of the group, or it may include other individuals who have won the trust of the ethnic group.

Whether ethnic parties emerge, the number of parties that emerge, their relative strength, and their interactions are largely determined by the strength and cohesion of the ethnic groups in a state. Strong ethnic loyalty can create intensely loyal party members, and divisions between ethnic groups may be formalized in ethnic party platforms.

GENESIS OF ETHNIC PARTIES
Environmental conditions help determine the issues on which ethnic parties focus. These issues and political framing heavily influence ethnic party members. States in which the government distributes public goods disproportionately among ethnic groups may encourage discontent in disadvantaged groups. Furthermore, economic cleavages among ethnic groups, political exclusion, and other social divisions can help establish preconditions for political opportunists to create ethnic parties. When, where, and how ethnic groups mobilize is contingent on political elites' harnessing such popular discontent and environmental preconditions. Political elites can focus the attention of ethnic groups on the differences between ethnic groups and thereby galvanize support for the party.

Ethnic parties outside of Europe have historically emerged at independence/postcolonization to compete for scarce resources or before independence to contest a colonial government. Ethnic groups often formed parties to contest a colonial administration's social and economic policies as well

as to rid a territory of a colonial power. Prior to independence, such political parties often had wide support but few active members. After states won their independence, victorious political parties controlled the government. This sparked debate among other ethnic groups that then sought a stake in the government by developing their own ethnic parties. In many newly independent states, established and dominant politicized ethnic groups helped spur other ethnic groups to politicize and contest for state resources and political space.

Ethnic parties may also be born of internal impulses. An ethnic party may embrace ethnic demands to serve the interest of its constituents. Such a party is identified with the particular concerns of the ethnic group that supports it and may polarize around a narrow set of issues. These parties appeal to ethnic group members by evoking an ethnic identity and represent a broad set of interests under a singular identity. This identity serves as an information tool: in ethnically politicized systems, individuals may not know any more about candidates than their ethnicity. By virtue of a shared ethnicity, constituents may vote for candidates with the assumption that they would better represent and defend constituent interests. Ethnic groups often vote on the basis of this ethnic identity and do not pursue other information about candidates.

CHALLENGES PRESENTED BY ETHNIC PARTIES
However, ethnic parties make conciliation among groups difficult. Especially in states with scarce resources, ethnic party elites frequently frame public goods as a zero-sum payoff. In an effort to activate the support of an ethnic group, mobilizers and elites use kinship ties, shared history, or other cultural attributes that may be particular to a specific ethnicity. Indeed, ethnic groups are by nature exclusive: there are definite ethnic insiders and outsiders. Ethnic parties allow for the stronger promotion of narrow group claims, and these claims may have absolute winners and losers. In a government defined by ethnic parties, political cleavages may enforce existing cultural cleavages in society and serve as destabilizing institutions, for example, by encouraging differences through an unwillingness to negotiate and compromise rather than encouraging unity that would produce legislation that would benefit the entire population.

The tendency to organize parties along ethnic lines is strong in deeply divided societies, particularly those in which several major ethnic groups are represented at the national level. Once one party organizes along ethnic lines, other ethnic groups are likely to mobilize. Ethnic elites may realize the potential payoffs from group organization and may be threatened by rival ethnic group mobilization. However, ethnic party systems can emerge contrary to party leaders' efforts. Party leaders, working for electoral victories, make compromises with different social groups to win a majority or votes for seats. Opportunistic political elites may take advantage of inherent weaknesses in ethnically diverse parties. Within a party, different elites may seize the opportunity to gain power by mobilizing ethnic identities and jockey for position within the party. The ethnically

diverse party may then fracture as other party leaders emulate a successful subparty split, resulting in the creation of multiple monoethnic parties from a system once characterized by multiethnic parties.

Scholars debate whether ethnic parties within a political system can cooperate, share public goods equally, and act in the interest of the general population. It may be difficult for an ethnic party to pursue policies that benefit people outside the group. Even if political leaders try to diversify the party's interest, members of the ruling ethnic group may only see state resources going to an ethnic rival. Ethnic group members may obstruct conciliatory political measures.

CONCLUSION

The adverse effects of ethnic parties can be ameliorated by individuals, parties, and institutions. Individuals and parties build interethnic alliances to win elections and pursue policy changes. A larger ethnic group may ensure a victory by adding voters from smaller ethnic groups, whereas ethnic groups of similar size may ally to challenge a larger ethnic group instead of entering political battles and maintaining their permanent losing status. Institutions can facilitate interethnic allegiances by requiring parties to win elections from multiple electoral districts. Also, some political systems have forms of affirmative action policies guaranteeing an ethnic group some minimum level of state participation.

Ethnocentrism

Ethnocentrism is the inability to understand other countries except through the lens of one's own country's culture, customs, values, and institutions. Ethnocentrism plagues all peoples and countries, but its consequences are particularly important for a global power such as the United States. Americans tend to view the rest of the world from the presumption that U.S. institutions and practices are superior. Ethnocentrism pervades all aspects of American life, including scholarly works in the field of comparative politics as well as U.S. foreign policies and practices.

Ethnocentrism dominated the works of the earliest scholars in comparative politics, such as Karl Loewenstein, Carl Friedrich, and Hannah Arendt. These scholars analyzed other countries from a Western-centric position, focusing their study on comparative constitutions, comparative legal systems, and various institutions of government such as the Parliament, the executive, and judicial institutions. The logic was that if countries imitated the United States or Western Europe, they would improve. However, others, such as Roy Macridis, contended their approach was not genuinely applicable to non-Western and developing countries, which had their own ways of doing things. Although his critique spurred subsequent scholars to pursue a systematic comparative approach, their work continued to be plagued with ethnocentrism.

David Easton, for example, attempted to establish a general, unbiased, presumably universal theory through integrating different aspects of political life as a system. His analysis, however, included inputs (e.g., culture, history, interest groups) and outputs (e.g., government decisions or policies) that sounded hauntingly similar to the functions of the Western system. Gabriel Almond applied Easton's schematic and attempted to identify common functions that all political systems performed, but he still used a Western-centric approach to analyze non-Western countries.

Exogenous factors, for instance, the decline of colonialism and the resulting independence of many former colonies of the British Empire, presented the opportunity to shift farther away from the legalistic-formalistic approach and toward a less ethnocentric analysis of world politics, but the new field of political development continued to be grounded in ethnocentrism in practice.

Economists Karl Polanyi, W. W. Rostow, and Alexander Gerschenkron asserted that economic growth drove social and political development or democratization, but their approach remained as ethnocentric as the legalistic-formalistic approach because it featured a universal model of a linear trajectory resulting in a democratic-capitalistic society. In fact, their theoretical progression has failed to manifest in the new developing nations; economic and social change seem uncorrelated.

Ethnocentrism also affected sociologists such as Talcott Parsons, who advanced a set of presumably universally valid categories (e.g., affective vs. affective neutrality; ascriptive vs. merit; particularism vs. universalism) for comparing "modern" and "traditional" societies. Yet his pattern variables dichotomized traditional and modern systems, creating an absoluteness about development, and it wreaked havoc on the developing nations as it sometimes undermined the very institutions (e.g., family, religion, tribe, the caste, and the clan) that gave coherence and stability to the developing nations. Other sociologists, including Daniel Lerner, Seymour Lipset, and Karl Deutsch, developed their own theses of modernization and democratization that made Western political and economic institutions the inevitable conclusion of a unilinear development model. The economists and sociologists had a heavy influence on political scientists, including Easton and Almond. Some scholars, such as Lucian Pye, acknowledged a diversity of definitions generally associated

with change; however, Pye's work still reveals his biases toward Western democracy.

Some scholars, notably Samuel Huntington, challenged ethnocentrism, and a few constructed indigenous models of development. These challenges, however, failed to affect the field significantly. They also failed to affect American foreign policies, which have been deeply shaped by the unilinear development model. For instance, American foreign aid to promote democracy, capitalism, and civil society failed to consider indigenous conditions and imposed a U.S. model of development on emerging nations. Recently, however, a trend is emerging in the United States to counter ethnocentrism. Universities are promoting multiculturalism through the introduction of new courses in non-Western languages and area studies, there is a greater emphasis on understanding other religions such as Islam, and there are efforts to teach students about other cultures.

Nonetheless, American foreign policies and practices, particularly democracy programs, foreign aid programs, and belief in free markets, remain ethnocentric because they are based on the American model of development. Even today Americans fail to grasp that the sequences, stages, and processes of development that the West experienced cannot be repeated in today's developing nations (e.g., Afghanistan and Iraq).

Europe, Democracy in

Democracy in Europe is a contested concept. It divides those who argue that the European Union (EU) has a democratic deficit from those who argue the contrary and divides those who would remedy the deficit through greater politicization from those who would not. Underpinning these divisions are different understandings of what democracy in the EU is or should be and how much it can be improved.

POLITICS OF THE EU

The EU's democratic institutions have much in common with national federal systems. They are characterized by a horizontal separation of powers, making for checks and balances among EU-level authorities, and a vertical division of powers between the EU and its member states, making for multilevel governance. However, unlike in federal systems, the national-level periphery has more power than the EU-level center, given member-state control of legislation. Legislation is approved by member-state executives in the Council of Ministers and by member-state representatives in

the European Parliament (EP) and implemented by national bureaucracies. However, the council and parliament are weak because of the EU Commission's role in legislative initiative and enforcement. Finally, while only the European Court of Justice has the power typical of supreme judicial courts in a federal system, it is arguably more independent, given EU rules that make it very difficult for council member states to overturn European Court of Justice judgments.

While EU institutions bear some resemblance to national ones, EU politics does not. The EU lacks a directly elected president or parliament-elected prime minister, a strong legislature, and vigorous political parties in a regionwide competitive, partisan electoral system. Instead, it has indirect representation by nationally elected executives in the Council of Ministers and the European Council, which is headed by a six-month rotating president. However, once the Lisbon Treaty went into effect, although the rotating presidency continued, the council president was appointed by the council to serve a two-and-a-half-year term that is renewable once, and a high representative was appointed as the equivalent of a foreign minister. Only the EP provides for direct representation; however, it is much weaker than any parliamentary democracy. It has no say over the appointment of the council president and has approval powers only over the appointment of the commission president. Its elections, which are organized within rather than across member states, are also second order, given the greater focus on national rather than European issues.

Most important, EU politics is not really politics in any traditional sense of party and partisanship because it is mainly about interests, whether the national interests projected by the member states in the council, the public interests defended by national representatives in the EP, or the organized interests mediated by the commission as well as, increasingly, by the EP. Partisan politics is marginalized in this pluralist, interest-based system for a variety of reasons. Political parties at the European level are weak and not very cohesive, although this has been changing in recent years. The commission's consensus-oriented, technical approach to policy initiation and development avoids left-right divides. And issues voted by the EP in codecision procedures with the council are decided mostly by supermajorities in the EP. The result is that policy making at the EU level can be characterized as policy without politics. This, in turn, leads to politics without policy at the national level as more policies are moved to the EU level even as politics continues primarily at the national level. This leaves an impoverished national political arena in which citizens feel increasingly disenfranchised because, as voters, they have voice over questions that do not count at the level at which they voice them. Nevertheless, the EU remains a sleeping giant for the moment with regard to EU-generated splits in national party politics despite the fact that some of these problems have been apparent during treaty referenda. These referenda have increasingly mobilized dissatisfied constituencies on the right and left, which helps explain the French and Dutch rejection of the Constitutional Treaty and the Irish rejection of the Lisbon Treaty.

THE LEGITIMACY OF THE EU

As a result of this wide range of political issues, the majority of EU scholars argue that the EU suffers from a democratic deficit. Only a few scholars defend the EU as already democratic enough. Majone (1998) argues that as a "regulatory state," the EU's legitimacy is based on the delegated responsibility of its "expertocracy." Moravcsik (2002) adds that the EU is no worse than other democracies, with legitimacy ensured through its checks and balances and delegated authorities. The problem with this emphasis on "output" democracy through governing effectiveness, as Scharpf's (1999) arguments suggest, is that it fails to deal with the "input" democracy expectations of citizens through representative democracy. Schmidt (2006) takes this point further by showing that unlike nation-states' mature democracies that have a full range of democratic legitimizing mechanisms, the EU has a fragmented democracy, split between "output" governing effectiveness for the people and interest consultation with the people at the EU level and "input" political participation by the people and citizen representation of the people at the national level.

Many scholars see the main solution to the EU's democratic deficit in the development of EU-level institutions that are more participatory and representative, but some argue they also need to be more redistributive. The EU itself has sought to increase its transparency and accountability and to do more to bring civil society into the policy-making process. The EU's ill-fated initiative on a constitutional treaty during the constitutional convention has been generally hailed as one of the first instances of deliberative democracy in the EU.

Some scholars argue that the EU needs to be politicized further to solve the democratic deficit, for example, by having the EP elect the commission president, hold EU-wide elections on the same day, and schedule transnational policy forums on issues of general concern. Others worry that it is too soon for any such politicization given the lack of a collective will in the EU or of a European public sphere. However, the main concern is that politicizing EU institutions will undermine the EU's ability to deliver policies efficiently and effectively. The problem is threefold: how does one maintain the effectiveness of the EU's output democracy for the people if one increases input democracy by and of the people at the EU level, since this would politicize decisions that were efficiently dealt with as technocratic in the past? By the same token, if one does not increase the input side through politicization, how does one respond to citizens' dissatisfaction with the lack of political debate about contested policy decisions? Yet if one does increase input democracy at the EU level, can one do this without undermining it at the national level? Any recommendations for the politicization of the EU have to face up to these questions and to the real limits to EU democratization today.

Europeanization

The theoretical approach to Europeanization defines it as the outcome of a long historical process in which western European culture and civilization have influenced the rest of Europe. Besides cultural traditions and a capitalist way of life, such values as democracy, solidarity, liberty, and tolerance are promoted. As Petr Kopecky and Cas Mudde (2000) argue, the result of being "Europeanized" is the development of democratic values by implementing democratic human rights regimes and open political systems.

The pragmatic interpretation of the term *Europeanization* emphasizes the policies and institutions of the European Union (EU), their influences on member states and candidate countries, and the impact of the national systems on the political and administrative structure of the EU. In this narrowed context, Europeanization can be used interchangeably with the notion of European integration process. However, two other points of view contribute to an exhaustive picture of the conceptual reality of the term: the top-down and the bottom-up perspectives.

THE TOP-DOWN APPROACH

The concept of Europeanization frequently refers to allocation of EU regulations and institutional structures to the domestic level. First, the developments and changes in the domestic systems of the EU member states—much more visible in the recently accepted member states (those that joined between 2004 and 2007)—suggest that the EU has enormous

political and institutional influence. Moreover, the top-down perspective reflects the reality that the political actors from the EU level are the individuals promoting the values of Europeanization, whereas national political actors are less involved in the process.

Claudio Radaelli (2000) sketches an even more pragmatic definition: Europeanization is a process through which the political, economic, and social dimensions of the EU become "incorporated in the logic of domestic discourse, identities, political structures and public policies." Hence, the overarching European structure determines obvious changes in national systems.

Second, this "downloaded" Europeanization implies a whole new procedure of regulation through which European institutions—especially the legislative and executive bodies—gradually transpose different areas of policy making from the national level to the supranational dimension. Consequently, new secondary legislation (i.e., directives, regulations, decisions) agreed on by the member states must be implemented by subnational and national governments alongside domestic laws or even modifying the latter as necessary.

Third, the top-down dimension can also be explained by the shaping of domestic institutional structures. On one hand, the EU brings about the creation of new agencies and new types of cooperation; on the other hand, it affects administrative reform, public procurement, regional development, and budgetary procedures within the domestic sphere.

Thus, the EU affects the relationship between legislative and executive bodies by widening the scope of technocrats and executive leadership, especially due to their role in the economic and monetary union, and limiting the functions of traditional parliaments. In addition, during the accession process, the main actors in the negotiations with the EU are the national elites of the candidate countries, that is, the chief negotiators and their teams, some ministers, and key officials of the central civil service. Furthermore, when EU membership becomes the primary foreign policy goal, governments allocate to this purpose considerable human resources, especially from the central administration, personnel who are well trained and in possession of technical expertise. Once accepted into the EU, these administrative elites continue to have a primary role in the process of European funds absorption. In this context, it can be asserted that European integration creates new technical elites within central and regional governments.

EUROPEANIZATION AND REGIONALIZATION

In line with the idea of the top-down approach, the phenomenon of Europeanization cannot be analyzed without at least mentioning the concept of regionalization. From a broad point of view, these two concepts can be perceived as contradictory: the EU is a complex extranational network of member and candidate countries, institutions, and political actors, whereas regionalization strengthens the idea of regions as actors, underlining the importance of being as close as possible to citizens and their concerns. However, Europeanization involves regional development and greater decentralization, especially in former communist countries in which everything was strongly centralized for decades. The accession process provides new incentives for creating regional administrative institutions, and membership status offers the possibility of acquiring specific structural funds aimed at reducing or eliminating differences between European regions.

THE BOTTOM-UP PERSPECTIVE

The response of national actors, such as national institutions, citizens, mass media, and civil society, to EU regulations, directives, recommendations, and general policy guidelines influences the supranational dimension created by the European Parliament, the European Commission, the European Court of Justice, and the Council of Ministers, among others. Accordingly, the EU member states, especially their citizens and domestic policies, exert a strong influence on the European institutional framework by transforming them continuously.

Tanja Börzel (2003) underlines the role of member states and their governments, which are the main agents driving European integration and policy making with the goal of protecting their geopolitical interests and the economic concerns of their constituencies. In addition, as Svien Andersen and Kjell Eliassen (1993) maintain, power is shared de facto between the EU and national governments, or as Thomas Lawton (1999) concludes, there is a visible de jure transfer of sovereignty from the domestic arena to the European structure. Andrew Moravcsik (1999) and Adrienne Heritier (1999) call this national impetus the "bottom-up" viewpoint of Europeanization or even the "uploading" process of Europeanization.

European Parliament

The European Parliament, a 785-member body, is the only European Union (EU) institution that is directly elected by the voters of the EU's twenty-seven member nations. The European Parliament, along with the Council of the European Union, constitutes the legislative branch of the EU. The parliament meets in Strasbourg, France (the official seat of the parliament) and in Brussels, Belgium. The secretariat of the parliament, the parliament's administrative arm, is headquartered in Luxembourg.

Since 1979, members of the European Parliament (MEPs) have been elected for five-year terms. The legislative jurisdiction of the parliament includes environmental protection, consumer rights, equal opportunities, transportation, and the free movement of workers, capital, services, and goods. However, this jurisdiction is limited in that issues must be referred to the European Commission, the EU's executive branch, which must draft legislation for the parliament to consider.

The European Parliament is presided over by a president, who is elected by the MEPs for a two-and-one-half-year term (one-half of the parliament's term) and can be reelected. Election is by secret ballot, with the candidate receiving an absolute majority (393 votes) being elected. If after three ballots no candidate receives an absolute majority, a president will be elected by simple majority (those present and voting) on the fourth ballot. In addition to chairing the body's plenary sessions, the president represents the European Parliament in its dealings with other EU institutions.

HISTORY

The European Parliament dates back to September 10, 1952, when the Common Assembly of the European Coal and Steel Community met for the first time. This was a seventy-eight-member body drawn from the national parliaments of the member nations. Initially, the body had no legislative powers. With the Treaty of Rome (1958), the European Economic Community and the European Atomic Energy Community were established, and the Common Assembly was renamed the European Parliamentary Assembly and became the consultative body for all three communities. In 1962, the body took its current name, the European Parliament. In 1970, the parliament was given authority over some parts of the European Community's budget, with power over the entire budget being granted to the body in 1975.

In 1979, the first elections were held for MEPs. The body elected Simone Veil, a French MEP, as the first female president of the European Parliament; she served until 1982.

It was not until 1992 that the seat of the parliament was firmly established. While the parliament had been headquartered in Strasbourg, in 1985 a second chamber was built in Brussels, and some of the parliament's work was moved there, notwithstanding protests from member states. Under the agreement reached by the European Council, the European Parliament meets twelve times a year in Strasbourg, its official home, with all other parliamentary activity taking place

in Brussels. This arrangement was reaffirmed in 1997 by the Treaty of Amsterdam.

The European Parliament has been more assertive in recent years. In 1999 the parliament forced Jacques Santer, the president of the European Commission, and his entire cabinet of European commissioners to resign over allegations of mismanagement and corruption. In 2004, the parliament rejected the nomination of Rocco Buttiglione, the Italian Christian Democrat, as commissioner of justice, freedom and security because of his opposition to homosexuality. This was the first time that the parliament had ever rejected a proposed commissioner.

POWERS

In addition to the legislative powers already cited, the body also approves the president of the European Commission (who is proposed by the European Council) and the other members of the commission. It can also censure the commission by a two-thirds vote, which will force the commission from office.

The Maastricht Treaty of 1992 gave the parliament additional powers. It can establish committees of inquiry and can challenge other EU institutions if they violate EU law or treaties. The parliament receives an annual report from the European Central Bank and elects the European ombudsman, who deals with public complaints against all EU institutions.

ORGANIZATIONAL STRUCTURE

The European Parliament is organized as follows:

The Conference of Presidents consists of the president of the European Parliament and the political group chairs. Two representatives who are not attached to political groups have seats in the conference but do not have voting rights. This body is responsible for the organization of the parliament's business, which includes establishing the charges of the parliament's committees and their membership. It is also the body responsible for relations with other EU institutions, the national parliaments, and non-EU countries.

The Conference of Delegation Chairmen oversees the operation of interparliamentary delegations and delegations to joint parliamentary committees. It elects a chair from its membership.

The Conference of Committee Chairmen facilitates cooperation between the standing committees. It consists of the chairs of all the standing and temporary committees and elects its chair from among its members.

The Bureau is the body responsible for drafting the parliament's preliminary budget and decides all administrative matters. It consists of the president of the European Parliament, the fourteen vice presidents, and the six quaestors (who are nonvoting members) selected by the parliament for a two-and-one-half-year term. The Bureau appoints the secretary-general, the parliament's chief administrative officer.

Standing committees prepare work for the parliament's plenary sessions. They draw up reports on legislative proposals that have been referred to the parliament as well as their own initiatives. As of June 2009, there are twenty standing committees covering such areas as foreign affairs, international trade,

budgets, environment, consumer protection, regional development, legal affairs, civil liberties, women's rights, and gender equality. The parliament has also established a temporary committee on climate change. Each committee elects a chair and four vice chairs and has a staff.

The College of Quaestors is a six-member body that is responsible for administrative and financial matters concerning the MEPs and their working conditions. They also serve as nonvoting members of the Bureau.

THE TREATY OF LISBON

The Treaty of Lisbon, signed in 2007, had a significant impact on the European Parliament. The codecision procedure, in which the parliament must approve some European Council decisions before they become EU law, was expanded to include all council proposals. The number of MEPs was reduced permanently to 750 in addition to the president of the parliament. As the treaty was not ratified in time for the June 2009 European Parliament elections, 736 MEPs, with another 18 observers, were elected; these observers will become MEPs when the Lisbon Treaty is ratified by all member states. The 754 MEPs will serve until 2014.

HOW REPRESENTATIVE IS THE EUROPEAN PARLIAMENT?

Some observers suggest that the European Parliament, notwithstanding the shift to popular elections, is not an effective legislative body. Among the weaknesses of the present structure, they contend, are that national parties run campaigns for European elections based on national agendas rather than EU issues and that the political groupings in the parliament lack a common political consciousness. They argue that elections contested by pan-European political parties campaigning on EU issues would increase voter turnout and make the European Parliament a more legitimate body. They also suggest that the European Commission and the Council of the European Union should be responsible to the European Parliament, which would then be able to operate more like a national parliament and have the power to bring a motion of no confidence against the European executive.

European Political Thought

European political thought is the study of the contents, values, beliefs, and institutions of political thought, one of the most peculiar productions generated by European culture, in Europe. Accordingly, this article will provide the reader with a historical look at this phenomenon.

ANCIENT FOUNDATIONS OF EUROPEAN POLITICAL THOUGHT

From ancient Greek times (starting in approximately the fifth century BCE) to the present, European political thought has evolved around the problems of the divine, nature, man, society, and history. During this long period, European political thought has shifted from a static nature based on absolutes and eternally valid ideas to a dynamic outlook based on relativity and the notion of ideas constantly evolving and changing. In their appeal to nature, the Greeks sought both incorporeal and changeless forms (Platonism) and effects and purposes in the realm of sensible objects and of change (Aristotelianism). To the end, they created the ethos of reason. The Greek invention of the city-state and politics, which took the forms of monarchical, aristocratic, and democratic forms of government, drastically affected many European thinkers. In addition to this, Stoic philosophy, which embraced the priority of reason from the post-Socratic Greek thinkers and emphasized the virtuous life, shaped political thought in the Roman Empire until its end in 476 AD.

THE EVOLUTION OF EUROPEAN POLITICAL THOUGHT IN THE MIDDLE AGES AND AFTER

Medieval thought in Europe moderated Stoic thought and emphasized the role of the state in general and man's soul in particular. During the Middle Ages, which covered roughly the period between the fifth century and the fifteenth century, there were two orders of power: the priesthood, culminating in the pope, and the lay government, culminating in the king and emperor. The first one—the spiritual power—and the second one—the temporal power—were unequal in dignity, the spiritual power being the superior. Especially after the thirteenth century the human community in Christian parts of the world was thought by the popes coextensive with the Church, with the pope being the head of this unity, the secular rulers serving as his agents in temporal matters, and the clergy serving as his agents in spiritual matters.

The spiritual authority over temporal matters maintained until the Renaissance and Reformation of the fifteenth and sixteenth centuries, during which a realist Machiavellian turn in political thought took place. Accordingly, the concern was no more about man's soul but about both his acquisition and his retention of power. Thus real politics was born.

The Enlightenment and the scientific revolution of the seventeenth and eighteenth centuries strengthened the belief in science, reason, and human progress. The individualism of social contract theorists, elaborated in John Locke's notions of life, liberty, and property principles and Immanuel Kant's

concept of individual autonomy, also became prevalent. Both classical liberalism's emphasis on individual liberty and modern republicanism's emphasis on equality and civic friendship found its embodiment in the French Revolution (1789–1799) and its stress on liberty, equality, fraternity, and human rights.

Out of resistance to the ideas of universal enlightenment and individualism came the romantic counterenlightenment. Thinkers of this movement, such as Jean Jacques Rousseau and Johann G. Herder stressed the value of community over the individual, emphasized the local rather than the general, and promoted the notions of a multitude of traditional ways of life as opposed to the Enlightenment's embrace of the moral demand of universal reason. In England, however, utilitarianism, claiming that morally right actions are those that maximize utility, became the mainstream ideology.

EXPANSION OF POLITICAL IDEAS THROUGH THE INDUSTRIAL REVOLUTION

The Industrial Revolution of the nineteenth century drastically changed the empirical grounds of European political thought and introduced the notion of the division of labor, the working class, the industrial bourgeoisie, and mass migrations of people to towns. Urbanization, the increase in literacy through compulsory education, and the impact of improved literacy on mass media contributed to the distillation of modern European thought.

Nineteenth-century Europe also witnessed some communitarian thinkers. Karl Marx and Friederich Engels's historical materialism and communist ideology, which advocated a class- and property-free society, and Mikhail Bakunin and Pierre-Joseph Proudhon's anarchism, which called for the destruction of all institutions, including the state, aimed at an egalitarian postindustrial society and broadened the spectrum of European political thought to the left.

EUROPEAN POLITICAL THOUGHT SINCE THE TWENTIETH CENTURY

European political thought in the twentieth century took different forms in different countries. In Germany, Max Weber stressed the bureaucratization and rationalization of daily life in modern societies. Furthermore, the Frankfurt school chastised the narrative of the Enlightenment and criticized the dominance of instrumental reason that created technology-dominant life spheres in late modern societies. In the same line of thinking the German thinker Jurgen Habermas elaborated democratic theory and communication in constitutional democracies. Many thinkers and politicians incorporated and accepted these ideas for constructing the future of the European Union.

In France, however, European political thought, thanks to the enormous theoretical contribution of Jean-Paul Sartre, was first shaped by an existentialist emphasis on the subjectivity of the individual based on freedom. Later, this construction of the individual was challenged by an idea of dissolution of man by structuralism, which was elaborated in the works of such thinkers as Claude Levi-Strauss, Louis Althusser, and Jacques Lacan.

The French poststructuralist Michel Foucault challenged the conventional idea of power (juridical power) accumulated in the state with a more ubiquitous and omnipresent understanding of power (disciplinary power) continuously created and recreated within such social and institutional structures as family, school, prison, and the military.

In Italy, Antonio Gramsci theorized a new Marxist concept emphasizing the role of the party working with intellectuals to create a counterhegemony among the masses against the bourgeoisie in civil society and finally initiate a revolutionary assault on the state.

In England, apart from other ideologies, especially liberalism, conservatism—historically powerful, historically against precipitous change, and skeptical about the possibilities of political knowledge, preferring instead the purported political wisdom—also gained strength in the twentieth century.

Today, in the early twenty-first century, the postmodern emphasis on identity and difference deeply affects many thinkers and schools of thought in Europe. As the result of this phenomenon, contemporary European political thought is demanding more elaborate understandings of the individual, of civil society, and of the state.

European Politics and Society

While European studies are interdisciplinary area studies, European politics and society is the political science subfield of European studies. It is a broad field with blurred boundaries, which encompasses research on the determinants and the

consequences of institutions, politics, and policies in European countries. It seems fair to say that the bulk of research in European politics and society focuses on west European democracies, while the study of central and eastern Europe has only more recently received rapidly increasing attention, with the democratization of this region and the Eastern enlargement of the European Union. This article aims at providing an overview of the major strands of research in the following areas of European politics and society: state- and nation-building, comparative European government, parties and party systems, and European political economy and welfare states.

THE EMERGENCE OF DEMOCRATIC NATION-STATES IN EUROPE

States, nation-states, and—eventually—modern democracies have their roots in western Europe, and much of the literature on the development of states and nations in all parts of the world draws on comparison with the European experience.

According to political scientist Charles Tilly, state formation was strongly driven by the military concerns of political entrepreneurs eager to secure their territories and by the availability of economic and political resources in particular geographical and economic contexts. Given this variation of contexts, of institutional precedents, and of the sequences of state formation, European states developed in a variety of forms. Hence, the gist of the standard works on state formation, notably the contributions of sociologists Michael Mann and Thomas Ertman, is that modern states—based on territorial centralization, infrastructural power, and modern bureaucracies—were not a product of intentional design but a highly contingent and variable outcome of particular historical contexts and sequences. This raises important implications for research on subsequent state formation processes in all parts of the world because one cannot necessarily assume the transferability of insights from the European experience.

Most Western states transformed into nation-states in the nineteenth century, adding an ideological fundament to the institutions of the state. In the famous terms of Benedict Anderson (2006), a scholar of nationalism, nations can be defined as "imagined communities," and nationalism entails the idea that nations are entitled to political autonomy. By means of historical research and comparison, the literature in this field debates the questions of whether nations have perennial roots or are genuinely modern and whether the idea of the nation emanates from the people itself or from elite discourse. There is no agreement between perennialist and modernist interpretations of nations, but it is clear that the institution of the nation-state is a genuinely modern, European invention. Institutionalist works on central and eastern Europe by sociologist Rogers Brubaker have demonstrated how institutions of citizenship contributed to the saliency and persistence of nations as relevant political categories.

Aside from state formation and nation building, democratization is the third important strand of historical studies on the political development of European states. The main goal of work on this topic is to identify the factors accounting for democratic stability as opposed to democratic breakdown, given that Europe's dark twentieth century was deeply marked by the eruption of dictatorship and authoritarianism. As with state- and nation-building, democratic stability appears to be the result of a complex historical configuration of factors. Barrington Moore proposed a model of different paths to democracy and dictatorship, with the democratic path depending on a balance of power between crown, nobility, and bourgeoisie in the seventeenth and eighteenth centuries and an early development of commercialized agriculture and markets. More recently, the works of political scientists Dietrich Rueschemeyer, Evelyne Huber, and John Stephens have shown that a strong but not radicalized working-class movement in the late nineteenth and early twentieth centuries was also an important driver of stable democratization.

COMPARATIVE EUROPEAN GOVERNMENT

Building on the largely historical political science literature on state formation and institutional development, a different strand of European politics research analyzes the determinants and the effects of varying government institutions. The field of comparative government is, of course, not focused on Europe exclusively, but the plurality and variation of democratic institutions on this continent (which otherwise shares many context conditions) makes it an obvious empirical candidate for comparative research.

European democracies vary to a great extent in their core institutions, such as the electoral system, parliamentary regimes, federalist versus unitary governance, direct versus representative democracy, and the possibility of constitutional review. Political scientist Arend Lijphart argued that the variation in these characteristics can be analyzed in a limited number of patterns, proportional representation tending to go together with, for example, coalition governments, federalism, and corporatism. On this basis, national democratic regimes have been categorized according to the extent to which they concentrate or disperse decision-making power. The concentration of power is particularly strong in the United Kingdom (and its former colonies outside Europe) and to some extent in France, whereas most of the other European countries, such as the Netherlands, Germany, Austria, Switzerland, Italy, and the Nordic countries distribute power across institutions and share it between different actors (government and opposition parties, trade unions and business association, courts, central banks, and substate governments). When discussing the sources of this institutional variation, the literature appeals mostly to a sociological explanation: most European societies are characterized by a plurality of social cleavages, that is, cultural, linguistic, ethnic, or political divides, that required some form of power sharing to allow for stable democratic government.

A very large literature deals with the effects of power sharing versus power concentration on policy outputs and policy change. The veto points and veto players literature represents an attempt to conceptualize these institutional effects in a most parsimonious way: the more actors' agreement is needed for a

reform to pass, that is, the higher the number of veto players, the higher is the expected policy stability in a country. This approach was most forcefully developed by the rational choice political scientist George Tsebelis. Thereby, the veto player approach adopts a one-dimensional concept of policy change simply in terms of change versus stability. Other scholars have attempted to substantiate predictions about the effect of institutional variations. One example is Bingham Powell's work on the responsiveness of proportional versus majoritarian regimes. Powell shows that proportional elections tend to produce policies that are closer to the preferences of the median voter. A second example is the link between power-sharing institutions and generous welfare states. Proportional democracies tend to spend and redistribute more than majoritarian ones. While this empirical correlation has been known for a long time, the jury is still out on competing explanations, at least two of them institutional. Michael Laver and W. Ben Hunt argue that coalition governments in proportional democracies tend to increase spending through log-rolling processes, whereas Torben Iversen and David Soskice argue that proportional representation electoral systems increase the chances of center-left governing coalitions, this leading to more generous social spending.

POLITICAL PARTIES AND PARTY SYSTEM CHANGE IN EUROPE

Political parties are the key actors in representative democracies, and the study of the development and transformation of European party systems is an important aspect of European politics and society research. Political parties developed in all western European countries with and because of the extension of the franchise. Works by political scientists Richard Katz, Peter Mair, and Daniele Caramani show how early "cadre parties," representing the interests of particular, privileged social elites, were followed by "mass parties," which mobilized broad ranges of voters in increasingly homogeneous national party systems.

The western European party systems that have emerged with full democratization are similar with regard to left parties but differ when it comes to the right. While left labor parties emerged in all countries, Christian Democratic parties appeared only in certain countries of continental Europe (such as Austria, Germany, Switzerland, Italy, and the Netherlands). Liberal parties remained marginal in most countries and became important in only a few of them, such as Switzerland or the United Kingdom. And agrarian parties developed mainly in the Nordic countries of Scandinavia. Moreover, the size and relative importance of the different parties varies strongly in cross-national comparison. The most prominent explanation of this variation was developed by political scientists Seymour Martin Lipset, Stein Rokkan, and Stefano Bartolini and Peter Mair, referring to the specific patterns and sequences of social cleavage politics in the different countries. Cultural and territorial cleavages were not equally salient in all countries, thereby fostering variation on the right, whereas the class cleavage emerged in all countries and gave rise to the mobilization of the left. Hence, the salience and temporal sequence of cleavage politics explains the variation in national party systems.

After the introduction of universal suffrage in the first half of the twentieth century, party systems froze, meaning that the number, type, and relative strength of the political parties of national party systems stabilized. This freezing process can be explained by the fact that with universal suffrage, the electorate became fully mobilized voters developing strong and stable party identification. By the 1970s and 1980s, however, the transition to a postindustrial society fundamentally changed the sociostructural underpinnings of party politics, leading first to new social movements and then to a sustained unfreezing of European party systems. Political scientists such as Herbert Kitschelt, Hanspeter Kriesi, and Simon Bornschier showed that the emergence of Green parties on the left, the transformation of Social Democratic parties from working-class to middle-class parties, and the appearance of new right-wing populist challengers in many European countries are the main results of this ongoing transformation.

With the democratization of central and eastern Europe, the transferability of the analytical insights gained from research on the old party systems to the new democracies has become a major question. However, research by Herbert Kitschelt and other political scientists shows that party systems in these countries are not fully stabilized and nationalized yet, and the political parties seem to align along dimensions of political competition that differ from the ones found in western Europe.

EUROPEAN POLITICAL ECONOMY AND WELFARE STATES

The study of European production regimes, industrial relations, welfare states, and economic policies is an important and thriving subfield of European politics and society. After the Second World War (1939–1945), all western European states introduced market regulation and social protection to steer economic development and to shield their populations from the major risks of income loss such as illness, unemployment, accident, old age, or disability. Thereby, European economies developed a model of regulated capitalism, which turned out to be highly successful in the postwar period with regard to economic prosperity, low social inequality, and generalized social welfare.

With regard to economic governance in the postwar period, European economies differed in the extent to which governments intervened directly in the economy as opposed to coordinating economic regulation with the representatives of business and labor by means of corporatist institutions. Countries like France relied on a strongly centralized, unilateral, and state-led model of economic regulation, characterized by bureaucratic planning of industrial policy, state ownership of major industries, and little societal strife. By contrast, countries with weaker bureaucratic capacity and more strongly organized societies, such as Germany and Sweden, and the small open economies of Europe developed institutions of tripartite economic steering, which include the representatives of the state, labor, and capital on an equal basis. An important work

on corporatism, regulatory states, and varieties of capitalism by political scientists including Philippe C. Schmitter, Gerhard Lehmbruch, Peter Katzenstein, J. Rogers Hollingsworth, Robert Boyer, Peter A. Hall, and David Soskice analyzed and explained these different institutional systems of economic governance. However, despite the national differences in economic regulation, a major commonality of European economies in the golden age from 1945 to the mid-1970s was strong economic growth and productivity.

In the postwar era, all western European countries developed encompassing welfare states, which, however, differed substantially in their generosity and effects. It was the path-breaking research by sociologist Gösta Esping-Andersen (1990) that showed that welfare states can be divided broadly into three "worlds of welfare capitalism." In Scandinavian welfare states, benefits are relatively high, universal, and tax financed. In addition, these countries provide a wide range of welfare services, which contrasts with the welfare states of continental Europe that are based on more stratified, income- and employment-related financial transfers. The United Kingdom differs from both models since it belongs to a more liberal Anglo-Saxon group of welfare states with lower, means-tested benefits. This characterization of the "three worlds of welfare capitalism" is largely accepted, but the literature holds diverging explanations of why welfare states, and their differences, came about. One strand of literature, represented mainly by Gösta Esping-Andersen and Kees van Kersbergen, argues that welfare states are the product of power configurations: they are generous and egalitarian in the Nordic countries, where Social Democracy was strongest, whereas Christian Democracy left its imprints on the continental welfare states and the dominance of the market-liberal right accounts for the minimal welfare state in the United Kingdom. The main alternative explanation by Peter A. Hall and David Soskice builds not on power and conflict but on institutional and functional complementarity with the economic production regime: generous social security schemes emerged in coordinated, corporatist market economies because they underlay and sustained the modes of production and the labor markets in these countries.

Since the end of the golden age and with the emergence of a postindustrial society in western Europe, market coordination, corporatism, and welfare states have come to face growing challenges. During the 1980s and 1990s, direct state intervention was reduced in all European economies, and many formerly public markets, such as the network industries, were liberalized and partly privatized, not least as a result of European Union regulations. So the main question in the literature on European economic and social policies became whether the European model of regulated capitalism and generous welfare states was sustainable in times of austerity and globalization or whether all European economies would converge on a more market-liberal model. So far, however, the results of major research projects on this question led by political scientists such as Herbert Kitschelt, Peter Lange, John Stephens, Fritz W. Scharpf, and Vivien A. Schmidt show that the cross-national differences have largely persisted, which either

may be the result of institutional inertia and path dependence or may reflect that even under changing structural conditions, different models of (welfare) capitalism continue to be viable and efficient. With the global crisis of financial markets and economies that started in 2008, some observers even ask whether the European social model may see an unexpected revival in and outside Europe.

European Union (EU)

In a world dominated by Westphalian states, the European Union (EU) is unique. Never before have independent countries collectively ceded so much authority to a supranational polity. The European experiment begun nearly sixty years ago has resulted in unprecedented economic and political integration. Precisely for this reason, the EU has captivated scholars' attention from its inception. Although interest has fluctuated in conjunction with real-world developments, political scientists remain fixated on this sui generis organization.

Yet empirical uniqueness need not preclude theoretical generalization. In this article, we examine the political science of the EU along two dimensions. First, to what extent do scholars conceptualize the EU as sui generis versus a test case for broader theoretical development? Second, to what extent do scholars endeavor either to export EU-derived theories outward toward other fields, geographic regions, and political phenomena or to import outside explanatory theories and tools into the political science of the EU?

We proceed as follows. First, we briefly review the various stages of European integration and describe the EU as it exists today. Next, we evaluate past waves of EU scholarship, paying particular attention to the degree to which scholars emphasized specific or general explanations of the EU experience. We conclude with an assessment of the current state of the field. Recent work is ample, diverse, and represented in multiple venues that spotlight all types of EU-related political science. We propose that the most promising programs for future research are those that engage the EU both in its empirical specificity and in its opportunities for theoretical generality.

THE SUI GENERIS EU

Following the devastation of World War II (1939–1945), western European elites committed themselves to peace through economic cooperation. In 1951, six countries—Belgium, France, Germany, Italy, Luxembourg, and the Netherlands—formed the European Coal and Steel Community (ECSC) through the Treaty of Paris, carrying out designs for a united Europe envisioned by Jean Monnet and proposed by French foreign minister Robert Schuman. The 1957 Treaty of Rome extended this cooperation to a broader functional sphere by calling for the establishment of a common market (the European Economic Community) within which goods, services, labor, and capital could circulate freely. The European Community, which emerged in the 1960s, covered a wide range of economic and related policies through an institutional framework comprising most importantly an executive and supranational European Commission, a legislative and intergovernmental Council of Ministers, a consultative supranational European Parliament (EP), and a supranational European Court of Justice.

Spurred by the European Community's early success, Denmark, Ireland, and the United Kingdom joined in 1973, followed by Greece in 1981 and Spain and Portugal in 1986. A new treaty, the Single European Act, entered into force in 1987. It called for completion of the single European market and undertook significant institutional reforms, including a return to majority voting in the Council of Ministers and an enhancement of the powers of the EP, the members of which had been directly and democratically elected since 1979. The 1993 Treaty on European Union (the Maastricht Treaty) expanded the sociopolitical ambitions of the new EU and outlined a future economic and monetary union, resulting in the 1999 adoption and 2002 circulation of a new single currency, the euro. Additional reforms further empowered the EP, renamed the Council of Ministers with the title Council of the European Union, institutionalized the European Council (gathering heads of state and government of EU member states), and laid the groundwork for expanded membership to include Austria, Finland, and Sweden in 1995, ten Mediterranean and central/eastern European countries in 2004 (the Czech Republic, Hungary, Poland, Slovakia, Estonia, Latvia, Lithuania, Slovenia, Cyprus, and Malta) and Bulgaria and Romania in 2007. The present EU encompasses nearly five hundred million citizens within twenty-seven member states and manages an economy of nearly $15 trillion (GDP; 2008 estimate). Its functional scope now ranges across most of the policy terrain once monopolized by the Westphalian state.

The EU is unquestionably the most successful regional integration effort in the world. Nowhere else has a group of national governments repeatedly concentrated such extensive decision-making power in the hands of a largely supranational entity. Throughout its history, European integration has provided ample fodder for political scientists, who have approached its study in a variety of ways.

Under the European Union, independent member states have integrated political and economic systems to create a supranational organization.

by James Caporaso and John Keeler (1995) and John Keeler (2005). Our main departure is to focus on the disciplinary contours of this evolution and to emphasize the interplay between the specific and the general in the political science of the EU.

FIRST WAVE: GENERALIZABLE INTENTIONS, LATE 1950S THROUGH EARLY 1970S

Conventional accounts date the first wave of political science research on the present-day EU from the late 1950s to the early 1970s. Three broad-scale grand theories of European integration emerged, all of which aspired to generalization either from the outside in (assimilating Europe to patterns identified from geographically and historically different cases) or from the inside out (deriving general lessons from the postwar European experience).

The first major approach began with a collective, interdisciplinary project led by political scientist Karl Deutsch of Princeton University. Focused on the question of international community formation, Deutsch and colleagues in *Political Community and the North Atlantic Area* (1957) examined ten historical cases to generate propositions about the prospects for a North Atlantic community, including western Europe. Deutsch's "transactionalism" argued that integration was a function of social interconnectedness, as produced by such things as flows of goods, mail, and people and as measured by these and by survey data tapping mutual sympathies among individuals. The greater the extent to which members of the units were assimilated into a common social space, the greater were the prospects for community formation and political integration. While political scientists undertook considerable and quite sophisticated research along these lines during the next decade and a half, transactionalist research petered out by the early 1970s, with an overall decline in political scientific interest in integration and the EU.

The second and most prominent first-wave integration theory—one that has never disappeared from political science research on the EU—emerged with the publication of Ernst Haas's *The Uniting of Europe* (1958). Analyzing the ECSC in the 1950s, Haas derived four general conditions for political integration: (1) well-developed central institutions that could argue for and respond to integrative demands, (2) elite activation around those central institutions, (3) embrace of "inherently expansive tasks" so as to promote "spillover" from initial to later steps, and (4) "continuity of national policy aims" (Lindberg 1963, 7–12). Haas's "neofunctional" approach to regional integration married the practice of Europe's "founding fathers," Jean Monnet and Robert Schumann, with the methods of modern political science.

Neofunctionalism became a vibrant political science research program in the 1960s. First, it gave rise to a spate of research on regional integration beyond Europe. While ambitious in their intent to generalize from the European experience, these efforts proved unsuccessful, especially insofar as less-developed countries were concerned. Second, and at the same time, neofunctionalism grappled with challenges presented by developments within Europe itself. French president Charles de Gaulle's 1965–1966 refusal to countenance further integrative steps laid out in the Treaty of Rome posed a special challenge to the theory, which had been predicated on continuous progression toward deeper integration. The resulting proliferation of concepts, variables, and measures suggested that neofunctionalism was an increasingly degenerating research program.

The last approach in this wave (and the major alternative to neofunctionalism), intergovernmentalism, insisted on the primacy of nation-states and national experiences in delimiting European integration. Most forcefully articulated by Stanley Hoffmann (1966), it argued that integration would proceed only as far as national governments conspired to work together, as national interests would always retain precedence and thereby hinder the emergence of a truly supranational organization. This would be especially true in areas of "high politics," including political and security issues, where the absolute sovereignty of nation-states would remain intact. Intergovernmentalism drew its inspiration from realist theories of international relations (IR), imbuing national governments with concrete security preferences that, in conjunction with uncertainty over other states' future intentions, would constrain their willingness to put European interests above national ones. Supranational and transnational efforts to transcend these hard constraints would only antagonize states and further retrench state sovereignty in core areas.

All three first-wave approaches aspired to general theoretical accounts of European integration. Deutsch and colleagues worked from the outside in, assimilating the postwar North Atlantic experience to patterns of community formation identified from other times and places. By contrast, Haas approached generalization from the inside out, analyzing the ECSC to "advance generalizations about the processes by which political communities are formed among sovereign states" (Haas 1958, xi). Hoffmann held the middle ground. While he sought to draw inferences from the European experience to "contemporary world politics" and "unification movements elsewhere" (Hoffmann 1966, 867), his major contribution was arguably to bring general IR theory (in his case, realism) into the study of the EU. In all three cases, theoretical elaborations and limitations, while aspiring to generality, mirrored facts on the ground, with the relatively optimistic neofunctional and transactionalist approaches holding sway when the EU was working well as a supranational organization and intergovernmentalism ascending when it was not.

SECOND WAVE: SUI GENERIS APPROACHES, EARLY 1970S THROUGH LATE 1980S

The second wave of political science research into the EU began with events in the real world, including the end of supranational integration post–de Gaulle and the end of the postwar economic miracle in the major European economies. Caporaso and Keeler (1995) refer to this as the "doldrums" period for the EU and political science research into it. Haas (1975) announced the obsolescence of his own neofunctionalism. And Donald

Puchala (1972) claimed that regional integration theorists had been like blind men inspecting an elephant, each finding a different part and none agreeing on the others' characterizations. The zeitgeist involved a substantial abandonment of grand theory and a retreat into narrower, less ambitious work that eschewed generalization beyond the European case. Work of this time was predominantly descriptive rather than explanatory or theoretical. John Keeler (2005) brings several indicators to bear along these lines, the most relevant of which is the retrenchment of work on the EU into specialized journals such as the *Journal of Common Market Studies* and the *Journal of European Integration*. In one view, "integration theory [was] run into the ground, probably because . . . this new and complex phenomenon could not be studied by our conventional tools of analysis" (Loukas Tsoukalis, quoted in Rosamond 2006, 12).

THIRD WAVE: GENERALIZABILITY RETURNS, LATE 1980S THROUGH 1990S

The European integration process was relaunched in the mid-1980s, most notably with the 1985 adoption of a single-market program calling for the abolition of all internal barriers to economic exchange by the end of 1992. This "1992 program," embodied in the 1987 Single European Act, not only reinvigorated the EU but also catalyzed a rediscovery of integration theory among political scientists. Two main contenders, both rooted in general IR political science scholarship, emerged relatively quickly. The first, signaled by Wayne Sandholtz and John Zysman's (1989) analysis of the single-market program, characterized the revival of the European Community as a series of elite bargains (involving especially the European Commission, industrial elites, and national politicians) responding to changes in the international economic structure (relative U.S. decline and the rise of Japanese economic power). Subsequent work emphasized similar features in explaining smaller-scale parts of EU integration and continued to insist on a foundation in IR, rather than integration, theory.

The reemergence of accounts that were at least consistent with, if not explicitly derived from, neofunctionalism generated a new intergovernmentalist response that emphasized the primacy of state interests in driving and delimiting the European integration process. Andrew Moravcsik (1991) downplayed the entrepreneurial success of the European Commission, denied any inherent institutional logic toward deeper integration, and minimized the role of transnational elites. Viewing European integration as "conventional statecraft," he emphasized that states' preferences and power defined both the demand for and the supply of supranational integration. This IR-inspired liberal intergovernmental approach eventually provided a powerful synthesis combining a theory of institutional choice with rigorous accounts of state preference formation and interstate bargaining.

In contrast to liberal intergovernmentalism, the rediscovery of supranational institutions and transnational societal (business) actors found expression in a further body of third-wave literature dealing not with the broad architecture of European integration (i.e., it was not a grand theory) but with the activities of the European Court of Justice and the ongoing process of legal integration. A related vein of research on the constitutionalization of the EU's founding treaties—whereby it was transformed from traditional international law into a hierarchically integrated legal system granting rights directly to citizens—merged neofunctionalist insights about elites with Karl Deutsch's concern for international transactions to provide a powerful political theory of EU legal integration. This discovery of the law by political scientists working on the EU remains a key feature of the literature.

Two last third-wave developments bear mentioning here. First, there were at least two additional attempts at developing grand political science theories of European integration to rival the revived neofunctionalist and intergovernmentalist work. Gary Marks (1993) proposed a theory of "multilevel governance" that sought to account for the general upward and downward diffusion of political authority in the EU and beyond. Alec Stone Sweet's (1998) work on legal integration guided new scholarship on EU development along transactionalist-neofunctionalist lines. Second, the 1990s amplified and extended the third wave's emphasis on the importation of theories, models, and methods from across political science. Simon Hix's (1994) call for more comparative politics work on the EU inspired countless studies. The 1990s also saw increasing attention to the American politics literature, with the adoption of ideas including spatial models, principal-agent models of delegation, and numerous others.

FOURTH WAVE: THE NORMAL POLITICAL SCIENCE OF THE EU, PRESENT DAY

The current phase of political science research into the EU represents a continuation of trends begun in the third wave. The grand theories of European integration have not gone away. References to neofunctionalism (also known as supranationalism) and intergovernmentalism remain de rigueur in the literature. Yet the bulk of research is occupied with lower-order problems tackled through middle-range theories, most often drawing on (or at least consonant with) broader political science literatures. Debates seem increasingly pragmatic rather than paradigmatic.

Thus, the normalization of the EU in political science is perhaps the most striking feature of the present-day literature. Recent work from both sides of the Atlantic draws on and informs non-EU work across the subfields and methodological traditions of the discipline. Four journals mainly devoted to the EU—*Journal of Common Market Studies, Journal of European Integration, Journal of European Public Policy,* and *European Union Politics*—speak equally to EU specialists and to political science generalists working in a wide range of subfields. The amount of EU-related work appearing in general journals is also on the rise. The degree of transatlantic and interdisciplinary cross-fertilization stands at unparalleled levels. Thus, we reject any long-standing questions about subfield (especially comparative and IR) incompatibilities, about an alleged transatlantic scholarly cleavage, and about the appropriateness of applying general political science to the sui generis EU.

CONCLUSION

The analysis above documents the main approaches to the study of the EU along two complementary dimensions: the scope of their theoretical aims (general or particular) and the direction of theoretical application (inside-out or outside-in). While not necessarily exclusive to any one period, the categories produced by this division allow us to capture the many ways in which EU scholarship has evolved and progressed over the years. The first period attempted to develop generalizable theories of integration, both from the inside out and from the outside in. Scholarship eventually moved to a second, more sui generis period concerned with EU-specific affairs when real-world integration decelerated. The third period witnessed the resurgence of prior integration theories, the development of entirely new exportable theoretical explanations, and the application of imported explanatory frameworks to EU data. Over the long haul, and in the present fourth wave, all of these trends have come to coexist. While the EU is still undeniably unique, political scientists now view it as a means for acquiring both general and specific knowledge.

Having summarized the main trends in EU-related political science, we here conclude with some final thoughts on its future. We expect the EU, as the most advanced regional integration project worldwide, to remain an important fixture of political science research for three reasons. First, the EU continues to evolve, providing a living laboratory within which to study rigorously a great many political phenomena. Second, this evolution inspires political scientists insofar as it reveals both an EU specificity and suspected similarities to political-economic, institutional, and behavioral processes operative elsewhere. Third, new regional integration efforts under way around the world may look to emulate the EU's model of supranational governance and economic union, giving rise to an already-bourgeoning field of comparative regionalism. Precisely because it is so distinctive and seductive, the EU provides scholars with endless options for engaging in both inside-out and outside-in theoretical work, either of which satisfies the aspirations of general political science.

Euthanasia

Euthanasia ("good death," from the Greek *eu,* meaning "good" and *thanatos,* meaning "death") refers to any medical act with an intended consequence of inducing the death of the patient (usually a terminally ill patient) in a painless manner. Euthanasia is a hotly debated topic in the field of medical ethics. Some doctors argue that the primary duty of medical doctors is to preserve human life under all circumstances. Indeed, the traditional Hippocratic oath (dating in its original form from the fourth century BCE) claims that medical doctors should never "prescribe a deadly drug." Especially in the twentieth century, however, various authors and legal and moral authorities have claimed that medical doctors have a moral and legal right to prevent their patients' suffering by helping them to die in a dignified and painless manner.

DEFINITION AND CONFLICT

In practice, *euthanasia* refers to a whole range of medical acts that are often not clearly distinguished from one another,

ranging from not prolonging a life-sustaining (but also not curative) treatment to providing prolonged and possibly lethal sedation to dying patients to administering an active life-terminating treatment. It should be noted that *euthanasia* typically refers to the life-ending act among chronically or terminally ill patients. Although during the Nazi era in Germany (1933–1945), the indiscriminate killing of mentally ill patients was labeled "euthanasia," this in no way falls under the current definition of the practice.

In various countries, laws and policy measures on euthanasia are a salient political issue. While liberal and progressive parties and groups normally are in favor of allowing euthanasia, the reverse is the case for conservative political parties. The topic of euthanasia is salient because it raises fundamental bioethical questions among the population, in the same manner as abortion or gay marriage tend to do. Often, the laws on euthanasia rise high on the political agenda because of the media focus on specific cases in which terminally ill and suffering patients were denied a physician-assisted death. In various countries, finding a compromise on the legal status of euthanasia has proved to be quite difficult.

EUTHANASIA IN EUROPE

The Netherlands was the first Western country to legalize euthanasia in a law of April 2001, which took effect on April 1, 2002. The 2001 law proclaims that every patient has an inalienable right to determine the manner and conditions in which he or she wants to end life. The law installs a specific procedure to allow patients to request euthanasia if they are in a state of "incurable and unbearable suffering." Healthy persons, too, can file formal statements indicating that they opt for euthanasia if, at some point in the future, they end up in such a position and are no longer able to express themselves. Medical doctors in the Netherlands who perform euthanasia will not be prosecuted if they follow a specific procedure. The doctor must be certain there is no standard medical solution for the suffering and that the patient has made the decision in a voluntary manner; the doctor must also have provided the patient with all necessary and relevant information and consulted another medical doctor before actually performing the act of euthanasia. Since 2002, the law has been implemented without any major incidents. There is some political discussion, however, about whether the law should be broadened to apply to patients who are not yet sixteen years old or to patients who are suffering mentally but not physically.

Neighboring Belgium followed suit in September 2002. Belgium basically copies the Dutch law, but the country installed an administrative procedure to report all cases of euthanasia to a central authority. In Belgian politics, euthanasia for minors remains a hotly debated question; there have also been some political debates about whether Catholic hospitals (which are the only hospitals available in some regions) should provide this service.

EUTHANASIA IN THE UNITED STATES

In a number of other industrialized countries political debates about euthanasia laws are under way, without having led to a specific change in the law. In France, the debate was revived in early 2008 by the case of a cancer patient with a large and very painful face tumor who requested permission for a physician-assisted death from the highest court in France. Shortly after the request was turned down, the patient committed suicide.

In the United States, too, some highly publicized clinical cases led to intense political debate. In 1976 the New Jersey Supreme Court decided that coma patient Karen Ann Quinlan could be taken off an artificial breathing machine. During the 1990s, the highly publicized trials against Michigan doctor Jack Kevorkian (1928–) led to intense debate, eventually leading to the conviction of Dr. Kevorkian on murder charges. In 2005, controversy erupted over the case of Terri Schiavo, who had lived in a coma for fifteen years. Despite attempts from President George W. Bush to stop a legal decision, Florida courts eventually gave permission to end the life-sustaining treatment of the patient.

In 1990 the U.S. Supreme Court ruled (in *Cruzan v. Director of Missouri Department of Health*) that there is no obligation to maintain life-sustaining treatment for terminally ill patients. There is no legal ground, however, for an active form of euthanasia that would actually shorten the life of the patient. In 1994, the state of Oregon passed a law allowing medical doctors to prescribe, but not administer themselves, lethal drugs to terminally ill patients. The Death with Dignity Act (in effect as of October 27, 1997) mandates that patients administer the lethal drugs themselves. Various attempts by the Bush administration to stop the implementation of the act failed, and in 2006 the act was upheld by the U.S. Supreme Court in *Gonzales v. Oregon*. According to official Oregon figures, in the period from 1997 to 2008 some four hundred patients have used the Death with Dignity Act to die in a painless manner. In November 2008, voters in the state of Washington approved the introduction of a similar act in their state.

It can be expected that the 2006 U.S. Supreme Court decision will lead to debate about euthanasia in other states. Euthanasia will remain a contentious issue, with sharp cleavages among the population, mostly according to liberal/conservative or religious dividing lines.

Evangelicalism

A religious movement born in Great Britain and colonial America, Evangelicalism has been politically significant for over two centuries. It is largely a Protestant spiritual renewal movement, emphasizing religious conversion, doctrinal orthodoxy, personal piety, and public morality.

The best definitions of Evangelicalism (e.g., David Bebbington's 1989 *Evangelicalism in Modern Britain*) focus on four hallmarks: (1) respect for the authority, perspicuity, and truthfulness of the Bible; (2) an emphasis on a personal acceptance of the faith, commonly described as conversion, a faith commitment, or being born again; (3) a belief that religious faith should permeate one's life, be shared with others, and be manifested in love for others; and (4) an affirmation of orthodox teachings about Jesus Christ, including His deity, virgin birth, atoning death on the cross, bodily resurrection, and eventual earthly return.

ORIGINS OF THE MOVEMENT

The movement's roots are found in the First Great Awakening of the eighteenth century. Leaders such as Jonathan Edwards, George Whitefield, and John Wesley sparked this spiritual revival. The political impact was personified by William Wilberforce, who fought a lifelong battle to end the slave trade in Britain.

It was the Second Great Awakening in the nineteenth century that gave rise to a distinctive evangelical presence in American public life. Nathaniel Taylor, Lyman Beecher, Charles Finney, and other evangelists inspired mass conversions, which led to the founding of hundreds of voluntary reform associations. Some associations were principally religious in their mission, distributing Bibles or promoting evangelism, but others concentrated on social and ethical issues: helping orphans, the deaf, and the destitute; promoting peace, literacy, and temperance; and combating dueling, prostitution, lotteries, and slavery.

As the century unfolded, pietistic fervor in the United States led to notions of Christian perfectionism and millennialism. When the number of converts reached a critical mass, they began to speak in terms of "manifest destiny" and "Christian America." The high-water mark was the effort of Northern evangelicals to spark widespread opposition to slavery. The low-water mark was the capitulation of Southern evangelicals to the proslavery cause.

After the U.S. Civil War (1861–1865), industrialization began to change the American landscape. Evangelical groups such as the Salvation Army, the Volunteers of America, the YMCA, and the Christian and Missionary Alliance responded by moving into the poorest areas of urban America to set up relief efforts. This was also the era in which evangelicals founded a number of colleges, formed the Christian Labor Union, and launched the Woman's Christian Temperance Union.

RETREAT AND REVIVAL

By the turn of the nineteenth century, evangelical efforts were overshadowed by more theologically liberal proponents of the social gospel. The Protestant social gospel movement, led by men such as Walter Rauschenbusch, Charles Sheldon, and Washington Gladden, shifted the focus of Christian churches from individual conversion to social reform by supplanting traditional doctrinal teachings with modern notions about human progress and God's immanence. These modernists moved from the periphery to the center of American Christianity, consolidating their power in seminaries and denominations. Among American Christians who were unwilling to jettison orthodoxy were the three groups that would become the heart of modern Evangelicalism in the United States: the fundamentalists, the Pentecostals, and the holiness movement. Each of these groups retreated from public life, establishing a vibrant but largely unnoticed subculture in middle America.

Feeling betrayed by the groups' separatism, contentiousness, and divisiveness, in-house critics soon gave birth to the modern evangelical movement. Men such as Carl F. H. Henry, Edward John Carnell, and Harold Ockenga, "fundamentalists with PhDs," led the charge, alongside the evangelist Billy Graham. Having been excluded from or marginalized by the major denominations, these men created parachurch organizations such as the National Association of Evangelicals (1942), Fuller Seminary (1947), and the Billy Graham Evangelistic Association (1950) as well as the magazine *Christianity Today* (1956).

A turning point came in 1947 with the publication of Henry's *The Uneasy Conscience of Modern Fundamentalism*. Henry argued that fundamentalism had become socially impotent, ethically indifferent, and morally irresponsible. His manifesto precipitated a profound change of heart within evangelical circles. Henry's influence was extended when Graham invited him to edit *Christianity Today*. This magazine helped forge the modern evangelical movement. During Henry's twelve-year tenure, politics, the bane of the fundamentalists, became common fare for evangelicals. The next generation dutifully returned to the public arena.

In the 1970s, the first wave of modern evangelical activism was surprisingly left of center as evidenced by Evangelicals for McGovern, *Sojourners* magazine, Ron Sider's *Rich Christians in an Age of Hunger* (1977), Evangelicals for Social Action, and the Chicago Declaration: a call to action on the issues of peace, race, and poverty. In 1976, the year pollster George Gallup and soon thereafter *Newsweek* magazine proclaimed the "Year of the Evangelical," evangelicals helped elect President Jimmy Carter, "the best known Baptist deacon in America."

This dalliance with the Democratic Party was short-lived. The catalyst for change was the rise of social liberalism. As social liberals gained control of the Democratic Party as well as the nation's media outlets, entertainment industry, and colleges and universities, their values became increasingly ubiquitous. The shunning of traditional values and moral authorities left social conservatives, including evangelicals, reeling. Evangelicals were eager to join forces with anyone who would fight back.

The link between political conservatism and evangelicals solidified during the second wave of evangelical activism when

Republican organizers helped Jerry Falwell, a Baptist television minister with a largely fundamentalist audience, form the Moral Majority in 1979. Similar organizations developed around the same time: Focus on the Family (1977), Christian Voice (1978), Concerned Women for America (1979), Religious Roundtable (1979), and the Traditional Values Coalition (1980). During the Reagan years, these groups mailed millions of voter guides, registered hundreds of thousands of voters, and enlisted thousands of campaign workers. Their actual influence, however, is contested, and the most visible of the lot, the Moral Majority, eventually fell on hard times and was disbanded in 1989.

The third wave of evangelical activism surfaced when another television evangelist, Pat Robertson, mounted a campaign for the 1988 Republican presidential nomination. His campaign brought the Pentecostal/Charismatic wing of Evangelicalism into politics. Defeat did not dampen Robertson's ardor for politics; he soon formed the Christian Coalition (1989), which employed a grassroots strategy, helping evangelicals achieve new levels of success.

The cumulative effect of these three waves is clear: evangelicals across the board are more likely to vote and more likely to vote conservatively. Despite limited electoral success and frequent public ridicule, evangelicals remain, for the foreseeable future, a force to be reckoned with in American politics.

EVANGELICALISM IN THE TWENTY-FIRST CENTURY

Contemporary evangelicals are a fusion of disparate groups. There are sociological, historical, and most important, theological differences among them. Even the political views of evangelicals cover the full spectrum—left, right, and center. Although many are conservative, most are not actively involved in organized political action.

The movement approaches politics with an Augustinian perspective, a Protestant theology, and a republican spirit. Their Augustinian perspective, reflecting the lingering influence of St. Augustine of Hippo, emphasizes dual citizenship (in an earthly city and in the City of God), human depravity (the corruption of human nature due to sin), and the indispensability of civil society. Their Protestant theology prizes the authority of the Bible, the centrality of religious liberty, and the separation of church and state. Their republican spirit demands limited government, democratic populism, and moral virtue.

The conservative majority has a brand of conservatism that differs from libertarians, traditionalists, and neoconservatives. They believe in the idea of an enduring moral order that societies ignore to their own detriment. They believe the Bible is key to knowing that moral order and that institutions other than government (the family and the church) are essential to preserving that moral order. They have a keen awareness of human fallibility and thus see a need for prudent restraints on human appetites and institutional power. Generally populist, evangelicals recognize that tradition can embody sinfulness as well as wisdom; they understand that a free market does not solve all problems (and actually creates many), and they mistrust centralized power in most forms (including corporations).

Evangelical activism is often associated with social issues such as abortion, same-sex marriage, stem cell research, pornography, and school prayer. Although those issues remain important, evangelicals are increasingly active in pressing for human rights and providing humanitarian aid. Various faith-based evangelical organizations have fought the slave trade in Sudan, exposed human rights abuses in North Korea, combated child prostitution in Cambodia, and fought for religious freedom for Tibetan Buddhists. Other issues on their agenda include prison reform, racial reconciliation, global poverty, third world debt relief, environmental stewardship, and sex trafficking.

In his 2002 book, *The Next Christendom: The Coming of Global Christianity,* Philip Jenkins suggests that a conservative Christian resurgence is spreading around the globe in Asia, Africa, and Latin America. Evangelicals are at the forefront of this resurgence. With some exceptions (evangelical Presbyterians in South Korea and evangelical Anglicans in Kenya and Nigeria), the rapid resurgence is largely a charismatic Pentecostal movement.

Comparative study of the political implications of the resurgence is a relatively new endeavor. Initial studies suggest (1) most evangelical movements in Asia, Africa, and Latin America are largely independent of evangelicals in the United States; (2) given the movement's lack of an organizational center, political agendas are generally determined by autonomous congregations in their local context; (3) much of the growth in Evangelicalism has occurred in disadvantaged and marginalized communities; and (4) evangelical churches serve as schools of democracy, teaching adherents important lessons about grassroots organization, civic leadership, and responsible participation.

Although evangelicals around the globe adhere to orthodox theological doctrines and traditional moral values, they are not easily categorized in liberal–conservative political terms. Evangelicals have endorsed right-wing authoritarian regimes, contributed to democratization, and supported leftist revolutionary movements. Political agendas vary from promotion of narrow interests to universal demands for democracy and human rights. They promote their agendas with a full range of political activity from running for public office (e.g., Lee Myung-bak in South Korea) to organizing minor political parties (e.g., Brazilian Republican Party) to defending basic human rights from the pulpit (e.g., Archbishop David Gitari in Kenya). Given these global developments, the political influence of Evangelicalism may well be even greater in the twenty-first century.

Event History and Duration Modeling

Event history analysis is a statistical technique that assesses the risk of an event's occurring. An event is a change from one state to another, for example, death, entry of a challenger in an election, confirmation of a judicial nominee, or the onset of war. The dependent variable is the time until the event occurs; the model considers both whether and when an event occurs. This technique is also referred to as duration, survival, or reliability analysis.

Event history models manage problems common to longitudinal data, such as censored observations and time-varying covariates. Censoring occurs when information about an observation is incomplete, such as when an observation has not experienced an event before the data collection process ends. Time-varying covariates take on different values over time for a single observation.

Parametric models assume that the time until an event occurs follows a specific distribution. The semiparametric Cox model is more appropriate when the primary objective is to understand the impact of covariates on the risk of an event and is the most commonly used model in event history analysis. Semiparametric models do not specify a distributional shape for the timing of events but are parameterized by the explanatory variables.

Key concepts for estimating and understanding the event history models are the hazard rate, risk set, failure rate, and survival function. A hazard rate is the probability that an event will occur for a particular observation at a particular time. The risk set includes all of the observations that are still at risk for experiencing the event. Once an event occurs, the observation is incorporated into the failure rate. All observations that have not failed are included in the survival function. The hazard rate is the proportion of the failure rate to the survival function.

Diagnostic tests should be used in event history analysis and include diagnostics to test for outliers, influence, adequacy of the model, linearity in the covariates, and proportional hazards. If the proportional hazards assumption holds, the hazard rate will be the same at the first time period under study as it is at the last period under study. There are numerous substantive reasons one may not expect the assumption of proportional effects to hold, such as learning. To correct for nonproportionality, the offending covariate is interacted with some function of time.

Advanced event history models incorporate ordered multiple events (repeated events model) and unordered multiple events (competing risks model). In repeated events data, dependence is possible when an event is conditional on another event's having occurred or the result of correlation in repeated processes. The conditional frailty model can handle both types of dependence.

Executive Immunity

Executive immunity aims to protect members of the executive branch by providing them the discretion needed to execute duties without fear of reprisal or civil liability. The U.S. Constitution fails to address the concept of executive immunity. Instead, the issue of granting immunity to members of the executive branch is often based on its adherence to

common-law principles. Declarations of executive immunity are quite complicated and are thus left to the discretion of the judicial system. As a result the legal basis for granting executive immunity is conflicting and perplexing.

In 1895, the Supreme Court in *Spalding v. Vilas* declared that executive branch officers were permitted absolute immunity. The tradition of limited presidential immunity goes back to this case. The courts frequently assert that the president or executive branch officials would be restricted in making decisions if immunity did not exist as a shelter. In *Barr v. Matteo* (1959), the Supreme Court stated that the purpose of immunity is to "aid in the effective functioning of government." Further rulings proposed the concept of qualified immunity and provided that absolute immunity would be granted as long as the official operated within the scope of his or her duties and did not knowingly violate the law.

Executive Order

Executive orders provide presidents with the unilateral authority to make decisions and, in many cases, law. The power to hand down executive orders, although not specifically stated in the U.S. Constitution, is implied through its grant of executive power to presidents and its requirement that laws be "faithfully executed." In executing their duties, all presidents have issued executive orders to control and guide executive branch agencies and departments. Congressional authorization is not required, but executive orders provide the same authority as laws passed by Congress and can be controversial.

Presidents have used executive orders to desegregate the military and schools and to end racial discrimination in federal housing and hiring. Congress provides the president with a considerable amount of discretion in executing laws, and, in many cases, Congress is not explicit as to how a law or program should be implemented. Therefore, presidents fill in the gaps and provide details for their execution by issuing executive orders. However, a president's actions are still checked. Executive orders can be overturned by the president or made invalid by the passage of a law. In addition, the U.S. Supreme Court can declare executive orders unconstitutional.

Executive Pardon

The Constitution provides the chief executive (the president) with the power to pardon: "he [the president] shall have power to grant reprieves and pardons for offenses against the United States, except in cases of impeachment." Three qualifications exist: the act being pardoned must have been an offense against the United States, impeachment cannot be involved, and the act in question must have already been committed. Pardoning is one of the more controversial powers exercised by the president because there is no check on this power; even though the judiciary is considered the arbiter of the Constitution, it is unable to oversee this executive function and rule on its constitutionality. Nevertheless, presidents seriously consider their options and exercise caution. A president's pardon may still raise the ire of the press, public, and Congress, as was the case when President Gerald Ford pardoned Richard Nixon. The power to pardon provides the president with the authority to constitutionally check abuses by the legislative and judicial branches. Rooted in English tradition, the pardon is at the president's sole discretion, and reasons for granting a pardon do not need to be disclosed. Presidents issue pardons to provide general amnesty to groups or to individuals whose actions were highly visible. President Jimmy Carter pardoned the Vietnam draft evaders; President Bill Clinton pardoned Marc Rich (the indicted international commodity trader), sixteen members of the Puerto Rican nationalist group FALN, and his own brother. President George W. Bush commutated the jail sentence of his former assistant I. Scooter Libby rather than issue him a pardon.

Executive Privilege

Executive privilege is the right granted to the president and executive branch officials that permits them to refuse to release information to Congress, the courts, and the public. Although the U.S. Constitution is not explicit in the provision of this right to the president, presidents have justified its use through the separation of powers doctrine that is inherent in the Constitution and the primacy of the executive branch in certain governmental activities, namely, foreign policy. Scholars believe that the concept of executive privilege is based on common law and derived from the English crown. Thus, "crown privilege," as it was referred to in England, was commonplace in monarchical systems.

Presidents frequently cite the precedents established by their predecessors in claiming executive privilege. The issue of executive privilege is quite perplexing. First, the American public and press genuinely encourage a strong presidency model. As such, presidential claims to executive privilege may at times be encouraged or implied by America's conventional support for a strong or activist presidency. Second, even though critical factions exist that challenge an activist president, seldom is there agreement on what is legitimately covered by executive privilege and what is not. Third, the Constitution lacks specificity on the subject, thereby making determinations of the constitutionality of a president's claim of executive privilege all the more difficult and indeterminate. Fourth, the Supreme Court usually defers to the president. Fifth, claims of executive

privilege are not exclusively issues about foreign policy but can encompass domestic policy as well. Furthermore, presidents usually are held to different standards depending on whether the issue is domestic policy or foreign policy. This double standard further aggravates the ambiguity surrounding executive privilege. Sixth, different outlooks on the issue of executive privilege suggest different institutional perspectives. Congress sees challenges to presidential authority as part of its constitutional obligation, while presidents see it as meddling in the affairs of the executive. Either way, these factors contribute to the controversial nature of executive privilege.

Several reasons provide justification for challenging a president's use of executive privilege. Critics argue that the use of executive privilege lacks a constitutional foundation. The Constitution is silent on the matter and does not explicitly state that the president does or does not have the authority to claim executive privilege. Another argument posed by critics has to do with the intent of the country's Founders. It is well documented that the Founders had reservations about a strong central government and a strong executive. In particular, they feared that a strong executive or president might transform into a tyrannical leader. Many in opposition to executive privilege view the exercise of power that is not explicitly granted to the president in the Constitution as bordering on abuse of power. According to critics, the unilateral and relatively unchecked nature of claims of executive privilege goes beyond the original intent of the Founders. Others argue that the principles and values that make America unique—open government, democratic society, and the free flow of information—come into question when something antithetical to these values is allowed. Furthermore, for the government to perform as intended, Congress should be fully provided with information about the actions of the executive branch. Last, presidents and their staffs are frequently accused of abusing the privilege. A few presidents and their staffers have invoked executive privilege to conceal illegal activities, cover up embarrassing information, and use it as a tool in maintaining political leverage. This cynical view of executive privilege is founded in the increasing distrust the average American has for government.

Regardless of whether executive privilege is indeed a power that can and should be exercised by the president and his or her staff or whether conditions should be placed on its usage, executive privilege is founded in the precedent established by George Washington and continued by his successors. Washington withheld certain portions of correspondence, which were requested by the Senate, between the secretary of state and the minister of the United States to France because he believed the information was damaging to the national interest. Similarly, Abraham Lincoln refused a congressional request to turn over information related to the arrests of Baltimore police commissioners at Fort McHenry. In 1901, William McKinley refused Congress's request for information regarding a War Department investigation into the use of Cuban funds. Last, George W. Bush invoked executive privilege and refused to release information regarding Vice President Dick Cheney's meetings with energy officials. As these examples illustrate,

presidents continue to claim executive privilege, regardless of the challenges, in executing their duties.

Executive, The

The word *execute* means "to put into effect"; thus, executive agencies are those institutions of government that carry out the will of whoever controls government. In a democracy, the executive is expected to follow the direction of popularly elected leaders; in a dictatorship, the executive is expected to do whatever the dictator commands. Every type of government relies on organizations that ensure that its laws are faithfully executed. In an era of big government, this means not only enforcing laws that require citizens to pay taxes but also executing laws that deliver benefits to citizens, such as education and social security checks.

Every state has a multiplicity of organizations to execute its many programs; otherwise the intentions of rulers would be only invocations of what they would like to see happen. To turn intentions into public policies that affect citizens, a government must have the organizational means to get things done. Without a functioning executive, a government would be little more than courtiers in the household of a monarch whose will has little or no effect outside the gates of the royal palace. With an effective executive, the Pharaohs of ancient Egypt were able to build pyramids and control the floodwaters of the river Nile. Today, the executive is used to deliver the public policies that collectively affect every household and every citizen. If executive institutions ceased to carry out their tasks, for example, in the aftermath of military defeat, this would result in a failed state. This occurred in Baghdad, Iraq, immediately after the U.S. invasion in 2003.

The organizations that put the intentions of governors into effect are described as the executive branch of government. *Executive* is a collective noun, and the organizations that can be grouped together under that heading differ in many respects. They can be headed by elected officials, political appointees, or individuals chosen because they are experts, for example, a medical doctor in charge of a public health agency. Some executive institutions are located in the national capital, while others are part of local government, and some have offices nationwide.

Executive agencies provide continuity in the work of government. Because a constitution is difficult to amend, the institutional structure of government changes little when an election replaces one president with another or when parties alternate between controlling the cabinet or being in opposition in a parliamentary system. In public policy whatever an election outcome, executive agencies maintain activities laid down in laws enacted by administrations in the past. The money to pay for these activities comes from public budgets

funded by the routine collection of taxes by revenue agencies. Many of these laws were enacted so long ago that the services in question—free secondary education, social security benefits, or clean air—are taken for granted.

The structure of the executive branch is often described as a hierarchy: political officials at the top of a pyramid, deciding what ought to be done; expert civil servants advising on technical and practical matters of policy and supervising the actions of lower-ranking officials administering policies; and public employees at the bottom delivering the outputs of public policy. Alternatively, a geographical model characterizes the executive as a sprawling range of hills with the bulk of the population living in the valleys distant from policy makers at the peak of executive institutions. To execute policies nationwide, central government departments cannot be confined to the national capital. They must have regional and local offices, or the actual execution of policies must be placed in the hands of regional and local governments and specific functional institutions such as hospitals.

ORGANIZING FOR POLITICAL DECISIONS

To give direction to executive agencies requires the political power to make decisions that are binding on many lower-level public employees. Formally, this power can be placed in a single office, that of a president or a dictator, or it can be given to a collective body, such as the cabinet in a parliamentary system.

American government is an extreme example of a democratic system that formally concentrates executive authority in a single individual. Article II of the U.S. Constitution declares, "The executive power shall be vested in a president." The Constitution says little about what the executive power consists of, beyond that of being the commander in chief of the army and navy and appointing ambassadors and judges. At the end of the eighteenth century, the federal government had few policies and few resources.

Today, the policies and institutions of the executive branch are vast. The *United States Government Manual,* published annually by the U.S. Government Printing Office, requires almost five hundred double-column pages to list in succinct form the dozens of agencies into which the federal executive is divided. The roles of the president have expanded too. Today, the president is meant to be head of state, leader of public opinion, manager of the economy, commander in chief of the armed forces, and leader of the free world as well as head of the executive branch. Each of these roles is extroverted, that is, it directs attention away from what is happening within the executive branch to what is happening in the national economy, on other continents, and in public opinion polls.

Since the president has not gained any more hours in the week to deal with these problems, the more numerous and varied the activities of the executive branch, the less time a president can devote to the great majority of policies that officials carry out in the president's name. In the words of presidential scholar Richard Neustadt, "The president is the prisoner of first things first; and almost always something else comes first." The chief priorities for presidential policy making are major issues of national security and the economy, problems extending outside the control of the executive branch.

The president cannot be a hands-on chief executive as may be the case with the head of a business firm. Management by exception, that is, concentrating on what is out of the ordinary, leaves supervision of routine activities of the executive branch in the hands of others. Nominal subordinates may appropriate the authority of the White House to advance their own interests and importance. For example, Richard Nixon was not consulted by White House staff who organized the Watergate break-in; he nonetheless paid a high price for covering up what his nominal subordinates initiated.

On many continents political leaders have sought to be strong presidents unchecked by the courts, a legislature, or even free elections. This can lead to a dictatorship in which power is personal. Major executive agencies can be placed in the hands of loyal followers who can influence the execution of laws corruptly in ways that benefit themselves and their political allies and punish their opponents. In the Soviet Union, the Communist Party placed party officials within the executive to make sure that public officials followed the party line. Josef Stalin, general secretary of the Communist Party, used terror and arbitrary punishments to enforce his will on the executive. In Nazi Germany, underlings perverted the workings of the executive in enthusiastic attempts to carry out what they thought Adolf Hitler would want. The People's Republic of China is today an outstanding example of a collective, undemocratic executive, concentrating ultimate authority in the hands of the Central Committee of the Communist Party.

Parliamentary democracies place control of the executive in the hands of a cabinet consisting of a prime minister and major politicians in the governing party. Ministers are individually in charge of the departments that collectively constitute the executive branch. The prime minister can practice intervention by making a preemptive claim to handle a policy in a crisis rather than leave it in the hands of a cabinet minister; however, cabinet ministers collectively have their hands on the departments of government. The prime minister's political eminence makes him or her the focus of media attention, which is sometimes favorable and sometimes unfavorable. The prime minister holds office as long as he or she can maintain the confidence of a majority of members of Parliament. Individual ministers are concerned not only with heading a government department but also with promoting their own popularity in Parliament, in their party, and with the public.

European political systems usually have a coalition government relying on two or more parties to constitute a majority in Parliament. Ministers in charge of departments of the executive branch are politicians of different parties. Coalition government strengthens the position of departmental ministers, who tend to see their political role as giving direction to their own department and to benefit their own party rather than government as a whole. This weakens the prime minister's authority in the executive branch; his or her first priority must be to maintain the support of a coalition of parties, or he or she will lose office by the collapse of the coalition. An American president often has problems dealing with Congress but remains head of the executive branch for the full duration of a four-year fixed term.

The European Union illustrates what happens when officials in the equivalent of its executive branch, the European Commission in Brussels, lack executive power. Officials in the departments of the commission can make decisions that are meant to have an impact across the whole of the European Union. However, the commission depends on the national governments of its twenty-seven member states to translate its decisions into national laws and to administer them in ways that are consistent with the intentions of the commission. It does not have executive control over what is done in its name. Nor does the commission have sanctions to invoke against a government that drifts from the intent of its directives; this is left to the courts.

Because the executive branch is both large and heterogeneous, decision making cannot be concentrated in a single person or a cabinet meeting a few hours a week. The concept of the core executive has been developed as a complement to the legalistic description of the executive. For any given issue, the membership of the core executive consists of a network of limited size that includes representatives of the major political groups affected by a decision and its implementation. A president or prime minister monitors the deliberations of core executive groups dealing with major issues. In the very porous American system, participants can include select members of Congress, committee chairs, their staffs, lobbyists, academic experts, and others with a stake in an issue. The membership of the core executive is not fixed, as are such formal offices as president or prime minister. Instead, it shifts with the issue at hand: executive branch officials involved in executing national security policies differ from those executing health policies. When disagreements arise between different organizations, they are resolved by political negotiations: politics unites what institutions divide.

ORGANIZING TO DO THINGS

In the introverted world of politics within the national capital, the most important concerns are those affecting power struggles and bargaining within the core executive. But for the outcome of such struggles to influence society, those powerful within the core executive must reach out to deliver programs to citizens far from the corridors of power in cities, suburbs, and rural areas that are hundreds or even thousands of miles from the national capital.

To understand the execution of public policy requires broadening attention from the core executive within central

government to the great variety of public agencies deliver-ing programs wherever citizens live. In the American federal system, this includes state and local government institutions, separately elected school boards, public utilities, state universi-ties, and special-purpose organizations executing everything from sewage disposal to printing money. In European welfare states, executive agencies extend to hospitals and a number of industries in state ownership. Every executive agency can be characterized in terms of its territorial scope, whether national, regional, or local, and in terms of its functions, whether broad, such as education, or narrow, such as running programs for dis-abled children or funding research in science and technology.

The programs of government. Whereas the institutions of government describe what government is, the programs of government describe what it does. Historically, government developed to maintain domestic order and provide security against foreign invasion. To do this required an army, diplo-mats, a police force, courts, and tax collectors. These programs remain major concerns of governors today. The agencies exe-cuting these policies are at the center of central government; they also appropriate outside the country to deal with foreign policy, the international economy, and military and counter-terrorism actions. While the maintenance of public order can be described as a public good, many citizens have viewed col-lection of taxes as a public "bad."

Industrialization challenged government with new prob-lems, such as providing sewage and clean water in cities; today, government executes programs dealing with air pollution, wherever it occurs. Regulatory agencies were created to ensure safety at work and that food was not contaminated. Today, every government has a variety of executive responsibilities for industry, employment, and trade. Whereas laws and budgets for these programs are enacted in the national capital, they must be executed on the spot, as in the case of inspecting factories. Unemployed people seek jobs from local employment agen-cies, and trade departments promote the export of domestically produced products through offices on every continent.

Social programs now account for the bulk of the money that government spends. Social security is the most costly pro-gram, with health second and education third. These programs are important to individuals throughout their lives, and at any given time every household benefits from one or two of these programs. In this way people are in regular contact with exec-utive agencies such as local schools and hospitals far removed from decision making at the top of the executive branch.

The growth of government has not been led by a big increase in the number of popularly elected representatives but by the great increase in the number of programs that govern-ment delivers. In turn, this has greatly increased the variety of institutions that collectively constitute government's executive agencies. Growth has occurred not at the top of the executive branch but mainly at the base through the multiplication of schools, hospitals, and other agencies responsible for delivering services to citizens nationwide. To understand the sprawling range of executive agencies, we must look outside as well as inside central government.

Different structures for different programs. Every public agency is authorized by laws that set out its policies, resources, orga-nization structure, and geographical scope within which it can execute its responsibilities. Within government, there are big differences in goals, resources, and geographical scope. Depart-ments of defense within two countries are likely to have more in common than do a department of defense and a department of agriculture within the same country.

To deliver programs, executive agencies can draw on three resources: laws, money, and personnel. Although most pro-grams make at least minimal claims on all three resources, they differ radically in the relative importance of each. Programs concerned with citizenship or abortion tend to be law inten-sive: laws set out what people can or cannot do within a mini-mum of involvement by executive agencies. Social security programs are money intensive: the principal responsibility of a social security agency is to collect social security taxes and pay out social security benefits. Education and health programs are labor intensive; they entitle people to receive the services of teachers, doctors, and nurses.

The organizations that constitute the executive vary with the nature of the program. An organization chart that is limited to the top of the executive branch—for example, members of the cabinet in a parliamentary system or heads of presidential agencies—is misleading. Even though a department may have a head with singular authority, within every department divi-sions have different and competing priorities. In a department of health, there is a common goal of promoting good health, but there are differences in the spending priorities of those concerned with promoting the health of children, those car-ing for older persons in ill health, bureaus concerned with the treatment of mental health, and those dealing with cancer. In a ministry of education, the concerns and priorities may be related logically but not related in the work of bureaus responsible for such different educational programs as primary education, scientific research, and educating the blind.

From a program perspective, a map of executive agencies is radically different from an organization chart that focuses on the top of central government. An agency concerned with broad issues of economic policy will have few employees but a high concentration of economic experts. It will also be based as close as possible to the key political decision makers in the national capital. By contrast, an organization concerned with delivering the mail to every household requires a network of local offices to take mail to the doorstep, regional offices to sort mail for distribution, and a small central coordinating office in the national capital.

Very few agencies are hierarchical command-and-control institutions in which the decisions of the political head are meant to be executed without question. A ministry of defense approximates this form of organization because there is a clear chain of command from the lowest- to the highest-ranking officers in the army, navy, and air force. In turn, each armed service is responsible to a politically appointed minister of defense, and the minister is accountable to the president or to a cabinet and parliament. Yet this seemingly simple structure is

complicated by differences in the ways in which the army, the navy, and the air force provide defense and in intradepartmental competition about which should be given the most money and the best equipment. Moreover, while civilian heads of the military can pull rank on uniformed officers, career military officials can claim that their expertise in defense matters gives them a claim to influence political decisions.

Some executive agencies are top heavy because their programs are exclusively the responsibility of central government, for example, the foreign ministry. It is distinctive in having far more staff scattered across the globe in its embassies without any branches within the country it represents. By contrast, a traditional program of government such as trash collection is executed by local government agencies rather than by a central government department for trash. A pensions ministry is concerned with a program paying out money to millions of people wherever they live. It requires a central office to pool the payments that individuals and employers make and to make payments from its central fund by computerized bank transfer. Thus, the British agency responsible for paying pensions is located more than 200 miles (322 kilometers) from London, and in the United States the Social Security Administration is located in Baltimore, Maryland, rather than Washington, D.C.

Health and education programs require the dispersion of schools, doctors' offices, and hospitals nationwide. Federal systems make this a point of principle: many services of this type are primarily the responsibility of the states that are partners to a federal compact. Unitary states accept institutional devolution as a necessary consequence of the welfare state. In the most centralized unitary states, the national ministry of education may have regional and local offices, employ teachers at all levels from primary school upward, and make decisions about the school curriculum. However, the top minister's capacity to influence the delivery of services is shared with those who are employed locally, and local education authorities turn over responsibility for delivering education to school heads and then to classroom teachers. Teachers have professional training in how to educate youths and considerable discretion in the classroom due to the remoteness of their nominal superiors.

The executive is multilevel and has many sides. Within every executive agency, the personnel are mixed. The leadership can be elected politicians and partisan supporters. In the United States, the president appoints hundreds from outside the Washington, D.C., area to high positions. In Europe, many of these posts are occupied by civil servants who are very experienced in the affairs of the department. In Britain, they are politically ambidextrous, that is, prepared to work for a government from either side of the House of Commons, whereas in continental Europe, high-ranking civil servants can combine party loyalties and expert knowledge of government. Government departments also have senior staff recruited for their expertise, for example, generals and admirals in the department of defense, economists in the central bank, and scientists in a department of the environment. However, for every one person to give direction to a program, there are likely to be hundreds employed to deliver it.

A comprehensive map of the executive branch, like a geographical relief map, needs to take into account both peaks in the national capital and valleys where most citizens live and where most public employees work. It must also take into account differences between programs. Those concerned with problems that are collective, such as the ministry of defense and the central bank, must be in the national capital. However, those concerned with delivering services such as health care, trash collection, and roads must operate wherever citizens live. While most of the money spent by executive agencies comes from national taxation, most of the people employed in delivering public goods and services are employed by local and regional government or by hospitals, schools, and universities.

The functional and geographical diversity of executive institutions creates the problem of joining up government. President Woodrow Wilson reflected, "I live in the midst of the government of the United States, but I never saw the government of the United States." A half century later a report commissioned by President Lyndon Johnson concluded, "The federal government remains largely a collection of fragmented bureau fiefdoms unable to co-ordinate with themselves intelligently."

THE POLITICS OF THE EXECUTIVE GOVERNMENT

Politics provides a dynamic stimulus to the routine activities of executive agencies. Different agencies that are nominally subordinate to the same president or cabinet can fight for budget resources, for priority in promoting new legislation, and for the president's or prime minister's favor. Within a government agency there are debates about which part of the agency should benefit if there is extra money to be spent and which part should suffer if there is a budget cut. There are also debates about whether and how many existing programs should be altered and which new programs an agency should promote. Politicians tend to favor making changes for which they can claim credit, whereas career officials tend to favor the status quo. Expert staff can be pulled two ways, favoring innovations that fit their professional views of what government ought to do while opposing initiatives that politicians endorse but that public employees could not deliver.

Agencies operating at different levels of government and responsible for different policies are becoming increasingly interdependent. For example, what universities teach undergraduate students depends in part on what is done in local schools in teaching mathematics and writing skills. National agencies concerned with promoting full employment rely on educational institutions to give their students skills that make them employable, and national agencies promoting new technology depend on what universities achieve.

In a unitary system of government, this creates intragovernmental politics. The national agency has the formal authority to make decisions, but the capacity to deliver programs requires the creation of a nationwide network of subordinate institutions. Even a country as centralized as Britain gives local governments responsibility for running schools, fire departments, and recreational facilities, and the creation of devolved

assemblies in Scotland, Wales, and Northern Ireland creates grounds for dispute about political principles and about the details of implementing a policy.

In a federal system, cooperation between agencies dealing with the same problem is an intergovernmental matter since each is accountable to separately elected groups of citizens, and this can justify differences in priorities for taxing and spending. Even when national policies set out common goals, the ways executive agencies act to meet these goals can differ from one part of the country to another.

In today's world, public policies are increasingly becoming intermestic as domestic and international influences jointly affect what a public agency does. The penetration of international influences is no longer confined to national departments dealing with foreign affairs and defense. A local government in an area where old industries are declining will look abroad to attract investment in new industries and office work. From Thailand to the Caribbean and the Mediterranean, countries that lack industries have turned to tourism, with foreign visitors providing the money that can be used to pay for imports of such necessities as energy. Tourists need not only private enterprises to provide hotels and restaurants but also public agencies to keep beaches clean, streets safe, and natural beauty spots beautiful. A central bank may control money supply in the national capital, but what that money will buy internationally depends on what happens in trading on foreign exchange markets.

The growth in intermestic problems has led national governments to set up institutions to get things done by acting across national boundaries. The North Atlantic Treaty Organization was established in 1949 to provide for the collective security of Europe, the United States, and Canada. Its executive headquarters in Brussels is in charge of defense forces that integrate units from the national forces of more than twenty countries. The European Central Bank has replaced the national currencies of sixteen countries with the euro and sets interest rates for half of Europe from its headquarters in Frankfurt.

The creation of supranational executive agencies has not eliminated political problems; instead, it has added another level to the interinstitutional politicking of multilevel governance. North Atlantic Treaty Organization forces are still subject to decisions taken by national governments. This is illustrated by member states' differing about whether and how their national forces could be committed to action in wars in Iraq and Afghanistan. The European Central Bank controls the money supply of national governments, but it lacks executive authority over the decisions of national governments about taxing and spending euros. The lack of executive power is even more evident in organizations with global responsibilities. The World Bank's capacity to give grants to developing nations depends on contributions from the governments of developed nations because it lacks the ability to collect taxes. Any United Nations effort to intervene in violent conflicts depends for its execution on the provision of effective forces by member states.

Exit Poll

An exit poll is a public opinion survey that is undertaken as voters leave polling facilities. Its goal is to provide an early approximation of who won balloting. Exit polls typically ask voters whom they voted for and record basic demographic data. They may also endeavor to measure voter attitudes on Election Day. Such polls are generally conducted by media outlets and provide indications of factors such as turnout and voter sentiment. In some countries, exit polls have been used to assess electoral fraud. If official results vary too greatly from the exit polls, it can be an indication of problems in the voting or counting systems. Exit polls have been criticized for providing inaccurate data since voters are not always truthful in their responses and problems with sampling points may skew the results. Increasingly, media outlets have pooled their exit polls or participated in joint polling in an effort to bolster the accuracy of their information. The early release of exit poll data has been criticized for depressing voter turnout: if early results indicate one candidate or party won, the supporters of the opposing candidates or parties may not vote. As a result, some countries, notably New Zealand, have outlawed the practice.

Experimental Design

Experiments offer a unique opportunity to examine the nature and direction of causal relationships between variables. Experiments represent a particularly effective and useful method when investigators need clear causal information, past studies have generated inconsistent or contradictory findings, multimethod validation is desired, or methodological triangulation may prove helpful in uncovering complex or subtle underlying processes.

Experiments typically refers to laboratory studies in which the investigator retains control over the recruitment, assignment to random condition, treatment, and measurement of participants. There are three important ways in which experiments differ

from other forms of social measurement. First, experimenters do not wait for events to occur and then observe and measure them; rather, experimenters create such situations, capture exactly what they are interested in studying, and measure those variables. Second, experimenters manipulate conditions so that some participants receive a control condition while others receive the treatment condition; then experimenters observe any systematic differences between groups or individuals, keeping everything the same except the manipulated variable. Third, experimenters randomize participants to conditions to ensure that observed differences do not result from preexisting differences between participants. Experimenters typically report average treatment effects and remain less concerned with the effect of a particular treatment on a given individual. Therefore, in analyses of results, demonstrating no effect may reflect a true finding but may result from additional factors that exert opposite effects on different kinds of people.

Experiments offer several important advantages. In addition to the ability to determine causal connections and randomize participants to conditions, experiments also allow scholars to take precise measurements of variables. Whether such measurements involve paper-and-pencil tests, physiological or behavioral measures, or other forms of self-report, experimenters can design and test the measurement strategies best suited for the scale and topic they are investigating. In this way, experiments allow researchers to begin to explore the microfoundational processes underlying a wide variety of social and political processes.

Experiments do not come without certain disadvantages. Experiments often present seemingly artificial situations and environments to unrepresentative participant pools. Artificial environments often result because it is either impossible or unethical to create the situation that the investigator wants to study. In addition, certain participants may or may not be suitably representative of the population most relevant for application.

Another important concern relates to the consequences of noncompliance among participants. Most experiments analyze data according to intent to treat, wherein participants are randomly assigned to treatment or control and the data are analyzed regardless of adherence to treatment or subsequent noncompliance or deviation from the experimental protocol. This can bias results if a participant's withdrawal from the experiment resulted from the treatment itself and not from some extraneous factor.

Experiments possess two kinds of validity, internal and external. *Internal validity* refers to whether a researcher is actually getting at the variables he or she claims to be investigating. *External validity* refers to whether particular findings can generalize to a larger, external reality. In general, psychologists are much more concerned with maintaining internal validity, whereas political scientists care much more about external validity.

Basic experimental design can take one of several forms. Within-subject studies examine changes within an individual as the result of a manipulation over time. Between-subjects studies explore the differences between people under these conditions. Often, it may be ethically impossible to compare individuals, as when a scientist wants to understand the effects of a certain disease; in such cases, a matching paradigm is used whereby control individuals are found who match the affected target participant in every way possible except for the existence of the illness or the other variable of interest. In matching designs, manipulations occur within the participant, but effects might then be compared across participants. Participants should never be matched to examine differences in a natural dimension such as race or sex because too many other variables are intertwined with such characteristics to make such a comparison valid or viable.

Field experiments and natural experiments are other kinds of experiments. Field experiments allow investigators to randomly assign individuals or groups to treatment and control. Although analyses must take account of additional contextual factors that can influence observed outcomes, they also permit an investigation of phenomena that might be hard to reproduce or study in a laboratory setting. In this way, there is a trade-off between a gain in external validity and a potential loss in internal validity. Natural experiments occur when an investigator takes advantage of a natural occurrence, such as a fire or hurricane, to examine particular consequences, but these experiments do not allow investigators to randomize participants across conditions.

Experimental incentives often differ. Participants in most economic experiments receive pay; participants in many experiments in psychology are given extra credit in return for participation. Finally, experimental ethics remains an important part of the process. Some experiments involve deception; others, such as those in economics, never do. All experiments should obtain informed consent from participants.

Extradition

Extradition is an action of international cooperation in handing over a person accused of criminal activities. In this process one sovereign state delivers an accused criminal or fugitive to another sovereign state at the request of the latter state. There are two major reasons for this transfer: first, to repress criminal activities, and second, to allow for the lawbreaker's being

punished according to the penal laws of the state where the crime was committed. The process of extradition has advanced among nations to maintain law, order, and tranquility, thus promoting a general sense of peace and happiness in society.

The history of extradition treaties dates back to 1280 BCE between Ramses II of Egypt and the Hittite prince Hattusuli III. It was signed after Ramses defeated Hattusuli. Originally it was a peace treaty between the two rival kings, but provisions were put in place for the return of criminals of one party who had fled and taken refuge in the territory of the other. The word *extradition* is derived from a Latin word *extradere,* which means "forceful return of a person to his or her sovereign." The term *extradition* was first used in a French decree of 1792; this is refuted by some scholars who argue that the term was employed as early as 1555 by the parliament of Paris against the extradition of its nationals.

Historically, extradition was sought not only in criminal cases but also for the handover of political and religious opponents of the ruling party or the reigning families. In European history, religious and political opponents were delivered by the formal procedure of extradition. Sovereigns obliged other sovereigns by surrendering a person or a group of people who were responsible for affecting the stability of the political order of the requesting state. By the nineteenth century Western Europe turned against the extradition of fugitives accused of political offenses. Belgium was one of the first states to enact a law, in 1833, that incorporated the principle of nonextradition for political offenses.

In international law *extradition* is generally defined as "the surrender of an individual by the state within whose territory he is found to the state under whose laws he is alleged to have committed (or already have been convicted) of a crime." In the United States, international extradition is governed by federal law, leaving the states with no power to extradite persons to foreign countries. The European Union (EU) adopted the European Arrest Warrant Act in 2002, which was designed to harmonize EU state responses to threats of terrorism and cross-border crime. The European Arrest Warrant Act also abolishes the system of extradition among EU members and replaces it with obligations of mutually recognized arrest warrants issued by judicial authorities of the member states.

Extraterritoriality

The term *extraterritoriality,* or *exterritoriality,* usually denotes the exclusion of foreign nationals from the territorial jurisdiction of the host country. The concept thereby deals with functional exceptions to the Westphalian principle of territorial sovereignty—either granted by international law or agreed on bilaterally. Exceptions under international law extend to cases such as military occupation and national ships on the high seas; bilateral military status-of-forces agreements are made routinely for externally deployed soldiers. Historically, the most classical example for extraterritoriality under international law was the doctrine on diplomatic status popularized by Hugo Grotius through his seminal work *De jure belli ac pacis* (1625). The concept is best explained through the image of an extraterritorial fictional space under the jurisdiction of the accredited country surrounding the diplomat. As this theory does not reflect state practice and international jurisdiction, it has been replaced by a concept explaining granted immunities and privileges through the functional necessity to efficiently exercise consular functions and diplomatic representation. Another historical application of extraterritorial jurisdiction concerned Western nationals in non-Western countries—such as Japan, Turkey, and China—who remained under national rule (during the second half of the nineteenth and first half of the twentieth century).

In a wider sense, forms of extraterritorial rule and jurisdiction going even beyond nationals can be observed in reaction to global challenges overburdening single states. Examples are the fight against terrorism (cf. United Nations Security Council Resolution 1373 [2001], internationally prescribing specific legislation), universal jurisdiction, and international economic regulation.

Fabianism

Fabianism has been one of the most discussed and controversial issues in political theory and practice in the later half of the nineteenth century and twentieth century. In England, the Fabian socialists, such as Sydney and Beatrice Webb, Bernard Shaw, H. G. Wells, G. D. H. Cole, William Clarke, and Annie Besant, realized the importance of the working class and visualized the possibilities of establishing socialism through a gradual process by increasing public ownership in industry and more representation of labor in the legislature, trade unions, and cooperatives. Whereas Eduard Bernstein's revisionism, influenced by the ethical philosophy of Immanuel Kant, was a direct attack on Marxism, Fabianism attacked Marxism indirectly. Fabian socialists believed in a gradual approach toward socialism through democratic means instead of revolutionary socialism. They were guided by the philosophy of the Roman general Q. Fabius Maximus, surnamed Cunctator, which means "delayer." Fabians believed in the philosophy, "For the right moment, you must wait as Fabius did most patiently when warring against Hannibal, though many censured his delays; but when the time comes you must strike hard as Fabius did, or your waiting will be in vain and fruitless" (see Mehrotra 1984, 246).

FABIANISM VERSUS MARXISM

The Fabians eschewed the revolutionary spirit of Marxism without ever adopting a doctrinaire attitude toward it. Unlike the Marxists, the Fabianists did not have any coherent philosophy. Nor did the Fabian Society have any authoritative spokesperson or a president. It was essentially a middle-class movement that Thomas Rush (1955–1956) noted was "free from any infusion of those of whose wrongs they were lecturing to set right" (p. 151). In Bernard Shaw's (1908) view, it was unreasonable to expect a society so constituted to be "ardent class strugglers" and "revolutionaries."

As intellectuals, the Fabians were more concerned with those values that suited their respective societies. They modified Marxism considerably. While retaining the revolutionary zeal of Marxism, they rejected its basic tenets, such as class struggle, economic determinism, theory of surplus value, dictatorship of the proletariat, and inevitability of revolution. Although Fabianism was based on the socialist creed of the Marxist traditional, historical, and economic foundation, they were poles apart from Marxism. For instance, whereas Marx found in history a continuous struggle between the haves and have-nots, Sidney Webb, one of the early Fabianists, observed that history constantly reveals both the "irresistible progress of democracy" and almost continuous progress of socialism. They did not consider socialism antithetical to democracy. Webb pointed out the fact that in England, middle-class suffrage superseded aristocratic suffrage in the early nineteenth century.

Fabianism emerged essentially as an English school of thought. Although Karl Marx spent the last thirty years of his life in England, Marxism never found a fertile ground. England being the mother of parliamentary democracy, the Fabians held deeply the view that transformation in the society could be brought by persuasion and flexible means. They did not believe in propagating socialists' ideas to achieve their desired goals. Rather, they sought elections to the local bodies, corporations, and Parliament with the aim of reforming the structure and working of the Parliament.

AN EVALUATION

The Fabians forgot the hard fact that the masses do not live on ideology alone, however sound or logical it might be. They also failed to realize that the parliamentary method is not "a way of confrontation" but of constant "adjustment, compromise and tactics" (see Dwivedy 1984, 348). The Fabians proved to be more ideological than pragmatic. They were generally criticized for their reformist attitude. J. Ellis Barker criticized Fabianism for being the least clear of a definite type of social order, and Friedrich Engels criticized the Fabians for their "tactics to fight the liberals not as decided opponents but to drive them onto socialistic consequences" (Mehrotra 1984, 253).

The Fabians were essentially reformers who believed in reforms without resentment and social reconstruction without dogma or fanaticism. Their socialism was the socialism of the simple minded; it signified indefinite extension of state activity. For most of the Fabians, it was "a journey with no assigned destination," wrote Alexander Gray (1946, 349). The Fabians played a significant role in practical politics by putting forward many workable schemes, such as social legislation, public ownership of basic industries, radical taxation, and welfare state.

Faction

A faction is an informal or unofficial group within a political party or other body. Factions are typically formed to pursue specific policy or legislative goals. Factions may also be organized on a regional basis. These groups pursue objectives that may not initially be shared by the broader membership of the organization. They differ from caucuses or other formal groups because of their ad hoc basis. The groupings usually do not have a formal structure or leadership system, although some political parties' systems grant formal recognition to factions. Factions generally do not conduct regular meetings or conventions or prepare policy platforms. Factions can weaken the stability and solidarity of a political party. Their pursuit of narrow goals can undermine the broad appeal of a party or grouping. They may also create infighting within the party. Early proponents of democracy, including the Baron de Montesquieu, argued that factions and political parties would undermine democracy by subverting the general good to special interests. In the United States, factions dominated the political system before the rise of the formal party system. The early factions, the Federalists and the Anti-Federalists, later evolved into the Federalist Party and the Democratic-Republican Party.

Fainsod, Merle

Merle Fainsod (1907–1972) was a prominent American scholar in the field of Soviet studies. He taught at Harvard University for forty years and produced influential works that described and analyzed the Soviet system.

Fainsod was educated at Washington University in St. Louis and at Harvard University, where he received a doctorate in 1932. He joined the Harvard faculty, and in addition to serving as a professor of government, he worked in various positions in the U.S. government (1936–1943) and served as the director of the Harvard Russian Research Center (1959–1964) and of the Harvard Library (1964–1972). His dedication to the university led one colleague to describe him as "Harvard's man for all seasons," and his teaching influenced a whole generation of students, many of whom would make their own contributions to Soviet studies.

Fainsod produced a number of important works. *International Socialism and the World War* (1935) analyzed the downfall of the Second Socialist International and was praised as a work of political history and as an essay on political theory. *Smolensk under Soviet Rule* (1958), based on a unique archive of Soviet documents captured by the Germans in World War II (1939–1945), detailed the inner workings of the Stalinist dictatorship. Fainsod also wrote dozens of articles on Soviet politics and society.

His most important work, however, was *How Russia Is Ruled,* originally published in 1953. Drawing on a unique source of data from interviews with Russian émigrés in Europe, Fainsod presented a detailed picture of life in the Soviet Union, including both its political institutions and its social structure. Described as a paradigmatic volume, *How Russia Is Ruled* emphasized the totalitarian aspects of the Soviet Union under Stalin, including the centralization of leadership, repression, suppression of opposition, and the deification of the leadership. Terror, however, was the lynchpin of the system. In addition, through use of data from interviews, he focused on inequality within the Soviet Union and the emergence of a hierarchical structure in a political system that ostensibly stood for equality of all. He also highlighted how loyalty to the Soviet system was weakest among the workers and peasants, the very classes supposed to be served by the Communist Party. *How Russia Is Ruled,* path breaking as one of the first empirical analyses of the Soviet Union as it really functioned and drawing on survey data, became the preeminent text in the field, and Fainsod's methods and insights would shape the field of Soviet studies.

Some suggested that changes in the Soviet Union after Stalin's death in 1953 made some of Fainsod's assessments dated. As a result, his classic work was extensively revised, was retitled *How the Soviet Union Is Governed* (1979), and included Jerry Hough, one of his former students, as a coauthor. Unlike Fainsod's original work, this volume emphasized that many features of Soviet politics and society were comparable with those in Western democratic states. Its arguments, as well as the fact that it was published with Fainsod's name on it, generated controversy within the field.

Fairness

The distinctive domain of fairness is decision-making processes or institutions. The concept of fairness is closely linked to a number of other moral concepts, including justice, equality, and impartiality. Like these other notions, fairness centers on how people are treated by others, especially the requirement that everyone be treated alike unless there are good reasons to treat particular people differently. Thus, a fair procedure makes decisions or allocates benefits or burdens on the basis of appropriate criteria, which are applied similarly to all cases unless exceptions can be justified. Fairness is appealed to in assessing both means through which decisions are made and the outcomes decisions bring about. The former is generally labeled "procedural" fairness, the latter "distributive" fairness. Although these two dimensions of decisions frequently run in tandem (i.e., fair procedures give rise to fair outcomes, and unfair procedures to unfair outcomes), this may not always be true. While the notion of fairness pertains to both dimensions, it is more closely associated with procedures, whereas the notion of justice (distributive justice) is generally more closely associated with outcomes.

Specific qualities that constitute fairness vary across contexts, in accordance with the nature of different decision processes or institutions. The variety of relevant contexts requires a corresponding range of criteria of fairness. For instance, in a fair election, candidates compete on even terms. In a fair bargain, participants reach an agreement under conditions that are similar for all, with no one having an advantage over others. In a fair trial, court officials are not biased toward one or another of the parties involved. In these and countless other cases, fairness turns on people's being treated equally, with departures from equality requiring justification, although exactly what constitutes equal treatment varies according to context.

HISTORICAL EXAMPLES

The concept of fairness has a long lineage. The *Oxford English Dictionary* gives examples of *fairness* and cognate words used in English with their present sense as far back as 1460. But we find clear instances in other languages many centuries earlier. For example, although the Greeks lacked a word that clearly means "fairness," Thucydides uses the concept in his *History of the Peloponnesian War* (late fifth century BCE). He describes the besieged people of Melos asking their Athenian besiegers to consider "that in the case of all who fall into danger there should be such a thing as fair play and just dealing (*ta eikota kai dikaia*)" between people. In other words, they request that similar rules apply to the strong and the weak without regard to differences in power. In his *Politics* (late fourth century BCE), Aristotle argues that standards of justice or fairness differ in different regimes. In democratic regimes, ruled over by the many who are poor, the governing idea is that people should be treated alike, so political offices should be distributed through a lottery system, while according to this view, free birth and citizenship constitute being alike. In contrast, in oligarchical regimes, ruled over by the rich, fairness is treating people differently, according to their merits,

with amount of property in this case constituting degree of merit. An important lesson of Aristotle's account is that there is no generally accepted standard of fairness with regard to either procedures or distribution. Different ways of dealing with people may seem to be fair as long as they accord similar treatment to people who are similar in important respects.

RECENT USAGE

In recent years, fairness has received considerable attention because of the work of John Rawls and his theory of "justice as fairness." In *A Theory of Justice* (1971), Rawls argues that specific principles of justice can be justified by showing that they would be chosen by representative individuals placed in a carefully constructed, artificial-choice situation. To ensure that people's particular interests do not influence their choice of principles, Rawls places the representative individuals behind a hypothetical "veil of ignorance." They are to choose principles without knowing about their own specific identities or attributes (e.g., social position, talents, religion, sex, age). Rawls calls his theory justice as fairness because this designation conveys the idea that the resultant principles of justice are agreed to in an initial situation that is fair. In recent years, different aspects of fairness have figured prominently in social science research. Researchers have examined people's views about procedural fairness in political, business, education, and other settings. Numerous studies support the strong effects of procedural considerations, which are not only distinct from outcome considerations but frequently more influential, even in cases with highly unfavorable outcomes. In assessing a variety of institutions, participants have been shown to place greater weight on their views of how decisions are made than on how the outcomes of the decisions affect them. An important implication of this so-called fair-process effect is the realization of people's willingness to accept undesirable decisions if they believe that the decisions have been made fairly. This has special salience with regard to political or other systems that require sacrifice of their subjects. Contrariwise, people have been shown to react strongly against decision processes they view as unfair, especially when decisions have outcomes they also view as unfavorable.

Concerns about fairness are also appealed to in order to ground moral requirements to support cooperative associations. The principle of fairness (or fair play), developed by H. L. A. Hart in 1955, is based on fair distribution of benefits and burdens. When a number of people join in cooperative activities to produce and receive common benefits, other people who receive the benefits but do not share the burdens of providing them (i.e., free riders) may be viewed as treating the cooperators unfairly. To remedy this situation, they too should cooperate, even if they would prefer not to. Developed along these lines, the principle of fairness grounds an influential recent account of why people should obey the law. Given the large-scale cooperation necessary to produce essential benefits of contemporary societies that include national defense and law and order, people who receive the benefits incur moral requirements to bear their fair share of the burdens required to produce them. Since important state benefits are coordinated

by the law, the principle of fairness can support general moral requirements to obey the law.

Faith-based Initiative

President George W. Bush's faith-based initiative had three primary components—regulatory reform, technical assistance, and tax reform—each designed to help religious social service providers partner with government.

The regulatory reform component included legislation designed to expand charitable choice to nearly all federal social service programs. These provisions, originally added to the 1996 welfare reform legislation and included in three subsequent laws, reduced barriers, thereby allowing religious organizations to apply for federal funding while maintaining their religious character. The second part provided technical assistance to smaller social service providers to help them navigate the federal grant process. The final piece, tax reform, sought new tax incentives to help charities.

The faith-based initiative was a high priority for Bush. Issued on January 29, 2001, Bush's first executive order created the White House Office of Faith-based and Community Initiatives (WHOFBCI) to help coordinate and implement faith-based initiatives. His second executive order created faith-based centers in five cabinet-level departments; two later orders added five more.

The regulatory and tax proposals attracted controversy and failed in Congress, but the WHOFBCI and its satellites succeeded behind the scenes in changing regulations, earmarking money for faith-based organizations, and generally transforming the relationship between the executive branch and religious groups.

President Barack Obama retained the faith-based office, changing its name to the Office of Faith-based and Neighborhood Partnerships and creating an interfaith advisory council.

False Consciousness

False consciousness is a concept often attributed to Karl Marx and Friedrich Engels that explains the oppressive processes and the possible misguiding effects of the dominant ideologies on individuals and masses. In fact, Marx and Engels do not use the phrase *false consciousness* in their collaborative writings, although they clearly acknowledge the fact that ideologies imply a view of reality that is "illusory, deceptive, partial, distorted" (McCarney 2005). The idea of a false consciousness was later used by several philosophers such as the French poststructuralist thinker Louis Althusser, who explained that whenever masses adopt the dominant ideologies, they get a false representation of reality.

The efficiency of ideologies precisely creates in the minds of the masses a kind of illusion about one's place in society. For example, the working poor living in urban North America would feel less like victims or exploited workers if they regularly watched the evening news relate cases of poorer people living in the third world and facing natural disasters and political corruption. In other words, false consciousness is the distorted perception of the masses. According to Marxism, the common individual does not adopt a false consciousness because he or she is unintelligent or because he or she is voluntarily creating stories but rather because the dominant ideologies make the world and reality appear as represented by the dominants.

In that sense, the mass media often contribute to the reproduction and perpetuation of the false consciousness, while the alternative media often try to reveal and denounce it, traditionally appealing to the awakening of the silent masses and crying for social change. In the same fashion, totalitarian regimes, such as North Korea, encourage a flattering, idealized image of themselves and try to ban any kind of critique. In the first pages of his book *False Consciousness* (1962/1976), French sociologist Joseph Gabel identifies racism, such as anti-Semitism, and Stalinism as two important examples of false consciousness. Believers of these two ideologies were morally wrong although they were convinced that anti-Semitism and Stalinism were solutions for a better world.

The academic study of false consciousness is fundamental in disciplines such as political science, sociology, philosophy, and cultural studies. In 1960, French sociologist Pierre Bourdieu introduced the concepts of habitus and doxa to explain that most people accept the dominant ideologies as inevitable. The conceptual and theoretical study of false consciousness is also central in the works of European sociologists such as Karl Mannheim, Gyorgy Lukács, Raymond Boudon, and Nicholas Abercrombie.

Family Values

Although *family values* can, in theory, apply to any of the world's many cultures—entailing an endorsement of traditional families as the building blocks of strong societies—the term has special importance for students of American politics and the American culture wars, which characterized the political landscape during the 1980s and 1990s. While never a strictly partisan term, *family values* played an important role in the Republican Party's efforts to gain and keep the support of social conservatives during those years and into the twenty-first century. Vice President Dan Quayle's address to the Commonwealth Club of California in the spring of 1992—in which he criticized television character Murphy Brown for bearing a child out of wedlock, connecting a post-1960s "poverty of values" with the hopelessness of urban poverty that fed the Los Angeles riots of that year—represents perhaps the most noted example of the rhetoric of family values.

Family values is an umbrella term referring to issue positions that combine a rejection of the many changes in post-1960s sexual morality with a defense of traditional family structures. It emerged out of opposition to the rise of modern feminism, *Roe v. Wade,* and the proposed Equal Rights Amendment, each of which was presented as part of a wider assault—pursued by a countercultural elite—on traditional values. (The Family Research Council, the American Family Association, and Focus on the Family—three of the most prominent groups promoting a family values agenda—were formed between 1977 and 1983.) Just how closely such family values resemble actually existing families in the nation's pre-1960s past remains a contested question, as Stephanie Coontz argues in *The Way We Never Were* (1992). The positions generally subsumed under the category of family values include a defense of traditional heterosexual marriage and support for legislation or a constitutional amendment defining marriage as the union of one man and one woman; opposition to abortion and support for adoption alternatives; support for public policies that encourage intact, two-parent families and discourage divorce; and opposition to media violence and pornography. Somewhat more broadly, family values evokes such character traits as deference toward authority, self-discipline, sexual restraint, and respect for one's elders.

Although, as mentioned above, the politics of family values in the United States does not divide evenly along partisan lines, it is undeniable that the Republican Party has been far more adept than the Democratic Party at building alliances based on such an agenda, and strong Christian right support for Republican candidates throughout the 1980s and 1990s provides evidence of this Republican success in speaking the language of family values. (More generally, Bill Clinton's critics often cited his admission of marital infidelity as evidence of his lack of commitment to traditional family values.)

Democrats speak of family values as well, but with far less attention to sexual behavior and far more attention to economics, often stressing a commitment to such issues as a living wage for working families threatened by poverty, universal health care to enable families to pay skyrocketing bills, and support for government services that aid families in balancing work and home life. Hillary Clinton's book *It Takes a Village* (1996), published while she was First Lady, places special emphasis on the many important factors outside the family that influence children's prospects for safe and happy lives. Bob Dole, the 1996 Republican presidential nominee, fired back in his acceptance speech, "It does not take a village to raise a child. It takes a family to raise a child." And in 2005, then senator Rick Santorum (R-Pa.) authored *It Takes a Family: Conservatism and the Common Good,* an overt demurral from Clinton's earlier work.

Debates about family values often evoke the culture wars thesis about American politics during the 1980s and 1990s. James Davison Hunter (1992) sketches out an American cultural-political landscape populated by two competing moral visions. On one hand, Americans holding orthodox views tend to see truth and morality in fixed terms and occupy tightly bounded communities that locate the sources of moral authority in an unchanging transhistorical or transcendent essence. Such a position views moral obligations as fairly concrete, personalized, unchanging, inflexible, and unaffected by the passage of time or with scientific or technological progress. On the other side of the cultural battleground, Hunter locates progressives who understand moral obligation and commitment as requiring a sensibility to historical or situational context and who view ethical obligations as unfolding and evolutionary in nature.

Fanon, Frantz

Frantz Fanon (1925–1961) was an ethno-psychiatrist and political theorist who spent his adult life fighting racism and promoting social justice. He was a Renaissance man who practiced medicine, actively resisted French imperialism, and wrote prolifically on a range of issues across the disciplines of political science, psychology, sociology, and economics. He is

widely known in the early twenty-first century as an antiracist revolutionary who advocated violence as a means of liberating the third world from European colonialism.

Fanon was born in Fort-de-France, Martinique. He was the fifth of eight children born into a middle-class black family that had the means to send him to the Lycée Schoelcher, where he received a French-colonial education. As an Afro-Caribbean growing up in a French colony, he witnessed at an early age white condescension and racism toward blacks. At the same time, he was taught by the Négritude poet Aimé Césaire, who challenged the dominance of French culture and advocated black pride. The psychology and politics of colonialism thus became dominant themes in Fanon's life and work.

In 1943, at the age of eighteen, Fanon joined the Free French forces led by Charles de Gaulle and was sent to fight in North Africa and Europe during World War II (1939–1945). After the war Fanon returned to France and studied psychiatry at the University of Lyon. He defended his dissertation in November 1951 and in the following year married Marie-Josephe Dublé, with whom he had one son. While working at a hospital in Saint-Alban, France, Fanon observed a variety of psychiatric problems among Algerian and Moroccan immigrants resulting from French racism, which he called the "North African syndrome." These experiences provided material for a collection of essays on language, sexuality, racism, and black identity that were published in a seminal book titled *Black Skin, White Masks* (1952).

In 1953 Fanon was appointed chief physician at the state hospital in Blida-Joinville, Algeria, which was then part of France. While caring for patients there he again observed the many pathological effects of French racism against the Algerians. Deciding that he could no longer work for the French in their colonial hospital, he joined the Algerian independence movement Front de Libération National (FLN) and resigned from his post. The French subsequently expelled Fanon and his wife and son from Algeria. Exiled in Tunisia, he continued practicing psychiatry and began writing for *El Moudjahid* (The Freedom Fighter), the underground newspaper of the FLN. He became the spokesperson for the FLN, twice narrowly escaped assassination, and in 1960 served as the Algerian ambassador to Ghana.

Fanon was diagnosed with leukemia in late 1960 and sought treatment first in the Soviet Union and then in the United States. While sick and dying, he hurriedly finished *The Wretched of the Earth* (1961), a masterpiece for which French existentialist philosopher Jean-Paul Sartre wrote the preface. This book, in which Fanon wrote that colonized peoples are emancipated through violence against their oppressors, quickly became an iconic handbook of third world liberation. When Fanon died on December 6, 1961, at the age of thirty-six, he was hailed by many as a revolutionary prophet.

Al-Farabi

Muhammad ibn Muhammad ibn Uzalagh ibn Tarkhan Abu Nasr al-Farabi (c. 870–950) probably was born in Wasij, a village area of the city of Farab in Transoxiana. Likely of Turkic origins, he has become known in modern times as al-Farabi after his city of origin rather than as Abu Nasr as was traditional among Muslim scholars.

Many of the details of al-Farabi's life are unclear. One source is his short semiautobiographical history of philosophy, *Kitab fi zuhur al-falsafah* (*Book on the Rise of Philosophy*), which survives as a few fragments documenting several events in his life.

A prolific author, al-Farabi completed more than one hundred books dealing with logic, literary theory, politics, philosophy, and all the sciences known to the medieval world, with the exception of medicine. Al-Farabi was fluent in Arabic, Turkish, Persian, Syriac, and Greek. As a linguist he wrote several commentaries on Aristotle's *Poetics, Rhetoric,* and *De Interpretatione.*

Al-Farabi probably completed his Quranic studies in Bukhara, where he became an Islamic judge (*qadi*). He was a practicing Sufi whose musical writings included discussions of the therapeutic benefits of music on the soul. These discussions were allied with his writings on psychological matters.

To complete his mastery of Arabic, al-Farabi studied in Baghdad. He also mastered the subject of logic, surpassing his teachers in the subject and dominating the field during his lifetime. One of his logic teachers, Yahanna ibn Haylan, a Nestorian Christian, made the writings of Neoplatonism available to him.

Al-Farabi traveled to Egypt and Ascalon after his stay in Baghdad. He then moved to Aleppo, where the Hamdani ruler Sayf al-Dawlah, a patron of the arts, took al-Farabi into his court.

Because of the importance of his work in philosophy, al-Farabi is called the Second Teacher (*al-Mu'allim al-Thani*) in the history of Islamic philosophy, with the first teacher or major philosopher being al-Kindi. As a philosopher, al-Farabi was greatly influenced by Neoplatonism, expressing his metaphysical views in his work, *Ibsa al-Ulum* (*The Enumeration of the Sciences*).

Al-Farabi was the first Muslim to write works on political philosophy. He was also the greatest political philosopher of the early Middle Ages. His political works were the last of his writings and include *al-Siyash al-Madaniyah* (*Civil Polity*), *al-Sirah al-Fadilah* (*Virtuous Regime*), and *al-Madinah al Fadilab*

(*Virtuous City*). In addition, his summary of Plato's last book, *Laws,* was the only commentary on the book until the 1800s.

Farm Lobby

The farm lobby is a collection of interest groups representing agricultural producers in the United States. It held sway in U.S. agricultural policy for most of the twentieth century and continues to be influential today.

The political organization of farmers in the United States began with the Granger movement, which lobbied successfully in state legislatures for the regulation of railroads in the 1870s and 1880s. The movement produced several state associations and the first national organization of farmers, the National Grange of the Order of Patrons of Husbandry, which was founded in 1867. However, farmers' organizations did not establish a permanent presence in Washington until World War I (1914–1918) when the National Grange, the National Farmers Union, and the American Farm Bureau Federation opened offices in the nation's capital. Of the three peak associations, the Farm Bureau had the largest, most prosperous, and most broadly dispersed membership, and it was the most significant by a good measure.

The farm lobby rose in access and influence during the interwar period. In one notorious instance in 1921, it enlisted a farm bloc of sympathetic senators and representatives and ambushed the congressional leadership on the eve of adjournment, winning several concessions, including passage of the Packers and Stockyards Act and the Futures Trading Act. Motivated to address a postwar economic crisis, it invested most of its energy in a campaign for economic aid to its core constituency, farmers of corn, wheat, cotton, tobacco, and milk. Unsuccessful in the Republican era, its lobbying efforts paid off with the passage of the New Deal Agricultural Adjustment Act in 1933. The farm lobby played a central role not only in Capitol Hill committee rooms but also in the offices of the U.S. Department of Agriculture and in the farmer-elected Agricultural Adjustment Act committees that administered the subsidy program in the countryside.

For its first three decades, the farm lobby maintained a bipartisan posture, working with farm state representatives and senators on both sides of the aisle. However, after the Second World War, debates about the nation's agricultural policy became politicized, and the farm lobby split on ideological lines. During the Eisenhower and Kennedy-Johnson administrations, the Farm Bureau and other conservative elements of the farm lobby supported Republican reforms in the agricultural subsidy programs that were opposed by the Farmers Union and other liberal groups. As interest groups representing producers of particular commodities proliferated, the farm lobby also fragmented. In the 1970s, the farm lobby patched up its ideological divisions, but it no longer speaks in one voice to the extent it did at midcentury. Still, the farm lobby remains a formidable presence in its domain. Since the Reagan administration, it has successfully resisted Republican attempts to curtail agricultural programs and Democratic initiatives to turn them to broader, progressive purposes—despite the dramatic decline in the economic and electoral importance of farmers.

Because of the farm lobby's political prowess, political science scholarship has taken an active interest in it. The farm organizations were among the earliest mass-membership advocacy groups, and they are a subject of many leading studies of interest group mobilization and membership. Truman (1951), for example, uses the agricultural sector to illustrate the way destabilizing disturbances in social relations propel the formation of lobbying groups, and Olson (1971), in critique, draws on the history of the Farm Bureau to show the importance of selective incentives in the maintenance of collective action. The farm lobby's interventions in the political process are textbook cases of the ways and conditions of interest group influence in American politics. With studies of agricultural politics, political scientists have analyzed the methods of group representation in Washington, influence of group cohesion and governmental structure, patterns of cooperation and conflict, exchanges of political intelligence and support, financial contributions to election campaigns, logrolling and coalition building, and organizational repertoires and governmental reforms on interest group access and influence.

The farm lobby also figured in the development of the pluralist model of American democracy and critiques thereof. In a classic statement of pluralist theory, Truman (1951) used the activities of the farm lobby to develop a group interpretation of American politics, depicting the political system as an equilibrium among organized and potential interest groups. In an early critique, McConnell (1953) related the decline of broad, inclusive, and democratic agrarian politics to the rejection of party mobilization and the embrace of interest group politics in the formation of the Farm Bureau. Likewise, Lowi (1979) used the farm lobby's involvement in legislation and administration of agricultural policy as a prime exhibit of the pathologies of pluralism's progeny, interest group liberalism.

Fascism

As an ideal type, Fascism is an ultranationalist totalitarianism of the extreme right and an ideology of the twentieth century, the era of mass politics. Fascism has appealed to people who reject modern bourgeois democracy, with its individualism and materialism, but who also oppose revolutionary communism.

The earliest Fascist governments were a reaction to the social upheaval, economic decline, and psychological impact of World War I (1914–1918) and its aftermath in postwar Europe. The despair of Europeans, their suffering and deprivations during this interwar period (1918–1939), together with the fear of communism, fed into a willingness by many people to blame other groups (usually racial) and nations for various economic and social problems, and to follow politicians who voiced their grievances. The rise of Fascism demonstrates how democratic liberties can be abolished and totalitarian ideas and regimes gain acceptance.

REGIMES

The first Fascist government came to power in Italy in 1922, led by Benito Mussolini (1883–1945). Mussolini skillfully combined syndicalism with nationalism. He called for direct action and advocated a national mission to revolutionize society from above, using government, and from below, using a mass movement to create an organized and robust community. To Mussolini, all liberty belongs to the state, and the only individual rights are those that stem from the needs of the state. Under the guidance of its natural leader, or *Duce,* the nation finds liberation from bourgeois and Marxist values in a culture dominated by elite warriors, heroic men ready to sacrifice their lives and their treasure for the good of the nation.

Adolf Hitler (1889–1945) came to power in Germany in 1933, demanding revision of the entire domestic and international order and promising new, permanent solutions. The

Benito Mussolini, left, and Adolf Hitler led the first fascist governments, capitalizing on nationalism, racism, and imperialist expansion to maintain their regimes.

prior government, dominated by social democrats and their allies, seemed unable to respond to a series of crises faced by a German people despondent after losing World War I and confronting heavy war reparations, together with massive unemployment, daily violence in the streets, runaway inflation, and a worldwide economic depression. The result was a population with shattered belief systems, willing to submit to any authority that promised to reestablish the old values and greatness of the past. Offering national salvation and leading a political revolution that secured social stability by applying a reactionary program combined with economic and social modernization, Hitler soon replaced the democratic constitution of the Weimar Republic with a dictatorship of his National Socialist German Workers', or Nazi, Party that made him supreme leader (*Fuehrer*) of both state and party.

Hitler's autobiography, *Mein Kampf* (1925, 1926), presages key themes of his years in power. He combines radical and

conservative notions in an often-shifting muddle of ideas. Hitler views Mussolini as an early model but soon surpasses him, emphasizing a more virulent form of racism that is irrational, anti-intellectual, and antimodern on its face and includes large doses of pseudoscientific social Darwinism: all life is an instinctive struggle by the pure race for victory over all other races, and for a loving unity among racial brothers. This is the historical destiny of the superior Aryan race.

Hitler posits that world history is made by culture founders, the pure race, which is strong, loyal, and willing to realize its historic mission and obey the leader. This race is the source of all natural leaders and is destined to rule the world. All loyal members must be willing to sacrifice themselves to this end, to be ready to hate and kill their racial enemies to the point of total extermination, and to dedicate themselves to absolute obedience to the leader and his chosen deputies.

Hitler's regime institutionalized the leadership principle. He was the absolute leader, answerable to nobody else, the only one who truly knew the will of the people and could lead them to their promised destiny as rulers of the world. He instituted a virtual police state under the direction of Heinrich Himmler (1900–1945), which empowered the new, paramilitary army of elite men whose only thoughts were to obey and fight for their leader to establish a legal reign of terror, including establishing death camps and concentration camps, and to arrest, imprison, and murder enemies of the regime. Every institution was designed to express the spirit of the *Volk* and to advance the victory of the Aryan race. To gain control, Hitler's followers first used street violence. Once in power, state violence was employed.

Together with his minister of propaganda, Joseph Goebbels (1897–1945), Hitler refined the big lie as a means to keep the masses in line. They used emotional appeals to a romanticized nationalism, including myths of a wonderful past that would be resurrected once all their enemies were defeated. A cult of personality was created around the supreme leader.

Mussolini's Fascist Italy and Hitler's Nazi Germany provide two concrete examples of Fascism in practice. They illustrate both the interaction of ideas and their application in a tangible setting, which at times led to the diluting or jettisoning of what had earlier seemed to their followers essential objectives. Many ideas were declared but never implemented, such as nationalization of trusts, profit sharing by large enterprises, communalization of wholesale distribution, and division of landed property. Indeed, some of these ideas were directly undercut by Hitler's support of conservative elites willing to be co-opted by him, such as the Prussian landed aristocracy, the military, the bureaucracy, and major capitalists. But he voiced a few constant themes: racial purity, the leadership principle, and the importance of *Lebensraum,* or imperialist expansion of national borders to provide living space and abundant resources in the east for favored ethnic groups.

AIMS AND METHODS

In light of the often thin relationship in Fascist governments between theory and practice, some consider the importance

Fascists place on irrational myths, social Darwinist ideas such as survival of the fittest, and racism as a capricious mix of often conflicting or incoherent promises signifying little of substance other than political opportunism in the service of power. Nevertheless, there are constants that can be identified, then related to philosophies and other ideologies and illustrated with reference to the goals and practices of actual regimes.

Fascist goals are reactionary, offering coordinated political action to revive a mythic triumphal era of the past, including traditional class structures and relationships, through the creation of a new order dominated by a new man whose mission is to cleanse the world of all enemies of the people, revolutionize society, and create a new way of life and a new civilization to be enjoyed by all. Only then can a new national civilization be realized.

Fascism promises to secure these utopian goals by instituting an elitist, repressive state apparatus that does not shrink from violence and bloodshed. Fascists believe the state should have every right to intervene in any sphere of human activity. Total conformity is demanded. No individual or group political or social rights against the state are permitted; neither is any disagreement with state goals. Any who are different and who might dissent and thus threaten the regime lose their freedom to act independently, especially religious and labor groups, academics and other intellectuals, and artists.

Fascism sees unlimited government at the moral center of the nation, and only a single political party is permitted to exercise total power. That party and its offshoots in the government and secret police organizations embody all the virtues of the new man, whose only purpose is to obey and fight for the leader. These bodies are entitled to wield unrestricted power as their members employ a monopoly of terror, organized violence, even genocide, unchecked by any law, against regime enemies.

Fascists' reviled enemies are members of repudiated, purportedly inferior racial, religious, or other targeted groups, such as homosexuals and assertive women. But the common foe also includes supporters of parliamentary democracy and Marxists. Fascists disdain the methods of the former, including their espousal of individual liberties, the rule of law, and open and competitive elections, and they reject the goals of the latter, such as the wish to create a society of economic and social equals where neither nation nor state has any purpose. Xenophobic hatred of enemies and foreigners is both a result of such revulsion and a useful tool for unifying the population behind the leadership and giving it an outlet for its grievances.

Fascists claim this serves the real interest of all the people. *The people,* it should be clear, does not refer simply to those living within the geographical borders of the state. In this new homogenized and revitalized organic community, membership is restricted to members of the preferred ethnic or national group, race, or religion.

Under Fascism, religion becomes a tool of the state. Traditional religions are subordinated to newly devised, quasi-religious beliefs and co-opted as a way to further the regime's

power. These new beliefs promote a messianic civil religion that promises national resurrection. Fascism posits that this will be accomplished by a communal body of believers who owe their highest loyalty not to themselves, their families and friends, or any traditional religious authorities who do not share the vision of the leader but to their nation.

As an alternative to coercion, Fascists seek the cooperation of established conservative elements of the old regime, including army, church, and industry. Each group is promised rewards: the protection of private ownership and virulent anti-Bolshevism for the owners of production, full employment for the workers, national regeneration for traditional conservatives, imperialist ventures for the military, state support for compliant religious authorities, recognition of special status for farmers and peasants, and encouragement to engage in xenophobic nativism for the masses seeking scapegoats for their grievances, real or imagined. As William Brustein (1996) argues in his book *The Logic of Evil: The Social Origins of the Nazi Party,* the motives of these groups may provide evidence for the thesis that many Germans joined the Nazi Party to promote their economic interests.

Change comes from the top, engineered by a government using the power of the total state dominated by a single political party and headed by a self-anointed supreme leader who embodies the national will and is aided by a paramilitary vanguard. Together they pledge to transform the chaos and degeneracy of the past into a resurgent community. The state is the creator of all values, secular and spiritual. It embodies national unity and is the guarantor of this oneness. Its strength is in the spiritual union of the masses. The nation is the source of all that is good—culture, civilization, true freedom—and the duty of all people is to patriotically serve their nation.

In the new community, equality of all is impossible because the masses are not fit to govern. The only attainable equality of the atomized masses is that of conformity as obedient contributors to the goals proclaimed by the leadership. When directed to it, even mob action is an appropriate means of public policy, particularly when carrying out racist policies. Regime supporters are whipped into a hysterical state in mass meetings by carefully crafted calls to defeat perceived enemies, all of whom can justifiably be subjugated, even eliminated.

Following a military model, at the head of this movement is the charismatic leader, the undisputed possessor of all the virtues of the new man, who instinctively knows what the incoherent masses really want because he embodies the spirit of the people. He is above criticism, as he is never wrong. All power flows from his desires, his will, his commands. He is the embodiment of the national purpose, the head of nation, state, party, and all their organs. He chooses the few qualified to serve as his subordinate leaders, who are often allowed to operate, unchecked, in their own assigned spheres of influence.

The leadership is almost exclusively male. Those few women who have a government function are placed in positions subordinate to men because of their assumed inferiority, and they are given work that is stereotypically the province of females, such as directing a women's organization or working as a secretary.

Traditional gender roles are rigidly observed. The state is the guardian of public morals and actively suppresses banned activities, such as demands for gender equality and homosexuality.

In elevating the leader to a godlike status among the people, the state's organs monopolize all means of information and communication, both to propagandize in support of the regime and to limit internal opposition. This monopoly enables the media to generate big lies without fear of contradiction. Big lies are untruths of such enormity and impudence that they are certain to influence the masses, for whom an emotional response is easier than reasoning.

State organs of propaganda also create a communal liturgy for mass organizations, where patriotic rituals, such as parades, songs, and flag-waving rallies, replace rational discussion and deliberation. They develop cults of physical strength, personal sacrifice for the fatherland and its people, and the need for violence and brutality toward enemies as they engage in imperialist conquest in pursuit of utopian goals.

War is good. It shows the capacity of individuals for sacrifice and mobilizes the masses for common purpose. It illustrates the value of unity of command, centralization of authority, and hierarchical leadership.

The state is the master of the economy. Fascism utilizes new methods for enhancing state power through control, planning, and mobilization of the national economy, including agriculture, industry, and finance. While Fascist regimes may permit ownership of private property and capitalist enterprise, these are subject to state regulation. Business and labor are placed in an organic and corporatist relationship with the state. These ties are organic, wherein individuals and groups are seen as subordinate parts of a complex structure of interdependent elements whose roles and value are determined by contributions to the state. Thus, where business or other elites have been active in putting a Fascist government in power, they have contributed and can expect to benefit.

Corporatism refers to a harmonious society divided into a limited number of noncompetitive corporations or monopolies based on the function each performs, such as labor or management. These corporations are created and sanctioned by the state to represent the interests of each functional group when economic decisions are made, but under close control of the regime. They replace both independent trade unions and owner organizations. Strikes are illegal, disputes are mediated by state agencies, and government sets all prices and wages. Class antagonism and class struggle are replaced by state-guided cooperation and an almost feudal bond between classes. All classes work together, each to its own task, each to its own place in a hierarchy, and each to its (unequal) rewards.

INFLUENCES

Fascism draws on certain ideas of political philosophy and incorporates ideas from other ideologies, particularly nationalism and anarcho-syndicalism, as well as from the organicist strain of socialism. From the ancients, such as Plato and Aristotle, Fascist thinker Giovanni Gentile (1875–1944) took the idea that humans are by nature social and political animals who are

free only as members of a community, in opposition to those liberal democrats who think humans are atomistic individuals.

Assimilating ideas from Machiavelli, Rousseau, and Hegel, Maurice Barrès (1862–1923), French politician and theorist, favored extreme nationalism. The central goal of politics is organizing and maintaining the power of the nation that expresses the organic needs of the vital collective. A strong hierarchical regime organizes the masses for united action. Incorporating biological determinism, romanticism, social Darwinism, and anti-Semitism, Barrès saw an unconscious, irrational vitalism at the root of the national soul. All values, such as justice and liberty, even honesty, must be measured in relation to the indispensable needs of the nation and the essential requirement that it conquer its enemies, especially the twin evils of Marxism and liberal democracy.

Georges Eugene Sorel (1847–1922) was an anarchist of the syndicalist school who supported socialism through collective action of the workers but preferred strikes and direct action to politics. In *Reflections on Violence* (1908) he advocates a general strike by the working class that would swiftly lead to a violent revolution that would wipe out decadent bourgeois society. Parliamentary government would be replaced by workers organized into industrial syndicates. These small economic communities would serve as the center of economic, social, and indeed all productive life, and all daily decisions would be made by people at their workplaces. Mussolini used some of Sorel's ideas, skillfully combining syndicalism with nationalism.

CONTEMPORARY FASCISM

Today Fascism is widely reviled. Still, most Western industrial nations have small, transitory groups that could be considered neo-Fascist and that often model themselves on Fascist movements of the past, agitate for their version of chauvinism and racial purity, and threaten a revival of some kind of Fascist government. These include political parties and organizations such as the National Socialist Movement and the Ku Klux Klan in the United States, Pamyat in Russia, the National Alliance in Italy, the National Front in France, and the Freedom Party in Austria.

In addition, some scholars have regarded movements and regimes in Latin America (Peron's in Argentina, Stroessner's in Paraguay, Pinochet's in Chile), Africa (Qaddafi in Libya, the National Party in South Africa), and Asia (Hindu extremists in India and governments in China, North Korea, and Myanmar) as Fascist. Other writers consider a number of these as more authoritarian than Fascist, and the difference between the two remains open to debate. Today the Internet serves as a means to propagate race hatred, anti-Semitism, and Holocaust denial, frequent themes of contemporary Fascists.

What has been termed Islamo-Fascism is an extreme fundamentalist version of Islam. It is a response to the failure of Western and Marxist ideologies to meet the perceived needs of the masses in Middle Eastern nations. It preaches such messages as the need for revolutionary struggle against enemies and the use of the power of the state in a totalitarian manner to achieve utopian goals, including a regenerated worldwide league of Muslim nations that would serve as a bulwark against the decadent, secular, capitalist Christian and Jewish West. As a result of an apocalyptic war, the Islamic caliphate of ancient times would be reestablished in a new society. The former Taliban regime and its warrior loyalists in Afghanistan and elsewhere reflect this outlook.

The evaluation of the impact of Fascist regimes depends on such empirical questions as whether the leaders are all powerful or rule over a mix of competing subordinates and bureaucrats of both state and party. For Nazi Germany, at least, regime outcomes might have reflected the unplanned consequences of competing elites in the economic sphere. But the case can be made that when it came to the Holocaust, a—perhaps *the*—major policy initiative of the Third Reich, there was a unity of purpose that, in most cases, reflected the direct and total wishes of Hitler. Another dispute is between so-called functionalists and intentionalists about whether most governmental action in Fascist nations was accidental or planned. Again looking at the Holocaust, one sees a series of carefully planned actions that were implemented in a sometimes-haphazard manner due to unanticipated circumstances, as observed by Daniel Goldhagen (1996). Finally, Hannah Arendt (1951) raises the question of the pervasiveness of totalitarianism. Were all Germans cowed by the organs of the state, particularly the secret police, or was the regime sensitive to popular resistance and willing to allow some individual liberty and choice? Once more, the Holocaust is instructive: a few favored elites who had Jewish ancestry may have escaped the heavy hand of the Nazi regime, including most notably Himmler's immediate subordinate, Reinhard Heydrich, and Erhard Milch, the head of the German Air Force. But with the exception of a few selected key people, resistance to this policy was typically met with severe retribution, including arrest, imprisonment in a concentration camp, and even execution. Until his assassination, Heydrich was one of the major enforcers of this strict policy.

Fascist Parties

Fascist parties evolved in most European societies after World War I (1914–1918), and the war was the most important reason for their emergence. Fascist parties were often founded after 1918 by semidemobilized units from regular armies, and they reflected both the incubated nationalism generated by the war and the extremely high levels of militarization that marked many European societies after armistice. The most notable parties broadly characterized as Fascist are the Partito Nazionale Fascista (PNF) in Italy, the Nationalsozialistische Deutsche Arbeiterpartei (NSDAP) in Germany, and the group of parties known as the Falange in Spain. Less significant examples of Fascist parties are the British Union of Fascists, the Arrow Cross Party (Hungary), and the Iron Guard (Rumania). Fascist parties were normally organized around one powerful leader: for example, Mussolini in Italy, Hitler in Germany, and Franco in Spain.

FASCISM, LIBERALISM, AND CAPITALISM

Fascist parties were defined by their hostility to the pluralistic principles of liberal democracy, and they normally came to power by mobilizing paramilitary units to contest the power of the democratic state and to disrupt normal democratic procedures. Where they entered government, Fascist parties either suspended or demolished the institutions of liberalism, that is, elected legislatures, independent judiciaries, and formal constitutions. They opted instead for a system of strong leadership, in which the directive or quasi-dictatorial force of the party was checked neither by countervailing powers nor by catalogues of general rights, and in which the party executive fused functions normally divided in liberal states between legislatures and executives. In most cases, Fascist parties imposed strict censorship on the media, and they ensured that activities in civil society were subject to repressive control. Fascist parties were also marked by the belief in the integrative function of extreme nationalism. This latter feature meant that some Fascist parties pledged themselves to racist policies and legislation. The NSDAP was a fervently anti-Semitic and racist party, and after its assumption of power in 1933, it violently persecuted all minorities, especially Jewish people. However, the PNF was not originally a racist party, but it began to adopt racist policies in the later 1930s. The nationalist regime in which the Falange was integrated was not essentially marked by racist policies.

In addition to World War I, the factor triggering the growth of Fascist parties was the economic crises of the early 1920s and 1930s. The appeal of Fascist doctrine was conditioned by a widespread anxiety about both the collapse of capitalism and the threat of Bolshevik revolution. Fascist parties tended initially to campaign on a collectivist platform, and both the PNF and the NSDAP employed anticapitalist rhetoric in their earliest manifestos. Debate still persists as to whether Fascist parties should be classified as belonging to the family of left-wing or right-wing parties. However, it was crucial to the structure of Fascist parties that they lacked a solid ideological core, allowing them to adapt their message to the opportunities of the political landscape in which they operated. In most European countries after 1918 the anticapitalist vote was already captured by entrenched socialist and communist parties, so Fascist parties soon abandoned their anticapitalist stance and recruited support from among the middle classes and even (albeit to a debatable degree) among business elites, who were alarmed by the rise of the far left and the power of the union movement. Fascist parties thus developed a catch-all ideology, which traversed a number of points in the conventional left/right spectrum, and this eclectic ideological design was fundamental to their success. This meant that Fascist parties could create unusual cross-class fronts and that they could produce new and destabilizing political cleavages to weaken established parties. In consequence, Fascist parties tended to campaign successfully in political systems whose transitions to parliamentary democracy had lacked deep consensual foundations, that were marked by precariously balanced and easily unsettled coalitions, that possessed strong left/right polarizations, and in which no one social class possessed a clear monopoly of power. A divided labor movement was a common precondition for the emergence of strong Fascist parties. Once established in power, Fascist parties did little to alter existing patterns of production, and they pioneered a highly technocratic pattern of corporate-capitalist growth management.

FASCISM AND WEAK STATES

Fascist parties also tended to be successful in societies that were marked by a history of weak or belated state integration. In Italy and Germany, in particular, the delayed process of national unification in the 1860s and 1870s meant that these countries were governed by states that lacked institutional cohesion, that struggled to perform reliable fiscal and judicial functions, and that failed to exercise power evenly across all their territories. In consequence, these states could be easily destabilized, their executive structures could be easily detached from their representative institutions, and they were highly susceptible to the influence of private groups seeking to arrogate public authority. Arguably, in fact, government by Fascist parties was not government by states at all: it was

government by compensatory organs of coercion, which assumed control of the means of public violence in societies in which the traditional organs of statehood were too weak to withstand intense economic pressures, and which farmed out state power to a diffuse array of quasi-privatistic societal actors and organizations. A strongly integrated state, possessing a broad-based democratic apparatus, was the main bulwark against the success of Fascist parties.

THE LEGACY OF FASCISM

Most Fascist regimes collapsed during World War II (1939–1945), and after 1945 Fascism lost potency. Some elements of Spanish Fascism arguably survived in South America, notably in Argentina under Perón. Some parties of the post-1945 European right have identified with the Fascist legacy. Examples are the Movimento Sociale Italiano in Italy, the Nationaldemokratische Partei Deutschlands and the Deutsche Volksunion in Germany, and arguably, the Front National in France. Since the 1980s, some populist parties, although clearly outside the Fascist camp, have successfully recruited voters by reviving elements of Fascist ideology. Examples are the Freiheitliche Partei Österreichs in Austria, the Progress Party in Norway, the Schweizerische Volkspartei in Switzerland, and the Alleanza Nazionale in Italy. However, most populist parties campaign primarily on an anti-immigration ticket, and their link with Fascism is merely a questionable element of their own propaganda.

Federalism

Federalism is a political movement that advances the governing concept of shared rule and self-rule through the development and operation of governmental arrangements called "federations." It represents an ideology of a particular form of divided government that promotes and preserves both unity and diversity. Most federal countries comprise some combination of territorial, ethnic, economic, and social diversity as the basis of their constituent units.

Although only about twenty-five or so existing nation-states encompass full constitutional divided rule federations, they tend to include many countries that are large in both area and population, for example, Argentina, Australia, Brazil, Canada, Germany, Nigeria, India, and the United States. Such smaller nations as Austria, Belgium, Malaysia, and Switzerland are federations as well. Also, many countries either experience high degrees of federal arrangements—Bosnia, Italy, Spain, South Africa, Ethiopia—or devolve substantial subnational autonomy in all or in parts—United Kingdom, Denmark-Greenland, France-Corsica, Tanzania—to be included in Federalizing nations. In addition, supranational movements such as the European Union (EU) are federal-like or at least confederal in nature. The EU country interests are struggling with a constitution that vacillates between maintaining state powers and upholding the more Federalist view of forming a strong European government.

It is not easy to conceptualize Federalism, because of the variety of interpretations that have been ascribed to it in the three centuries or so of its modern existence. William Stewart (1984) provided a list of almost five hundred labels characterizing Federalism, for example, "centralized Federalism," "marble cake Federalism," and "judicial Federalism." The list has since grown considerably to include such common terms as *cooperative Federalism, coercive Federalism,* and *regulatory Federalism.* Recently, vertical fiscal imbalance in Spain and South Africa has been called "consumption Federalism," whereas Germany's proclivity to forge countrywide agreement on major policies is called "unitary Federalism."

How can Federalism and federation be defined both in practice and as objects of study? Preston King (1982) considers federation to be "an institutional arrangement, taking the form of a sovereign state, and distinguished from other such states solely by the fact that its central government incorporates regional units into its decision procedure on some constitutionally entrenched basis" (p. 8). Federalism, which obviously informs federation, is "the recommendation and (sometimes) the active promotion of support for federation" (p. 8). Daniel Elazar (1987) defines Federalism simply as self-rule plus shared rule, operating contractually on a noncentralized basis through a matrix of governments, with fluid power loadings. Since their inception in the late eighteenth century, Federalism and federation have become important areas of study within political science.

Unity in federal countries is represented by a single federal or general (national) government, whereas diversity is manifested through constituent unit governments: states, provinces, and regions. The general government holds together the constituent units and acts, for all the people, on behalf of the entire country. Diversity is enhanced by the power that is shared in constituent governments through its own set of institutions. Depending on the country, respective ethnic, economic, geographic, and social differences, in combination, normally demarcate these units.

Canadian provinces, for example, represent different linguistic-ethnic, geographic, and economic interests. Australia's federation is based largely on both geographic and economic differences; its states were preindependence colonies. Belgium is federated by linguistic-ethnic differences between the Flemish and Walloons. India's states are a mixture of historic principalities, distinct ethnic-language groups, British colonial demarcation, and religious preferences. In each case, federal arrangements have developed to allow for representation and promotion of these differences within the framework of a single country.

For some time, divided rule was considered to be a product of some bargain among sovereign entities that agree to yield sovereignty to increase their public security, sometimes economic interests, or both. William Riker (1964) notes that the product of the bargain is a division of final decisions between two levels. Alfred Stepan (1999) argues that the problem with this definition of origin is that many democratic federations follow a different political and historical logic, one of "holding together" through Federalism. He cites as examples India in the late 1940s, Spain in the late 1970s, and Belgium from the 1970s to the 1990s, where strong unitary features were set aside in favor of constitutionally devolved power and their polities were transformed into federal countries.

HISTORICAL DEVELOPMENTS

As numerous theologians and political philosophers have noted, the federal idea has biblical roots. Theologically speaking, the partnership between people and God as described in the Bible was covenantal in idea, which in turn was transformed to the covenantal (or federal) relationship between individuals and families leading to the formation of political bodies as compound polities. The term *federal* is derived from the Latin *foedus,* which like the Hebrew term *brit* means "covenant." The political application of this theological use gave rise to *federal* as explicitly governmental. The ancient Greeks used federal arrangements after the Peloponnesian War (431–404 BCE) for military purposes, as small city-states combined in limited union or confederation to ward off larger powers. The constituent cities delegated to federal rulers only military authority, retaining diplomatic, treaty, and related powers. Similarly, in northern Italy and southern Germany, medieval cities formed military confederations to resist the power of larger nation-states. Both of these federative movements suffered from increasing restrictions on the authority of military leaders by their constituent governments, which led to ineffective defensive performance and eventual dissolution. Moreover, in general, confederations were unable to mobilize sufficient political support or government power to maintain themselves in an age of exclusive nationalism. They proved unable to raise revenues, promote their economies, or even defend themselves.

That indeed is a primary force behind the American transformation from a confederation into the first modern federation. The Articles of Confederation were written in 1777 but were not adopted until March 1781 as the War of Independence from Britain (1776–1783) was ending. The roots of the struggle between the forces of strong national government and

independent states go deep into colonial history and experience, as do quasi-independence and partial self-governance under the British Crown. In the end the articles left ultimate power in the hands of states, whereas the general government was given, according to Merrill Jensen (1950), "specific and circumscribed powers."

The story of the first federation that followed the U.S. Constitutional Convention of 1787 is well known. The new federal system, which developed largely along nationalist lines and very much according to James Madison's image, would occupy some middle ground between a confederation of sovereign states and a consolidated (or unitary) nation. After much debate and compromise, a single countrywide union was formed that would act directly on the population, through representative assemblies rather than through the states. The national government was to be insulated from the direct political control of the states, but its own influences would be checked by division of institutional powers between the legislative bodies, the executive, and a judiciary. The new national government was to be a limited government of enumerated powers but with all of the necessary means to secure the safety, liberty, and prosperity of the larger community.

The nineteenth century saw the establishment of a number of federations or at least constitutionally federal regimes, influenced to some degree by the United States. The first was Switzerland in 1848, followed by Canada in 1867, the German Empire (and Reich) from 1871 to 1918, and Australia in the early twentieth century. Four Latin American countries—Venezuela (1811), Mexico (1824), Argentina (1853), and Brazil (1891)—followed suit with federal constitutions, although they all have faced varying degrees of instability and/or military governments that, in effect, have attenuated their federal arrangements and have experienced periods of strong centralization.

FEDERALISM IN THOUGHT

Neither the ancient Greek philosophers (e.g., Plato and Aristotle) nor their successors developed a theory of Federalism. The earliest writings surrounded the Swiss and Dutch confederations, which led to the first full-blown conceptual framework. Johannes Althusius (1562–1638) made the connection of union or *consociatio,* the first federal theory of popular sovereignty. Althusius stated in his *Politica* that "human society develops from private to public association by the definite steps and progressions of small societies, the public association exists when many private associations are linked together for the purpose of establishing an inclusive political order (*politeuma*)" (Carney 1964, 84).

The work of James Madison at the American Constitutional Convention and in the *Federalist Papers,* which supported ratification of the proposed Constitution, did the most to forge modern federal theory. Madison argued for a large republic in which both local and collective interests were to be represented, where power given by the people would be divided between two governments (*Federalist* No. 51). It is described as "a compound republic, partaking of both a national and federal character" (*Federalist* No. 62), "a confederated republic"

(*Federalist* No. 63), forming a combination of the great and aggregated interests, the local, and particularly state representations (*Federalist* No. 10). At the time Madison made no distinction between "federal," "confederate," and "confederacy," but Gottfried Dietze (1999) maintains that he clearly meant to distinguish between a compact forming a league among distinct societies and a compact by the people, not of individuals composing one entire nation but of the people of the states. The federal state is one state composed of several states, invoking "both the national and federal character" (*Federalist* No. 62).

Alexander Hamilton, like Madison, thought the supremacy clause granting the general government ultimate power when there were disputes among the levels is where the emphasis of Federalism lies. He writes in the *Federalist Papers,* "The vigor of government" is "essential to the security of liberty" (*Federalist* No. 1) and to be effective must possess energy in pursuing the public good (*Federalist* No. 30). He clearly considers territorial power (and institutional power division) less important than does Madison. The advantage of a modern federation is that it can act directly on individuals, and through its greater powers the federal government prevents states from falling into a state of anarchy, civil war, or dissolution. A strong federal government is more likely to slay "the political monster of *imperium im imperio*" (*Federalist* No. 15). Hamilton makes it clear that there is only one national government, one federal republic, one federal state.

Federal theory in the United States and elsewhere has naturally been expanded through the number of applications to different countries and, of course, as these countries evolve and deal with new situations. Robert Agranoff and Michael McGuire (2003) note that the application of U.S. Federalism has changed and theoretically has been characterized as dual, cooperative, coercive, and more recently open to a number of models of overlapping and opportunistic behavior. American theory in general has been centralizing or national in focus. In a similar vein, federal experiences on a cross-national basis have been ideologically identified as leaning toward pluralist in a multiple institutional sense, centralist in formation of a union, decentralist in the sense of reinforcing multiple power centers, and balanced between integration and diversification.

Federal theory has also been closely attached to particular value or normative positions. Alain Gagnon and Charles Gibbs (1999) indicate the three most central as (1) communitarian, both social and political; (2) functional, in the sense of operating manageable political systems; and (3) democratic, enhancing the liberty of persons plus participation of citizens and the promotion of equality. Promotion of these principles has evolved as being part of the federal ideology. For example, as democratic ideals and universal suffrage systems emerged, federal systems evolved along with the rise of democracy through political parties and other forms of mass political participation.

FEDERAL CONSTITUTIONALISM AND LAW

Ronald Watts (1999) writes that federal systems normally require "a written supreme constitution not unilaterally amendable and requiring the consent of all or a majority of the constituent units" (p. 7). Because federal countries share rule, their constitutions must identify the broad foci of powers since two levels govern the same territory and people and each has the authority to make some decisions independent of the other. Watts identifies the following essential features of federal constitutionalism: (1) delineation and distribution of powers and institutional structures, (2) broad design of constituent units, (3) allocation of legislative and executive powers, (4) essential federal or general government powers, (5) the role of constituent unit representatives in decision making, (6) special provision for proportionate representation, (7) role of courts and judicial review, (8) constitutional amendment processes, (9) protection of individual and collective rights, and (10) the status of the constitution as supreme law.

Most federal countries live under systems of dual constitutionalism wherein constituent unit's—states', provinces', and regions'—government constitutions frame their governments, similarly distributing powers among the legislative, executive, and judicial branches, and generate provisions governing local governments. Australia, Brazil, Canada, Germany, Mexico, Spain, and the United States are among those with subnational constitutions.

FEDERAL INSTITUTIONS AND POWER SHARING

Institutions within federal countries make a difference because they structure patterns of interaction within societies. One important institutional feature of federal countries is the distribution of powers between levels. In 2004 Enric Argullol Murgadas and associates examined the allocation of competencies by level in some twelve federal countries. In all systems some powers are exclusive by level, and some are concurrent, with residual powers varying by particular federal system. While such powers as foreign policy, defense, the monetary system, borders and immigration, and management of the economy are normally exclusive general government powers in all countries, a mixed pattern of overlapping responsibilities between the first and second tiers of governments exists in most countries, with states, provinces, or regions taking the lead responsibility for the operation of most domestic/welfare state functions, for example, employment, health, education, social services, and economic development.

Almost all federal countries employ legislative second chambers or senates that to varying degrees are representative of area or constituent units. Some are appointed, and some are popularly elected by the constituent units. Their powers vary considerably from country to country. In the United States, Australia, and Brazil senate and lower-house powers are equal, whereas in Canada and Spain second chambers are considerably weaker. Germany has a unique situation wherein the upper house *Bundestag* not only has equal powers to the *Bundesrat,* its parliament, but includes direct representatives from the *Länder* (state) governments, most of whom are Länder cabinet administrators.

Legislative bodies are normally organized by the major political parties that are in the majority and minority of each

chamber, similar to that of nonfederal parliaments. The parties in federal systems, however, are almost always organized on a federal basis. Spain's two major statewide parties, for example, maintain their basic units at the regional or autonomous community level so that, in effect, there are at least thirty-four party organizations (more, when nonstate parties are considered) that convene centrally only around general elections. The same pattern holds for Canada, Australia, the United States, and many other countries.

All federal countries distribute revenue powers among the levels of government, although the general governments tend to raise the largest sums of money. Vertical and horizontal (among subnational units) imbalances are then adjusted through such mechanisms as tax sharing and subventions. Older federations, for example, the United States, Canada, and Australia, use the federal general spending power for broad purposes, even those that effect exclusive powers of other levels. These actions have generally been upheld by their courts.

The divided power nature of federal systems means that some form of court must adjudicate jurisdictional disputes and resolve conflicts. Some differences are, of course, worked out politically and/or administratively, and some systems rely on referenda to settle some issues. All federations nevertheless provide for judicial remedies for disputes relating to federal questions, that is, matters of power and responsibility by level. Some countries use their general federal court systems to adjudicate such constitutional issues as well as other matters relating to general government. This is the case for Austria, Australia, Canada, the United States, Malaysia, and India. Other countries—Germany, Spain, and Belgium—employ dedicated constitutional courts, which specialize in matters of rights and constitutional interpretation, particularly matters relating to issues and conflicts between the tiers of government.

INTERGOVERNMENTAL RELATIONS

Fiscal and program interdependencies among governments mean that officials within federal countries must interact regularly. These actions are called intergovernmental relations (IGR). Dale Krane and Deil Wright (1998) define IGR as "the various combinations and interdependencies and influences among public officials—elected and administrative—in all types and levels of governmental units, with particular emphasis on financial, policy, and political issues" (p. 1168). The concept (not the practice) originated in the United States during the Great Depression of 1929, when new activities and programs drastically altered the concept of separation of functions by level of government. It has come to characterize the patterns of interaction among levels in many countries, particularly in federal systems.

Deil Wright (1988) sets out five distinct features that define and guide IGR studies: (1) number and types of governmental units, their legal status, and changes over time; (2) number and types of public officials by jurisdiction and unit; their background, attitudes, and perceptions of their roles and responsibilities; and their actions; (3) patterns of interaction among and between officials representing various jurisdictions and governmental units; (4) range of involvement by all public officials elected and appointed, national and local, executive, legislative, and judicial, particularly when involved in policies that affect multiple units; and (5) policies and programs implemented through intergovernmental arrangements, with emphasis on administrative rules in programming, fiscal flows, and services delivery. In many ways the process study of IGR as a means of understanding federal countries stands in contrast to and considerably enhances more legalistic and institutional analyses. It is studied in many other federal contexts under different labels, for example, "central-local relations" and "multilevel governance."

IGR unfolds in federal systems through a number of administrative, political, economic, and legal mechanisms or practices that operate across jurisdictional boundaries. Among the more important economic mechanisms are the various forms of subventions or grants, tax efforts (e.g., shared taxes), tax forgiveness/reciprocal taxation, fiscal auditing and accounting, intergovernmental loans, and intergovernmental fiscal equalization commissions. Among the more important and widespread legal mechanisms are regulations imposed by higher-level governments on subnational governments, cooperation and intergovernmental agreements among governments, and reciprocal or interdependent legal actions (e.g., EU social policy and the many organic laws governing subnational governments). There are several important political instruments, including various intergovernmental councils, first ministers' conferences in parliamentary federal systems, sectoral conferences, second legislative chambers in countries such as Germany and South Africa, forms of intergovernmental contacts and lobbying by individual officials and by associations, and use of internal political party channels to advance intergovernmental interests. Finally, the most notable administrative instruments include contracts for services, program assessments or audits, negotiation for performance or results in exchange for controls, and various forms of place-based or regional management at the horizontal level. While the extensiveness of these practices obviously varies from country to country, they have proved to be the major lenses through which researchers examine the various IGR dimensions.

SOCIAL FEDERALISM: VALUES AND ATTITUDES

Vincent Ostrom (1987) writes that the way "people think and relate to one another is a most fundamental feature in the governance of human affairs" (p. 10). It is believed that the manner and the customs of people, called "habits of the heart" by Alexis de Tocqueville (1848/1969, 305), include the covenantal forms of Federalism. To William Livingston (1952), where there are geographically distributed diversities the result may be a society that is federal, and "coherence in the society may depend on devolution upon these groups of the exercise of functions appropriate to the diversities they represent" (p. 37). Social Federalism includes (1) an underlying culture or belief in the values of Federalism; (2) mutual respect or comity among the partners, who will not harm one

another's interests; and (3) recognition by all or most parties of the social diversity that different constituent units manifest politically.

It is thus not only economic and political forces that ultimately make the outward forms of Federalism (e.g., an ideology) necessary. Social and cultural issues are also forces of maintenance and growth. Federal systems do not grow by accident but as a result of multiple forces. As William Livingston (1952) writes, "a federal system is consciously adopted as a means of solving the problems represented by these stimuli" (p. 36).

CONCLUSION

The Federalism idea involves both structure and processes of governance that seek to establish unity on the basis of consent while preserving diversity by constitutionally uniting separate political communities into an encompassing polity. Powers are divided and shared between constituent governments and a federal government, where the constituent governments have broad responsibilities and the autonomy to carry out responsibilities and the federal government undertakes broader countrywide responsibilities. A democratic federation is, in effect, a republic of republics, which emphasizes partnership and cooperation for the common good while also allowing diversity and competition.

In an era of increasing globalization and international interdependence, along with increased contemporary within-country emphasis on ethnic identity and decentralization, there are those who maintain that a postmodern era of Federalism is emerging that promotes a variety of new federal arrangements. To Daniel Elazar (1996), the nation-state system is taking on a new dimension or overlay on government, "a network of agreements that are not only militarily and economically binding for *de facto* reasons but are becoming constitutionally binding, *de jure*" (p. 419). These agreements are federal in nature, not in the sense of federation but in other ideational manifestations of Federalism, including the revival of such confederal arrangements as the EU, various union arrangements (United Kingdom), devolved regional autonomy (Italy), consociational arrangements (Belgium), federacies (Puerto Rico and customs unions), and leagues (North American Free Trade Agreement, free trade areas). The state is not going away, but new forms of shared rule or multilevel governance are emerging. Wherever both unity and diversity must be simultaneously preserved, Federalism is an ideology that can offer solutions.

Federalism, Comparative

Federalism is a principle of government that seeks to reconcile unity and diversity through the exercise of political power along multiple autonomous levels. The crux of this principle is the idea of combining self-rule and shared rule. Through Federalism, different political units can live together yet apart since they share a government while at the same time having their own.

Federalism as a principle has three main political uses: fragmenting political power to protect against absolutism (the case of the United States), decentralizing policy making to stimulate economic development and render government more efficient and closer to the people, and managing ethnic diversity by devolving power over fields that traditionally create tensions between the various communities (Canada and Switzerland).

FEDERALISM AND FEDERATIONS

If Federalism is a principle, *federation* refers to a specific type of political system where two or more levels of government are sovereign (autonomous) within their own given jurisdictions. Therefore, a federation is made up of a federal level of political authority and constituent (or federated) units whose names vary. In addition to the sharing of sovereignty between levels of government, federations generally present three features.

The first is a formal division of power between central and regional governments. Powers of federal governments almost always include citizenship and immigration, defense, foreign policy, international trade and commerce, and currency. Constituent units usually have power in the areas of language, culture, health, education, social services, and municipal affairs. Most federations also specify concurrent powers, that is, powers that should be exercised by both levels of governments.

The second feature of federations is that the division of powers is specified in a constitution. In most federations, constitutional change in the division of powers requires a qualified majority in the two federal legislatures, one of which represents the constituent units, and the support of a majority of the constituent units themselves. This is the case in the United States, where constitutional change necessitates a two-thirds majority in the House of Representatives and the Senate in addition to the support of three-quarters of the states. In Switzerland and Australia, the requirement is a qualified majority in the federal legislatures and popular support as demonstrated by a referendum where the change is approved by an overall majority and a majority of constituent units.

The third feature of federations is the representation of constituent units within central institutions. The idea of having constituent units participating in decision making and policy making at the federal level embodies the federal concern with unity, shared rule, and interdependence. The Senate of the United States provides meaningful representation for its constituent units because it combines formal power with the democratic legitimacy provided by the election of two senators per state.

INTERGOVERNMENTAL RELATIONS AND FISCAL ARRANGEMENTS

The study of comparative Federalism often involves a focus on intergovernmental relations and fiscal arrangements. The division of power in federations almost never translates into a situation where the two levels of government can act without having to interact with one another. This need for interaction explains why federations have developed mechanisms of consultation and coordination such as meetings between heads of government from constituent units and/or cabinet ministers and specific forums such as the Council of Australian Governments.

Federalism tends to give policy areas such as health care and education, which are expensive to fund, to constituents that have less revenue than the federal government. For this reason, federations have developed mechanisms for financial transfers that can be conditional or unconditional. Conditional transfers are transfers for which the federal government stipulates how the funds should be spent. Unconditional transfers come with no strings attached. In the United States, virtually all transfers are conditional. Constituent unit governments can have varying degrees of fiscal autonomy, which in turn conditions their budgetary situations. In federations in which constituent unit governments are strongly dependent on the federal government for financial resources but have the freedom to borrow, persistent deficits often result.

In giving autonomy to constituent units, federations may unwillingly accentuate uneven economic development. In this context, most federations (the United States being the exception) have equalization payments, which are unconditional. The idea behind equalization payments is to reduce socioeconomic disparities between constituent units and prevent disparities in the levels of social services among those units. These types of transfers generally stem from the federal government and are based on an agreed-on formula.

CENTRALIZATION/DECENTRALIZATION, SYMMETRY/ASYMMETRY

Comparative Federalism studies also involve researching the different outlooks that federations can take. Two pairs of concepts are frequently used to characterize federations. The first is centralization/decentralization, which refers to the relative power of the federal government and the constituent units. A centralized federation is a federation in which the powers of the federal government are relatively greater than those of the constituent units. A decentralized federation is a federation in which the powers of the constituent units are relatively greater than those of the federal government.

This being said, characterizing the degree of centralization/decentralization of federations is tricky because it is unclear which criterion should be used. At least three criteria can be considered.

The first is the written constitution. Which level of government is given more powers? Who has power over the most important fields? Who is given residual powers, that is, power over all fields that are not specified in the constitution? This is seemingly a straightforward approach for assessing the degree of centralization/decentralization of a federation. However, it is often misleading because federations change, sometimes becoming quite different from their original forms as specified in the constitution. A second criterion that can be used to compare the relative importance of public spending by the different levels of government is government expenditures. The argument is that federations with the highest percentage of public spending for constituent units are more decentralized since their units are the most able to use their powers to effectively provide public services. From this perspective, federations such as Malaysia and Austria are centralized, while Switzerland and Canada are decentralized. A third criterion involves looking at federal institutions. This angle involves focusing on the representation of the constituent units in these institutions and on their capacity to shape federal policy making.

In addition to being centralized or decentralized, federations can be symmetrical or asymmetrical. Symmetry means that all constituent units have a similar status and similar powers. In contrast, asymmetry involves one or more constituent units' having a distinct status and different powers. Asymmetry can be constitutionally specified. The Belgian constitution, for example, recognizes the existence of two types of constituent units, regions and communities, each with different sets of powers. Canada exhibits signs of political asymmetry, which refers to constituent units' developing a de facto distinct status or acquiring additional powers through informal arrangements. Quebec has greater powers than other provinces in the fields of immigration, pensions, taxation, and manpower training.

Federalism and Foreign Relations

Among the roughly 195 nation-states in the world today, only two dozen or so maintain federal systems of government, but these governments represent almost 40 percent of the world's population. In an era of globalization and growing interconnectedness among nations, many noncentral governments in federal systems have decided to engage in foreign relations. Flanders (Belgium), Catalonia (Spain), and Quebec (Canada) have the most active foreign relations programs in terms of money spent and personnel devoted to international activities. Quebec, for example, has created its own Ministry of International Relations with more than 550 personnel and an annual budget exceeding one hundred million dollars. In Canada, provincial governments are generally free to act internationally within their areas of competence outlined in the Canadian constitution, and the national government is expected to consult with the provinces before entering into any international treaty affecting these provincial areas of competence. In the case of Quebec, both the pro-Federalist Liberal Party and the pro-sovereignty Parti Québécois have consistently favored being engaged internationally.

In the United States, Article I, Section 8 of the U.S. Constitution, and the commerce and supremacy clauses in the same document, clearly indicate that the federal government is to play the primary role in foreign relations. However, almost forty state governments now operate about two hundred offices abroad, and most governors lead international missions every year. The federal government does not object to states' involving themselves in a wide range of international activities, but it frowns on states' making their own foreign policy. For example, Massachusetts mandated its own set of economic sanctions against Burma (Myanmar), and some states have attempted to impose sanctions on companies doing business with Sudan, Iran, and a few other countries. The federal courts have ruled that Massachusetts exceeded its authority in the Burma case and Illinois did the same in its sanctions against Sudan. The federal government wants to ensure that the nation will speak with one voice on major foreign policy issues and expects state governments to refrain from making their own foreign policy.

The North American Free Trade Agreement has helped intensify linkages between the provinces in Canada and the states in Mexico and the United States. A number of cross-border organizations have been created to facilitate greater regional cooperation among noncentral governments. Similar regional organizations have been created in Europe, and within the European Union itself, noncentral governments in federal or quasi-federal systems such as those of Austria, Belgium, Germany, and Spain often dispatch representatives to Brussels as well as to other places around the globe. Some of the Swiss cantons are very active in the field of foreign relations, as are some of the Australian states. Increasing involvement in foreign affairs is also occurring among some of the constituent units in Argentina, Brazil, India, Malaysia, Nigeria, Russia, and South Africa.

Federal systems in general will face some significant challenges in the future as globalization intensifies and noncentral governments increasingly engage in international activities as a way to protect and enhance the interests of their constituents. Some refer to this phenomenon as "glocalization," meaning the growing linkages between the international and the local. Noncentral governments in federal systems are guaranteed constitutionally some autonomy to act within their areas of competence, and they will desire to exercise this competence beyond the borders of their own nation-states in an increasingly complex and interdependent global setting. Even in the United States, where the Constitution clearly favors the national government's dominating foreign relations, the Tenth Amendment reserves all powers not explicitly delegated to Washington, D.C., to the states and the people. Arguably, these reserved powers may provide the state governments with the flexibility to be actively engaged in an even broader range of overseas pursuits.

Activism in the realm of foreign relations is a mechanism for some noncentral governments to enhance their own positions

within their respective federal systems. Quebec's special relations with France and within La Francophonie underscore its intention to protect its French language and distinctive Québécois culture within a Canadian nation that is overwhelmingly English speaking. In its foreign affairs, Flanders is able to accentuate its economic dominance and the special status of the Flemish language, and Catalonia is doing the same in emphasizing its distinctiveness within the Spanish Federalist structure. In these cases, activism in foreign relations is a symptom of ongoing regional tensions and uncertainties within certain nation-states.

Finally, *intermestic* denotes the blurring of the line between what constitutes domestic policy and foreign policy in an era of expanding globalization. This blurring is especially germane in federal systems, and federal nations will continue to struggle in ascertaining the appropriate and effective role of their non-central governments in foreign affairs.

Federalist Papers

Written to persuade New York voters of the merits of ratifying the U.S. Constitution, *The Federalist Papers* are a collection of eighty-five articles that seek to explain and justify key features of the Constitution and to respond to the objections of its critics. *The Federalist Papers* are typically regarded as one of the most important works of American political thought and are a critical record of both the principles and the debates that informed the drafting and ratification of the Constitution.

The Federalist Papers were written principally by Alexander Hamilton and James Madison (due to illness and other obligations, John Jay wrote only five articles). Published under the pseudonym "Publius," *The Federalist Papers* appeared three to four times a week in New York newspapers between October 27, 1787, and April 2, 1788. Advocating a more powerful, central government, *The Federalist Papers* reflect the Framers'

concern that the Articles of Confederation were unable to ensure political stability and resolve conflicts between the states as enforcement of the acts of Congress under the articles was left to the state governments. Publius argued that a more energetic national government that would both represent and act directly on citizens without being mediated by state governments would foster the United States's political and economic development, curb the potential excesses of popular government, and better secure the rights of citizens. For Publius, the Constitution embodied the progress of the "science of politics" and proved that people could establish government through reflection and choice rather than depending on accident and force.

REPUBLICANISM AND REPRESENTATION

Publius described the form of government created by the Constitution as republican, although Madison's use of this term departed from its traditional association with civic virtue and small, culturally homogeneous nations. Madison described a republic as "a government deriving power directly or indirectly from the great body of people, administered by people holding office for specific term or good behavior." By emphasizing representative government and the indirect power of citizens, Publius insisted that applying the "republican principle" to the more expansive territory of the United States would render the principle more effective and the government more stable. A large republic would enable a scheme of representation that could insulate officeholders from the transient passions of the public while retaining a sense of the people's will. Because representatives would be elected from relatively large districts and senators chosen by state legislatures, they would more likely be selected on the basis of their reputation and public standing; less animated by merely local attachments, they would filter rather than simply mirror their constituents' interests. Moreover, as Madison argued in *Federalist* No. 10, a large republic could more effectively address the problem of faction, which he defined as any number of citizens, whether a majority or a minority, "who are united and actuated by some common impulse or passion, or of interest, adverse to the rights of other citizens or to the permanent and aggregate interests of the community." The republican principle itself could solve the problem of minority faction—minorities would be diluted through the process of representation—but a large republic would guard against majority faction by taking in such a large number of interests that no single one would be able to form a majority.

CHECKS AND BALANCES

The U.S. Constitution sought to mitigate the threat that an energetic national government might pose to individual rights through the separation of powers (the justification that Publius credits Montesquieu with having provided). However, given the tendency of power to extend beyond its limits, the mere delineation of specific powers to each branch would provide only "parchment barriers" to the concentration of

power in any single branch. These powers therefore had to be not only separated but also blended; Publius insisted that each branch must be given partial agency in the others as a way of checking their actions. The limitation of government through an adversarial institutional arrangement thus reflected Madison's belief that "ambition must be made to counteract ambition." The idea of checks and balances rested on the fundamental assumption that individuals are driven at worst by passion and at best by self-interest. Because the ambition of officeholders would lead them to increase the share of power that they exercised, their interests must be carefully attached to the preservation of the rights and powers of their office. By carefully blending the powers of each branch (e.g., the veto power of the president, the Senate's power to try impeachments), Publius argued that each could check the actions of the others and thus resist their encroachments.

FEDERALISM

Despite Madison's claim that the division of power into national and state governments would provide a "double security" for citizens' rights, Publius typically envisions the national government as a brake on the excesses of the state governments, not vice versa. While opponents of the newly proposed Constitution largely agreed that the national government created by the Articles of Confederation was too weak, they nonetheless believed that states were better suited to protect citizens' freedom; because state governments were more responsive to the popular will, the states would be a more reliable check on the power of the federal government. By contrast, Publius believed that without a powerful national government the states were likely to fall into dissension among themselves, and Hamilton framed the ratification debate in *The Federalist Papers* as a choice between union or disintegration into "an infinity of little, jealous, clashing, tumultuous commonwealths." Precisely because states were more responsive to the popular will, they were more susceptible to faction, and Publius therefore believed that the threat to liberty posed by state governments was at least as great as that posed by the national government. Given people's natural attachments to what is local and close at hand, Publius—Hamilton in particular—worried that the national government might not be powerful enough and repeatedly argued that the energy of the national government must be commensurate with the importance of the powers granted to it. By giving it authority over matters of national and international importance, Publius hoped that the national government would attract more ambitious individuals and gradually garner the attachments and confidence of the people.

The Federalist Papers are often taken as a guide to the Framers' intent, and while they are an indispensable exposition of the principles underlying the Constitution, there are limitations to using them in this manner. In the first place, they were written to secure the ratification of the Constitution. As such, they were carefully tailored to their readers and sought to put the document in the best possible light. Second, the Framers' sense of the compromises that would be necessary to secure ratification constrained the drafting of the Constitution itself,

and *The Federalist Papers'* discussion of some of the Constitution's features presents necessities as virtues. Finally, Hamilton and Madison were only two of the individuals involved in drafting the Constitution, and in subsequent years even they would construe the document differently; for Hamilton the national government it created might have its own will and ends, while for Madison it was charged with protecting private rights and serving as a neutral arbiter of conflicting interests. The single voice of Publius therefore masked significant differences of opinion among participants in the constitutional convention, who ultimately agreed on the text but not necessarily the meaning of the Constitution.

Federal Mandates

A federal mandate, or direct order, in the United States is a federal regulation that must be complied with by a subnational government under the threat of a criminal or civil sanction. There are myriad arrays of federal mandates involving a broad range of state and local functions and programs. An excellent and prominent example of a federal mandate in the United States is the Equal Opportunity Act of 1972, forbidding employee job discrimination by state and local governments on the basis of race, color, religion, sex, or national origin. Additional prominent federal mandates involve the environment (air and water quality), homeland security, fair housing, fair labor standards, occupational safety, drug and alcohol testing, and endangered species.

Prior to the 1960s, there were relatively few federal mandates imposed on state and local governments. The proliferation of federal mandates began in the mid-1960s and continued with even greater force in the 1970s, 1980s, and 1990s, substantially due to the belief of the U.S. Congress that the imposition of federal mandates on state and local governments was an efficient and economical mechanism for promoting uniform national minimum policy standards. In an aggregate sense, this

development marked the shift from a somewhat voluntaristic national-state-local intergovernmental relationship to one of a more coercive federal nature.

A number of developments in the United States accounted for the proliferation of federal mandates during the last half of the twentieth century. First, the general failure of the states to alleviate critical environmental problems, such as air and water pollution, generated support for national action and federal mandates. Second, members of Congress became convinced that conditional grants-in-aid to the states and local governments had failed to solve national problems. Federal mandates, and other forms of federal regulation, were viewed by Congress members as the only feasible alternative approach for alleviating these problems. Third, national public interest groups, particularly those concerned with environmental problems, supported and strongly lobbied Congress for corrective federal mandates. In addition, influential business interests often preferred that their operations be regulated by a single mandated federal standard rather than a variety of state regulatory policies. Fifth, state and local officials, in some instances, such as with regard to the licensing of interstate motor carriers, viewed with favor the imposition of a federal mandate. And finally, members of Congress, often for reasons of political expediency and visibility, championed the passage of a federal mandate to achieve a desirable and popular social goal.

The imposition of federal mandates on the state and local governments has been criticized on various grounds and has generated a fair amount of political controversy. First, and most critically, state and local officials have viewed with considerable dismay the federal government's practice of imposing mandates on subnational governments without any compensatory or adequate funding. Second, federal mandates have often proved to be inflexible, prescribing rigid policies and performance standards regardless of varying circumstances. Third, federal mandates in some instances have been found to be counterproductive, such as the federal mandate that requires state and local governments to issue documents in both English and Spanish, increasing their operational costs, even in those instances in which there is largely an absence of Latinos. In addition, on occasion federal mandates have proved to be inconsistent, with state and local officials confronted with conflicting goals, standards, procedures, and timetables. And finally, the continuing proliferation of federal mandates has served to render the operation of government more confusing and incomprehensible to the citizenry, undermining the concept of democratic accountability.

Partly in response to the various criticisms of federal mandates, Congress passed in 1995 the Unfunded Mandates Reform Act, which requires that Congress define the costs and consequences of any proposed new federal mandate. The passage of the Unfunded Mandates Reform Act has not reduced the number of federal mandates but has rendered new federal mandates less extensive and more narrowly written.

As a result of the proliferation of federal mandates and the consequent enhancement of the regulatory role of the federal government in the intergovernmental system, the American polity has transitioned from cooperative Federalism to an era of coercive Federalism. Given the continuing and increasing range of domestic and foreign policy challenges confronting the United States and often the need for a national response to these challenges, we can well expect the federal government to promulgate additional mandates and other forms of policy regulations.

Federation and Confederation

The two forms of organizing political authority—confederation and federation—can, in theory, be distinguished as follows. A confederation is a union of equal, sovereign states (normally recognized as such internationally) that have formed, for limited general purposes, a common government. By contrast, a federation consists of a system of divided powers wherein a central government and territorial units (known variously as provinces, regions, states, or cantons) each has different policy responsibilities. Thus, a confederation is a treaty-based union that concedes few powers to the center for the sake of the liberty of the constituent units, which are also in principle free to secede. Conversely, a federation has a constitution, which presupposes the permanency of the union, designed both to secure individual rights and to divide power—the purpose being to reconcile unit self-government and individual freedom. As a result, even if in both types of union the units are subject to a central political authority, in a confederation this binds the states only as collective actors, thereby not creating rights or duties for individuals. However, in a federation, government reaches down to individuals, for instance, by guaranteeing certain constitutional freedoms or extracting taxes directly from citizens. This difference is visible in the legislative institutions of both types of union since a confederation has only one chamber, where all units are represented, whereas a federation has two chambers, one chosen to represent the units and another that represents all the citizens. This is why a confederation is best described as a union of states while a federation is at the same time a union of states and a community of individuals.

In addition, given the need to respect state equality and sovereignty, decisions in a confederation—especially over reforming the treaty of union—are taken by unanimity; all members must agree before the powers or purposes of the union can be altered. The division of powers between territorial levels of government in a federation cannot be changed unilaterally by either level. Any change is based on a constitutional process incorporating both the units and the center. However, federal decision making is based on the majority principle, not unanimity; for constitutional change this typically requires a higher threshold, known as a "supermajority," rather than a simple majority. Hence both types of union share similar features that distinguish them from unitary states, which have a simple hierarchy of government, no special representation of territorial units in the legislature, and a center free to redraw the boundaries and reallocate the powers of territorial government unhindered.

CONFEDERATIONS AND FEDERATIONS IN MODERN WORLD POLITICS

Although better known as an international organization, the United Nations (UN) is in effect a global confederation, which tries to reconcile state sovereignty with a weak common government concerned with global problems, notably peace, human rights, international development, and environmental protection. The UN also illustrates the chief defects of confederation: the absence of a coercive authority to enforce member state compliance except ultimately via recourse to armed force, the subsequent reliance on states' respect for their UN-imposed obligations, and the stymieing effect of unanimous decision making, at least among the permanent members of the Security Council. These structural weaknesses help explain why self-defense confederations such as the United Provinces of the Netherlands (1579–1795), the Swiss Confederation (1291–1848), the German Bund (1815–1866), and the United States under the Articles of Confederation (1781–1789) failed to survive into the modern era.

Indeed, it was the desire to remedy the faults of confederation that prompted the members of the Philadelphia Convention (1787–1788) to design the first modern federation, the United States of America. U.S. Federalism was intended as a preferable alternative to a unitary, centralized republic because individual liberty was thought to require an effective central government kept in check by unit self-government. Hence, Federalism is considered a way of institutionalizing democracy, which is why nondemocratic federations, such as the former Soviet Union (1922–1991) or even the contemporary Russian Federation (1991–), are sometimes seen as spurious instances of federation. Nonetheless, the spread of Federalism has been such that by 2000, two billion people lived in federations.

By cleaving political authority between two levels of government, the U.S. federal Constitution left unresolved many problems regarding how this separation would function in practice. The study of these issues is known as intergovernmental relations. Major research questions in this field include whether federations are subject to ongoing centralization or else cycles of centralization and decentralization. The impact of Federalism on the effectiveness and outcome of policy making is also much studied. The relationship between democracy and Federalism is also considerably debated since the antimajoritarian nature of federal decision making has been linked to conservatism and the entrenchment of special interests.

Today, however, the principal attraction of federation is less the protection of abstract notions of individual liberty than the ability to guarantee certain rights dear to ethnic, religious, or linguistic minorities by granting autonomy to these territorially based minorities. Thus, the development of Federalism in plural societies such as India, Canada, or Belgium has been explained as a process of holding together a state, often leading to asymmetric autonomy between the constituent units.

AN IN-BETWEEN CATEGORY: THE EUROPEAN UNION

The novelty of the European Union (EU) is its combination of confederal and federal principles. What began as a regional economic confederation is now neither a pure federation nor a pure confederation. Instead, the hybrid EU polity is characterized by the creation of an autonomous, constitutionalized legal order consisting of individual rights alongside a political order where major decisions are taken unanimously by member states. Thus, aspects of confederation, notably the treaty system of common government, the right of exit, and a chamber representing state governments, coexist alongside a federal legal order. There is also a directly elected lower chamber—the European Parliament—whose federal-like legislative powers have continued to expand.

The EU, therefore, is almost a political laboratory, as the merits and flaws of confederation and federation are constantly debated—often drawing on the U.S. experience—especially from the perspective of the respective democratic legitimacy they confer. In addition, the EU model is seen as a blueprint for overcoming long-standing antagonisms between nation-states. However, it remains to be seen whether the EU is an exceptional case or whether other regional organizations of states, such as the African Union, Mercosur (South American), or the Association of Southeast Asian Nations, will mimic its hybrid development.

Feminism

The term *feminism,* deriving from its mid-nineteenth century French origins in *feministe,* refers most basically to an ideological commitment to the social, economic, and political equality of men and women within nations and across the globe. Feminism entails a way of critically engaging with the world from a perspective grounded in sex, gender, and sexuality to advance freedom, equality, and inclusion for women as full citizens with the right to determine their life paths. Two identifiable periods of feminism, often referred to as the first and second waves, track democracy's political trajectory beginning with women's ongoing struggle for equal rights in the nineteenth- and early-twentieth-century suffrage movements and moving into claims related to sexual liberation, employment, education, and the family from the early 1960s until today. This highly contested term encompasses diverse schools of thought emanating from multiple identities and standpoints that reflect how feminism transforms the political arena by interjecting an understanding of its subjects as gendered, sexed, and sexual human beings. Feminism, in all its rich complexity, then conveys a theoretical vision requiring direct action to address the oppression of women that has changed the meaning of politics by identifying and challenging the boundaries of public and private life in two key ways.

FIRST WAVE: POLITICAL PARTICIPATION AND REPRESENTATION

First, formal recognition as citizens marks the initial break through the barrier to women's participation in formal politics associated with the first wave of feminism. Between the late 1700s and the early 1900s, broader claims to equal rights narrowed into the right to vote. The resulting suffrage movements grew out of the revolutionary periods in France, Britain, Germany, and the United States during the late eighteenth century. Olympe de Gouge (b. 1748), in the midst of the French Revolution (1789–1799), vehemently proclaimed women's equal rights in her *Declaration of the Rights of Woman and the Citizen* (1791), which resulted in Maximilien Robespierre's putting her to death by guillotine in 1793. In the United States, Elizabeth Cady Stanton (1815–1902) modeled the *Declaration of Sentiments* (1848) on the Declaration of Independence (1776), which justified the American colonists' revolution against Great Britain. Women first broke into the formal political realm in New Zealand, the first country to grant women unrestricted voting rights in 1893. British women won suffrage in 1918, the United States in 1920, and the French, a late European arrival, in 1944. Voting rights now extend to most women across the globe, with the exceptions of those in Bhutan, Brunei, and Saudi Arabia, indicating a dramatic redrafting of who participates in public life.

In addition, the fight for formal recognition evolved into women's push for representation as elected politicians. Widow's succession, the process of a woman's assuming her husband or father's office after his death, served as the primary way in which women entered public office. Sirimavo Bandaranai (1916–2000) of Sri Lanka became the world's first female prime minister in 1960 when she ran as the Sri Lankan Freedom Party's candidate after her husband's assassination. She won office in her own right in 1970. Prominent female heads of state such as Indira Gandhi (1917–1984), Indian prime minister from 1966 to 1977, and Golda Meir (1898–1978), Israel's prime minister from 1969 to 1974, indicate how women increasingly acquired leadership positions by winning elective offices with greater levels of political power. Women now hold 16 percent of the seats in legislative bodies worldwide; that, coupled with voting rights, signals how feminism transformed the public sphere by securing greater inclusion of female citizens and representatives on a global scale.

SECOND WAVE: EQUALITY, LIBERATION, AND GLOBALIZATION

Second, feminism expanded its focus on the formal political arena to include jobs, education, the family, and reproductive freedom as part of a growing awareness that the private sphere shapes both the public and women and men's role in it. Simone de Beauvoir's *The Second Sex* (1949) catalyzed the second wave, which, unlike the first, aimed to liberate women from their biologically determined sex roles as mothers and wives. Second-wave feminists responded to the two-pronged struggle for equal rights and liberation in diverse ways indicated by the schools of thought—ranging from liberal, radical, socialist, Marxist, lesbian, and black to cultural, psychoanalytic, and postmodern—that contributed greatly to building contemporary feminism's theoretical foundation. The slogan "the personal is political" broadly conveys the key shift in this period when women awakened to their oppression as women in the classroom, the boardroom, and even the bedroom. Issues conventionally classified as personal, or belonging to the private, such as birth control, abortion, marital and date rape, sexual harassment, and domestic violence became legislative and policy-making matters. The U.S. Supreme Court's decision in *Roe v. Wade* (1973) granting women the legal right to an abortion propelled reproductive rights, conventionally relegated to the private sphere, into the center of American politics. As a result, the backlash against feminism formed, first taking shape in the Moral Majority established in 1975, which morphed into the Christian Right, ushering in an era of social conservatism lasting into the twenty-first century.

Globalization combines with democratization to reveal other fault lines that stake out the contemporary political terrain of feminism. At the International Women's Year gathering held in Mexico City in 1975, Mexican feminists convened a countercongress to highlight the diversity of women's issues and their rejection of first world women's claims to represent all women. This event spotlights a division between women in the global North and South working to advance feminism.

Third world, global, and transnational feminisms, in response, challenge the Western imperialist and colonial legacy of feminism that perpetuates the exclusion of women from different castes, classes, and colors and provide alternative visions for a global feminist movement. Given its role in redrawing public and private life and the identity of political subjects, feminism remains a site where the politics of gender, sex, and sexuality will be negotiated around issues such as human trafficking, surrogacy, gay marriage, and HIV/AIDS and provides a lens critical for analyzing the complex dynamics of power in and between political communities and their citizens.

Feminism, Postcolonial

The term *postcolonial feminism* references a field of study and activism by and for women that challenges dominant patriarchal ideologies and practices of postcolonial societies. The term is rooted in oppositional consciousness to the dominant social order as a form of transformative politics. Tied closely to nationhood, its strategies are marked by political activism of women concerned with gaining rights. It challenges gendered state biases that disable empowerment and equal rights and views women's political struggle as essential to deconstructing patriarchal power. Postcolonial feminists have therefore challenged state power structures for access to political equality and participation, opposed discriminatory legislation that oppresses women, and championed women's empowerment. The beginnings of postcolonial feminism tend to be associated largely with colonies and former colonies of Western powers in Africa, Asia, Latin America, and the Caribbean. As a field of activism, it can be dated to the decolonization period (from the 1950s and 1960s) in former colonial countries, and as a field of study, it is often associated with the rise of postcolonial and feminist writings of the mid-1970s.

HISTORY

Postcolonial feminism is a subset of both postcolonial and feminist studies. A history of the term suggests it is has been framed by active legacies of colonialism and postcolonial movements. Feminists were concerned that the transfer of power at independence to many former colonial states was in fact the transfer of national sovereignty to a masculine power structure. Although independence offered the promise of new beginnings, for women it signaled the transfer of power to local elites, who inherited dominant patriarchal colonial systems of administration with embedded values relating to the diminished place of women in nationhood. Women activists saw the need for political struggle, which was influenced by the larger feminist movement of the 1960s, civil rights in the United States, growing black power movements in former colonized states in the 1970s, and a rising postcolonial consciousness worldwide. Hence, an association of postcolonial issues with feminist thought brought together discourses of power and domination and challenged institutional and ideological structures that oppressed women.

VARIATIONS

Postcolonial feminism draws attention to varying conditions of women that are contextual, geographical, and temporal. Hence, there is no single form of postcolonial feminism. Geographical examples include dowry deaths in India; state-legislated discriminatory laws that demean and punish women in Pakistan; access to clean water and housing in Africa, Central America, and Southeast Asia; and challenging practices of dislocating women as subjects of history in the Caribbean. Representations in the media that objectify and circulate stereotypes about postcolonial women is another major concern of the field. Postcolonial feminists have drawn attention to the need to replace disparaging images of these women with images defined by the women themselves.

DEFINING THE FIELD

There has been a tendency to conflate postcolonial feminism with third world feminism. Although both feminisms sometimes overlap, Robert Young suggests postcolonial feminism's particular politics are framed by gendered power relations that allow postcolonial state structures to enforce a neocolonial status on women. Third world feminism on the other hand is less focused on nationhood but functions as an umbrella term for a range of feminist contestations and voices that focus on women's marginality, exclusion, racism, sexuality and sexual expressions, and global capitalism, among others.

Major international proponents of the postcolonial feminist ideology include feminist critics Hazel Carby (1987), Chandra Talpade Mohanty (1991), Gayatri Chakravorty Spivak (1988), Sara Suleri (1992), Anne McClintock (1995), Ania Loombia (1998), and Uma Narayan (1997). Some authors tend also to associate the term mainly with third world or developing countries; however, many feminists from developed countries identify their struggle against marginalization as postcolonial. Indigenous feminists in Canada, Australia, and the United States suggest they live in both a colonial and a postcolonial moment simultaneously (a fourth world) and therefore suffer various levels of oppression shaped by legacies of dispossession, racism, and sexism. Hence, fourth world feminists bring to postcolonial feminism a focus on indigenous women's rights and struggles for status, legal rights, citizenship, and social justice.

CONTESTATIONS

Contestations within the field are marked by tensions within feminism itself. Postcolonial feminists argue against Western liberal feminism's tendency to universalize and speak for all women. Liberal feminists are also accused of stereotyping postcolonial women by focusing on their difference and distance against a Western norm. Chandra Mohanty draws attention to the continuous discursive production of "difference" about these women as distant, muted subjects.

Contestations relating to voice also resonate within postcolonial feminism itself. Gayatri Spivak suggests that many (elite) theorists and writers in postcolonial societies are often unaware of the true conditions of marginalized and subaltern women and are therefore unable to speak for these postcolonial subjects. Hence, the continuous production of texts about these women renders the subaltern voiceless and incapable of speaking. The field is therefore challenged to reconfigure its continuous production of postcolonial women as voiceless subjects and instead provide them with agency by highlighting their experiences as authors and speakers.

Feminism, Radical

The term *radical feminism* references a school of feminist thought and approach to mobilization that envisions women's liberation as completely transforming existing political, economic, and social structures by eradicating the sex/gender system. *Radical* comes from the ancient word for *root*. Radical feminism then identifies the root of women's oppression throughout political history in sex, meaning the traditional sex roles of mother and wife in the family, male and female biology, and genital intercourse. "The personal is political," a well-known slogan from radical feminism, captures how this movement transformed the female private sphere into a site of politics where men's exercise of power over women maintains patriarchy. Radical feminism, a movement at its peak of activism in the United States between 1967 and 1975, as a result, redrew the boundary between male public and female private life by locating the body, sex, gender, and sexuality in the political arena so that reproductive freedom, domestic violence, child care, rape, and sexual harassment remain crucial issues nationally and globally.

Evolving from the 1960s civil rights and student movements, radical feminism began by asserting the claim that women needed to organize *as women* for *their* issues. Casey Hayden and Mary King's "Sex and Caste" memo (1965) first expressed this position and equated women's liberation with that of all human beings. The movement took shape as small groups of women, starting with the New York Radical Feminists in 1967, met in each other's apartments and homes to share and analyze their emotions and daily experiences with work, school, and marriage. These consciousness-raising groups popped up across the United States as women awakened to the broader social, political, and economic structures oppressing them as women, which catalyzed action for change.

Grassroots direct actions using creative and performative strategies characterized how radical feminists translated consciousness raising into challenging women's traditional sex roles. The New York Radical Feminists organized the first such action following the Jeanette Rankin Brigade protest against the Vietnam War (1959–1975) in January 1968, when five hundred protestors gathered at Arlington Cemetery to bury Traditional Womanhood next to the symbol of Traditional Manhood. This burial illustrates radical feminism's position that achieving equality and freedom for women requires eliminating sex roles, which would render gender, or the social construction of male and female, obsolete. Later in 1968, national media turned attention on the Miss America Beauty Pageant protest in Atlantic City, when the female body was clearly politicized. Radical feminists outside on the boardwalk—while female contestants wearing swimsuits and spiked heels paraded across the stage inside the convention center—threw girdles, bras, eyelash curlers, and other objects representing the constraints of femininity into the Freedom Trash Can. This protest conveyed a rejection of women's sexual objectification that extended into a powerful critique of how men exercised power over women through sex and sexuality.

Heterosexual intercourse, as a result of Kate Millett's groundbreaking book *Sexual Politics* (1970), became central to radical feminism as a power relationship paradigmatic of all others in society. Shulamith Firestone, in *The Dialectic of Sex* (1970), proposed eliminating male and female sex roles by

using artificial methods to replace sexual intercourse for pro-creation as the basis for the family. Radical feminism's claims about the power exercised through genital sex led to the sex wars of the 1970s and 1980s when radical feminists such as Robin Morgan, Andrea Dworkin, and Catherine MacKinnon framed pornography as the cause of rape and violence against women. Others such as Ellen Willis, in contrast, advocated for women's right to explore various forms of sexual desire that might include pornography. Theorizing sex as an exercise of power sustaining women's oppression, whether in beauty pageants or pornography, radical feminism inserted the body into the terms of American political debate.

Radical feminism achieved its landmark success in the fight for reproductive freedom with the U.S. Supreme Court's decision in *Roe v. Wade* (1973), which granted women the legal right to an abortion. This movement's significance for the twenty-first century can be measured in the United States by acts such as the Violence Against Women Act (1994), which secures federal legal protections against domestic violence, and globally as the United Nations and transnational feminist organizations align women's rights with the struggle for human rights.

Feminism, Socialist

Socialist feminism is a system of analysis of gender oppression as well as a strategy for political change. While it has been defined and practiced in many ways, there are central tenants that link the socialist feminism movement together. Socialist feminism focuses on the intersection between capitalism and patriarchy. It examines the ideological construction of femininity within patriarchal capitalism. Socialist feminism draws attention to issues such as sexuality, reproduction, domestic and paid labor, gender socialization, class conflict, sexism, and classism. Socialist feminism recognizes oppression based on gender and social class. Its focus most often does not extend to subordination based on ethnicity, sexuality, age, and able-bodiness.

THEORISTS IN SOCIALIST FEMINISM
The socialist movement has traditionally been attributed to the contributions of the nineteenth-century writers Karl Marx and Frederick Engels. From the earliest days of European socialism, however, women have played a significant, although somewhat invisible, role within the socialist movement. They have challenged men's definitions of socialism and have struggled for analyses and programs that better reflect the interests and needs of women. Some significant theoretical and political contributions to the socialist movement have been made by women such as Emma Goldman, Rosa Luxemburg, and Alexandra Kollontai.

Engels's classic work of 1884, *The Origin of the Family, Private Property, and the State,* is a significant text within the socialist feminist movement. It asserts that women's liberation could come only with women's entry into the paid/public workforce. As many socialist feminist scholars have suggested, women's work within the domestic/private sphere serves to support not only individual families but the interests of the capitalist economic system as well. The family serves to reproduce societal values and norms that perpetuate the existence of capitalism. As Nancy Hartmann asserted, the nuclear family in North America should be considered the principal site of women's subordination.

Emma Goldman, an early twentieth-century writer, drew attention to the role of capitalism in shaping sexuality and sex roles. Much of her theoretical work laid the foundation for contemporary socialist feminist scholars such as Nancy Hartmann, Pat Armstrong, Hugh Armstrong, and Meg Luxton.

Juliet Mitchell, writing in the 1970s and 1980s, outlined four central points of a socialist feminist analysis. She emphasized the need to restructure (1) the production of goods and services, to meet human needs; (2) the organization and control of sexuality; (3) the practices surrounding childbearing as well as women's responsibility for the emotional, physical, and psychological needs of family members; and (4) the organization of gender socialization. Mitchell stressed that all potential egalitarian solutions with regard to any of these central issues must be explored in relation to one another to prevent one system's solutions becoming another's problems.

DEFINING SOCIALIST FEMINISM
Socialist feminism combines Marxist feminism, which attributes women's subordination to the class oppression of capitalism, with radical feminism, which attributes women's oppression to patriarchy. Socialist feminists assert that the root of gender subordination is the combination of capitalism and patriarchal ideology. Women are thus seen as casualties of both classism and sexism. The elimination of gender inequality from a socialist feminist perspective can be achieved only by the eradication of both capitalism and patriarchy.

Socialist feminism has been considered by some scholars to be synonymous with Marxist feminism. While it is rooted heavily in Marxist feminist writings, there are several differences

between these two paradigms that should be noted. For Marxist feminists, gender inequality is a product of the inequality between classes. Ending women's oppression, within this view, would thus require the elimination of economic oppression. Socialist feminism, however, does not postulate that gender oppression can be reduced to economic exploitation. Instead, socialist feminists suggest that gender subordination is a social phenomenon in and of itself, requiring recognition and analysis. Socialist feminists have critiqued Marxist feminists for their concentration on class, accusing them of discounting the effects of gender.

A central issue for socialist feminist writers is the collectivity of oppression. The organization of social class is considered to be inseparable from gender: the rich exploit and oppress the poor just as men exploit and oppress women. This is not to suggest that women's subordination can be attributed to one man, however. Socialist feminists assert that women's oppression is a result of the collective oppression of all women by all men, within a world organized by class.

RESISTANCE AND THEORETICAL DEVELOPMENTS

Some social feminists claim that women's experience, culture, and practice can provide a basis for a feminist resistance to patriarchal ideologies. Nancy Hartsock (*The Feminist Standpoint Revisited and Other Essays,* 1983) claims that "the feminist standpoint," rooted in women's particular experiences and perspectives, is necessary for developing a critique of patriarchal ideology and practice. The feminist standpoint is also crucial for the expansion of discussions surrounding theory and practice and how both can be forwarded in alternate, and perhaps more progressive, directions.

Contemporary socialist feminist scholars are moving beyond the traditional constructions of gender, feminism, and politics and have begun exploring them within a contemporary context. Donna Haraway's work investigates the complexity of women's identity within the context of the rapidly changing world of technology. She examines male bias within a culture of science and technology. Clara Fraser examines the connection between sexism and racism as well the issues surrounding women's involvement within the contemporary socialist movement. Socialist feminism is a developing and ongoing theoretical and political project.

Feminist Legal Theory

Political theories that examine the fundamental structure of the law and have ramifications for the practice and application of the law are known as jurisprudence (Smith 1993, 483). Feminist jurisprudence holds that the law has been written primarily by men and reflects male life patterns and ideologies. Thus, feminist legal theory looks at legal concepts and distinctions and critiques any subordination of women found within such notions. Feminist legal theory is descriptive in that it describes the world, but it is also normative in that it argues for a specific remedy: bringing women's experiences to light in legal reasoning and challenging patriarchy. As jurisprudence, feminist legal theory is related to critical legal studies and legal realism. Both critical legal studies and legal realism argue that the law is not objective but represents a point of view, and both are focused on solving problems in the world. Likewise, feminist legal theory tries to determine how the law can treat women and men more equally and how to use the law to eliminate women's subordination to men in different areas of life (the family or the economy, e.g.). Different types of feminist legal theory argue for different ways of solving the problem of inequality, but all feminist legal theories agree that the law is patriarchal, that this patriarchy is neither natural nor inevitable, and that the male norms embedded in the law can and should be corrected.

LIBERAL/SAMENESS APPROACH

Different approaches to feminist legal theory may be most easily understood through the evolution of the question of sex differences under the law. The first phase of feminist legal theory, which arose in the early 1970s, is often called the "sameness" or "equality" phase and was most influenced by core concepts of liberalism such as autonomy, choice, individualism, and the moral equality of all people. In this phase, feminist legal theorists aimed to assimilate women into the existing legal structure rather than change the structure of the law. This is also known as the "formal equality" approach because it argues that the law should not distinguish between the sexes; if the form of the law treats men and women the same by ridding itself of explicit distinctions between the sexes, then equality has been achieved.

Associate justice of the U.S. Supreme Court Ruth Bader Ginsberg is closely associated with this phase of feminist legal theory because she applied the formal equality doctrine to her work with the American Civil Liberties Union's Women's Rights Project and took on many cases wherein the law explicitly differentiated between men and women, whether this distinction worked to the benefit of men or women. In fact, many of Ginsberg's clients were men challenging laws that excluded them from a special privilege granted to women.

The formal equality approach has been successful in changing the way the Supreme Court applies the Fourteenth Amendment's equal protection clause to sexual discrimination cases. Gender is now considered suspect under this clause, so any law that treats people differently based on their sex is

subject to review at the level of intermediate scrutiny. This means it is easier to discriminate legally between men and women than between racial groups (such laws are subject to strict scrutiny), but it is harder than discriminating on the basis of age, for example, as such laws are subject only to rational-basis review, the most lenient level of review.

RADICAL AND CULTURAL/DIFFERENCE APPROACHES

While the sameness/equality doctrine was still being argued, difference (cultural) feminism and dominance (radical) feminism became more prominent in the 1980s. Rather than contending that women are the same as men, this difference approach to feminist legal theory argues that there are important differences between women and men. Building on psychologist Carol Gilligan's work, *In a Different Voice* (1982), difference feminists say that while men have an "ethic of justice" that emphasizes abstract rules and rights, women have an "ethic of care" that emphasizes concrete relationships and responsibilities. This relational approach, especially as developed by legal scholar Robin West, focuses on women's culture and biology, emphasizing women's connection to others due to mothering and reproductive roles and the physical acts of pregnancy and breast-feeding. According to this view, female virtues should be brought into the law by promoting caretaking and interconnection rather than individualism and empathy rather than detachment. Difference legal scholar Carrie Menkel-Meadow's work has influenced the rising practice of alternative dispute resolution (mediation), which is premised on cooperation and trust as the basis of legal dealings rather than the adversary system of the courtroom.

The dominance approach to feminist legal theory is most closely associated with American feminist Catharine MacKinnon and radical feminism. MacKinnon argues that rather than being natural distinctions, sex differences are cultural constructions premised on male dominance and female subordination. To treat women and men equally, the law must not support these views. Instead it should recognize that men and women are equally different from each other rather than seeing men as a norm from which women differ. Because men and women are different, they must be treated differently to get equal outcomes. This position is considered radical because it calls for substantive changes in the structure of the law, not formal assimilation of women into men's laws. Dominance feminism arose in response especially to legal areas in which men and women were clearly different and not similarly situated—for example, domestic violence, rape, and sexual harassment. This approach has been most successful in getting, for example, marital rape and sexual harassment defined as "harms" where formerly these categories or harms did not exist in the law.

DIVERSITY APPROACH

Beginning in the 1990s, feminist legal theory developed an interconnected set of approaches loosely labeled the "diversity" view. Whereas the difference approach studied women's differences from men, the diversity views examined women's differences from each other, arguing that not all women have had the same life experiences. The diversity approach is anti-essentialist and more contextual than earlier modes of feminist legal theory, and it is informed by pragmatic feminism, critical race theory, lesbian feminism, postmodern theory, and work on intersectionality. Diversity theory states that there are distinct harms that women experience when they inhabit multiple, overlapping subordinated identity categories. Thus, it contests gender essentialist theories that make women choose whether they want to press claims as women or as Hispanics, for example, rather than as both, as Latinas. Like difference theorists, diversity theorists argue that access to institutions is not sufficient to achieve equality, not only because once women have access to formerly all-male places of employment they might be subject to sexual harassment, for example, but because the kinds of harassment they face will be different depending on their race and sexuality. The diversity approach examines particular problems as they arise and how gender expectations affect specific groups of women differently.

CONCLUSION

The varying approaches to feminist legal theory are still employed by legal scholars and lawyers addressing questions of patriarchy in the law, although the sameness approach has had the most influence on legal decision making. The other perspectives, such as the difference or diversity approaches, have had more acceptance in law schools and journals but have been less successfully adapted to the actual practice of the law.

Feminist Movement

There have been a number of discrete but related movements for women's equality and for the social transformation of gender relations. Early texts such as Christine de Pizan's *The Book of the City of Ladies* (1405) and Mary Wollstonecraft's *A Vindication of the Rights of Women* (1792) contributed to as well as reflected women's challenges to male authority and their vision of a more just, egalitarian, and beautiful society.

While women have been political actors in a wide variety of economic, social, and religious contexts, organized political action by groups of women with sufficient numbers and presence to rise to visibility as a political movement began in the mid-nineteenth century. Each of these movements involves a set of organizations, ideologies, and cultural practices that are extensive, often contradictory, and dynamic, leading feminist scholars to stress the importance of movement both as the actions of a body of persons and as the process of motion itself.

Feminism is often described as occurring in three waves. Each emergence has been closely linked to political activism around racial and class injustices. In the United States, the first wave, from about the mid-1800s to the 1920s, emerged largely out of the abolition movement and is symbolically represented by the Declaration of Rights and Sentiments issued by the Seneca Falls Women's Rights Convention of 1848. The first wave eventually narrowed around demands for women's suffrage, finally achieved in 1920, but the movement actually had a much broader theoretical and practical reach, including radical critiques of capitalism, religion, sexuality, and war. Across Europe, Japan, and Australia, the first wave combined middle-class women's agitation for property rights, legal equality, and marriage reform with working-class women's trade union activism. In Africa, South America, the Middle East, and Asia, first-wave feminism generally emerged in the context of anticolonial movements for national liberation. Success in achieving suffrage, along with the devastating consequences of economic collapse, Fascism, and war, led to a decline of feminist movements after 1920.

Second wave refers to the women's liberation movement of the 1960s through 1980s. Simone de Beauvoir's *The Second Sex* (1949) was perhaps the foundational text, along with Betty Freidan's *The Feminine Mystique* (1963). In the United States and Europe, feminism emerged in connection with the civil rights movement as well as antiwar activism, environmentalism, and cultural revolution. In the third world, national liberation movements again provided the context for feminist organizing. Women of color in both the developed and the developing worlds confronted the white, middle-class orientation of mainstream groups such as the National Organization for Women, while lesbians problematized homophobia in the movement as well as the larger society. *This Bridge Called My Back: Writings of Radical Women of Color* (1981), edited by Gloria Anzaldúa and Cherríe Moraga, was a pivotal text. The academic field of women's studies was initially the creation of the second wave, as were a host of reforms involving legal equality, health care, domestic violence, and reproduction.

While many aspects of the second wave continue to thrive, particularly the insistence on bringing race and class into conversation with sex and gender, a third wave of feminist organizing emerged in the 1990s. Third-wave feminism often attracts younger women, who may distinguish themselves from their aging second-wave counterparts, as reflected in Jennifer Baumgardner and Amy Richard's book *Manifesta: Young Women, Feminism and the Future* (2000). Third-wave feminism reflects the rise of postmodernism in the sense that it deconstructs the categories of women and men as well as gay and straight that had often been taken for granted as necessary for political organizing, as shown by one of the most influential texts of the third wave, Judith Butler's *Gender Trouble* (1990). Third-wave feminism is more self-consciously global than its predecessors, energized by the series of United Nations conferences on women, and has campaigned worldwide for women's rights as human rights. Critical analyses of neoliberal models of globalization, environmental destruction, and rape in war are prominent contributions of an increasingly global feminism.

Feminist Parties

Although feminism as a social movement dates back to the nineteenth century, feminist political parties are relatively recent phenomena in most countries. Feminist parties, like environmentalist parties, are oriented around specific political issues and concentrate on addressing the needs of women in

the context of patriarchal and masculine political cultures. For example, in Sweden, the Feminist Initiative was founded in 2005 and focused during the 2006 elections on the premise that "women's lives, choices and opportunities are restricted by the patriarchal power structure" (Feminist Initiative).

THE HISTORICAL BACKGROUND
Calls for female suffrage and political representation increased during the second half of the nineteenth century, especially following the Second Industrial Revolution (1870–1914), when a great number of women entered the workforce in the 1850s. While early feminist movements concentrated on the specific issues of abuse of women in the sex trade, marital rape, sexual abuse of children, and equal educational, employment, and legal rights for women, it was the focus on the universal suffrage of women that united all feminists.

The second wave of feminist movements emerged in the 1960s with the shift from civil and political rights to changing socially accepted values, beliefs, and attitudes toward women in society. This movement managed to politicize women by mobilizing around a wide range of issues, including unofficial (de facto) and official legal inequalities, sexuality, family, the workplace, and reproductive rights.

RECENT DEVELOPMENTS AND THE EMERGENCE OF FEMINIST PARTIES
The third wave of feminism began in the early 1990s. Argumentatively, it challenged what many considered the second movement's view of a universal female identity with an over-emphasis on the experiences of upper-middle-class white women (although this claim is disputed). Instead, under the influence of poststructuralism, the third feminist movement focused on micropolitics, avoiding the normative approaches to what is or is not good for women and instead concentrating on the discursive power and ambiguity of gender. Thus, this movement emphasized the importance of incorporating women's ethnic, national, religious, and cultural identities into everyday politics.

Swiss political scientist Simon Hug offers one convincing explanation of how these feminist social movements developed into formal political parties by suggesting that women needed to form their own political parties to protect their own interests when existing political parties failed to incorporate the demands of these feminist movements. Other scholars argued that additional factors must also have contributed to the establishment of feminist parties, such as a greater public consciousness of the palpable inequality between men and women, a politicized social cleavage between men and women, and a low threshold for party entry in the political system. For example, the two-party presidential system and a high threshold for congressional party representations in the United States offer a difficult political environment for women in which to establish political parties and win elections. Multiparty election systems with lower thresholds for representation, such as those in the United Kingdom, Sweden, Germany, Israel, and Poland, provide more political incentives for women to formally organize under a specific political party.

The politicization of women's issues has proven that parties can accommodate feminist demands in two ways: through rhetoric, as in most countries, and through affirmative action and positive discrimination (by filling certain quotas), such as in the Labour Party in Norway and Social Democratic Parties in Denmark and Sweden. However, most political parties in Europe encouraged the integration of women into politics by creating separate women's groups within their own parties instead of having women create their own separate parties.

CONCLUSION
The desire to eliminate discrimination and gender-based inequalities and promote women's issues in politics has resulted in a number of feminist parties currently found worldwide, including the Shamiram Women's Party in Armenia, the Australian Women's Party in Australia, the Cambodian Women's Party, the FemINist INitiative of BC in Canada, the Feminist Party of Germany, the Gabriela Women's Party in the Philippines, the Women of Russia Party in Russia, the Feminist Initiative in Sweden, and the parties of the All-Ukrainian Party of Women's Initiative in the Ukraine.

However, these political parties do not overcome the low representation of women in politics, as, for example, the world average of women in Parliament was only 18.8 percent as of January 30, 2010. Feminist parties, while not a recent phenomenon, still have a long way to go to succeed in achieving equal representation and parity for women in the societies.

Feminist Political Theory

Feminist political theory involves distinctive modes of critique engaging both the classic texts in Western political theory and the inequitable and unjust conditions of women's existence. Investigating androcentric bias in key concepts and practices such as freedom, justice, order, sovereignty, autonomy, democracy, liberalism, nationalism, the state, war, and peace, feminist political theory seeks to illuminate the barriers and constraints that circumscribe women's lives, explain their dynamics and persistence, and identify mechanisms for change.

Working within particular philosophical traditions, feminist theorists have identified omissions and distortions circulating

in philosophical texts that generate noxious representations of women. They have demonstrated that classical and mainstream philosophers often violate disciplinary standards of argument and evidence when making claims about women, that their contradictory assertions about women undermine the internal consistency of their claims about human nature, and that they routinely fail to notice that the hypotheses advanced about women are inadequately warranted.

CONCEPTUALIZING GENDER JUSTICE AND INJUSTICE: ALTERNATIVE APPROACHES

Feminist political theories articulate claims of justice that do not fit the models of justice as restitution, reparation, or rectification developed in the Western philosophical literature. Since Aristotle advanced his conception of compensatory justice as a rectifying or reparatory transaction between one person and another, Western philosophers have argued that both wrongdoing and its rectification must be tied to specific historical events. But the systematic inequities that women experience in particular times and places do not conform to the model of injury or the possibilities for rectification that Aristotle envisioned. As such, mainstream philosophy denies any possibility for rectification: how can justice dispel something that cannot be accounted for by a verdict? How can women be accorded sovereignty when it is not a matter of restoration precisely because women have never had it? How can justice address the micro-inequities that permeate women's daily lives when they are not unlawful or illegal?

Feminist theorists have developed analytic strategies and conceptual vocabularies necessary to make the injustice of male domination and women's subordination visible and to refigure conceptions of justice so that rectification becomes possible. In an effort to denaturalize social relations and social roles of women and men, liberal feminist theorists have argued that women's nature is an altogether artificial thing, the result of forced repression of certain capacities and excessive stimulation of other capabilities. They have emphasized the role of law in excluding women from educational and occupational opportunities, from legal standing and constitutional rights, and from participation in politics and public life, thereby producing women as inferior beings. As early as the 1830s, black feminist theorists in the United States also pointed out that state and federal laws deprived black women and men of the status of human beings, denying them rights of self-determination and constitutional protections in ways that differed significantly from the deprivations experienced by white American women. Contrary to dominant beliefs, feminists argued that the subordination of women and the systematic dehumanization of blacks was the effect of the legal code, a socially produced and sustained hierarchy, not a reflection of natural aptitudes and abilities. Within this liberal framework, laws that served as the instrument of sexual and racial oppression were targeted for change. Thus, one strain of feminist and critical race theorizing has consistently focused on the transformation of the state and its legal apparatus as a primary mechanism for social change.

Socialist feminist theorists construe the causes of women's oppression and the strategies for social change quite differently, suggesting that a full understanding of the woman question requires conceptualization of exploitative divisions of labor within capitalist industrial production, unequal roles in physical and social reproduction sanctioned by marriage practices and kinship systems, commodity fetishism, and modes of circulation, trade, and exchange. Arguing that the overthrow of capitalism and the achievement of socialism are essential to the feminist project in the long run, socialist feminist theorists advance specific prescriptions for social transformation in the domestic labor debates, proliferating versions of materialist feminism, and in dual systems theory, which explores the intricate relations between capitalism and patriarchy.

While some feminist theorists problematize women's exclusion from the major institutions of the public world (social, political, economic, religious, academic), others focus on difference as a primary category of analysis (women's differences from men as well as systemic differences among women based on race, class, nationality, sexuality, historicity), and yet others embrace the postmodern refusal of categorization, deploying deconstructive and genealogical methods to interrogate binaries and investigate power-knowledge constellations of particular concepts. Suspicious of the will to truth embedded in quests for analytic precision and totalizing metanarratives, postmodern feminist theorists urge transformative strategies designed to destabilize boundaries, fixities, and givens and to resist normalizing practices.

Western feminist political theorists have challenged received views about the nature of political life, particularly concerning the assumed neutrality of the state. They have demonstrated how the mutual constitution of public and private realms has marginalized women and undermined their full citizenship; how conceptions of politics, power, freedom, and order have been tied to male experiences of embodiment that exclude women; how social contract theory presupposes an exploitive sexual contract prior to the creation of the state, which the state then enforces; how conceptions of proper femininity have been used to fix meaning and escape instability by making the unfamiliar familiar and the unknown known; how the state functions as a mechanism to shore up particular conceptions of race and nation tied to practices of kinship; and how dominant paradigms of power continue to neglect gender power embedded in organizational rules, routines, and policies that sustain prohibitions, exclusions, denigrations, and obstructions that circumscribe women's lives while normalizing male dominance and rendering women, along with their needs and interests, invisible.

FEMINIST THEORY IN THE GLOBAL SOUTH

Postcolonial feminist theorists have advanced persuasive critiques of ethnocentric universalism, a mode of structural domination that suppresses the heterogeneity of women and

men in the global South. Replicating patterns of Western hegemony, dominant assumptions about the public/private distinction fail to recognize that enslaved and colonized peoples had no private sphere sanctioned by the state; every aspect of existence was subject to intervention by the state and its representatives. Gendered divisions of labor such as the male breadwinner–female homemaker model taken for granted by Western theorists are at odds with women's role in the production of subsistence in much of the global South and occlude inequalities created when Western development agencies imposed an ill-fitting male-breadwinner model in many parts of the world. Western analyses of class dynamics fail to comprehend how class relations can be complicated by caste even decades after the legal abolition of castes. To avoid prescriptions for social transformation advanced in ignorance of the specificities of women's needs and circumstances and without consultation with women in the global South, post-colonial feminist theorists insist that the politics of representation, the question of who speaks for whom and what is said, must become central to feminist political theorizing.

Feminization of Poverty

The term *feminization of poverty* is used to explain the fact that women and their dependent children make up the bulk of the world's poor. The term was coined in 1976 by sociologist Diana Pearce. In developing nations, poverty may be the result of a heavy dependence on the agricultural sector and the lack of government resources. In some countries, women and children eke out a scant existence by working the land while older males labor in more affluent neighboring nations to ensure the family's survival. In developed countries, women become poor through divorce, insufficient employment opportunities, low levels of education, or exclusion from decision-making processes. Those who reject the concept of the feminization of poverty generally do so because they view women as extensions of men or because they view the problem of poverty as non–gender related.

In all societies, women's work is devalued in relation to men's with the result that women are paid less for doing the same work even in countries where laws promise equal pay for equal work. The inequities arise in part because women tend to cluster in lower-status female-dominated occupations. Globally, women earn one-half to three-fourths of the salaries paid to men. In some developing countries, women need their husbands' permission to work, obtain passports, buy or sell property, secure bank loans, and open bank accounts. These are some of the same political issues that propelled the first wave of feminism in the United States and Europe during the mid-nineteenth and early twentieth centuries.

The problem of female poverty is so extensive that the United Nations has declared poverty "a violation of [women's] human rights to health and well-being, food, adequate housing, a safe and healthy living environment, social security, employment and development." The United Nations General Assembly designated 1996 the International Year for the Eradication of Poverty and subsequently established guidelines aimed at alleviating the feminization of poverty.

THE UNITED STATES

Despite the fact that the United States is the most heavily developed nation in the world with a per capita income of $41,000, 12 percent of the population lives in poverty. It has been estimated that 57.2 percent of all Americans living below the poverty line are female and that one in every four American children under the age of six lives in poverty. Among Americans who earn less than $4,000 annually, 70 percent are female. Minority women are more likely than white women to be poor. Current estimates place female poverty rates at 31.7 percent for black, 32.0 percent for Hispanic, and 12.6 percent for white people. In contrast, 24.7 percent of male poor are black, 26.8 percent are Hispanic, and 9.8 percent are white.

In addition to sex and race, common factors associated with poverty are single parenthood, low levels of education, and a lack of marketable skills. Women are economically vulnerable after divorce because men often fail to pay child support, and

alimony is rare among lower economic levels. Mothers who have been out of the job market raising children often find it difficult after a divorce to reenter the work world where advancing technology rapidly changes skill requirements.

Women with small children have an additional disadvantage as workers because they must find safe and affordable child care. An overhaul of the welfare system under President Bill Clinton broadened the safety net for mothers on welfare through job programs and extended periods of subsidized health care for low-income working mothers. However, many low-income women never receive welfare and must depend on families, friends, and churches for support when fathers fail to shoulder their responsibilities.

Even if they do find jobs, women are faced with pay inequities. In 1960, women earned 60.7 percent of male wages. Within two decades, that number had dropped by 0.5 percent. After 1981, in response to the women's movement and new laws, the wage gap steadily decreased. Yet even as wages for women in the general population grew, the extent of poverty among female-headed families rose to one in five as a result of social programs eliminated or slashed under the Reagan administration. By 2004, still far from equity, the wage gap narrowed to 77.0 percent.

EUROPE

Poor women in Europe face many of the same problems as do those in the United States. Part-time work is a major factor in the feminization of poverty, and large numbers of European women, particularly single mothers and those in Northern Europe, work part-time. In the Netherlands, 88 percent of women are so employed. The wage gap is also large among European women and has changed little during the past several decades except in Britain (68 percent), Portugal (72 percent), Denmark (85 percent), and France (81 percent). Unlike women in the United States, poor European women have access to strong safety nets that assist those in need.

Among all countries of the world, Finland and Sweden serve as role models for preventing the feminization of poverty. Parents share responsibility for children, and extensive social welfare systems keep single-parent families from falling into poverty, in part because of government-supported daycare centers and liberal paid parental leave policies.

THE MIDDLE EAST

Women in much of the Middle East are denied political and economic rights because of religious and cultural dictates. The most extreme example is Afghanistan, where Islamic law is enforced by the Taliban. Afghani women are barred from the workplace, and restrictions on female education result in a female literacy rate of only 21 percent. Domestic violence is prevalent; but if women leave abusive husbands, they are left without means of support.

Afghani women are frequently prevented from receiving necessary health care because they cannot be treated by male doctors. With a fertility rate of 6.69 children per woman, females suffer from a variety of pregnancy-related conditions. Lack of access to health care is particularly devastating among poor women because Afghanis face high risks of food and waterborne diseases such as hepatitis A and typhoid fever, and malaria is a constant threat from March to November.

In November 2006, Muslim women launched a campaign to end repression by holding a convention in Barcelona, Spain, to address issues that promote the feminization of poverty. The convention agenda specifically targeted polygamy, domestic violence, and Islamic laws that relegate women to inferior roles.

HIV/AIDS AS A FACTOR IN POVERTY

Women in sub-Saharan Africa and parts of Asia are the poorest in the world. They often live under appalling conditions in nations with low per capita incomes; low life expectancy; high infant, child, and maternal mortality rates; high incidences of preventable diseases; and limited access to education, health care, and social services. They may also lack access to safe drinking water and basic sanitation. During the past few decades, women in these nations have been further impoverished by HIV/AIDS outbreaks that have reached epidemic proportions.

By the end of 2005, 24.5 million people in Africa were living with HIV/AIDS, with South Africa (21.5 percent) and Zambia (16.5 percent) experiencing the highest incidences. Women are disproportionately affected by HIV/AIDS because men are more likely to have multiple sex partners. In 2000, estimates by international organizations placed the number of children orphaned and impoverished in Africa, Asia, Latin America, and the Caribbean at 34.7 million and predicted that the number will reach 44 million within a decade.

Feudalism

Feudalism is an indefinite term referring to either a form of political organization or a type of economic system. Politically, feudalism is an aristocratic hierarchy in which political authority is dispersed among lords and their vassals. Such feudal relations center on the homage pledged to lords by vassals, who were granted a benefice or fief (usually land) in return for service (primarily military). While feudal relations arose in many countries, such as Japan from the ninth to nineteenth centuries, they dominated in northern Europe during the Middle Ages, especially in Germany, France, and England. *Feudalism* was not a term used during this time to describe a specific system of government but is an abstraction used by Enlightenment scholars, some of whom gave it a primarily economic meaning and condemned it as a form of oppression.

Vassalage was a bond of honor between lord and vassal, who might be someone already recognized among the aristocracy or a free commoner. In a solemn ceremony the vassal gave an oath of personal loyalty and service for which the vassal received support and protection by the lord. A vassal would attend his lord's court; be consulted in governmental, judicial, and military decision making; and most important, fight in the service of his lord. A king would have vassals throughout his domain, and these in turn would establish vassalage relationships with others in their localities. Vassalage gave rise to a new class of nobility—knights, heavily armed warriors mounted on horses and obliged to serve their lords. Simultaneously, a code of honorable behavior called chivalry arose among these knights. Thus, vassalage differed from the relationship of serf and peasant to lord, subject to ruler, or citizen to state. Vassals not only gave counsel in the lord's court but performed most governmental functions in their own localities in which they were lords in turn. Under feudalism, then, political authority was shared among a small group of free lords and military leaders, each of whom exercised it in relatively limited territories and who further distributed that authority to subordinates. Government was not centralized but functioned mostly at the local level at which the lord and his court maintained order, determined law, collected taxes, and performed judicial and administrative functions. In these ways, feudalism is one antecedent of Federalism.

Peasants pay taxes to their lord in both money and livestock. Feudal lords controlled agricultural resources, which peasants paid to use.

Vassalage hearkens back to both German and Roman traditions, but in the Middle Ages it came to be accompanied by a benefice or fief, by means of which the vassal could support himself. This land grant was precarious, contingent on fulfillment of duties to the lord, but it provided a stronger and more stable bond between lord and vassal. Fiefs eventually became hereditary, with the vassal's heir paying homage to the same lord. The details of the duties and rights for both vassal and lord varied greatly from region to region. As a result there was no single, fixed form of feudal government. Feudal relations began in the eighth and ninth centuries in Europe as loose, flexible alliances, and they gradually became increasingly precise and clearly articulated in the twelfth and thirteenth centuries when feudal relations were at their height.

Feudalism as an economic term arose with Enlightenment scholars in the eighteenth century. Feudal lords presided over most means of production in the agrarian economy: land, forests, rivers, buildings, markets, and mills. The land was either worked by serfs or rented to peasant tenants, but in principle the entire produce of the land belonged to the landlord. Adam Smith, in *An Inquiry into the Nature and Causes of the Wealth of Nations* (1776), used the term "feudal system" to describe a system of economic production in which peasants and serfs are exploited by being coerced to labor for the landlord rather than provided with the monetary incentives of a free market system. A similar understanding of feudalism as manorialism was adopted by Karl Marx and Friedrich Engels, who described feudalism as one of the phases of political and economic development marked by severe class oppression.

While feudalism in Europe during the Middle Ages was characterized by considerable violence and frequent warfare between lords, it was not anarchic. The possession of substantial land and political authority entailed the public responsibilities of defending, policing, administering, and judging. Political power was exercised locally as a private possession of a lord, but concepts of central government survived in the form of kingship, which retained real prestige if not always executable sovereign power. Vassalage assigned certain duties and rights to both lords and vassals, which preserved conceptions of individual liberty and other rights, thereby guarding against absolutism, as demonstrated in the Magna Carta.

Fidelism (Castroism)

Fidelism (also known as Castroism) is a political ideology derived from and inspired by Fidel Castro (1926–). As an ideology, Fidelism represents a particular case of cross-fertilization of revolutionary pan-Americanism in the tradition of Simón Bolivar and the European Communist movement. Although Fidelism today represents a tendency within the broader communist tradition, it is the only tendency to have developed from outside the communist movement. In that sense, Fidelism represents the a posteriori application of a Marxist-Leninist doctrine to the political praxis of a particular Latin American revolutionary movement. Fidelism can further be distinguished from other tendencies within the communist movement by its source of authority, its tactics, its unique geographical influence, and its revolutionary strategy.

The source of authority in Fidelism is Fidel Castro. The seeds of Fidelism were planted when Castro led his audacious yet unsuccessful attack against Cuban President Fulgencio Batista at the Moncado barracks on July 26, 1953. This act enabled Castro to emerge as an independent political figure with his own personal following. Castro's "history will absolve me" speech, delivered during his trial in October 1953, became the centerpiece for the new Castroites and represented a program of radical social reform for Cuba with Fidel Castro at its helm. The program itself fit well within the confines of traditional left-wing Latin American politics in Cuba, which is situated well outside the communist movement. Castro and his movement drew inspiration from the likes of Máximo Gómez, Simón Bolivar, José Martí, and other Latin American revolutionaries. As such, Fidelism was uniquely Cuban from its inception. Following the July 26 attacks, the charismatic and audacious Fidel Castro was able to build a personal following in Cuba and elsewhere, which gave him an increasing maneuverability to define and redefine his movement and ideology.

Fidelism stresses tactics over ideology. Even before coming to power, Fidel Castro continually demonstrated a willingness to negotiate and employ selective ideologies as a means for securing power and consolidating his vision of a more equitable and just society in Cuba. In fact, Castro has never firmly cast his movement in any theoretical mold. Rather, he has shown a willingness to enter into broad alliances with any group that will enable him to build political capital and consolidate his vision. During his struggle in the Sierra Maestra in Cuba's Southeast, he entered into broad alliances with Auténicos and the Communist party. Upon seizing power in 1959, he emphatically told the United States, "We are not communist. The doors are open to private investments that contribute to the development of industry in Cuba." It was only after relations with the United States deteriorated that Castro turned toward Marxist-Leninism and the Soviet model to consolidate his power in Cuba and defend his nationalist project against U.S. aggression. Following the demise of the Soviet Union in 1991, Castro once again demonstrated this ideological flexibility by initiating limited, market-oriented reforms. In this sense, Fidelism is not so much an ism as it is a leader who is willing to borrow ideology to support his actions.

Fidelism can be distinguished from other communist tendencies in that it is uniquely Latin American. Argentine revolutionary Che Guevara pointed out that the Cuban revolution has provided Latin Americans with a uniquely indigenous alternative that speaks to them in Spanish, in their own language. Thus, the inspiration for and language of Fidelism is uniquely Latin American, a difference that exacerbates and nationalizes the differences between Fidelism and other communist tendencies.

Finally, Fidelism's revolutionary strategy represents a stark departure from traditional communist formulations. In Marxist formulations of revolution, objective conditions created the basis for armed struggle. However, Fidelism exalts the ethos of guerrilla warfare over historical condition. Castro, Guevara, and the Castroites presented their victory as the exclusive outcome of an armed struggle waged by guerrillas in the Sierra Maestra. As Guevara writes, "We have demonstrated that a small group of men who are determined, supported by the people, and without fear of dying . . . can overcome a regular army. . . . We must make agrarian revolution, fight in the fields, in the mountains, and from here take the revolution to the cities, not try to make it in the latter." In this formulation, armed struggle alone is sufficient. This unique guerilla aspect of Fidelism is accredited primarily to the contributions of Guevara.

Field Experiment

Field experiments, as distinct from laboratory experiments, are randomized interventions that take place in naturalistic settings. Field experiments are principally designed to establish causal relationships. Well-executed field experiments combine the strengths of randomized designs with the external validity of field studies. While a laboratory study, for example, might examine the effects of political advertising on voter turnout by exposing treatment and control groups to different advertising stimuli within an artificial setting and gauging their vote intentions by means of a survey, a field experiment would randomly manipulate the content and timing of actual advertisement campaigns and attempt to link these varied interventions to observed patterns of voting. Both types of studies use randomization, but the latter has the advantage of linking cause and effect in terms that have direct real-world applicability.

Although field experimentation is in principle a strong research methodology, in practice it faces important ethical and pragmatic constraints. Rarely do social scientists have the opportunity or authority to manipulate the variables of most interest to them, such as culture, political systems, economic prosperity, and the like. Even in situations wherein random interventions are attempted, they are sometimes undone by the people charged with implementing them. Political campaigns participating in a field experiment may be tempted to influence the control group in an effort to garner additional votes.

The challenge of orchestrating field experiments and maintaining the integrity of the randomization means that they tend to occur in a small number of sites that are chosen for reasons of convenience rather than through systematic sampling procedures. This constraint raises the issue of whether the study's conclusions apply only to the types of people who actually participate in an experiment. Replication is the appropriate response to concerns about drawing conclusions based on studies of particular times, places, and people.

A further complication arises when experimental subjects refuse to participate in the study or cannot be reached for treatment. Although noncompliance diminishes the power of an experimental design, it is a remediable problem as long as the decision to participate is unrelated to the strength of the treatment effect. The statistical correction is to perform an instrumental variables regression in which the independent variable is whether a subject was actually treated and the instrumental variable is whether a subject was originally assigned to the treatment group. The resulting effect estimate is termed the "treatment-on-treated" effect because it is the effect of the treatment on those who actually receive it. The severity of attrition problems depends on whether there is differential attrition for treatment and control groups.

Despite these challenges, field experimentation has grown dramatically in political science since the late 1990s, as scholars have sought to assess the effectiveness of interventions ranging from voter mobilization tactics to tax compliance to lobbying. Scholars have also become increasingly adept at seizing opportunities to study naturally occurring randomization, such as judicial assignments, ballot order, and the representation of women in local governance. The continued growth of field experimentation depends on whether policy makers and political actors can be convinced to incorporate random assignment when deploying resources across time or space, so that they and the scholarly community can rigorously assess the effects of their interventions.

Filibuster

The filibuster is a parliamentary tactic used to delay or prevent a vote on legislation through unlimited speech or debate. The word *filibuster* is derived from the Dutch word for "pirate" and connotes the attempt to highjack a piece of legislation that would otherwise pass with a majority vote. The origins of the filibuster date to the Roman senator Cato the Younger who, when faced with a measure he opposed, would speak continuously until the proponents of the action would withdraw it or grant concessions. Many modern parliamentary systems allow some form of the filibuster. For instance, in most Westminster systems, parliamentarians may be allowed to continue debate on a measure and introduce endless amendments as long as they are related to the motion. In the United States, initially members of both the House of Representatives and Senate had the right to filibuster. However, the House imposed restrictions on debate in 1842. Senators continue to have the privilege of unlimited debate, although the Senate adopted a rule in 1917 that allows it to invoke cloture with a three-fifths majority vote (sixty senators). Strom Thurmond (R-S.C.) holds the record for the longest filibuster at twenty-four hours and eighteen minutes during his 1957 effort to block the passage of civil rights legislation.

Filmer, Sir Robert

Twentieth-century political scientists know Sir Robert Filmer (1588–1653), an English absolutist theorist and perhaps the most famous proponent of the theory of patriarchalism during the seventeenth century, primarily in his capacity as the target of John Locke's criticisms in the *Two Treatises of Government.* Eldest son of Sir Edward Filmer of East Sutton, Kent, Robert Filmer entered Trinity College, Cambridge, in 1604.

After a year at Trinity, Filmer was admitted to Lincoln's Inn to study law, although it is not clear whether he ever actually did so. He married Anne Heton in 1618 and inherited his family's estates upon Sir Edward's death in 1629.

By the time that the English Civil War (1642–1651; armed conflict between Parliament and King Charles I) broke out in 1642, Filmer—although a fervent supporter of the king—was too old to take an active part in the fighting. Remaining at his family estate, he was forced to contribute to the parliamentarian cause when Kent fell to Parliament and was imprisoned for a time during the mid-1640s. Three important works by Filmer appeared in 1648: *The Freeholder's Grand Inquest,* a historical survey that argued that Parliament sat at the king's pleasure; *The Anarchy of a Limited or Mixed Monarchy,* which attacked parliamentary supporter Philip Hunton's *Treatise of Monarchie* (1643); and *The Necessity of the Absolute Power of All Kings,* which reproduced excerpts from Richard Knolles's 1606 translation of French sovereignty theorist Jean Bodin into English. With the execution of the king in January 1649, Filmer retreated from public life, although he did remain informed about the political and intellectual currents of his time. Filmer's *Observations upon Aristotle's Politiques*—a critique of Hobbes, Milton, and Grotius—appeared in 1652, one year before his death.

Filmer's best-known work, *Patriarcha,* was written around 1628 but remained in manuscript form until its publication in 1680, at which time it was celebrated by resurgent Anglican royalists and denounced in print by no less than three important Whig thinkers: Locke, James Tyrell is his *Patriarcha, Non Monarcha* (1681), and Algernon Sidney is his *Discourses Concerning Government* (1698). In *Patriarcha,* he took aim at such Catholic thinkers as Robert Bellarmine and Adolfo Suarez, who had criticized the Crown's requirement that English Catholics take oaths of allegiance in the wake of the Gunpowder Plot. More broadly, however, *Patriarcha* attacked contract theories of political obligation, which claimed a right on the part of the people actively to resist the king, and denounced defenses of Parliament that sought to limit or extract concessions from the king. In distinct contrast to his most famous critic, John Locke, Filmer equated political power and paternal power and denied the natural freedom of humankind. In other words, just as a father possessed absolute authority over his family, the king possessed absolute authority over all the families in the kingdom. Just as every individual was born subject to the head of his or her family, so was everyone born subject to a political ruler.

First Past the Post

First past the post is an electoral formula whereby the candidate who obtains a plurality of votes in a single-member district wins the corresponding seat. One of the simplest, oldest, and most widely adopted election mechanisms—used by countries including the United States and the United Kingdom—first past the post is also highly disproportional as it grants, by definition, 100 percent of district representation to the party that wins a simple majority of the vote while leaving the remaining competitors unrepresented regardless of their electoral strength. This incentivizes electoral aggregation at the constituency and national level and penalizes third parties with a geographically dispersed support. Based on this logic and on empirical evidence, most comparativists believe that in the medium or long run first past the post favors a two-party system—the oft-cited Duverger's law—or at least decreases the number of parties compared to other mechanisms such as proportional or runoff formulas (exemplified, respectively, by the German and French systems).

For advocates of first past the post, by simplifying the party system and facilitating the formation of single-party or small coalition governments, this formula allows voters to choose between clear public policy alternatives and increases the stability, efficiency, and democratic accountability of parliamentary executives. Critics, on the other hand, view first past the post as a less than democratic mechanism, which reduces the options of the electorate and produces a distorted picture of the society in representative institutions, where cleavages are artificially reduced, minorities are systematically underrepresented, and political diversity all but disappears.

Fiscal Conservatism

Fiscal conservatism is an ideological perspective on what constitutes the appropriate approach to economic matters within modern capitalist states; it is a term more commonly used in the United States, Canada, and Australia, but the perspective can be found throughout Europe as well. The fundamentals of the approach favored by this perspective include limited government spending, low tax rates, free trade agreements with other nations, only modest amounts of business regulation, a strong respect for individual property rights, and balanced budgets. Sometimes referred to as "traditional economic conservatism" or "classical liberal economics," this perspective grounds itself in what its advocates see as the laissez-faire tradition of economic thought, beginning with Adam Smith and David Ricardo, and continuing on through contemporary economists such as Milton Friedman and George Stigler. As such, it is a perspective that either completely rejects or greatly qualifies the economic arguments advanced by contemporary liberal thinkers such as John Maynard Keynes, agrarian or

protectionist political leaders such as John Taylor or Henry Clay, and socialist thinkers such as Karl Marx.

Fiscal conservatism does not carry with it any necessary connection with traditionalism or conservatism on social or moral matters. In fact, it is not uncommon to find fiscal conservatism pared with social libertarianism, assuming that a leave-it-alone approach to matters of individual wealth and economic growth ought to be paralleled with a similar hands-off attitude toward matters of lifestyle and culture. Many fiscal conservatives, while not embracing a fully libertarian attitude with regard to social issues, will nonetheless often emphasize their identity as economic conservatives as opposed to people whose conservative beliefs are focused more on social or moral matters and are rooted in religious or traditionalist beliefs. At the same time, some fiscal conservatives embrace some form of social conservatism as a necessary supplement to their own fiscal preferences, arguing that a virtuous culture is the most likely foundation for the trust that capitalist economies require. This intersection of contrasting conservative priorities has often been the cause of deep disputes among those political parties that have most strongly adopted fiscal conservatism as part of their platform.

Fiscal conservatism's use as a descriptive label was greatly shaped by the historical contest between collectivist economic theories and capitalist ones throughout the twentieth century in the United States and Europe. For example, the growth of government spending, federal regulations, and tax rates in the United States, particularly through and following the Great Depression of 1929 and World War II (1939–1945), led many to believe that local and free enterprise economic principles were being consciously undermined by opponents of economic freedom. Through the 1960s and 1970s, the notion of fiscal responsibility was put forward by many conservative thinkers and activists in the United States in contrast to what they perceived as the socialist-influenced profligacy and bureaucratic entanglements that resulted from postwar economic planning. This movement was paralleled by similar efforts during the same time period to reform the economic restrictions that had been put in place by social democratic governments in many western European nations following the war. With the election of Margaret Thatcher as prime minister in Great Britain in 1979, Ronald Reagan to the American presidency in 1980, and Helmut Kohl as prime minister of West Germany in 1982, the fiscal conservative reaction attained significant power, and the economic deregulation, reduction, or simplification of tax rates; privatization of industries; cutting of government social services; and other moves in the direction of less intervention in the operations of the free market during the 1980s are often looked on by fiscal conservatives as a high-water mark for the ideology.

Fiscal conservatism does not necessarily mandate an opposition to all government spending, regulation, or taxation, particularly if the policies in question are tied to matters of national defense, which is generally recognized by voters and parties alike to not be a matter particularly governed by economic realities. In regard to government spending or

regulation on public interest matters such as health, education, or environmental protection, rather than rejecting such responsibilities entirely, often fiscal conservative thinkers will suggest making use of market-like incentives to harness the self-interest of individual economic actors to accomplish public ends. It is believed that a reliance on vouchers, tax breaks, and other similar policies will provide the public goods that society needs without top-down, command-and-control policies that, fiscal conservatism argues, distort the innovation and opportunities that markets provide.

Fiscal Policy

Fiscal policy involves decisions about government revenues, spending, and borrowing. These decisions require politicians to address the reality of limited means and unlimited desires. The politics of fiscal policy is often contentious and is affected by rules that vary across national and subnational governments. Issues may be divided according to the size of government, as measured by spending and taxes (fiscal scale), and the causes and consequences of deficits (fiscal balance).

SIZE OF GOVERNMENT

Prior to the twentieth century, the fiscal scale of democratic governments tended to be quite limited except during times of war. Nondefense government spending and taxes grew relative to the economy in many countries from about 1910 to 1940, and then again from about 1960 to 1980. Reasons for this expansion likely included demands created by industrialization and urbanization, widespread acceptance of the idea that the provision of social services and free education are basic government functions, and an enhanced ability to monitor economic activity and collect taxes and fees.

Looking across national and subnational governments, current levels of spending and taxes depend on political and institutional variables as well as demand. Liberal parties tend to tax and spend more than conservative parties, but the ability of a party to move fiscal scale to its most preferred level is often dependent on maintaining control for a number of years. Some recent research in political economy has focused on the effects of government structure and electoral rules on fiscal scale. In general, presidential governments chosen in majoritarian electoral systems tend to have smaller fiscal scales than parliamentary governments chosen in proportional representation systems. Additional research has focused on the effects of constitutional or statutory restrictions, such as California's famous Proposition 13, which limits the amount of property tax revenue available to state and local governments. In the United States, the mere existence of a state constitutional provision that allows citizens to place tax and spending limitations directly on the ballot tends to restrict the fiscal scale of government.

DEFICITS AND DEBT

Although voters everywhere tend to prefer lower taxes, they also look to elected politicians to provide various services and programs that cost money. The temptation, therefore, is to finance these services and programs with borrowing that pushes the burden of payment into the future.

Fiscal balance, like fiscal scale, may be affected by the design of institutions. Governments elected in majoritarian systems tend to run smaller deficits relative to the economy. Balanced budget laws and constitutional restrictions on borrowing are fairly common for subnational governments in the United States, but few, if any, national governments have these restrictions.

An alternative source of discipline is credit markets. Governments that run persistent, excessive deficits find that the cost of borrowing goes up and interest payments begin to crowd out spending on services and programs. The possibility of actual default creates substantial risks for lenders and may lead to a request for assistance by the national government to a subnational government or by international sources to a national government.

In recent decades, persistent, significant deficits absent wars or recessions have become an important issue. In the 1930s, governments adopted Keynesian economic principles to combat economic recessions with increased government spending. While this was politically popular, the Keynesian prescription to offset these deficits with increased taxes or decreased spending during times of prosperity was not at all popular. In the 1980s, some conservative governments adopted supply-side economic policies in the belief that the best way to stimulate economic growth is to encourage investment by cutting taxes. Once again, cutting taxes is politically easy, but offsetting spending cuts is hard. Finally, most industrialized democracies have adopted a variety of entitlement programs that provide for income security and health insurance. As life expectancies increase and populations age, the ratios of beneficiaries of these programs to taxpayers increase. The result is that a number of national, as well as some subnational, governments are on unsustainable trajectories. Reform of entitlement programs that benefit middle- and upper-middle-class citizens who turn out to vote in elections is a very difficult political task, but one that many governments are likely to find unavoidable.

Floating Voter

Floating voters (also known as swing voters) are individuals who do not maintain their allegiance to a particular party but instead vote for candidates in other parties or groupings. Traditionally, most voters maintain their loyalty to a particular party, and most scholarship suggests that party affiliation is formed during childhood. However, in the twentieth century, an increasing percentage of the electorate began to vote for candidates based on ideas or policy preferences as opposed to party ideology. The rise of floating voters prompted many political parties to seek candidates who could appeal to members of other parties. Some political leaders considered floating voters faithless party members because of their willingness to cross party lines during elections. Research has also indicated that some floating voters are less informed and more likely to cast ballots based on personal preferences rather than political analysis. Other theorists assert that floating voters reflect democratic ideals since they are not bound by partisanship and vote based on policy choices. Consequently, they can serve as a corrective mechanism for political parties that advocate policies or measures that are out of step with the mainstream. The number or percentage of floating voters increases during periods of significant economic, social, or political upheaval.

Follett, Mary Parker

Mary Parker Follett (1868–1933) was an American political analyst and social activist in the late nineteenth and early twentieth centuries. She formulated her political and social views and theories based on many years of civic engagement and community-based experiences, including her participation in the Women's Municipal League and her tireless dedication to establishing social centers in the Boston, Massachusetts, area.

Born in Quincy, Massachusetts, to a wealthy Quaker family, Follett had an unhappy childhood. In 1884, she attended Thayer Academy, an academically challenging private school in Boston, and graduated at age sixteen. When she turned seventeen, she applied to and was accepted to enroll in the Society to Encourage Studies at Home to continue her education. After three years of study in the society, she enrolled as a special student at Harvard Annex for Women (Radcliffe College), taking time out to study at Newnham College in Cambridge, England. She eventually returned to Radcliffe, received an AB degree, and graduated with highest honors in June 1898. While a student at Radcliffe, she conducted research on government and published it as *The Speaker of the House of Representatives* (1896), a well-documented scholarly account of the U.S. Speaker's political power based on historical and qualitative research methods.

In the early part of the twentieth century, she was involved in social work public service in the Boston area. Shortly later, she was chair of the Women's Municipal League's Committee on Extended Use of School Buildings. In 1911, she continued to devote her time and energy to help build a sense of community by helping to establish the East Boston High School Social Center. Her involvement in public service and government affairs continued through her appointment to the Massachusetts Minimum Wage Board and appointment as the vice president of the National Community Center Association in 1917. In 1918 she published *The New State,* her second book, now considered a classic in democratic political theory.

In the early 1920s, Follett began her work on management and administration in industry and public institutions in earnest. In 1924, she wrote her third book, *Creative Experience,* which was based on her community experiences on conflict resolution and small-group management. Her last two books, based on her civic and professional work experiences during twenty years in Boston-area neighborhoods, served as the basis for constructing a new model of democracy whereby she sought to empower Boston-area immigrants by making them responsible for their civic duties, thus increasing their level of participation in government affairs. Follett left the United States for London in 1928. Unfortunately, prior to this move abroad, she destroyed most of her personal papers, and she requested that any other papers be destroyed upon her death.

Despite Follett's major contributions to political science, she is best known for her work on management and organization, which was summarily dismissed in the United States during the 1930s and 1940s, although it remained highly popular in Great Britain. Her work on management resurfaced in the 1960s and today is considered classic management theory.

Food Policy

A food policy is a decision, program, or project, endorsed by a government agency, business, or organization, that affects how food is produced, processed, distributed, purchased, protected, and disposed of. Food policy can pertain to local, regional, provincial, national, or within-institution regulations. Food policy is closely related to agricultural policy, which is the process of assessing sectoral performance and providing appropriate and participative policy formulation for the development of the sector. These policies aim to correct market failure, to react to crisis situations, and to promote environmental sustainability. The main objective of the policies is to increase productivity and income growth, to enhance food security and equity, and to ultimately reduce the number of those suffering from hunger.

THE WORLD FOOD SITUATION

DEFINING FOOD SECURITY

To understand the genesis and underlying rationale of most international food policies, one must first examine the endemic global or regional food problems prompting the need for such policy regulation. Problems, such as food security, have become a priority for countries and international organizations that work collectively to alleviate low levels of food security plaguing many nations. Food security means having sufficient amounts of food within a population and is largely measured on a variety of factors including the availability of world supplies of food, accessibility of available supplies, income of the designated population, consumption rate of food, and amount that can be set aside for future use. Although over the past three decades the world has produced more food, and agricultural production has experienced favorable conditions, food insecurity remains a major problem worldwide.

Food security is an important issue that will continue to be faced by policy makers from developing countries and developed countries in this and the next millennium. A clear understanding of the causes of hunger and malnutrition is imperative to enable and challenge policy makers to lay the groundwork at the grassroots level for appropriate policy measures and the development of programs designed to alleviate hunger and its consequences. Due to a lack of reliable worldwide population data, it is difficult to say exactly how many people are undernourished. However, even in the absence of appropriate data collection and analysis, there is general agreement that the number of people severely affected by hunger and malnutrition is extremely large.

STATISTICS

According to a World Food Programme estimate, the number of undernourished people in the world increased in 2008 to 963 million, an increase by 115 million during the past two years. This increase is due to dramatically rising food and fuel prices aggravated by widespread turmoil among international financial systems. Currently, another 1 billion are at risk of falling into the ranks of the hungry, and if trends continue, this number is expected to grow dramatically. The Food and Agriculture Organization's latest estimates show even before the recent surge in food prices, worrisome long-term trends toward increasing hunger were already apparent.

The vast majority of the world's undernourished people—907 million—live in developing countries according to the 2008 data reported in the Food and Agriculture Organization's *State of Food Insecurity in the World*. Of these, 65 percent live in seven countries: India, China, the Democratic Republic of Congo, Bangladesh, Indonesia, Pakistan, and Ethiopia. Progress in these countries with large populations would have an important impact on global hunger reduction. In sub-Saharan Africa, one in three people—or 236 million—are chronically hungry, the highest proportion of undernourished people in the total population, according to a 2007 World Bank Africa report. The majority of these persons resided in the Democratic Republic of Congo. Due to the widespread and persistent conflict in the country from 2003 to 2005, the number of chronically hungry persons in the Congo rose from 11 million to 43 million, and the proportion of undernourished rose from 29 to 76 percent.

DEVELOPMENT OF FOOD POLICY

Historically, food policies have been designed to solve global and regional problems of food security and stimulate economic growth for third world nations. As mentioned previously, in many countries, food policy forms an integral part of agricultural policy. For example, in Germany, agricultural, health, and environmental policies are closely linked to food policy as they are shaped by legal and regulatory policies, financial and commercial policies, and research and educational policies. Furthermore, while independent states have domestic food policies, many food policies as discussed below are created and regulated by collective state efforts to effectively rely on regional resources and international support to relieve a region's food security problems writ large.

In Africa, the agricultural policy called the Comprehensive Africa Development Programme was developed in 2003 by African heads of state and governments. Its primary objectives are to (a) improve national agricultural policy frameworks; (b) strengthen institutions and governance; (c) enhance agricultural productivity; (d) foster trade, investment, economic growth, and sustainable development; and (e) promote regional integration. The Comprehensive Africa Development Programme is an acknowledgment of the failures of past agricultural policies in Africa, which attempted to bring a green revolution to Africa.

European Union (EU) agricultural policy has its roots in the post–World War II food shortages of the 1950s and early 1960s. The emphasis was on providing enough food for a Europe emerging from a decade of war-induced shortages. Subsidizing production on a large scale and buying up surpluses in the interests of food security are now largely things of the past. EU policy aims to enable producers of all forms of food—from crops and livestock to fruit and vegetables or wine—to survive by themselves in EU and world markets.

In the 1960s, many Asian governments, particularly India's, created and implemented a favorable policy to support a new

agricultural innovation called the green revolution. The green revolution was a response to the emerging Asian food crisis incited by rapid population growth and stagnant grain production. The revolution was driven by a technology revolution comprising a package of modern inputs—irrigation, improved seeds, fertilizers, and pesticides—which would together significantly increase crop production. The speed and scale with which it solved the food problem was remarkable and unprecedented, and it contributed to a substantial reduction in poverty and the launching of broader economic growth in many Asian countries. Today, Asia's significantly growing populations and state attempts to modernize its agricultural and economic investments to keep pace with global markets limit the lasting effects of the green revolution. However, without the green revolution in the 1960s, analysts claim the food insecurity and poverty in Asia could have been much higher than it is today.

CHALLENGES FOR FOOD POLICY

The key challenge for food policy is to help agriculture play its role as an engine of growth and poverty reduction. Food policy should provide a useful framework to focus the discussion on food insecurity. Essentially, designing food and agricultural policy that will enable rural populations to pull themselves out of their impoverished conditions remains a challenge in many developing countries. Addressing the political economy of agriculture-for-development agendas will continue to be difficult, particularly in Africa. Due to poor investment in research and development throughout the continent, it will likely be difficult in the short term to establish food policies and a regulatory environment that will promote new waves of technological agricultural innovations in Africa. Last, a major challenge facing the agricultural sector is the effect of global climate change on agriculture. This effect is uncertain. Therefore, a preventive policy and a plan of action have to be elaborated by policy makers not only nationally but also internationally.

Ford, Henry Jones

Henry Jones Ford (1851–1925) began his life as an editor, and for the next thirty-three years he worked for six magazines in three cities. He then went on to teach at Johns Hopkins University, the University of Pennsylvania, and Princeton University, and during that time he also served a term as president of the American Political Science Association (1918–1919).

While at Princeton he met Woodrow Wilson, then president of the college. When Wilson became governor of New Jersey, he brought Ford along with him and appointed him to the position of commissioner of banking and insurance. Later, as president of the United States, Wilson sent Ford to the Philippines on a special mission, reporting directly to Wilson. It is universally agreed that the mission was to write a report on the governmental conditions in the area, although any such report was never published. Toward the end of Wilson's presidency, he appointed Ford to a position on the Interstate Commerce Commission. This position, however, was ad interim due to a growing difference of opinion between Wilson and the Senate of the time.

Ford was also a published writer. In addition to numerous articles, he wrote *The Cost of Our National Government* (1909); *The Scotch-Irish in America* (1915); *The Natural History of the State* (1915); *Woodrow Wilson, the Man, and His Work* (1916); *Washington and His Colleagues* (1918); and *The Cleveland Era* (1919). A major topic of interest for him was the American presidency, which he thought of as an elected kingship that dominated public policy. Ford felt that the president, when need be, could control Congress through recess appointments and vetoes. As a reformist, Ford believed that the presidency need be only as powerful as a role that ends party duplicity and defines issues in such a way that the public can decide on them. The increase in power for the president came about because of popularity. Citizens made the president the "organ of the will for the nation" (Ford 196). Through this overwhelming presidential support, the power of the legislative branch dwindled. Congress would avoid any difficult decisions and often did unless the president decided to bring them back up again. He had the power to control them.

Forecasting, Political

Political forecasting identifies political phenomena that may occur at a later point in time, whether specific events or conditions in the broader political milieu. The forecasts that result may provide (1) estimates of a predicted event's magnitude, through point forecasts, such as the percentage vote that a candidate is expected to receive in an upcoming election; (2) estimates of the probability that an event will occur, such as the likelihood of an international crisis erupting; and (3) scenarios of the future, which specify alternative outcomes that are conceivable and the intervening circumstances necessary for each outcome to occur, such as alternative configurations of power that might exist among nations in twenty years.

RETROSPECTIVE AND PROSPECTIVE FORECASTING

Although political forecasting anticipates the future, *future* has different meanings. In fact, political forecasting encompasses predicting political phenomena in the past. For example, data from one decade might be used to create a statistical model of conflict in the Middle East, which then is used to predict outcomes in a later decade in the past. In this useful procedure for testing hypotheses, the future is from the perspective of the original period on which the model is based. The results are retrospective forecasts, *ex post* forecasts, or post-diction.

Predicting the actual future is termed "prospective forecasting," "*ex ante* forecasting," or "pre-diction." These forecasts may be useful in testing models and hypotheses, like retrospective forecasts. But by attempting to predict the current future, prospective forecasts have an additional practical value. For example, knowing the likely income from government revenues next year is useful, regardless of whether the forecast tests a hypothesis. This applied dimension of prospective political forecasting has led to criticism by political scientists who contend that an activity that does not contribute to understanding political phenomena lacks scholarly value. In practice, however, usually there is a theoretical underpinning to prospective forecasts because many applied forecasters are scholars whose theoretical knowledge of the subject informs their forecasts.

SUBJECTS OF POLITICAL FORECASTS

Most political forecasting to date has focused on three subjects: (1) elections, (2) interstate and domestic political conflict, and (3) government revenues.

ELECTIONS

Forecasts of the popular vote in U.S. presidential elections have been made by random-sample campaign polls since 1936. Polls were joined by a judgment-based index technique in 1982, by regression forecasts also in 1982, by futures markets for elections in 1988, and by Delphi surveys of experts and combining forecasts in 2004. All of these techniques usually have predicted the election winner correctly, with the 13 Keys index having a perfect record. Forecasts of the percentage vote have varied in accuracy, depending on the method and election year. The elections futures market at the University of Iowa appears to have been the most consistently accurate over time.

Forecasts of the U.S. electoral college vote, most of which are compilations of state forecasts, have appeared less frequently and have had variable accuracy. Beyond U.S. presidential election outcomes, prospective forecasts have been made of party nominations for president, of congressional election results, and of results in parliamentary and presidential elections in Europe and elsewhere.

CONFLICT

Political forecasters also have been active in predicting domestic political conflict, primarily in developing countries, and conflict among nation-states. Forecasts of domestic conflict have predicted forms of internal political instability, such as riots and military coups, as well as larger societal collapses (state failure), including civil wars and revolutions. Forecasts of conflict between nation-states have focused mostly on crises and wars. More recently, predicting attacks by nonstate terrorist groups has gained increased attention. In practice, the lines between intrastate and interstate forecasting have become blurred in part because some phenomena have aspects of both, such as external interference in civil wars.

Conflict forecasting often has a policy motivation. Major academic projects in this field have been funded by government agencies, and some conflict forecasting is undertaken by agencies in-house, especially within intelligence and defense organizations, to support policy requirements. In fact, much of conflict forecasting is conducted under the banner of *early warning,* a term that implies there is a policy response to the warning.

GOVERNMENT REVENUES

Because every unit of government is dependent on tax revenues and must produce budgets for the future, revenue forecasting is important at all levels of government. The volume of government revenue forecasts in the United States is large, owing to the thousands of municipal governments that exist in the country. In the many smaller municipalities, revenue forecasts often are limited to the impressionistic judgment of local officials. By contrast, forecasting revenues for the U.S. federal government is a complex quantitative process undertaken by the Congressional Budget Office and executive organizations, notably the Office of Management and Budget and the Treasury. At the state level, revenue forecasts usually are produced in the state finance office or similar organization by economists who use systematic forecasting methods and who sometimes draw on expertise in state universities.

Revenue forecasts often are significantly inaccurate. Much of this error is due to the difficulty of the forecasting task,

but political influences and other biases may play a part. An administration that favors increased spending has an incentive to overestimate revenues to bolster the argument that new programs are affordable. An administration that favors reducing taxes may also overestimate revenues to justify tax cuts. At the state level, where the government budget must be balanced, forecasting agencies usually underestimate revenues, particularly exercising caution toward uncertain revenue sources.

OTHER SUBJECTS

Predicting changes in Federal Reserve monetary policy has long occupied many government, business, and academic analysts. Other more limited political forecasting activity has included predicting (1) the outcome of U.S. Supreme Court cases, (2) Senate votes to confirm Supreme Court nominees, (3) the performance of the president, (4) congressional support for legislative positions taken by the president, (5) the length of the Iraq War (2003–), (6) the likelihood of Quebec's seceding from Canada, and (7) the probability of political occurrences abroad that are detrimental to domestic companies' foreign investments.

CONCLUSION

Although underappreciated within political science in the past, political forecasting is gaining increased recognition for bringing rigor to hypothesis testing and for contributing to the policy requirements of government. Growing support for forecasting is evident in the formation of the Political Forecasting Group and its designation in 2006 as a Related Group of the American Political Science Association.

Foreign Aid

Foreign aid (or development assistance) consists of voluntary transfers of resources from a donor to a (developing) recipient country. More specifically, official development assistance (ODA) is restricted to transfers of government resources via bilateral or multilateral channels.

DEFINITIONS AND OVERVIEW

Bilateral ODA involves only the donor's and the recipient's governments, while multilateral channels consist of international organizations such as the World Bank, the International Monetary Fund, and the United Nations Development Programme. ODA therefore excludes private funds raised by international nongovernmental organizations. In 2008, bilateral and multilateral ODA from members of the Organization for Economic Cooperation and Development (OECD) totaled approximately US$120 billion; the biggest bilateral donor countries were the United States, Germany, the United Kingdom, France, and Japan. Although OECD donors agreed in the late 1970s on a spending goal of 0.7 percent of their countries' combined gross national income, ODA in 2008 represented only roughly 0.3 percent of OECD members' gross national income.

Generally, aid can be delivered in different forms. First, one can distinguish between humanitarian aid and assistance delivered for more structural objectives. Humanitarian aid is normally short term, is often in material form, and exists as a response to cases of humanitarian crisis caused by natural catastrophes or political violence. In contrast, structural aid has rather long-term goals and—at least rhetorically—aims at reducing economic and political barriers for development. Primarily, long-term aid is an attempt at promoting economic growth, poverty reduction, and democratization. Nevertheless, the list of such structural goals has continuously expanded during the past five decades, as mirrored in the United Nations Millennium Development Goals. Currently,

international development challenges—such as climate change, new security threats, and economic turmoil—have added a global perspective to the foreign aid agenda, which traditionally focused mainly on national contexts. According to some observers, this expansion with little prioritization is threatening to overburden the capabilities of development assistance and is reducing the accountability of aid organizations.

A second distinction can be drawn between financial and technical instruments of providing development assistance. Financial instruments typically consist of subsidized credits, grants, and debt relief, which are often conditioned on policy or institutional reforms in the recipient country. Technical cooperation in the form of capacity building mostly contains training or assistance when reforms are implemented. As development assistance increasingly is targeted to tackle institutional barriers for development, financial and technical cooperation have become more political. A political dialogue at the national level often accompanies aid instruments between donor and recipient governments because profound, reaching reforms in fields such as education, health, and public finance generally have far-reaching implications for the political settlement of the recipient society.

THE AID EFFECTIVENESS DEBATE

At least until the 1990s, the debate about the effectiveness of development aid was mainly centered on the impact of aid on economic development, which, in turn, was assumed to further increase overall human development. Studies evaluating the effectiveness of development aid across countries, however, uncovered a paradoxical finding: although development aid has mostly been evaluated in a positive manner at the project level or in specific sectors, such as education, no robust evidence of causality between development aid and economic growth or poverty reduction at a macro-economic level could be identified—at least not for the period spanning from the 1960s to the 1990s. This micro-macro paradox can be attributed to a number of negative externalities, which result from the increasing aid dependency of poor countries.

First, substantial aid inflows can negatively affect the recipient country's international competitiveness because, as the currency appreciates with growing aid inflows, the competitiveness of the tradable sector declines (a phenomenon known as Dutch disease). Second, poor countries especially face constraints in their absorptive capacity because they simply do not have the human and technical capacity to manage large resource inflows and the administration connected to this in an effective manner. Third, high aid inflows can distort incentives for policy makers to engage in development-friendly policies. High aid inflows channeled through recipient countries' governments can be prone to misuse and may even spur corruption inside the recipient country. Moreover, aid flows are subject to fungibility. Fungibility implies that governments tend to alter their spending decisions and reallocate their budgets in such a way that development aid can at least partly substitute national spending in sectors relevant for development. The resulting fiscal maneuvering space of recipient governments can be used

for sustaining patronage systems and protecting autocratic structures. The challenge of fungibility and the potential misuse of aid for serving powerful interest groups are reduced in countries where political transparency and democratic participation are higher. Considering this, empirical evidence suggests that the effectiveness of development aid is dependent on the policy environment of the recipient and is increased by good governance.

POLITICAL ECONOMY PERSPECTIVES ON FOREIGN AID

To be most effective, most forms of aid should overproportionally flow not only to the relatively poor but also to relatively well-governed countries. At least until the mid-1990s, the allocation of aid had not always responded to these criteria. Moreover, an analysis of specific donor countries' allocation patterns revealed great heterogeneity. While especially Scandinavian donors responded to development-friendly allocation criteria, larger countries often disbursed aid according to their own geostrategic, economic, or diplomatic interests. In addition, aid disbursements and conditionality of multilateral organizations such as the World Bank or the International Monetary Fund were also influenced (not determined) by political interests of major donor countries, namely, the United States. Consequently, critical perspectives on development assistance have repeatedly pointed out that self-interest-driven aid-allocation patterns of major donors have contributed to limited aid effectiveness in the past.

Political economy perspectives have also revealed how the growing bilateral and multilateral aid bureaucracies developed special interests of their own. In the past, aid projects often were badly coordinated, and donor organizations competed for scarce resources, gave little importance to independent evaluation, and established different standards, thereby impeding knowledge diffusion and transparency. Moreover, the overall donor fragmentation and project proliferation imposed high transaction costs on recipients' administrative structures. Thus, it became evident that for aid to be effective, what mattered were both the institutional quality of recipient countries and the institutional setup of donor countries responsible for organizing development promotion.

In response to criticism of traditional aid delivery, the international aid system has embarked on a transformation process. In this context, the Paris Declaration of 2005 set out a series of principles aimed at (1) improving harmonization of donor activities and reducing the proliferation of small-scale projects, (2) strengthening the recipient countries' voice in defining aid strategies, and (3) strengthening independent evaluation and learning processes. More recent studies have also pointed out that aid allocation in recent years has become more in line with development-friendly criteria. To what extent these reforms have constrained the impact of special interests and substantially increased aid effectiveness remains a question. In sum, from a political economy perspective, foreign aid to a certain extent mirrors the challenges of domestic social policy. While there is consensus that a society needs at least some

transfers from the rich to the poor, one crucial challenge for making social policies effective consists in constraining the impact of powerful interest groups that emerge in the course of the redistribution process.

Foreign Direct Investment

Foreign direct investment (FDI) is an investment made by a multinational corporation in a country other than its home country. For a company to be considered a multinational corporation, it must possess at least one FDI project in which it maintains management rights or control. There are two main forms of FDI: Greenfield investment and mergers and acquisitions. Greenfield investment is the name given to the construction of new facilities, usually geared toward production, in foreign countries. This is a familiar form of FDI wherein an international business builds factories in foreign countries for manufacturing uses, such as Nike's opening a factory in the Philippines. However, mergers and acquisitions is the most common form of FDI. This occurs when a company is able to gain control of the managerial aspects of a foreign company, usually through the purchasing of stocks.

Historically, it was during the era of British hegemony in the nineteenth century that FDI started to become a norm. The use of the British East India Company to govern India is a classic example of the beginnings of FDI—the British Crown left the development of the Indian colony up to a new multinational corporation. However, it was not until after World War II (1939–1945) that investment in countries by foreign companies exploded. Immediately after the war, the leading recipients of FDI were developed countries, including the United States and the United Kingdom. This occurrence happened because of the international economic environment in the 1940s and 1950s. The Bretton Woods organizations were pushing for a much larger and internationally inclusive global economy that could be achieved through international investments, and European and American companies were investing in each other's countries at a very high rate during this time. The United States was devoted to the rebuilding of western Europe through the Marshall Plan, which was reciprocated in later years by investment in the United States itself.

FDI has been promoted as the road to development for many less-developed countries. For instance, the United Nations (2000) claims that "FDI has the potential to generate employment, raise productivity, transfer skill and technology, [and] enhance exports." Investment is supposed to create growth; however, this is done at the expense of domestic policy because less-developed countries are supposed to exude an air of political and financial stability, usually through privatization and liberalization. Also, multinational corporations pressure local governments to deregulate health and safety standards, keep minimum wages low, and not constrain the use of child labor. Many less-developed countries see the use of FDI as a means of neocolonialism; instead of foreign governments controlling policies, multinational corporations take their place. Underdeveloped countries worry that multinational corporations will challenge local domestic authorities by demanding policies that will make the country more attractive to foreign investors. Also, smaller local businesses are threatened by the influx of bigger international corporations, and many of these companies fall victim to multinational corporations, hurting the local economy.

According to the 2004 Foreign Direct Investment Confidence Index compiled by A. T. Kearney, a global management-consulting firm, corporate investors named China, the United States, India, the United Kingdom, Germany, France, Australia, Hong Kong, Italy, and Japan as the top ten countries that are nonrisk investments. These investors see Asia and Europe—especially in the eastern and central parts of the continent—as the areas with the highest growth potential in the coming years. Africa, on the other hand, is seen as one of the most risky investment areas because of corrupt governments and high crime rates. Multinational corporations are also less likely to invest in a country that is not just politically unstable but also militarily unstable. Places like Africa, where there are a number of conflicts taking place, are not attractive to outside investors as there is no guarantee of the safety of their investments.

Foreign Policy

Work on foreign policy is ubiquitous because its central focus is essential to the study of international relations (IR) more generally: understanding how decision makers perceive threats, constraints, and opportunities in their external and internal environments, and how these perceptions guide actions toward other governments and nongovernmental actors. The subfield of foreign policy is a prominent research area in the study of IR. The Foreign Policy organized section of the American Political Science Association has one of the largest memberships of the association's thirty-seven sections; the subfield supports a dedicated journal, *Foreign Policy Analysis;* and the academic publishing house Palgrave Macmillan hosts the book series titled *Advances in Foreign Policy Analysis.* Foreign policy research can be found across the major paradigms of IR, including realism, liberalism, and constructivism. Foreign policy scholars have published work covering all the regions of the globe in studies that are both historically grounded and focused on the contemporary. Seminal studies investigate foreign policy making of the great powers, especially U.S. and Soviet decision making during the cold war era and at the end of the cold war. Other studies compare and contrast the foreign policies of different states on similar issues and focus on the foreign policies of middle powers and small states. Scholars of foreign policy have also addressed the dominant debates in the field of IR, including the extent to which decision makers are influenced by domestic or international factors or a combination of the two, the behavior of democracies versus authoritarian states, and whether rational choice or sociological frameworks are more useful in the study of political behavior. While the decision-making approach to foreign policy has dominated the subfield, new developments in the study of foreign policy include the analysis of how state decisions are influenced not only by individual policy makers but also by larger factors, such as cultural trends and religion. In addition, recent work has moved beyond the dependent variable of foreign policy to focus on foreign policy change and on the impact of foreign policy on domestic politics (the second image reversed).

PARADIGMATIC APPROACHES TO FOREIGN POLICY

It is typically argued that realist IR theory does not provide a theory of foreign policy. To be sure, realist theories primarily focus on broad trends and patterns in interstate interactions and make predictions regarding aggregate state behavior. Kenneth N. Waltz, one of the most prominent contemporary political realists, has famously noted in *Theory of International Politics* (1979) that his theory of international politics "does not tell us why state X made a certain move last Tuesday"

U.S. foreign policy under the Monroe Doctrine encouraged expansionism and the United States established an imperial presence in many places around the world.

(p. 121). Notwithstanding Waltz's claim that structural-level theories cannot account for state foreign policy, most realist theorists have applied their approaches to account for foreign policy outcomes, and they often participate actively in foreign policy debates.

Realists generally make three interrelated claims regarding foreign policy. First, realists assert that foreign policies are largely driven by external constraints and opportunities, namely, the state's position in the international system and the system's distribution of material capabilities. While realists acknowledge that domestic politics, normative discourse, and ideas and ideologies can affect a state's foreign policy decision making, they suggest that most of the time foreign policy is a function of material factors such as international anarchy and the states' capacity for fighting wars. Since international structural conditions are constants and generate both fear and lack of trust, foreign policy choices tend to be limited and are reflective of the national interest and the need to survive. Indeed, even contemporary neoclassical realists, who attempt to bring domestic-level variables and decision makers' perceptions back into the study of foreign policy outcomes,

nevertheless begin their analyses with the external pressures and incentives that states face: unit-level variables intervene between structural constraints and foreign policy choice.

Second, realists claim that if states face similar structural constraints and opportunities, then their foreign policies will be remarkably similar as well. Differences in state regime types and identities, as well as new leadership and decision-making styles, are largely irrelevant to the analysis. Last, realists argue not that domestic politics and individual-level variables never matter for foreign policy decision making but rather that states that continually base foreign policies on such factors will inevitably suffer from poor foreign policy performance. That is, realists focus less on the foreign policy–making process, which may or may not be influenced by nonstructural factors, and more on the consequences of foreign policy outcomes. Past and recent realist studies have, for example, criticized U.S. foreign policy for being inconsistent with national strategic interests due to the influence of ideology and domestic political interest groups.

Whereas realists view foreign policy choices as driven by a state's position in the international system, liberal IR theorists maintain that variation in state-societal factors influences foreign policy, even for states that face similar structural constraints and opportunities. Focusing on the domestic sources of foreign policy, scholars have examined a wide range of variables including institutional fragmentation and cohesion, public opinion, and the role of the media.

In recent years, the proposition that democratic states' foreign policies are more pacific—whether only in relation to other democracies or in general—than are those of autocracies has become a cottage industry within both the subfield of foreign policy and the broader field of IR. Discussions of foreign policy decision-making processes and outcomes, particularly crises among democracies that resulted in near-wars, dominate the debate about the notion of democratic peace. For proponents, it is crucial that foreign policy match the predictions made by democratic peace theory; democratic peace theorists are interested in showing not only that in the aggregate democracies act differently abroad but also that democratically elected decision makers act and think in ways consistent with the theory. For opponents, the analysis of foreign policy crises and war and peace decisions suggests that power differentials and material capabilities matter more for the decisions of both democratically elected and authoritarian leaders.

Foreign policy researchers have also used case studies of foreign policy to challenge the democratic peace theory's truncated version of domestic politics in general and democratic politics in particular. Criticism has been leveled at the democratic peace theory's perspective on the second image, which tends to emphasize regime type (democracy vs. nondemocracy) at the expense of other domestic-level variables that also vary among democracies (e.g., civil-military relations, executive-legislative balances of power, and leadership styles). Here, foreign policy analysis has suggested that democratic states frequently endorse different foreign policy positions as a result of differing national roles and leadership orientations; that for democratically elected leaders threat perception is often based less on the regime type of opposing states, as democratic peace proponents claim, and more on the personalities and international rule-following propensities of foreign counterparts; and that domestic pathologies of democratic decision making, such as the executive's ability to manipulate information and the agenda, can lead to detrimental foreign policy outcomes.

While realist and liberal IR theorists engage the study of foreign policy, constructivist IR theory is perhaps the most closely associated with foreign policy analysis due to its emphasis on how threats and national interests are defined and framed and the ways in which external reality is shaped by agents, including foreign policy decision makers. Constructivists have examined how international and domestic norms influence the type of response that foreign policy makers will opt for when faced with an international crisis and how international events and developments are constructed as threats and problems for national security. The central argument here is that nonmaterial factors, including norms, culture, ideology, and identity, can shape decision makers' opinions regarding appropriate and inappropriate foreign policy options as well as assessments of the likely consequences of different foreign policy actions.

THE DECISION-MAKING APPROACH

Central to the study of foreign policy is the notion that human beings misperceive information and that organizations skew decision making away from rational choice. An understanding of political psychology and bureaucratic politics is thus at the core of the foreign policy subfield. As Stephen G. Walker and Mark Schafer (2006) note, "research programs in foreign policy have always maintained that who decides matters" (p. 3). The focus of inquiry is the process of decision making, including the framing of problems, the prioritization of goals, and the assessing of options.

Foreign policy researchers have developed approaches that apply to individual decision makers, foreign policy makers working in small-group forums, and foreign policy decisions and implementation by large organizations. What unites these approaches is the key assumption that beliefs, attitudes, formative experiences, memories, and values shape the ways in which foreign policy makers approach and cope with the world around them.

One of the most influential research programs on the psychological dimensions of decision making is the analysis of operational codes. Scholars have teased out how foreign policy choice is influenced by the beliefs of leaders regarding the likelihood of international conflict; leaders' propensities for believing in worst-case scenarios and their tendency to reason by analogy; and a leader's estimation that he or she can change the world. Another prominent research area has developed around prospect theory. Applied to foreign policy, prospect theory claims that foreign policy makers will expend more risks to avoid perceived losses to national security than they will to realize gains in state power or resources. Recently, the approach has been persuasively used to investigate great power foreign policy and war and peace decision making.

NEW TRENDS IN THE STUDY OF FOREIGN POLICY

In the aftermath of the September 11 attacks, IR scholars have increasingly challenged the secularized nature of IR theory and have endorsed new theoretical approaches that explicitly include the religious dimensions of social and political life. Recent work on foreign policy has picked up on this theme. For example, in the context of the United States, scholars have considered how U.S. foreign policy has reflected the ebbs and flows in the political fortunes of various Christian religious dominations and how the foreign policy decision to go to war in Iraq in March 2003 was influenced by President George W. Bush's religious beliefs and the religiously based views of other prominent neoconservatives in the Bush administration. Outside of the U.S. context, new work investigates how religious opposition groups have influenced Israel's capacity to pursue peace making as a foreign policy option and whether religious viewpoints dominate the foreign policies of states in the Muslim world. Non-Western states may fuse religion and the state in ways that are markedly different from the liberal secular model. Accordingly, foreign policy researchers should continue to investigate whether and how religiously motivated actors and religiously based institutions influence foreign policy decision making and outcomes in polities characterized by religion in the public sphere.

In addition to focusing on culture and religion, foreign policy analysts must further investigate the nature of foreign policy change. While a number of studies of foreign policy change have been recently published, more work needs to be done. In light of the major shift in U.S. foreign policy sparked by the September 11 attacks—changes that continue to have short- and long-term consequences for both the United States and IR—scholars of foreign policy need to continue to develop cross-national models that tell us how domestic and international variables contribute to large-scale foreign policy change. We need to better understand the conditions that give rise to changes in national security and economic strategies and the circumstances under which decision makers learn and are then able to alter established foreign policy platforms: do the same domestic and international variables that influence the initial choice among a set of foreign policy options also influence the decision to alter foreign policy course? Does it matter if foreign policy change is abrupt or not?

Last, while the study of domestic-level influences on foreign policy has a long pedigree, scholars of foreign policy have recently begun to study the reverse causal arrow by considering the impact of foreign policies on domestic politics, including state-societal relations and state-building and institutional development. Driven as much by theoretical interests as by bipartisan U.S. support for democracy promotion abroad, particularly since the end of the cold war, foreign policy analysts have investigated the success of U.S. policies to support democracy in different global regions and how regime change can best be achieved. Outside of the U.S. context, scholars have considered how the European Union's foreign policies have influenced domestic political reforms and church-state relations in those states seeking European Union membership, as in the case of Turkey. Recent work in the subfield has also investigated the impact of regional security conditions on the propensity for states to democratize. A key finding in this growing literature is that foreign policies that support peaceful means of regional conflict resolution can influence not only the likelihood of war but also domestic institutional development, civil-military relations, and bargaining outcomes among domestic political actors. Future work in the subfield should continue to explore how different foreign policy choices, such as decisions to pursue external balancing (e.g., alliances) versus internal balancing (e.g., nuclear weapons programs), influence domestic political outcomes over time.

Future work on foreign policy must continue to advance in these areas while also encouraging the application of theories and perspectives to multiple states across regions and historical time. Typically, work on foreign policy focuses on just one country. The subfield boasts many seminal and new studies of the foreign policy decision-making process and foreign policy outcomes in countries as diverse as Israel, China, Japan, Cuba, and many more. A comparative study, however, permits multiple tests of theoretical propositions and enables findings to cumulate across states with disparate histories, regime types, and identities. Several new studies aim to compare and contrast the foreign policies of different states. Yet compared with single-country analyses, studies of comparative foreign policy are few and far between. More work remains to be done on how foreign policy is both similar and different across a diverse range of international actors. This will be facilitated by regional and country-specific experts' collaborating with foreign policy and IR theorists, as well as students of comparative politics, to develop models that apply outside of the U.S. context and that are meaningful and robust for the changing and volatile nature of contemporary IR.

Foreign Policy Role

The foreign policy role is the currency of international relations, the medium of exchange in foreign affairs. It is neither power (the means of foreign policy) nor state interest (the long-term goals of statecraft to which a government aspires). The foreign policy role is the practical, day-to-day reality of international political discourse, which governments barter, jealously guard, and sometimes contest. It involves the particular concerns and immediate ends of statecraft. As with state interest, a foreign policy role is legitimized when other actors recognize the role and declare it politically acceptable. Role is that which the system allows the state to obtain.

Governments speak of "giving China a role" in talks with North Korea about relinquishing the development of nuclear weapons. More than symbolic association, role may involve institutional concerns such as admittance to the World Trade Organization for Russia, with all the likely trade benefits; membership in the prestigious Club of Eight for Canada; or permanent membership on the United Nations Security Council. Inclusion in the North Atlantic Treaty Organization or in the European Union is crucial to governments like Romania and the Czech Republic. Role concerns sovereignty and economic growth. Security itself may be at stake for governments such as those of Ukraine and Georgia as they seek a closer role in European affairs.

In power cycle theory, role is coequal in significance with power in statecraft; it is the coordinate concept that amends realism. Role is implicated in major war and is crucial to long-term equilibrium. Role lags behind power on both the rising and the declining sides of the state power cycle, causing power-role gaps. Failure of role to adjust to power change creates a structural disequilibrium that goes to the heart of the capacity to act in foreign policy and is a cause of massive warfare. Perception is always key to role, and misperception of role is often the operative cause of war. Foreign policy role is a large element of foreign policy identity.

The War of the Spanish Succession (1703–1714) was fought over whether, after the death of the last Spanish Hapsburg, Spanish possessions would be bequeathed to the grandson of the French king, uniting the Spanish and French crowns. Most of Europe found this role for Louis XIV's grandson a recipe for French predominance. At the Treaties of Utrecht, until he gave up claims to the inheritance of France, he was denied the role of king of Spain. The dynastic transfer of territory and population was no longer a legitimate barter of the foreign policy role.

A quintessential example of the centrality of role, and of what it entails in diplomacy, is the Crimean War (1853–1856). Traditionally, Russia enjoyed the role of protector of Christians in Ottoman-controlled territories. Napoleon III forced the sultan to recognize France as the protector of Latin Christians; the sultan rejected Russian claims for equal recognition of its role. This contest over role precipitated a three-year war that involved every major power except Austria.

Security is nonnegotiable, but security roles can be transferred. After 1970, Britain voluntarily transferred order-maintenance in the Persian Gulf to the United States. Role also sometimes invites acknowledgment of spheres of influence as the Soviet Union demanded of the United States (unsuccessfully) regarding Soviet presence in Eastern Europe. Agreement regarding the respective roles of governments in a dispute is often propitious to its management.

Formal Political Theory

The term *formal political theory* is a catch phrase for myriad modeling traditions in political science. The various traditions include game theory, social choice theory, spatial theory of elections, decision theory, and behavioral game theory. At the heart of formal theory is an axiomatic system or mathematical approach to model political behavior. The underlying premise that drives this approach is the assumption made about human behavior (or players) relating to rationality. This assumption specifies that players who populate the various models take actions that maximize their (expected) utility or payoffs. While there are many assumptions that define a utility function or how players have preferences over outcomes, the basic premise is that given the choice of two or more alternatives a player is able to rank the alternatives from best to worse or specify indifference between alternatives, and when given a choice between two or more alternatives players will always behave rationally and select the alternative that has the highest value to themselves regardless of how this affects other players. Using this assumption, formal political theory allows a mathematical method to model human behavior within political institutions.

GAME THEORY

John Von Neumann and Oscar Morgenstern pioneered game theory in 1944 by building on earlier work by Ernest Zermelo (1913), Emile Borel (1921), and John Von Neumann (1928). Game theory studies the interdependence of actions of players or their strategic interaction. This approach is concerned with how the adoption of particular strategies by players results in optimal (or nonoptimal) outcomes. Since incentives are held fixed, the resulting outcome usually is determined by the payoffs assigned to particular strategies, the information that players have about the actions of other players or assigned payoffs, and the institutional rules that have been imposed on the players' environment.

Game theory can be divided into two broad categories: cooperative (or coalition) games and noncooperative (or strategic) games. (Cooperative game theory is also called "social choice theory" and will be discussed later.) In noncooperative games players cannot enter into binding agreements, whereas cooperative games players are allowed to enter into binding agreements. The classic distinction used to revolve around whether players can communicate with each other, but noncooperative games that allow for communication have been developed, such as cheap talk games. Within noncooperative games there is a further distinction between normal form games (games represented by a payoff matrix) and extensive form games (games represented by a game tree). The extensive form is useful to model games where players have more than one move and also games where players might have imperfect information such as the case wherein a player may not know what action another player has taken. Normal form games consider a situation in which the players must make choices simultaneously so that they make choices without

knowing how the other player is going to choose. There are also repeated games in which players play the same game for either a finite or an infinite number of times. Games can also have incomplete information wherein players do not know all of the payoffs (or probabilities of payoffs) of the other players.

In the early 1950s, John Nash proposed a solution for non-cooperative games referred to as a Nash equilibrium, in which all players' play strategies are optimal or a best response given what other players have played. A Nash equilibrium is established when all players have selected strategies and no player has a positive incentive to change her or his strategy given what strategies other players have adopted. Games can have two types of equilibrium, either a pure-strategy equilibrium (where players select a single strategy) or a mixed-strategy equilibrium (where a probability distribution is calculated over the strategy set). A mixed strategy assigns a particular probability to each strategy in the set, for example, it might specify that a player will select strategy A 45 percent of the time and strategy B 55 percent of the time. Nash proved that all games with a finite strategy set have at least one Nash equilibrium either in pure or mixed strategies, although games can and do have more than one Nash equilibrium.

Subsequent equilibrium concepts have been refinements of the Nash equilibrium. In terms of solving games, one concept that is often invoked is Pareto efficiency, named after Vilfredo Pareto (1935). When a game has more than one equilibrium, then a Pareto-optimal equilibrium is an equilibrium wherein all players jointly are better off than another equilibrium wherein there is a lower payoff for all the players. A weaker version of the selection of a Pareto-optimal equilibrium is the case in which some players are indifferent to payoffs in another equilibrium but other players receive a positive gain from its selection.

Other noncooperative equilibrium concepts or refinements have included the notion of iterated elimination of dominated strategies. This concept simply eliminates a player's strategy if all payoff components of a player's particular strategy are lower than another viable strategy. Subgame perfect equilibrium for extensive form games eliminates outcomes that are not reasonable given the game's structure. This procedure eliminates outcomes that would not be chosen given that the players are rational. For Bayesian games that incorporate incomplete information, a Bayesian Nash equilibrium was developed to predict outcomes when uncertainty over a state of nature or when another player's move is involved. In this refinement, Bayes rules are used to establish that players' beliefs are consistent with the history of game play.

CLASSIC NONCOOPERATIVE GAMES

The first classic noncooperative game is the chicken game. In this game two players (in the original game they are portrayed as rebellious teens) are in their cars, and they drive their cars at high rates of speed directly at each other; the first to swerve away is considered to be the chicken and loses the game. In this game if each player chooses not to swerve they end up in the worse payoff (possible death), but if one player swerves and

the other does not, then the one who does not swerve wins since the one who swerves is considered a chicken. There are two equilibria to this game, in which one player swerves and the other player does not and vice versa. However, the best (or Pareto outcome) is for both players to swerve. One aspect of this game is the existence of a credible threat (i.e., reputation building). For example, if one of the drivers were to throw his or her steering wheel out of the car, then that action would be a credible threat and the other player should swerve.

The second game examines social dilemmas and is referred to as the Prisoner's Dilemma. The classic story behind this game is that two suspected criminals have been arrested for a crime, and the district attorney separates them, giving each the same deal. The deal is that if one criminal reveals the details of the crime before the other, the one who confesses first will get a lesser sentence in court than the other suspected criminal. Hence, each suspected criminal achieves a better outcome if he or she confesses or reveals the details of the crime while the other criminal remains silent. The best outcome is a cooperative outcome (or Pareto outcome) if both criminal suspects remain silent and do not confess the details of the crime. The worse outcome for both criminal suspects is for both of them to confess. The dilemma in this game is that both players have a dominated strategy to confess or defect, which yields an outcome that is worse than the outcome if they both cooperated. This game illustrates the problem of cooperation because even if the two players could communicate and agree not to confess, they both still have incentives to renege and to confess.

The last is the battle of the sexes, which is a coordination game. In this game a husband and wife have to decide whether to go to a ballet or to a boxing match. The man most prefers to go to the boxing match, whereas the wife most prefers to go to the ballet. Each prefers to be together rather than to be alone, but the husband gets more utility if they go to the boxing match and the wife gets more utility if they go to the ballet. Each receives his or her lowest utility if he or she goes alone. In this game there are two equilibria in which they both go to the boxing match or they both go to the ballet. Hence, both players have an incentive to cooperate, but the problem is coordination since they do not agree on which outcome is better. In this game bargaining may lead to a solution, or the wife could restrict alternatives and say that she faints at the sight of blood, forcing the husband to go to the ballet.

SOCIAL CHOICE THEORY

Social choice theory, or cooperative game theory, examines how the aggregation of individual preferences translates into a group choice or collective preference (sometimes referred to as "collect choice"). The problem explored is generating a social choice function (a voting mechanism that determines voting outcomes) that is fair and equitable. The roots of social choice theory date back to 1299 when Ramon Llull proposed that candidates in multicandidate elections compete against each other two at a time.

Cooperative game theory, unlike noncooperative game theory, assumes players compete as teams as opposed to individuals, where coalitions are a team of individuals who have agreed to coordinate on a common set of strategies to play in the game. It is assumed that cooperation can be enforced by an outside party.

Cooperative games are derived and solved either axiomatically or spatially. Using the axiomatic method, conditions (or axioms) are specified, and then these conditions are checked for consistency. Spatially (or geometrically), the political environment is composed of dimensions (vectors in Euclidean space), where the dimensions can be thought of as policy spaces. Players within the space are assumed to have utility functions represented as points on the dimension for one dimension and within the dimension for two or more dimensions. Utility functions defined over dimensions measure the distance an alternative is from a player's ideal point (or a player's personal location in the dimensional space) and assume that the closer the alternative is to the ideal point, the more that player prefers that alternative.

The central problems investigated within this area can be illustrated by the voter's paradox. Assume that three equal-sized groups of voters have to decide among three alternatives: x, y, and z, where group 1 most prefers x to y to z, group 2 prefers y to z to x, and group 3 prefers z to x to y. Now assume that the voting rule requires pairwise comparisons of alternatives. If x is paired against z, then z wins since groups 2 and 3 prefer z to x. Now pair z against y where groups 1 and 2 prefer y to z. Pairing y against x yields x as the eventual winner. This configuration of preferences yields what is called an intransitive social ordering, in which the winner of the election depends on the matchup that voters are presented with. In other words there is no Condorcet winner (named after Marquis de Condorcet 1785), which is a winner that beats all other alternatives in a pairwise comparison.

This example is generalized by the general impossibility theorem or the Arrow's impossibility theorem (named after Kenneth Arrow 1951), which proves that when the social choice function assumes four reasonable assumptions about preferences and there are more than two alternatives, then it is impossible to develop a perfect system of voting. The following are Arrow's four assumptions: assumption 1 is "universal domain," which assumes social preferences should be transitive and complete in the sense that given a choice between alternatives y and x, x is preferred to y, y is preferred to x, or the two are indifferent. Assumption 2 is Pareto efficiency, positing that if each individual prefers one alternative to another, then that alternative should be the winner. Assumption 3 is "nondictatorship," in which one individual should not dictate the outcome. Finally, assumption 4 is "independence from irrelevant alternative," wherein the social preference of y compared with x should be independent of preferences for other alternatives. Arrow proved that these four assumptions are inconsistent and result in a voting system that is a dictatorship. In other words, there is no voting rule, such as majority voting, for establishing social preferences from arbitrary individual preferences.

Furthermore, Alan Gibbard's (1973) and Mark Satterthwaite's (1975) impossibility theorems show that any reasonable

voting scheme such as majority-rule voting is susceptible to manipulation even when considering strategic or sophisticated voting. Strategic voting is voting for a player's lesser-preferred alternative to gain a more desirable outcome.

Formally, there have been two ways to bypass these results. First, it is argued that interpersonal comparison of utility is not scientifically sound. That is, what one person derives from a utility, such as food for a homeless person, is different from the utility a person derives if he or she is wealthy. Hence, it is impossible to assign the same utility for food to the two individuals. Second, the impossibility theorem can be solved if players are assumed to have single-peaked preferences. Single-peaked preferences assume a single dimension where x comes before y and y comes before z, each individual has a preference over the dimension where there is a unique ideal point over their most preferred preference (the highest peak), and the second and third preferences descend below the first. In the voter's paradox example, if the dimension is arranged such that x appears first, y second, and z third, then the voter's third preference ordered of z, x, y would be disallowed since it is not single peaked (x is second in order instead of y).

When social choice functions are examined spatially, one of the primary efforts is trying to define a core. Like the Nash equilibrium, a core is a point or strategies in which no coalition of players has a positive incentive to defect (i.e., it is the set of maximal choices). When a majority-rule core exists, then it is also known as a Condorcet winner (see Peter Ordeshook's 1986 *Game Theory and Political Theory* for variants on the properties of the core.)

Assuming two dimensions and using Euclidean preferences (which allow players to have preferences over two dimensions), a core is guaranteed only by the very strict Plott-McKelvey symmetry condition. Since this condition requires precise placement of ideal points in the dimensional space, which is unlikely or rare in the real world, it is conjectured that equilibrium in two-dimensional space is unlikely unless institutional rules are imposed. Lacking institutional structure within two dimensions, Richard McKelvey ("Intransitivities in Multidimensional Voting Bodies" 1976) proposed what is referred to as the "chaos theorem," which means there is instability within the dimensions since there is no Condorcet winner. Assuming all players vote sincerely and that one player (an agenda setter) can determine the location of the alternatives that are voted on within the dimensions, then this player can achieve any desired outcome (including his or her ideal point). Again this result implies that majority-rule institutions can be dictatorial.

Instability within the dimensions can be overcome by imposing institutional structure such as issue-by-issue voting in which players vote for one alternative on one dimension first and then they vote for another alternative on the second dimension. This effectively reduces the two-dimensional model to two one-dimensional models, wherein the equilibrium is the intersection of the median of the two one-dimensional models. Other institutional features create a structurally induced equilibrium or stability such as different types of voting rules, committee types, and norms of reciprocity, among others.

A subset of these types of spatial games is the spatial theory of elections. In 1957 Anthony Downs proposed the famous median voter theorem in which candidates seeking political office will take a position on the dimension at the median preference of voters (Duncan Black contributed similar findings for committees in 1958). The implication of this theorem is that in a two-candidate election the position of both candidates will be similar or close to the median voter. In a single-dimension environment, equilibrium is ensured as long as there are an odd number of players. James Enelow and Melvin Hinich (1984) introduced the ideal of salience and separability for spatial preferences that allowed voter choices to be more realistic.

INDIVIDUAL DECISION MAKING

As opposed to the previous discussion that involved two or more players, as the name implies, individual decision making concerns the study of an individual player and whether that player's behavior conforms to the tenets of expected utility theory. The classic example that illustrates the problems of expected utility theory is the Allais paradox, named after Maurice Allais (1953). Consider two sets of gambles: A and B, and C and D. An individual has a choice between, for A, getting one million dollars with certainty and, for B, an 89 percent chance of getting one million dollars, a 10 percent chance of getting five million dollars, and a 1 percent chance of getting nothing. When experiments are conducted, participants overwhelmingly pick A. Now consider gamble C and D. An individual has a choice between, for C, a 10 percent chance of getting five million dollars and a 90 percent chance of getting nothing and, for D, an 11 percent chance of getting one million dollars and an 89 percent chance of getting nothing. In this case participants generally choose C. However, it can be shown that selecting A in the first lottery and C in the second lottery violates the independent axiom since both gambles yield the same expected payoffs. Instead, to satisfy this condition players should select A and D or B and C. (See also Daniel Ellsberg's 1961 paradox for similar results.)

Daniel Kahneman and Amos Tversky (1979) proposed prospect theory, which examines the way people frame decisions. They argue that individuals do not view probabilities in a linear manner; rather, they view probabilities according to a nonlinear weighting function that alters their perceptions of losses and gains. Other developments in this area have included George Ainslie and Nick Haslam's (1992) hyperbolic discounting and Robert Sugden's (1993) regret theory.

BEHAVIORAL GAME THEORY

One of the most recent developments in formal theory is the advent of behavioral game theory. It is argued that people are generally nonrational and do not make decisions according to the dictates of expected utility theory. Behavioral game theory attempts to predict how people actually behave by incorporating psychological (or stochastic) elements and learning into formal models. A critical part of behavioral game theory is laboratory experiments to test the behavior of players within various game theory models. Richard McKelvey and Thomas

Palfrey's (1995, 1998) quantal response equilibrium is an example of an application of behavioral game theory since this concept allows players to make errors and learn during game play.

Foucault, Michel Paul

Michel Paul Foucault (1926–1984) was a French philosopher and social theorist. Trained initially in philosophy and later in psychology, he turned to a critical analysis of modernity (including its conception and practices of knowledge and its practices of the self), the constitution of power, the development of modern institutions, and the deployment of discourses and practices of sexuality. In his accounts of these phenomena he examined how they were intertwined, often reinforcing one another, sometimes at odds with one another, and how they changed over time.

Foucault described his early work as a form of archaeology. This involved the detailed historical examination of the rules that govern systems of thought and discourses of knowledge with respect to any particular subject matter. For example, in *History of Madness* (2006; originally published in English in abridged form as *Madness and Civilization*), Foucault examines the development of rules of exclusion and confinement regarding those considered insane in the modern period. These rules were not those that were consciously applied, but those that operated just below the level of conscious examination and discussion of madness and reason that took place during the emergence of the modern account of unreason.

Foucault's later work shifted to a genealogical focus that explored the changes that take place from any one historical period to another. This genealogical method, influenced by the work of German philosopher Friedrich Nietzsche, emphasizes the extent to which the changes that take place from one historical period to another do not reflect any grand strategy, conscious plan, or progressive laws of development but are the result of the contingent coincidence of historical and technological developments, competing systems of ideas, and the development of new institutions.

Several themes emerge in Foucault's thought. Most fundamentally, along with Nietzsche, Foucault can be described as an antiessentialist. That is, he believed there is no single account of the world that reveals the essential world, as it is in itself. This also leads him to reject foundationalism, or the claim that there is a single form of knowledge that is the foundation for all other forms of knowledge.

Second, Foucault also challenged the Enlightenment idea that power and knowledge could and should be separated from one another. In his view every discourse of knowledge is made possible by networks of power and institutions, and every network of power is made possible by discourses of knowledge.

Third, much of Foucault's later work concerns the ways in which the self—or the individual in modern terms—is constituted by practices, institutions, discourses of knowledge, technologies, and philosophical doctrines. His *Discipline and Punish: The Birth of the Prison* (originally published in 1975) is an examination of how modern systems of power in the form of surveillance, standards of normality, and systems of discipline take hold in modern institutions and everyday life, thereby constituting modern practices of the self that reflect less freedom than is understood by modern individuals. Similarly, his three-volume *The History of Sexuality* (originally published between 1976 and 1984) explores the changes that take place in how ideas and practices of sexuality are formed and the behaviors they impose on modern individuals.

In response to these phenomena, Foucault encouraged practices of the self that are resistant to forms of discipline, standards of normality, governmentality, and subjugation. He articulated an ethics of the self that would help to provide for greater resistance to the increasing docility of individuals and the homogenization of modern, totalizing societies.

Fractionalization Index

The concept of fractionalization denotes the fragmentation and indirectly also the concentration of a set of elements (a population) into subsets (or components) along certain criteria. In the social sciences, such sets of elements used as the unit of analysis are commonly social systems, such as a legislative body, a party system, or a society as a whole. An index of fractionalization measures the degree of such fragmentation or concentration characterizing a system. Fractionalization becomes a relevant feature of political life in the context of social and political cleavages, that is, where circumstances that have the potential for conflict among members of a population force those members to take sides. Among the criteria, on which the division of elements or individuals into relevant subgroups might be based, are attitudes toward political issues, voting behavior, membership in parties or other politically relevant organizations, or social characteristics, such as mother tongue, religion, caste membership, and other self-ascriptive identity markers.

A commonly used index of fractionalization (F) is computed as the complement of the Herfindahl-Hirschman index of concentration, $H_j = \sum_{i=1}^{n} s_{ij}^2$, that is, by subtracting the values of that index from 1. The formula for F can thus be stated as $F_j = 1 - \sum_{i=1}^{n} s_{ij}^2$, where s_{ij} is the share of group i ($i = 1 \ldots N$) in the unit of analysis j. The value of this index indicates the likelihood that two randomly drawn elements of a given set belong to different subsets within that set, with higher likelihoods indicating a higher degree of fragmentation. The values of the fractionalization index range from 0 to 1. The larger the number of subsets of the total population, and the more evenly the elements are distributed among those subsets, the larger will be the value of the fragmentation index. In political science, Douglas Rae first proposed the use of this index to measure the fragmentation of party systems in 1967.

To illustrate the results of the fractionalization index, demonstration of a few hypothetical constellations based on a frequently encountered example drawn from political sociology appears useful. If a population is divided along religious lines, the different preferences over the issues at hand might conceivably be condensed into subgroups along religious affiliation. If the population consisted of four religious subgroups of equal size, this would yield an H-value of 0.25 and an F-value of 0.75. If, hypothetically, the population consisted of only one religious affiliation, this would yield an H-value of 1.00 and an F-value of 0.00, indicating maximum concentration and conversely minimum fragmentation. If ten subgroups of equal size (0.10) existed, the H- and F-values would be 0.10 and 0.90, respectively, indicating a high level of fractionalization. If, however, the raw number of religious subgroups were three, of which one group's share was 0.80, while the other two groups were of equal size (0.10), the H-value would be 0.66 and the F-value, 0.34. If, on the other hand, the groups were of equal size, the H-value would be around 0.33, and the F-value would be around 0.67. Thus, due to the fact that the formula provides for a weighting of each component's weighting by its own share, the relative weight depends heavily on the distribution of group sizes.

To provide for a more intuitive interpretation regarding the relative strength of contending parties to a conflict, the "effective number" indices have been proposed and found acceptance as alternatives in research on party systems as well as ethnic politics. They were first suggested by Laakso and Taagepera in 1979 to measure the number of "relevant" parties (Sartori) in a competitive party system. The most commonly found formulation for its calculation, related to the party systems literature, is

$$N_j = \frac{1}{\sum_{i=1}^{n} s_{ij}^2}.$$

However, in a generalized form it can also be stated as $N_j = \left(\sum_{i=1}^{n} s_{ij}^a \right)^{(1/1-a)}$. A population divided into four equally strong groups would thus yield an effective number value of 4. This is more in accordance with intuition than an F-value of 0.75 for the same constellation. Due to this more intuitive appeal, this index has become relatively more popular than Rae's index

when measuring the level of concentration or fragmentation of size or relevance of a system of elements in political science. Since, however, this index also has a number of mathematical properties that produce counterintuitive results, especially in situations wherein one component is comparatively large in relation to the others, criticisms and suggestions for its modification have frequently been made.

Framing and Public Opinion

Frames are discursive cues, found throughout the communication process, that emphasize a particular interpretation of an issue or event. Frames initially appear in a speaker's mind as conscious or unconscious decisions are made about how to present an issue to the public. The speaker then expresses the frame in text (e.g., article, speech) by using language that reinforces the selected interpretation. For example, a newspaper article might frame the offshore oil drilling debate by emphasizing environmental concerns or energy needs. Frames are also used by individuals to structure their comprehension and interpretation of issues. Someone who thinks about the environment when evaluating offshore drilling would be thinking through an environmental frame of mind. Finally, frames can be found more broadly at the societal level. In fact, it is the stock of preexisting ideas shared within a culture that enables frames to be useful elements of communication.

Framing affects public opinion when a speaker's frame shapes how an issue is perceived and evaluated. Specifically, framing occurs when a speaker highlights a particular piece of information, leading individuals to focus on this information above other considerations when forming an opinion. For example, a speaker might frame the offshore drilling debate by emphasizing energy considerations that could cause people to think about energy needs (rather than environmental concerns) when evaluating the issue, thus making them more likely to support drilling. Amos Tversky and Daniel Kahneman's work on prospect theory showed that even very subtle frames could affect public opinion. One of their studies found that people were more likely to support an economic policy when it was framed as producing 95 percent employment than when it was framed as resulting in 5 percent unemployment, even though both scenarios have an equivalent outcome.

Framing research has developed in many directions, creating what Robert Entman (1993) calls a "fractured paradigm." Some work focuses on text by using frame analysis methodology to study how frames are used in discourse among social movements and political institutions. Others have focused on the potential for bias in media reporting based on the selection (and thus exclusion) of particular frames. By obscuring certain elements of a debate, the media (and those who seek to control them) could exert power over how the public understands critical policy options, from domestic issues to decisions about going to war. In addition, the potential for political elites to control the framing of issues, and thus control the issues on which the public expresses an opinion, raises concerns about the veritable nature of public opinion.

These concerns are at least partially addressed in work on the moderation and limitations of framing effects. While framing had traditionally been treated as a fairly automatic process, growing evidence now suggests that people consider a frame and weigh its merits before adopting it. As such, framing effects can be moderated by strong predispositions (e.g., values, partisanship), political knowledge, the frame's perceived applicability, its relative strength, and the credibility of the speaker. Moreover, competing frames and counterarguments from interpersonal discussions can lessen a frame's initial impact.

Public opinion can be influenced by the way speakers frame issues or situations. While framing effects have been widely demonstrated, researchers continue to investigate the implications of framing and the factors that may condition its impact on public opinion.

Francophone Africa

The term *Francophone* applies to all people whose cultural background is primarily associated with the French language. Francophone Africa specifically refers to all the African states formerly colonized by France and Belgium in the period between the late nineteenth and the mid-twentieth centuries. There are twenty-nine Francophone African countries situated mainly in west, central, and north Africa.

French is the official language in eighteen of these countries. It is one of two official languages in six of them and is spoken widely, though not officially apportioned, in the remaining five countries. It is ironic that during the colonial era French was spoken by only a few educated elite, but today French is a major language in independent Africa; the number of French speakers is second only to the number of English speakers. Each of the French-speaking countries has adopted the language to fit in with local pronunciation and existing vocabulary.

The nations of Francophone Africa are noted by their colonization by France or Belgium, and many hold French as their official language.

In sub-Saharan Africa, Francophone nations include Benin, Burkina Faso, Burundi, Cameroon, Central African Republic, Chad, the Comoros, Democratic Republic of the Congo, Côte d'Ivoire, Djibouti, Equatorial Guinea, Gabon, Guinea, Madagascar, Mali, Niger, Rwanda, Senegal, and Togo. In north Africa, Francophone nations include Algeria, Mauritania, Morocco, and Tunisia. In terms of size, the Democratic Republic of the Congo is the largest. Neighboring Rwanda on the other hand holds the double distinction of being the smallest but also the most densely populated Francophone country in Africa. Except for Algeria, all Francophone African countries are members of the Organisation Internationale de la Francophonie (the International Organization of La Francophonie), an intergovernmental organization that brings together French-speaking nations to enhance cooperation in areas such as culture, science, governance, and the economy.

French colonialism in Africa dates back to 1848 with the official inclusion of Algeria as part of the Republic of France. This followed several years of French military action in the region following disagreement with then Algerian ruler (dey) Hussein, who had provoked French hostility in 1827 for refusing to apologize after slapping the French consul with a fly whisk. Stung at home by defeat in the Franco-Prussian War (1870–1871) against Germany, the French increasingly looked to Africa to enhance its prestige. The officially quoted motive however was the idea of *mission civilisatrice* (spreading French civilization).

The proceedings of the Berlin Conference of 1885 (also referred to as the "scramble for Africa"), during which European powers formally divided Africa, became the road map for French colonization in sub-Saharan Africa. By the beginning of the twentieth century, the French had occupied Senegal, Mali, Burkina Faso, Benin, Guinea, Côte d'Ivoire, and Niger. Senegal was the administrative capital of the French west African colonies.

It was in west Africa that the French applied a distinct administrative style known as "assimilation." The basic idea was to train specific Africans to become Frenchmen by abandoning their cultures in favor of the French culture and then to offer them French citizenship. Unable to sustain this policy for long, the French later turned to a policy of "association." This was a more lenient approach, with the main idea being to inculcate a sense of pride, love, and respect for France among the colonial subjects.

Following protracted armed conflicts in both Tunisia and Algeria in the early to mid-1950s and other hostilities in Morocco and Cameroon, the French colonial empire began to fold in the late 1950s amid bitterness at the country's rejection by some of its colonies (as seen in the case of Guinea's vote to reject union with France). Tunisia became independent in 1956. Other French colonies across Africa followed suit in quick succession, with Algeria finally gaining independence in 1962.

Belgium's prized possession in Africa was the Congo Free State (today's Democratic Republic of the Congo). Initially occupied by King Leopold through a private company in 1876, the Congo became a Belgian colony in 1908. Of all the Francophone colonies in Africa, the Congo suffered greatly under Belgian colonialism as a result of the colonial administration's policy of forced labor and brutal mistreatment of the indigenous people. The country became independent in 1960.

Although similarities abound across Francophone African countries especially in law, administration, and education systems, these countries differ significantly in levels of democratization and economic growth. Francophone Africa is largely undemocratic and is marked by poverty and dependence on foreign assistance. Chad, for example, remains poor, badly governed, and conflict prone. On the other hand, despite being a progressive democracy, Senegal is heavily reliant on donor assistance and has been offered beneficial debt relief as one of the International Monetary Fund's designated Highly Indebted Poor Countries.

In the early twenty-first century, the French continue to play a major role in Francophone Africa. Not only are a significant number of the countries dependent on France for trade and financial assistance; but the French military remains on call to intervene in case of armed conflict in many of its former colonies, as seen in the cases of French military intervention in Côte d'Ivoire (2002) and Chad (1983, 2006, 2008).

Frank, Andre Gunder

Andre Gunder Frank (1929–2005) was a sociologist, political scientist, and world historian active in the debates surrounding dependency theory and world systems theory during the late twentieth century. He was born in Berlin, but his family fled Germany following Hitler's rise to power. He lived in Switzerland for a time as a youth until his family immigrated to the United States in 1941. Frank attended Swarthmore College and received his doctorate in economics in 1957 from the University of Chicago, where he completed a dissertation on Soviet agriculture under the supervision of the noted free market economist Milton Friedman.

Frank taught at several American universities before moving to Latin America in 1962, where he took a position as professor of sociology and economics at the University of Chile. Frank was part of the intellectual circles in Chile at the time that assisted in the social and economic reforms inaugurated by the democratic socialist president Salvador Allende. Allende would later be overthrown in a coup by conservative general

Augusto Pinochet, who turned to the free market economic policies of the so-called Chicago school (Frank's former colleagues) to modernize and develop his nation.

During this period, modernization theory was the dominant paradigm in the social sciences explaining economic history and the relative lack of development of the so-called third world. Modernization theory argued that the third world's economic and social difficulties resulted from a lack of capitalist institutions, the weakness of their internal markets, and their lack of involvement in global trade. For modernization theory, the key to third world development was strengthening the internal market and developing an export-based economy rather than one based on subsistence peasant agriculture.

Frank quickly became a leading dissident against modernization theory. Attending conferences across Latin America, he argued that the third world had been integrated into the capitalist economy from its outset and that the underdevelopment of these countries was written into the very global nature of capitalist development itself. In a sense, the third world's backwardness was precisely the reason the West was modern and advanced. According to Frank, a structural imbalance was built into the global capitalist system that created the geographic disparity of wealth between the third world and the developed countries.

During the 1960s, Frank and several colleagues began to formalize this view. A new school of dependency theory—to which Frank was a major contributor—quickly became an influential methodology among dissident and left-wing scholars in the social sciences across the globe.

Following the Pinochet coup, Frank fled to Holland, where he found an academic position at the University of Amsterdam. During the 1970s and continuing until his death, he would play a key role in the development of world systems theory, a social science paradigm that argues the world has been unified in a global social and economic system since at least the sixteenth century and that social and economic events in one region have effects throughout the system. In this field, Frank proved to be just as controversial as he was in his earlier work. He argued that the world system actually arose in antiquity rather than in the so-called long sixteenth century. He also authored a controversial book arguing for the central importance of Chinese civilization in the world system. Western Europe's global dominance, he argued, was a relatively recent and temporary phenomenon that would likely be surpassed by a new era of Asian—and specifically Chinese—hegemony in the not too distant future.

Frank was a voluminous author who wrote numerous books and articles. His influence was felt most profoundly in the 1960s and 1970s through the key role he played in the development of dependency theory. However, his work in world system theory, while controversial, is an important point of reference for world historians today.

Frankfurt School

Frankfurt school usually refers to a set of intellectuals of Marxist origins who worked within the framework of the Frankfurt Institute for Social Research after Max Horkheimer became its director in 1930. This article discusses the impact of and the intellectuals within this school. It first reconstructs the profile of the first generation of Frankfurt school theorists and then analyzes the second and third generation as well as their contemporary legacy.

THE FIRST GENERATION

The Frankfurt Institute for Social Research was funded in 1924, but it was only under the directorship of Max Horkheimer that it gained its distinctive character. The institute was an interdisciplinary research organization that brought together philosophers, economists, sociologists, psychologists, political scientists, and literary and music critics, including Theodor Adorno, Walter Benjamin (although he was not a formal member), Erich Fromm, Leo Loewenthal, Herbert Marcuse, Otto Kirchheimer, Franz Neumann, and Friedrick Pollock. After Hitler's rise to power, the institute was closed, and its members emigrated to Switzerland first (in 1933) and then to the United States (in 1935). The institute was reopened in Frankfurt in 1950.

Horkheimer exercised a deep influence as director of the institute, pushing his colleagues to question the economicism of orthodox Marxism and take into considerations what earlier Marxists had relegated to the so-called superstructure of politics, law, culture, and ideology. In his contributions to the *Zeitschrift für Sozialforschung,* the institute's main intellectual organ, Horkheimer argued for the need to develop what he named a "critical theory" of society, an intellectual endeavor that, thanks to its multidisciplinary approach, is able to analyze human relationships in their complexity and thus better identify the conditions for emancipation from domination. While traditional social science simply reflects the way things are and is therefore aimed at perpetuating the status quo, a critical theory seeks to liberate human beings from the circumstances that enslave them.

What is typical of the Frankfurt school is its combination of an unorthodox Marxist theory of society with insights taken from German philosophical tradition (in particular Georg Wilhem Friedrich Hegel) and psychoanalysis (in particular

Sigmund Freud). Authors in the Frankfurt school tradition typically combine such a theoretical background with empirical analysis. So while Neumann and Kirchheimer analyzed the rise of Nazism by looking at the way in which it destructed the traditional liberal legal protections such as the rule of law, others emphasized the psychological and sociological conditions that favored the emergence of an authoritarian personality. The latter generated a big multidisciplinary research project whose final results were published in 1950 as *The Authoritarian Personality.*

The critique of totalitarianism is, however, not limited to the sole European Fascism; Frankfurt school theorists are known for having diagnosed germs of a totalitarian domination in mass industrial democracies as well. In particular, Adorno, Horkheimer, and Marcuse put forward a powerful critique of the role of ideology in industrialized societies. In their influential *Dialectic of Enlightenment,* Adorno and Horkheimer analyze the mechanisms of domination inherent to what they call "culture industry." Although high culture once possessed a critical potential, this has vanished in contemporary mass culture; the latter has become a homogenizing system of entertainment that includes cinema, film, and music and is aimed at only reproducing and stabilizing the system of domination. Difference is tolerated only as it can be subsumed under universal domination. While Marcuse's critique of industrial societies, as developed in *Eros and Civilisation* and *One-dimensional Man,* discloses a possible way out from domination in the liberation of the unnecessarily repressed instincts and the power of imagination, the authors of the *Dialectic of Enlightenment* seem to see no way out from the system of domination. In their view, the entire Western Enlightenment is based on an instrumental concept of reason as domination over nature that cannot but result in the opposite of reason, that is, myth and barbarism.

The critique of reason remains a crucial theme of Horkheimer's writings, which assume a darker connotation toward the end of his life (showing the influence of Schopenhauer's metaphysical pessimism). In his later writings, Adorno continues instead his critique of systematic philosophy by rethinking history and society in light of a negative dialectic.

THE SECOND GENERATION AND THE LEGACY OF THE FRANKFURT SCHOOL

The most complex figure within the second generation of Frankfurt school theorists is Juergen Habermas. Professor of philosophy in Frankfurt until his retirement in 1994, Habermas's contribution spans from social sciences to moral, legal, and political philosophy. Notwithstanding significant continuities with his predecessors, Habermas criticized Adorno and Horkheimer for overlooking the unfulfilled potential of emancipation of modern rationality. In his view, they failed to provide a solid basis for a critical social theory because their critique rested on the tacit assumption of a privileged standpoint from which to expose ideology.

In Habermas's view, a critical theory must be concerned not only with the unmasking of domination but also with the validation of its own critical standards. Habermas put forward a new version of critical theory in which the Marxian legacy is as important as the Kantian one. In his *Theory of Communicative Action,* a work that combines the insights of German philosophy with the analytic philosophy of language, Habermas argues that the normative foundations for critical social theory must be found in the conditions for communicative action, that is, the "idealizing presuppositions" that must be undertaken by anyone trying to come to an understanding with someone else. Habermas's attempt to ground reason in a universal pragmatics of communication has been extremely influential for the following generations of critical theorists. In his successive writings, and in particular in *Between Facts and Norms,* Habermas applies his discourse theory to legal theory and to the theory of democracy.

With the partial exception of the first research directly promoted by the Frankfurt Institute, it is impossible to identify a single method that unifies all Frankfurt school theorists. Yet it is perhaps in such a capacity to inspire critical social research in very different ambits that the main legacy of the Frankfurt school resides. Among the newest generations of critical theorists, some, such as Rainer Forst, have continued the search for the normative foundations of reason, whereas others, such as Axel Honneth, have recovered Hegel and psychoanalysis by emphasizing the importance of conflict and the struggle for recognition. Others, such as Albrecht Wellmer and Alfred Schmidt, have recovered insights from the first generation, in particular Adorno and Horkheimer. Finally, there are also those contemporary theorists who have enlarged the agenda of critical theory to new objects such as international relations or gender studies.

Freedom

Freedom is a prime example of what W. B. Gallie refers to as "essentially contested concepts," a term that refers to concepts that participate in a tradition of conflicting interpretations so fundamental that they are permanent and without resolution. Understanding the concept of freedom means understanding the fundamentally different ways in which the concept has been used. A particularly important distinction is that between freedom from hindrance on one hand and the freedom to fully realize one's potential on the other. This difference roughly corresponds to that between the Anglo-American tradition of "freedom from" and the continental European tradition of "freedom to," although that puts it a little too simply.

Drawing fine semantic distinctions, such as that between *freedom* and *liberty,* will not help us understand freedom. In practice, the terms are synonymous, as the British philosopher and historian of ideas Isaiah Berlin points out in his famous work "Two Concepts of Liberty." We can pursue the meaning of *freedom* by deciding which distinctions are useful and which are not and even whether approaching freedom by making fine distinctions is fruitful.

NEGATIVE AND POSITIVE FREEDOM

Berlin argues that we should not confuse freedom with every good thing, such as a decent income and life chances. Freedom, Berlin says, means lack of restraint. He calls it "negative liberty," not because it is bad but because the definition focuses on limits to actions. Berlin says that to know freedom, you must ask how many doors are open to you and how wide they are open.

Berlin defines "positive liberty" as the freedom to realize one's deepest ambitions, to participate in one's own governance, and to become who one truly is. Under positive liberty, one is not free just because no one prevents him or her from speaking out in public or from getting a better education. Because positive liberty includes the means to realize one's values, one is free only when he or she has the means to get others to listen to him or her and only when one has a decent education, which is often what it takes to open doors in this world.

Berlin does not dismiss positive liberty, but he worries that emphasizing positive liberty as true freedom risks giving too much power to the government or even to fellow citizens. For a person to possess the means to self-development, such as a college education, he or she may have to be more heavily taxed, which could restrict freedom to travel, for example. Berlin asks, How much freedom does a person really have when the majority of citizens, rather than the tyrant, tells that person what to give up to be free? Furthermore, positive freedom is more likely to result in the confusion of freedom with constraint. Jean-Jacques Rousseau notoriously remarked that the individual may be "forced to be free" by the community if the individual fails to understand that his or her good is bound up with that of the whole.

Another distinction that is well known among those who study freedom is what Benjamin Constant called "The Liberty of Ancients Compared with That of Moderns." Ancient liberty, the liberty of classical Athens, for example, is the freedom to participate in one's own self-governance, so as not to be governed by another city-state or polis. The ancient notion of freedom inspired German-émigré political philosopher Hannah Arendt, who sees the apex of freedom as residing in the Athenian polis. Modern liberty, by contrast, is the freedom to be left alone by government to make money and enjoy the pleasures of private life. Most people in contemporary society see participating in government as, at best, a civic duty. Participation is hardly ever understood as the essence of freedom.

What has changed in the modern world to transform the meaning of freedom so completely? The simple answer is the rise of individualism, in which people come to think of themselves as autonomous centers of value or choice. This view is epitomized by French existential philosopher Jean-Paul Sartre in *Being and Nothingness.* In our minds and imaginations, he claims that men and women are absolutely free. Sartre says that while we cannot make the world in any way we want, we are free to interpret our world in any way we choose. The trouble is that I am not the only one in the world. When I live with others, they become the enemy of my freedom, as it is everyone's natural tendency to view themselves as they imagine others see them. In seeing myself this way, I betray my original freedom, defining my situation in relationship to the other.

Sartre calls this betrayal bad faith ("mauvaise foi"). For Sartre, freedom has nothing to do with the fact that the world resists people's will. Freedom means that people have a choice about how to react to everything that happens to them and how to come to terms with it. Indeed, Sartre holds that, for the most part, we choose our passions. Somewhere deep inside each one of us there is an empty space that Sartre calls "néant," or nothingness, which no one and no thing can touch. That place is freedom, for in it, people can give the events of their lives any meaning they choose. For example, I may see prison as a chance to liberate myself from a life of crime, as Malcolm X did.

WHAT IS FREEDOM GOOD FOR?

The concept of freedom can be written as a history of competing definitions, a history that could be organized in many ways. However, a more fruitful approach would be to consider why freedom is such a difficult concept in the first place. German philosopher G. W. F. Hegel put it this way: "No idea is so generally recognized as indefinite, ambiguous and open to the greatest misconceptions . . . as the idea of freedom: none in the common currency with so little appreciation of its meaning" (*Philosophy of Mind,* 1971, 239). It seems there is something about freedom itself that makes it, at least in the

modern West, both an unquestioned good and a questionable concept.

Instead of asking, What is freedom? it is more useful to ask, What is freedom good for? Here, the British philosopher John Stuart Mill is useful. Mill's (1975) argument appears to be a straightforward utilitarian argument: "Freedom allows the maximum of self-expression consistent with the rights of others, and in this way, the marketplace of ideas is enlarged. More speech puts more ideas in play, and from these ideas, the best will eventually be chosen and so freedom brings progress."

Such an interpretation is not incorrect. However, a closer reading of Mill reveals his aristocratic side. Mill was never primarily interested in the freedom of the average man or woman. Mill valued freedom as providing an opportunity for an exceptional few to make of their lives a work of beauty. From this perspective, freedom is the means, and the cultivation of individuality is the end. Hence he writes,

"It is not by wearing down into uniformity all that is individual in themselves, but by cultivating it and calling it forth, within the limits imposed by the rights and interests of others, that human begins become noble and beautiful objects of contemplation. In proportion to the development of his individuality, each person becomes more valuable to himself and is therefore capable of being more valuable to others. There is a greater fullness of life about his own existence, and when there is more life in the units, there is more in the mass that is composed of them. I might here close the argument: for what more or better can be said of any condition of human affairs than it brings human beings themselves nearer to the best things they can be? Or what worse can be said of any obstruction to good than it prevents this?" (*On Liberty,* 1975, 59–60)

FREEDOM AS COMMUNAL VIRTUOSITY

If Mill were interested in freedom for the sake of the richness and virtuosity of the individual, then Hannah Arendt may be seen as taking this argument a step further by claiming in "What Is Freedom?" that freedom is virtuosity. Freedom is not just the cultivation and development of certain excellences. Freedom resides in the public performance itself in which we act and speak in public, showing others who we are and bringing something new into the world. Only through such acts of political creativity do humans overcome the entropy that would otherwise overtake human existence.

While critics often focus on Arendt's nostalgia for an ancient Athenian ideal of politics that no longer has a place in the modern world, the more salient problem with her vision of freedom is that, in the end, it fails to include the full scope of human interaction. A critical reading of her work suggests that it is the role of our fellow citizens to serve as an audience, so someone may be present to appreciate and remember our noble words and great deeds. Even a virtuoso needs an audience who can understand and appreciate his or her art.

A vision of freedom that is better suited to the shared character of political life is required. Jazz musicians talk about being "in the groove," a state of improvisation that involves not just one person's music but also the music of others in the group. Although individual skills and talent are involved, they do not create the groove. It is created by the space among the players, and as such, "in the groove" is a temporary creation, as transient as the performance. If "in the groove" is a spontaneous experience at one level, at another level it reflects spontaneity built on hundreds of hours of negotiation, learning to barter the musical assertion of others with one's own musical self-assertion. "In the groove" is, of course, not just an account of playing jazz music. It is a way of thinking about the complex sharing with others that freedom requires. It is about creating freedom in a complex space that is framed by the activities of those who make and share the freedom they create.

This communal virtuosity has sometimes been experienced in times of great political struggle. In Arendt's "The Revolutionary Tradition and Its Lost Treasure," her reference to the "lost treasure" refers to the poet René Char who joined the French Resistance to Nazi occupation during World War II (1939–1945) and found himself. Arendt writes, "Wherever he went he appeared as he was to others and to himself. . . . He could afford to 'go naked.' These reflections . . . testify to the involuntary self-discourse, to the joys of appearing in word and deed without equivocation and without self reflection that are inherent in action" (Arendt 2000). Arendt argues that such an experience could be brought into mundane, everyday political practice. She takes Thomas Jefferson's ward system as a model for a participatory democracy that may not be compatible with freedom as lack of constraint, or negative freedom, but a space in which average citizens flourish through political participation.

Yet it may be that Arendt continues to ask of politics what it cannot—and perhaps should not—deliver. In particular, one wonders whether political freedom is really the realm in which such ambitions should be realized, especially in the day-to-day grind of administration and party life or even for such a good cause as the French Resistance. Recall Berlin's simple caution that because freedom is good does not mean that it is every good thing. Contemporary political philosopher Richard Rorty argues in *Contingency, Irony, and Solidarity* that conflating politics and self-development—that is, ignoring the distinction between public and private—is risky business.

FREEDOM'S AFFINITY WITH CONSTRAINT

The equation of freedom with constraint is at least as old as the Greek and Roman Stoics and reaches its apotheosis, although certainly not its end, in the work of Immanuel Kant. Consider Epictetus, who taught that the path to freedom is to want only what happens to us. "Whoever wants to be free, therefore, let him not want or avoid anything that is up to others. Otherwise, he will necessarily be a slave" (*Handbook,* c. 15). Desire is the enemy of freedom, for it is desire that confronts us with a world of possibilities beyond our control.

Therefore, the stoic "is on guard against himself as an enemy lying in wait" (*Handbook,* c. 48). In sum, "do not seek to have events happen as you want them to, but instead want them to happen as they do happen, and your life will go well" (*Handbook,* c. 8).

That the stoic achieves freedom by means of self-constraint, never wishing for anything he cannot have, is not news. But how does Immanuel Kant, personification of the Enlightenment, fit into this scheme? For Kant, human freedom is the freedom to accept objective reality, such as the laws of nature, or the categorical imperative. The categorical imperative is a standard of rationality from which all moral principles are derived: act only according to those principles that you would have become universal laws. For example, to steal when you do not want stealing to be legal for everyone is, in Kant's view, a logical contradiction. Kant believes that the laws of objective reality, which appear to be external to human beings, are actually the unwitting projections of human reason. Thus, to accept these laws is equivalent to accepting what we ourselves have willed or made. "The will is a kind of causality belonging to living beings insofar as they are rational; freedom would be the property of this causality that makes it effective independent of any determination by alien causes" (Kant, *Grounding for the Metaphysics of Morals,* 1981, 49). Although a person may rebel at the determination of these laws, if the person is rational, he or she will accept these laws, knowing that he or she helped make them. This is not Stoicism. Rather, it is a stoicism gone on an idealistic adventure, discovering that all the things people once thought were constraints on freedom were actually willed on themselves, as rational beings, all along.

FREEDOM AS EXPERIENCE AND PRACTICE

Let us give the critical theorists of the Frankfurt school, Max Horkheimer and Theodor Adorno, the last word on Kant's strategy, recalling that they are writing during the postwar era in American life, in which the self-censorship of movies was at its peak. "Kant intuitively anticipated what Hollywood has consciously put into practice: Images are precensored during production by the same standard of understanding that will later determine their reception by viewers. The perception by which public judgment feels itself confirmed has been shaped by that judgment even before the perception takes place" (*Dialectic of Enlightenment* 2002, 65–66).

The point, of course, is that to call self-censorship freedom because it conforms to what one would have wanted anyway ignores the possibility that what one wants depends on what one thinks one can have. And why would anyone restrict his or her imagination in this way? It would be done to protect the illusion of perfect freedom. If I cannot imagine having something, then I need not experience the limits to my freedom.

What lesson is to be drawn from all this? Perhaps only that it makes more sense to go out and test one's freedom, even risk losing it, than to devote entire philosophies to guaranteeing that one's freedom is already absolute. In the end, freedom is an experience and a practice, not just an idea or a concept.

Freedom of Assembly

In the United States, freedom of assembly is one of the fundamental rights guaranteed to the American people. It is specifically guaranteed under the First Amendment to the U.S. Constitution in the Bill of Rights. As it is located in the Bill of Rights, it is considered a legal right, enforceable in the courts under 42 U.S.C. § 1983 and enforceable against the states under the Fourteenth Amendment. Freedom of assembly is distinct and different from freedom of association. Generally, freedom of assembly usually applies to the congregation of groups, and freedom of association applies to the rights of individuals to associate with other persons or entities.

A POLITICAL RIGHT

However, it is not just a legal right; it is also a political right. The difference between the two is not just academic. A legal right is a right that is enforceable by the courts. In contrast, a purely political right is a right that is recognized in a political philosophy. There is frequently overlap between political and legal rights. Some political rights might be enforceable in a court. Others might not be enforceable.

A primary example of a political right would be the right to revolt. In the U.S. Declaration of Independence, it is expressly recognized that when a government becomes destructive of the unalienable rights of the people, the people have the right to alter or abolish it—that is, to revolt, which is exactly what colonial Americans did during the American Revolutionary War (1776–1783). However, no court in the United States of America has recognized or approved of the right to revolt, nor has any other court in any other nation. Indeed, if a court were to recognize such a right, it would essentially be permitting its own destruction. Thus, it is a purely political right.

An example of the qualitative difference and difference in enforceability between legal and political rights can be found in the decision of the U.S. Supreme Court in the case of *Baker v. Carr* (1962), wherein the Court recognized the various aspects of what constitutes a political question. More specifically, the U.S. Supreme Court recognized in the case of *Luther v. Borden* (1849) that it will not consider issues that are purely political in nature, such as whether a state has a republican form of government. This was an interesting situation addressing what is known as Dorr's Rebellion, where a portion of the populace of Rhode Island attempted to establish its own government on the grounds that the regular government was not representative of the people and attempts at internal change were ineffective. Although the Court did not address the freedom of assembly in *Luther,* it is interesting to note that Dorr and his followers actually met to formulate their new government.

A FUNDAMENTAL RIGHT

Freedom of assembly, under the First Amendment, is a fundamental right that allows the people to peacefully assemble. The U.S. Supreme Court has presented three basic definitions of a fundamental right. The first is whether the right in question is a natural right under the principles of natural law, such as the right of self-defense as espoused by, for example, Sir William Blackstone, a famous English legal commentator, in his *Commentaries on the Laws of England*. The second is whether the right in question is fundamental to American justice and implicit in the concept of ordered liberty, as recognized in the case of *Duncan v. Louisiana* (1968), which was a case in which an African American was denied the right to a trial by jury. The third is whether the right is implied in the penumbra of the Bill of Rights, such as the right of privacy, as recognized in the case of *Griswold v. Connecticut* (1965) concerning access to birth control. The second meaning has been the most frequently cited by the American courts. As a practical matter, what is a fundamental right in America consists of the first ten amendments to the U.S. Constitution, as presented in the Bill of Rights, with some exceptions under the doctrine of selective incorporation, which mandates that most of the rights listed in the Bill of Rights are fundamental and are applicable against the states as well as the federal government.

In the decision of *De Jonge v. Oregon* (1937), the U.S. Supreme Court recognized that the primary purpose of the freedom to assemble includes the right to consult on public affairs and to petition for the redress of grievances. Thus, the basis of the freedom of assembly is to protect the political process, which is significantly dependent on the right to assemble. However, this does not mean that the freedom to assemble involves only consulting on public affairs or petitioning for the redress of grievances. There are other facets of political activity that fall within the freedom of assembly. Thus, it is clearly a political right, and it is enforceable in the courts as a legal right.

A LIMITED RIGHT

The U.S. Supreme Court, in the decision of *Kovacs v. Cooper* (1949), recognized that all rights, even fundamental rights guaranteed under the Bill of Rights, are not absolute. Limitations can be imposed. One example is the requirement of licensing. It has been universally recognized across the United States that the government's requiring some form of licensing for public demonstrations is constitutional and does not violate the right to assemble. However, such licensing cannot subject the participants to unreasonable limitations on the time, place, or manner of the public demonstrations.

A primary example of an appropriate limitation on the right to assemble is the crime of rioting. Although the people have the fundamental right to gather for political purposes, such a gathering must be peaceful. If the gathering becomes violent and disorderly, disturbing the general peace, then the participants will lose the protection of the right to assemble and be subject to criminal prosecution. However, even abhorrent ideas are protected by the freedom of assembly, as illustrated by the infamous Nazi parade in Skokie, Illinois, in 1977. The Skokie case involved a Nazi group's attempting to parade in a significantly Jewish community. It brought the issue of the right to assemble to the forefront, even where the content or purpose of the assembly might be highly offensive to many people.

INTERNATIONAL LAW

Political rights are recognized in international law. In the United Nations Charter, political rights are not specifically mentioned. However, in articles 1 and 55 of the charter, equal rights and the right to self-determination are jointly recognized; these are political rights, and as a practical matter, they cannot be implemented without the right to assemble. Furthermore, in article 21 of the International Covenant on Civil and Political Rights, the right to peacefully assemble is recognized. However, it must be realized that even though these rights are recognized in these international documents, the United Nations Charter is generally recognized to be aspirational as opposed to mandatory, and the covenant, even though it is a treaty, is not enforceable in American courts because of the numerous reservations made during its ratification. Thus, the issue of legal as opposed to political rights involving the right to assemble is a significant issue concerning international law.

Freedom of Association

Freedom of association is essentially the right to interact with other people or entities without interference from the government. It is not specifically mentioned in the Bill of Rights of the U.S. Constitution. However, the U.S. Supreme Court, in the decisions of *NAACP v. Alabama* (1958) and *Bates v. City of Little Rock* (1960), specifically recognized the freedom to associate as being related to the right to assemble and freedom of speech under the due process clause. Both of these cases involved the government's attempts to obtain the membership lists of organizations, which the Court found interfered with the freedom of association. It must be realized that freedom of association is distinct and different from freedom of assembly. Generally, freedom of association applies to the rights of individuals to associate with other persons or entities, and freedom of assembly usually applies to the congregation of groups.

A FUNDAMENTAL RIGHT

Even though freedom of association is not listed in the Bill of Rights, it is considered a fundamental right. The U.S. Supreme Court has presented three basic definitions of a fundamental right. The first is whether the right in question is a natural right under the principles of natural law. This includes the right of self-defense as espoused by Sir William Blackstone, an eighteenth-century English legal commentator, in his *Commentaries on the Laws of England*. The second is whether the right in question is fundamental to American justice and implicit in the concept of ordered liberty, as recognized in the case of *Duncan v. Louisiana* (1968), in which an African American youth was sentenced without a jury to a term of two years in jail for assault. The third is whether the right is implied in the penumbra of the Bill of Rights, such as the right of privacy, as recognized in the case of *Griswold v. Connecticut* (1965) concerning access to birth control. The second meaning has been the most frequently cited by the American courts. As a practical matter, what is a fundamental right in America consists of the first ten amendments to the U.S. Constitution, as presented in the Bill of Rights, with some exceptions under the doctrine of selective incorporation, which mandates that most of the rights listed in the Bill of Rights are fundamental and are applicable against the states as well as the federal government.

The U.S. Supreme Court, in *NAACP v. Alabama* (1958), found that the freedom of association is broad ranging and does not concern just public political matters. It found that the freedom of association applies, essentially, to any reason, whether it be public, private, political, economic, religious, or cultural. Moreover, in contrast to the freedom to assemble, the freedom to associate involves the right of privacy as, among other aspects, it may involve controversial matters. Thus, although the freedom of association involves political rights, it is much more.

Also of great importance, the freedom of association involves the rights of labor. The U.S. Supreme Court, in the decision of *National Labor Relations Board v. Weingarten* (1975), found that the freedom of association applies to labor and unions in that there is a right to associate to advance the interests of labor against management.

LIMITS

However, like the freedom to assemble, the freedom to associate is not absolute. As with all rights, even fundamental rights guaranteed under the Bill of Rights, the U.S. Supreme Court, in the decision of *Kovacs v. Cooper* (1949), recognized that limitations on the right can be imposed. But such limits must be reasonable, and as it is a fundamental right, any infringement will be examined by the courts under strict scrutiny.

These circumstances came to the forefront in the infamous Supreme Court case of *Dennis v. United States* (1951). Dennis was an organizer and member of the Communist Party in America and taught from various Communist books. Dennis was indicted and convicted because one of the tenants of the Communist Party was the violent overthrow of the United States. However, as stated in the vehement dissents, there was no clear and present danger. Thus, Dennis was convicted, at least in some part, based on his membership in the Communist Party. This case still raises serious questions about the freedom of association today and if it is truly a fundamental right or if it was sacrificed on the altar of political expediency. However, few would dispute that associating with groups that present a clear and present danger as to the violent and imminent overthrow of the government would not be protected under the freedom of association.

INTERNATIONAL LAW

In the realm of international law, the freedom of association is not specifically mentioned in the United Nations Charter. However, it is present by implication. In articles 55 and 62 of the charter, social equality, social progress, and social problems are recognized as goals, which implies that freedom to associate is also present. Furthermore, in the International Covenant on Civil and Political Rights, in article 22, the freedom of association is specifically recognized and includes the right to unionize.

Indeed, one of the most infamous international examples of abuse of the freedom of association was in South Africa during the period of apartheid. *Apartheid* loosely translates as "apartness." It refers to the principle that the white race is so superior to the black race that the two must be kept apart. In support of the enforcement of apartheid, people were banned, which means that they were not allowed to meet or communicate with more than one person at a time.

The freedom of association is an essential fundamental right that has effects throughout a person's life and not just in the

political arena. As demonstrated in South Africa with apartheid, without freedom of association, life can be so restricted that the concept of liberty becomes meaningless.

Freedom of Conscience

One might understand the concept of conscience as a judicial concept whereby, on reflection, we retrospectively make a personal judgment about what we did. The judicial conscience results from personal values or internal judgments, engaging in a subjective evaluation of our prior actions. An intuitive notion, the retrospective approach to conscience is strongly associated with moral and value-oriented evaluations. Such evaluations might lead one to suffer from a guilty conscience given prior actions that are, in retrospect, deemed incorrect.

Conscience also acts as a prospective concept, serving a legislative role in directing a person's actions and providing a broader framework for consideration and evaluation of future events. Conscience in the legislative sense results from a meta-judgment closely linked to one's essential moral commitments, creating a disposition to act pursuant to one's fundamental beliefs and self-identifying moral principles. It is a self-conscious activity to create self-committed decisions about what is right and wrong.

Thus, a pacifist belief dictates a refusal to use weapons against another human being, resulting in military conscientious objection and a refusal to engage in any form of military service requiring or supporting the use of arms against another. There even have been instances of pacifists' conscientiously refusing to pay a portion of their income tax, against the percentage of monetary resources dedicated to the support of the military.

The legislative role of conscience has been subject to greater analysis and consideration given its potential to alter the future behavior of individuals. Thus, respect for the prospective nature of conscience has resulted in the emergence of a human right to freedom of conscience as a protected belief, one that is closely associated with, and at times even comparable to, the importance accorded to a religious belief and its attendant freedom(s).

INTERNAL AND EXTERNAL NATURE OF CONSCIENCE

Conscience in the legislative sense leads to the instillation of a conscientious belief. Such a belief is composed of an internal aspect, the *forum internum,* involving the development of one's conscientious belief system, and the *forum externum,* whereby one externally manifests a conscientious belief.

The forum internum relates to the ability to mentally develop, and eventually adhere to, conscientious beliefs, creating the groundwork for future external behavior. This evaluative, cognitive, conscientious process shapes and develops a belief into a structured set of cognitive directives or imperatives that mandate particular and specific external action (or inaction). A belief system centered on the importance of human life will dictate the type of actions that one may hold to be morally unacceptable to undertake against another (such as to perform an abortion) pursuant to the beliefs that have internally shaped and formed.

An ensuing conscientious decision to act personifies that person's approach to moral action for both that particular action and similar future situations. A conscientious belief manifests when the belief requires a particular form of practice. One must discern a link between the action and the particular practice demanded from the belief system. The forum externum then results from an internal-driven process to create a set of mandates that merit manifestation of one's conscientious beliefs as external actions taken in pursuance of a belief. Manifestation of a conscientious belief reflects the standard developed in the forum internum, as manifestation of a conscientious belief relates to an application of specific and crucial principles deriving from the belief. Thus, a medical practitioner harboring a conscientious belief concerning the importance of human life even in its earliest stages might refuse when asked to cooperate in certain medical actions, such as abortions. The conscientious belief manifests to prevent the individual from performing an action contrary to the belief itself.

Unlike a religious belief, however, which is (generally) associated with a set of stated principles and norms, the scope of manifestation for a conscientious belief is a vexing issue due to problems of proof regarding the existence of a particular conscientious belief and demonstrating one's actual belief in the asserted principles. Nonetheless, a conscientious believer desires to adhere to an asserted conscientious belief regardless of the outcome. What is important is the manifestation of a conscientious belief to ensure the maintenance of the belief. Prevention of the desired action or inaction will not only impede its performance but also generate an unyielding predicament that can serve to thwart the internal conscientious belief as well.

CONSCIENCE AS A HUMAN RIGHT

Given the importance of the development and manifestation of a conscientious belief, the notion of conscience as a protected human right has emerged in both domestic and international frameworks. The scope of the right remains unclear, however, since in many instances, the right is associated with a religious belief at the expense of allowing for the manifestation of a conscientious belief.

For example, the principal allowance for conscience as a human right is its association with pacifism, as many states

recognize the right of military conscientious objection. A military conscientious objector asserts a conscientious belief, such as against the bearing of arms, whereby the requested action by the state, participating in the military, entails a direct conflict with the belief. States might provide an exemption from military service or an option of alternative military service that does not involve the use of military weapons. The problem is that many states limit conscientious objection solely to religious-based contentions, at the expense of conscientious beliefs that also merit manifestation and protection, such as when emanating from a nonreligious pacifist who asserts a conscience-based belief in not using weapons of any sort.

Conscientious belief also maintains legal protection in international treaties, such as the International Covenant on Civil and Political Rights, article 18, and the European Convention on Human Rights, article 9. For example, the attendant oversight committee of the International Covenant, the Human Rights Committee, has stated that the capacity for military conscientious objection applies to all forms of beliefs, both religious and otherwise, thereby including conscientious beliefs as well. By contrast, the European Court on Human Rights has held that the European Convention does not necessarily provide for the right to military conscientious objection as the right of exemption is left to the decision of a state.

In his 2009 report, the United Nations Human Rights Council–appointed special rapporteur on freedom of religion or belief referred to nontheistic and atheistic beliefs that merit protection against discrimination, such as in the field of education. The understanding was that conscientious beliefs are entitled to some form of protection against state discrimination, such as in state schools mandating daily religious prayer for all students or providing universal religious instruction. Previous rapporteurs had also called on states to recognize and apply the right to military conscientious objection and provide the means for alternative service.

Finally, the potential capacity for additional forms of conscientious objection merits noting. This includes conscientious objection in the medical field, such as objecting to the performance of abortions or euthanasia; claiming refugee status after feeling a state denied a person the right to military conscientious objection; and the capacity for selective conscientious objection (wherein a specific military action is conducted in a manner contrary to one's conscientious belief).

Freedom of Information

Freedom of information (FOI) signifies one's right of access to information held by government. Generally, this access includes access to both government-owned documents and government meetings. FOI, sometimes referred to as the "right to know," contributes more broadly to transparency, which is evaluated by how well one is able to see what government is doing. According to Suzanne Piotrowski (2007), transparency is achieved through five avenues: FOI laws, proactive dissemination of information, open meetings, whistle-blowing, and leaks. FOI—and transparency generally—is salient because it helps to ensure and foster democracy, accountability, and citizen trust as well as potentially curb corruption. Since democracy works best when people are informed, information flow from the government, then, can be thought of as a way to ensure better democratic practices and citizen participation. Furthermore, access to government documents, information, and meetings paves the way for an accountability mechanism or check from the public by allowing the public to monitor the decisions and actions taken (or not taken) by government. While FOI is thought to be an essential right for all, too much FOI could potentially pose a threat. Personal privacy and the need for secrecy—especially in cases of security—have the potential to be at odds with FOI rights. As a result, one's right to know as well as one's right to privacy and security must be balanced in such a way that neither is breached.

HOW FOI IS ACHIEVED

FOI can be achieved in two major ways: access to documents and access to meetings. Access to documents is typically obtained through the use of FOI laws. FOI laws vary around the world but generally include, among other components, the types of documents that can be requested, who can request them, from what government agencies and bodies they can be requested, the types of documents exempt from release, the process for appealing denial of access, and fee schedules. Some laws protect the FOI rights of citizens only, while others allow all persons to submit and be granted requests for information.

The first known FOI law was adopted in Sweden as the Freedom of the Press Act in 1766, which mandated that all public records be considered open to the public. According to David Banisar (2006), the worldwide spread of FOI as a right did not occur until almost two hundred years later after World War II (1939–1945) with the establishment of the United Nations and the creation of international standards for human rights. Furthermore, Banisar reports that as of 2006, close to seventy countries in the world have such laws on the

books, and an additional fifty laws are pending. In recent years, FOI laws have come to be known as standard, with the international community—such as the United Nations, the European Union, and the African Union—urging countries to adopt them.

A second avenue of access to government documents is proactive dissemination. Here, governments release documents and information without having been asked. Proactive dissemination may occur when information is requested at such a frequency that it is best for the government to release it for the public to peruse on its own or when it is no longer necessary that the information be private. Documents released this way can be kept in libraries, online, or in other locations. Proactive dissemination practices and norms may or may not be included in FOI laws.

Another way FOI can be achieved is through the use of sunshine laws. Sunshine laws, or open meetings laws, allow for the public to attend meetings and proceedings of a governmental body. In the United States, these laws are typical of all states and apply to state and local government bodies. These laws generally include requirements of notice, agendas, and written minutes of meeting proceedings. Much like FOI laws, there are usually specific provisions that cover which types of meetings can be conducted in private. Common examples of acceptable closed meetings in the United States include proceedings pertaining to particular personnel or meetings during bargaining for real estate transactions. In some cases, written records of proceedings conducted behind closed doors are liable to becoming public once privacy or secrecy is no longer at issue. Last, FOI and access to meetings are sometimes covered together under a single law.

WHEN FOI IS FAILED

FOI, as discussed above, can help to ensure democratic processes within government. Citizens and residents who utilize these laws can act as a potential check on government with close inspection of information and proceedings. However, FOI can only truly be achieved if a government is transparent and open about its information. In other words, FOI rights are upheld when governments produce honest documents and information in a timely manner that is not burdensome on requestors.

When dishonest or falsified government information is released to the public under the guise of true information, FOI is violated and is only present in theory. In these cases, whistle-blowing or leaks are sometimes necessary for FOI rights and transparency to prevail. A whistle-blower is defined by Sissela Bok (1989) as one who "make[s] revelations meant to call attention to negligence, abuses, or dangers that threaten the public interest. They sound an alarm based on their expertise or inside knowledge, often from within the very organization in which they work." A leak occurs when an informant on the inside, usually keeping him- or herself anonymous, releases this information to the press. A famous example of leaking occurred in the United States during the Watergate scandal of the 1970s Nixon administration. When whistle-blowing or

leaks are necessary for the public to be informed, FOI is not being maintained.

Freedom of Movement

Neither the 1787 Constitution of the United States nor any ratification since mentions anything specific about a right to move or travel within the country or beyond its borders (Article I, Clause 6 recognizes the right of national legislators to travel to and from Congress). Nevertheless, the U.S. Supreme Court has recognized this right as a part of U.S. law, and it is also an important part of international law.

THE CONSTITUTIONAL RIGHT TO TRAVEL WITHIN THE UNITED STATES

Article IV of the Articles of Confederation (replaced by the Constitution of 1787) did confer upon "the free inhabitants of each of these States, paupers, vagabonds, and fugitives from justice excepted," the right to "free ingress and regress to and from any other State." The privileges and immunities clause of Article IV of the 1787 Constitution that displaced the Articles of Confederation omits specific reference, as does the Fourteenth Amendment (1868) ratified after the U.S. Civil War (1861–1865), which says in part, "No State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States." Yet there are many federal and state laws that have curtailed or burdened an individual's freedom of movement, and some of them have been invalidated by the U.S. Supreme Court as unconstitutional infringements on the right to travel. Many other laws and regulations raise important constitutional problems.

In *Saenz v. Roe* (1999), the Court acknowledged that while the Constitution does not mention travel in any context except for regarding members of Congress, such a basic right is nevertheless firmly established in U.S. law and precedent. In *Shapiro v. Thompson* (1969) the Court struck down a one-year durational residency requirement as a condition for receiving

welfare benefits for which a newly arrived state resident was otherwise eligible. Connecticut sought to discourage people from moving there to receive richer benefits than they had been receiving in other states. The 6–3 majority held that this was unconstitutional restraint on the right to travel interstate, although the justices failed to identify the source of this right. Thirty years later in the *Saenz* case a 7–2 Court majority declared unconstitutional a California law that provided a newly arrived and eligible resident with welfare benefits but, for the first year, only the dollar amount he or she had been receiving in the previous state of residence. Congress, in revising welfare law through its 1996 amendments, had authorized the states to do what California had done here.

Admitting that nothing is specified anywhere in the text of the document, speaking for the majority in *Saenz,* Justice John Paul Stevens explained, "The 'right to travel' discussed in our cases embraces at least three different components. It protects the right of a citizen of one State to enter and to leave another State, the right to be treated as a welcome visitor rather than an unfriendly alien when temporarily present in the second State, and, for those travelers who elect to become permanent residents, the right to be treated like other citizens of that State." The "second component," he said, is "expressly protected" by the privileges and immunities clause of Article IV of the Constitution: "The Citizens of each State shall be entitled to all Privileges and Immunities of Citizens in the several States." California interfered with the third aspect of the right to travel—"the right of the newly arrived citizen to the same privileges and immunities enjoyed by other citizens of the same State," a right, the Court announced for the first time, "plainly identified" in the Fourteenth Amendment: "No State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States." Discriminatory penalties imposed on this third component of the right are unconstitutional, even if Congress allows them as Congress did here, because the national legislature cannot authorize a state to violate the Constitution.

LIMITATIONS ON FREEDOM OF MOVEMENT

This right to travel elaborated on in *Saenz* raises all sorts of constitutional issues that eventually find their way into the judiciary and occasionally percolate up to the Supreme Court. Congress, for example, can restrict travel to other countries and can impose passport restrictions on certain people. However, these restrictions could raise First Amendment issues if, for instance, the limitations on foreign travel were aimed at someone's political or religious affiliations. Many of these once cold war questions were resolved by the Court in favor of individual freedom, but these matters could recur in the context of the war on terror. States also have the legitimate power to restrict the movement of parolees or condition child custody on parental residence within the state of the child. Other impediments relate to laws that track sex offenders, most of which require convicts, even those who have completed their sentences, to register their whereabouts and/or

document or confine their permanent residence. This can become public knowledge, often posted on official Web sites. The public interest promoted by such regulations is to alert people that a convicted sex offender might become one of their neighbors. The state of Washington had a law compelling convicted rapists who had completed their sentences to live in confined quarters that some argued were a jail in disguise, thus triggering the issue of double jeopardy, forbidden by the Fifth Amendment. A federal judge in Seattle had, in fact, ruled exactly that.

Perhaps the most inevitable collision with the undefined and, given the sweeping language in *Saenz,* broad right to travel will develop from same-sex married couples who move to states that do not recognize such marriages. Many people move from one state to another because of job offers or transfers or for other reasons. Article IV of the Constitution requires each state to give "full faith and credit" to all "public acts, records, and judicial proceedings" of all other states, including marriage certificates and licenses. Almost forty states have laws refusing to recognize same-sex marriages, civil unions, or domestic partnerships. Congress has authority in the full faith and credit clause in that it "may by general laws prescribe the manner in which such acts, records, and proceedings shall be proved, and the effect thereof." In 1996 Congress passed and the president signed the Defense of Marriage Act (DOMA), which specifically exempts states from any obligation to recognize such marriages. Gay and lesbian couples in Massachusetts, for example, or any of the other handful of states permitting same-sex marriages, may have their marital status legally abolished simply by resettling in another state. Some may challenge DOMA as beyond the power of Congress under the full faith and credit clause. However, one could also claim that state laws spun from DOMA constitute an undue interference with the right to travel, or in the language of *Saenz,* the right of the traveling citizen "to be treated as a welcome visitor rather than an unfriendly alien when temporarily present in the second State, and, for those travelers who elect to become permanent residents, the right to be treated like other citizens of that State."

The amorphous right to travel has an indefinite reach that potentially collides with many legal restrictions. It will be interesting to see how the judiciary, especially the Supreme Court, develops this line of constitutional law.

LIBERTY OF MOVEMENT BEYOND THE UNITED STATES

Freedom of movement in the international arena is ostensibly protected by international law. For example, the International Covenant on Civil and Political Rights, adopted by the United Nations General Assembly in 1966 and in effect since 1976 as a multilateral agreement endorsed by most countries in the world, contains article 12, which guarantees "liberty of movement" within the territory of a state for anyone lawfully within such a state. It also ensures that everyone is free to leave a country (including his or her own) and ensures the right not to be "arbitrarily deprived of the right to enter his own

country." However, article 12 recognizes that restrictions can be imposed on movement "to protect national security, public order, public health or morals, or the rights and freedoms of others." Limitations obviously can be significant given the ambiguity of this language. Citizens of the European Union have firmer and more secure legal rights to move and reside within any of the member states of the European Union. By treaty and by a parliamentary directive, European Union residents and their families can enter any member state and reside there for up to three months, a stay that can, without too much legal interference, become permanent.

Freedom of Religion

Freedom of religion, *libertas religionis,* is among the oldest internationally recognized rights, and most people today in liberal, secular states around the world consider religious freedom a fundamental human right. Even most states with an official religion allow the practice of other religions within their jurisdictions. How much religious freedom, of course, varies from one state to another.

RELIGIOUS FREEDOM IN THE UNITED STATES

In the United States, religious freedom takes pride of place in the Bill of Rights, the bedrock of constitutional freedom emulated in emerging democracies in the post–World War II era. The First Amendment (1791) of the United States Constitution (1787) guarantees that "Congress shall make no law . . . prohibiting the free exercise" of religion. Article I of the Constitution also prohibits religious oaths as a precondition for federal elected office. Thus, freedom of religion has been enshrined in the basic law of the country since the earliest days of the constitutional system—in fact, absolutely protected, according to the text of the First Amendment. In *Cantwell v. Connecticut* (1940) the Supreme Court held that the amendment's protection also applies against the states: "The First Amendment declares that Congress shall make no law respecting an establishment of religion or prohibiting the free exercise thereof. The Fourteenth Amendment has rendered

the legislatures of the states as incompetent as Congress to enact such laws."

The basic constitutional problem, besides defining religion, has been framing the extent to which a believer is free to observe his or her religion. To make exceptions from otherwise valid laws because they curtail someone's religious practice could seriously impair government's ability to govern effectively and fairly. The Court in the *Cantwell* case acknowledged this by holding that "the Amendment embraces two concepts—freedom to believe and freedom to act. The first is absolute but, in the nature of things, the second cannot be." The "nature of things" has changed profoundly. It was difficult enough at the beginning of the Republic when most people were Christians of some sort. Today the problem is compounded greatly because the United States is the most pluralistic country in the world. Every known religion is practiced somewhere in the country, and many laws, from local to national, to some extent restrict the free exercise of religion. Observances of familiar, mainstream religions almost never generated lawsuits. Constitutional disputes have arisen from religious minorities, and when they appeared before the country's highest court, if the groups prevailed, these disputes tended to be resolved mostly as free speech matters. For example, the Supreme Court held in *West Virginia State Board of Education v. Barnette* (1943) that government cannot compel Jehovah's Witnesses—in fact, anyone—to salute the American flag because the freedom of speech clause protected them. When Jehovah's Witnesses first sought exemption from compulsory flag salutes in public schools in Pennsylvania on free exercise of religion grounds (saluting the flag was akin to worshipping a graven image, in violation of their religion), the Court in *Minersville School District v. Gobitis* (1940) rejected (8–1) the claim that the free exercise clause required any exception. For most of American history the Supreme Court had given little attention to the meaning of the free exercise clause, and the *Gobitis* case exemplified that posture.

PROTECTING THE "EXERCISE" IN FREE EXERCISE OF RELIGION

In 1963, however, that changed. Adell Sherbert was a member of the Seventh-day Adventist Church and refused to work on Saturdays, her religious Sabbath. She had worked for years as a textile mill operator for a company in South Carolina that switched from a five- to a six-day workweek. After she was fired for refusing to work Saturdays, she filed for workers' compensation benefits for which she was eligible as long as she was able and available to work but could not find suitable work. The state's Employment Security Commission denied her benefits when she claimed she was not able or available, for religious reasons, to work on Saturdays. She sued, lost her case, but eventually reached the U.S. Supreme Court, where a 7–2 majority unexpectedly ruled in *Sherbert v. Verner* (1963) that South Carolina had imposed an unconstitutional burden on her free exercise of religion. Just two years before, the Court had flatly rejected the plea of an orthodox Jew for an exemption from a state's blue laws, which forced

businesses like his to close on Sundays (his Sabbath required him also to close on Saturdays). Fashioning an abrupt reversal of constitutional policy, the majority in *Sherbert* held that in defeating a free exercise claim for exemption the burden is now on the government to show a "compelling" state interest achievable only by interfering with the religious practice in question. This new standard is very difficult for states or the federal government to pass. Government must not only demonstrate a compelling public interest but also prove that intruding on religious freedom is the least drastic, or perhaps the only, means of promoting that interest. The Court was unconvinced that South Carolina's denial of Mrs. Sherbert's benefits was necessary to thwart fraudulent and deceitful compensation claims.

In *Wisconsin v. Yoder* (1972) the Court reconfirmed its commitment to this new posture. Applying the same test, a unanimous Court ruled that children of the Old Order Amish religion and the Conservative Amish Mennonite Church were constitutionally exempted from Wisconsin's compulsory school attendance law. Their parents had sued claiming that high school was not necessary to their simple lifestyle and that coercive exposure to modernity through a high school curriculum collided with their free exercise of religion. The Supreme Court agreed, although one justice wanted to leave the decision to the children, not the parents. In *Yoder* the Court recognized the problem in trying to distinguish between secular and religious: "Thus, if the Amish asserted their claims because of their subjective evaluation and rejection of the contemporary secular values accepted by the majority, much as Thoreau rejected the social values of his time and isolated himself at Walden Pond, their claims would not rest on a religious basis. Thoreau's choice was philosophical and personal rather than religious, and such belief does not rise to the demands of the Religion Clauses." However, when Christian fundamentalists objected to mandatory use of certain books in high school curricula offensive to their children's religious convictions, the Supreme Court refused even to hear their claims. The message thus seemed to be selective constitutional exemptions from general regulatory laws for some religiously inspired conduct. The free exercise predicament and inconsistent results were all too obvious.

JUDICIAL RETREAT

Other liberal democracies never went as far as the United States in interpreting their constitutional principles so broadly, and many nonliberal states impose substantial limitations on religious practice. France and Italy, where religious freedom is comparatively very high, nonetheless have not exempted Muslim girls and young women from public school dress codes. Wearing the burka or *hijab* in public schools has created in both countries the inevitable clash between religious freedom and public order. Having given religious practice a greater value in the conflict of liberty and order at least since the *Sherbert* case in 1963, in *Employment Division of Oregon Department of Human Resources v. Smith* (1990), a narrowly split (5–4) Court eliminated this problem altogether by

suddenly reversing course. As long as the contested regulation is nondiscriminatory (that is, not aimed specifically at religious behavior) and rationally related to a legitimate governmental goal, no one could henceforth claim immunity on the basis of religious obligation. In reformulating free exercise law, Justice Antonin Scalia's majority opinion attempted judicially to "distinguish" both *Yoder* and *Sherbert* as particular, special exceptions. However, Justice Sandra Day O'Connor, for herself and three other dissenters, complained that the Court "dramatically departs from well-settled First Amendment jurisprudence." Under this policy, the federal, state, or local government in the United States could ban the hijab in public schools as long as the prohibition was driven by some neutral, secular purpose.

Despite a congressional effort to reverse the Court's interpretation of the First Amendment, the Smith doctrine has prevailed. The free exercise problem generated by religious pluralism has disappeared. As the Court in *Cantwell* first ruled, people can believe whatever they want, but free exercise of their religions no longer has constitutional shelter unless government has specifically targeted those religious practices. Other countries where freedom of religion is cherished continue to wrestle with these difficult issues, which increase in number and intensity in accord with the spread of religious pluralism and diversity.

Freedom of Speech

U.S. Supreme Court Justice Benjamin Cardozo in *Palko v. Louisiana* (1937) described freedom of speech as "the matrix, the indispensable condition, of nearly every other form of freedom." Without the capacity to identify and protest injustice, people would neither know what their rights are nor be able to challenge deprivations of those rights. Near universal agreement on the merits of speech rights in the abstract, however, has not entailed any general agreement on what speech constitutions and laws must permit. Legal scholars, elected officials, and judges dispute the central purposes of free speech, what constitutes speech, and the values that might

justify some limits on speech. These disputes have gone international. The United States protects far more speech than any other constitutional democracy.

Proponents of expression rights insist that what Thomas Emerson (1970) described as a "system of free expression" serves at least four values. First, speech rights are central to the discovery of truth. "Let her and Falsehood grapple; who ever knew Truth put the worse, in a free and open encounter," John Milton famously declared in his *Areopagitica* in 1644. Second, speech rights are a necessary condition for democracy. Popular sovereignty exists, democratic theorists recognize, only when citizens are free to debate the merits of rival policies and candidates. Third, speech rights are vital for self-expression. An open society values diverse individuals who express and establish their identities through various communicative acts. Finally, expression rights may be a means by which political opposition is cabined. People who are free to express their contempt for the status quo with words are less likely to express their contempt with violence. John Stuart Mill in *On Liberty* (1859) combined several of these principles when he observed, "Complete liberty of contradicting and disproving our opinion, is the very condition which justifies us in assuming its truth for purposes of action."

REGULATING FREE SPEECH

These different values determine what counts as speech. Some proponents of the truth function of expression believe that government should protect only rational arguments. Insults, obscenity, advertising, and political buttons might not count as speech under this rationale. Many democratic theorists insist that government should protect only political speech. Alexander Meiklejohn, the most influential American free speech theorist during the 1960s, insisted that while government could never regulate speech on political affairs, radio and television were forms of entertainment that could be regulated, as is any other business enterprise. Great literature could not be regulated, in his view, only insofar as such works as *Hamlet* and *Anna Karenina* could be said to influence voting and other political choices. Those who champion self-expression believe government must protect a wider range of speech. Great literature and even mediocre literature and obscenity merit the same degree of protection as political speech because an open society allows people to choose what communications to make and receive. During the past half century, commercial advertising has increasingly enjoyed free speech protection as a form of economic communication.

The conditions under which speech should be regulated are as controversial as what counts as speech. At one extreme is the view that communication that meets the conditions for speech can never be regulated, no matter what the possible harm. U.S. Supreme Court Justice Hugo Black advanced this position when he declared that the words "no law" in the First Amendment mean "no law." Once Black found that a person had engaged in constitutionally defined speech, he rejected claims that any contrary value could justify regulation. At the other extreme is the bad tendency test, a test that enables government to regulate any speech that has some tendency to cause some harm. Under this view government can regulate pamphlets because they have some tendency to cause litter as well as speech critical of the government, no matter how tame, because such speech might have some tendency to cause crime. Actual practice in most nations, not surprisingly, takes a position in between these two poles. Speech may be regulated, but only when the harm is serious and a very likely consequence of the speech.

FREE SPEECH IN THE UNITED STATES AND OTHER DEMOCRACIES

Free speech in the United States has been subject to increased protection and expanded scope for the past century. At the turn of the twentieth century, both elected officials and justices insisted that only political speech was subject to any protection. Many insisted that persons could be imprisoned for opposing government policy even when they did not explicitly advocate unlawful conduct. After admitting that the petitioners in *Schenck v. United States* (1919) "confined" themselves to advocating "peaceful measures such as a petition for the repeal of the [draft]," Supreme Court Justice Oliver Wendell Holmes nevertheless maintained, "We do not see what effect it could be expected to have upon persons subject to the draft except to influence them to obstruct the carrying of it out." Contemporary U.S. constitutional law excludes speech from protection only when speakers incite illegal conduct and that incitement is likely to cause such conduct in the immediate future. The Supreme Court has further insisted that persons have a constitutional right to criticize public officials as long as they do not intentionally or recklessly utter falsehoods and that government can place a prior restraint on speech only if officials can demonstrate a harm equivalent to imperiling a ship at sea. In the contemporary American free speech law, obscenity, commercial advertising, and campaign finance are given (almost) the same protection as political expression. Racial insults are given the highest degree of political protection, because they are considered a form of political speech.

Other democracies do not tend to provide as great a degree of protection. Great Britain, other European nations, and new democracies in both Asia and Africa are willing to limit speech on a lesser showing of harm. In particular, most other nations regulate hate speech and campaign finance far more than the United States. The right to free speech in Canada and other countries does not include the right to deny the humanity of other citizens or spend unlimited sums of money in efforts to gain political office. Studies indicate that the Japanese and Germans, in particular, are far more concerned with the potential harms to reputation than the free market of ideas.

Americans who are aware of practice in other democracies tend to see foreign speech regulations as proof that other nations are still not quite as free as the United States. Many civil libertarians are convinced that any regulation of speech will provide precedents creating a slippery slope that will eventually threaten basic democratic rights. Citizens in other nations charge the United States with being more concerned

with the forms than substance of democracy. Basic democratic rights, in this view, require active governmental intervention to ensure equal access to the marketplace of ideas.

Freedom of the Press

Freedom of the press is the right to publish information and opinions and disseminate it to the public without interference from the government. It is both an individual and an organizational right. This means that it applies to both individual people and organizations that publish written material, such as newspapers and publishing houses. However, with the advent of modern technology, the term *press* has taken on an expansive meaning; it is not limited to just the printed word. Freedom of the press also includes electronic publishing media, such as news broadcasts on television and blogs on the Internet.

CONSTITUTIONAL RIGHT

Freedom of the press is located in the First Amendment of the Bill of Rights of the U.S. Constitution. Although freedom of the press is part of the First Amendment and intricately linked to freedom of speech, it is a separate and distinct right. In America, freedom of the press is a fundamental right, which means that it has the highest level of protection in the American political and legal system. However, this freedom is not absolute.

In modern times, there are a number of laws prohibiting certain public statements involving, for example, libel, obscenity, and national security. Libel is the defamation of a person through the written word. A person who has been defamed in writing generally has the right to sue for damages and equitable relief prohibiting the defamation in court. However, if a person is a public figure or a private person who speaks publicly on an issue of public concern, then the protections provided by libel laws are reduced. The publication of criticisms of public officials and statements on matters of public concern are considered to be essential to a free political system. Furthermore, the government cannot be libeled. In the realm of politics and American political theory, this is an essential protection; otherwise, the ruling party would be able to easily stifle dissent and opposition.

SEDITION AND NATIONAL SECURITY

Indeed, in 1798, the infamous Alien and Sedition Acts, enacted under President John Adams, made it a crime to criticize the government and were intended to stifle political opposition. President Thomas Jefferson subsequently pardoned the people convicted under the Sedition Act. Although the Sedition Act was not tested in court, because it had expired, the U.S. Supreme Court recognized its unconstitutionality in the famous case of *New York Times v. United States* (1971) as being the antithesis of American democracy.

National security can also be a reason for limiting freedom of the press. The Smith Act of 1940 made it a criminal offense to advocate for the violent overthrow of the U.S. government. In the related case of *Dennis v. United States* (1951), which concerned people who were members of the Communist Party advocating the violent overthrow of the government, the Supreme Court found that if a publication presents a clear and present danger resulting in the illegal evil meant to be prevented, then the First Amendment will not protect the publication. Dennis's conviction was upheld. This principle was reinforced in the famous decision of *New York Times v. United States* (1971), when the Supreme Court ruled that the publication of the Pentagon Papers during the Vietnam War (1959–1975), which revealed information about the conduct of the war that embarrassed the U.S. government, was protected by the right to freedom of the press, as there was no clear and present danger to national security.

OBSCENITY

Obscenity is difficult to define. In American society, there have been numerous cases involving what is obscene and not protected by the First Amendment. In the famous case of *Miller v. California* (1973), which involved a person distributing obscene material, the U.S. Supreme Court defined something as obscene if it met the following test: (1) the average person, applying contemporary community standards, would find that the work, taken as a whole, appeals to the prurient interest; (2) whether the work depicts or describes, in a patently offensive way, sexual conduct; and (3) whether the work, taken as a whole, lacks serious literary, artistic, political, or scientific value. The difficulty of applying this definition is highlighted by the statement of Supreme Court Justice Potter Stewart—even though he could not define obscenity, he knew it when he saw it. Obscenity can have an important role in political debate. For example, in the case of *Cohen v. California* (1971), the Supreme Court found that the use of the phrase "Fuck the draft" (worn on a T-shirt) was protected by the First Amendment, as at the time of the Vietnam War, the draft was a serious political issue. In the opinion, Justice Harlan noted that one man's vulgarity may be another man's lyric.

CONCLUSION

Whatever the form or purpose, it is widely accepted that freedom of the press was primarily enacted for the protection of political discourse. At the time of the American Revolution (1776–1783), much of the impetus and support for the revolution was based in the publications of such

luminaries as Benjamin Franklin. Indeed, political speech, to include statements in the press, is given the highest level of protection under the First Amendment, as opposed to other forms of speech, such as commercial speech and advertisement.

Freedom of the press is also recognized internationally. In article 19 of the Universal Declaration of Human Rights and in article 19 of the International Covenant on Civil and Political Rights, the right to a free media is recognized.

Freedom to Bear Arms

One of the most controversial amendments in the Bill of Rights to the U.S. Constitution is the Second Amendment, which protects the right to keep and bear arms. The controversy stems from four basic issues: (1) Is it an individual right or a collective right? (2) What is the purpose of the right? (3) Is it a fundamental right? and (4) Is it necessary in modern society such that certain limits should be placed on it?

A COLLECTIVE OR INDIVIDUAL RIGHT?

Throughout the latter half of the twentieth century, the first issue, whether the right to keep and bear arms is a collective right or an individual right, has been the primary focus of discussion concerning the Second Amendment. Proponents of the collective right theory stated that the Second Amendment applies only to militias that are under the control of the government and not to individuals. The individual right proponents relied on the fact that it was the individual citizens who bore arms during the American Revolution (1776–1783) and not militias controlled by the government. Furthermore, the many writings of the Founders clearly supported the individual right to keep and bear arms.

In modern jurisprudence, the issue has been raised in the lower courts in a number of cases, but these decisions almost uniformly find that the Second Amendment provides only a collective right. One of the most famous exceptions was the decision in *United States v. Emerson* (1999), wherein a federal district court in Texas found that it was an individual right. The

issue was brought to the U.S. Supreme Court on a number of occasions, but the Court refused to hear the issue. Finally, the U.S. Supreme Court, in the case of *District of Columbia v. Heller,* in 2008, ruled that the Second Amendment protected an individual right to keep and bear arms.

PURPOSE OF THE SECOND AMENDMENT?

As to the second issue, the purpose of the Second Amendment, once again, there is controversy. However, the controversy is more frightening, lurking underground, and not often mentioned, if mentioned at all, in either court decisions or academic debate. Indeed, this controversy is probably the most political of all questions. This political question is the issue of the right to revolt. The U.S. Declaration of Independence clearly advocates the right to revolt against a tyranny. The writings of the Founders indisputably recognize the right to revolt. Indeed, the Founders did just that, revolt from British rule. Yet even a cursory review of the literature and judicial decisions reveals an overwhelming focus on the right to self-defense, usually in the context of defending oneself from common criminals. The right to revolt is conspicuously absent.

As no American court has recognized the legal right to revolt, it would seem that there is no such right. Indeed, if a court were to recognize such a right, it would essentially be permitting its own destruction. However, there are grounds for considering the right to revolt a political right. A legal right is a right that is enforceable by the courts. In contrast, a political right is a right that is recognized in a political philosophy. There is frequently overlap between political and legal rights. Some political rights might be enforceable in a court. Others might not be enforceable.

Indeed, the U.S. Supreme Court has specifically recognized that it will not hear what is referred to as "a political question." In the decisions of *Baker v. Carr* (1962) and *Luther v. Borden* (1849) the U.S. Supreme Court explained that political questions involve those issues best left to the other branches of government. As a practical matter, anyone who unsuccessfully revolts against the government would be subject to criminal prosecution, and a defense based on the Second Amendment would not be recognized.

A FUNDAMENTAL RIGHT?

The third issue is whether the right to keep and bear arms is a fundamental right. The U.S. Supreme Court has presented three basic definitions of a fundamental right. The first is whether the right in question is a natural right, under the principles of natural law, such as the right of self-defense, as espoused by, for example, Sir William Blackstone, a famous English legal commentator, in his *Commentaries on the Laws of England* published in the late eighteenth century. The second is whether the right in question is fundamental to American justice and implicit in the concept of ordered liberty, as recognized in the case of *Duncan v. Louisiana* (1968). The third is whether the right is implied in the penumbra of the Bill of Rights, such as the right of privacy, recognized in the case

of *Griswold v. Connecticut* (1965) concerning access to birth control. The second meaning has been the most frequently cited by the American courts.

As a general matter, fundamental rights in America consist of the first ten amendments, the Bill of Rights, to the U.S. Constitution, with some exceptions under the doctrine of selective incorporation. Under the doctrine of selective incorporation, some of the rights in the Bill of Rights are not incorporated. In this context, this means that the right in question will not apply to the states under the Fourteenth Amendment. If a federal right is not incorporated, then the states are not required to enforce or acknowledge that right. At this time, the Second Amendment, although it has been recognized as an individual right, has not been recognized as a fundamental right such that it should be incorporated and applicable to the states.

AN OUTDATED RIGHT?

The fourth major issue concerning the right to keep and bear arms is whether society has changed such that the right is outmoded. There are numerous political groups opposed to the ownership of guns. They have successfully lobbied for the enactment of numerous gun control laws across the nation, which mandate such requirements as licensing, waiting periods before purchases, background checks before purchasing, and prohibitions. The basic premise of such groups is that guns are dangerous. Many people are killed with guns, and many crimes are committed with guns. These groups argue that regulating, controlling, and even prohibiting the ownership and use of guns will reduce these dangers to society. There is significant evidence supporting aspects of these claims.

However, when considering the right to keep and bear arms, a balancing must be made: do the benefits of individual gun ownership (the right to revolt against a tyrannical government) outweigh the risks (crimes committed with guns)? This question is still being debated in the political arena in America. In the international context, the right to keep and bear arms is generally not recognized. It is not part of the United Nations Charter, nor is it part of the International Covenant on Civil and Political Rights.

Free Trade

The concept of free trade is rooted in the eighteenth-century antimercantilist movement seen in Europe and prerevolutionary America. Mercantilism is an economic theory founded on a belief that the global volume of international trade is fixed or unchangeable and that the prosperity of a nation depends on its supply of capital, particularly gold and silver. According to mercantilists, governments should maximize their capital with protectionist policies, encouraging exports and discouraging imports through tariffs and subsidies, resulting in a positive balance of trade. Conversely, the emerging free trade concepts in the 1700s among intellectuals in France, Great Britain, and colonial America were based on a belief in laissez-faire government and international commerce. Focusing on agriculture as the only source of true wealth for nations, a group of French economists known as physiocrats argued a nation's net product could be increased by reducing barriers to trade and regulations impeding the growth of this sector.

English economists such as David Hume and Adam Smith, "helped transform anti-mercantilism into the positive cosmopolitical vision of free trade benefiting humanity" (Eckes, *Opening America's Market: U.S. Foreign Trade Policy Since 1776,* 1995, 4). They argued mercantilists failed to understand the benefits of free trade between nations and the notion of comparative advantage, which was fully developed later in the 1800s by David Ricardo, an English political economist. The theory of comparative advantage argues, for example, that if France were a more efficient producer of both cloth and wine than Britain, but Britain could produce cloth with fewer resources than it could produce wine, both countries could financially benefit by specializing, Britain in cloth and France in wine, and then trading. Trade, in other words, was no longer viewed as a zero-sum game but as a means of enhancing the wealth of all nations involved.

HISTORY OF FREE TRADE

In prerevolutionary America, one could find ardent supporters of free trade in Benjamin Franklin, Thomas Paine, and Thomas Jefferson. While Paine and Jefferson argued for "freedom to trade," Franklin thought trade should be free between all nations of the world and "no nation was ever ruined by trade, even, seemingly the most disadvantageous" (Eckes 1995, 2). Early taxes imposed by the British parliament on the British colonies in North America came disguised in the form of tariffs on specific imports. The Townshend Acts of 1767 placed duties on goods that the colonists did not produce in great quantities, such as paper, glass, and tea. While some colonists avoided the tariffs by boycotting the taxed products, others

staged public protests, leading to the Boston Massacre of 1770 and the Boston Tea Party in 1773. After the Declaration of Independence in 1776, the Continental Congress, seeking freedom to trade on equal terms with other nations, drafted a treaty calling for reciprocal national treatment, which is treating foreign products the same as domestic ones in terms of taxation and regulation, and unconditional most favored nation treatment, which is granting all countries equal trade privileges. Although these principles did not become standard practices in U.S. treaties or under international obligations until the twentieth century, they established the groundwork for fair international treatment in trade.

An overwhelming need for revenue, however, seemed to override many nations' support for actual free trade during the next century. In the United States, the first tariff bill of 1789 included a mix of ad valorem, which is a percentage of the value of a good, with fixed per-unit taxes designed primarily to service the war debt and finance government expenditures. However, political controversy over which goods to tax and whether high or low tariffs were optimal for preventing economic depressions or recessions raged on through the 1800s and into the 1900s in the United States and the world.

The 1930 Smoot-Hawley Bill, which passed the highest tariff rates in U.S. history, is believed to be at least partially to blame for the severity of the worldwide economic depression that followed shortly thereafter. The U.S. Congress reacted by passing the 1934 Reciprocal Trade Agreements Act, delegating greater powers to the executive branch to lower tariffs through bilateral reciprocal trade negotiations. The 1947 General Agreement on Trade and Tariffs (GATT), a multilateral treaty signed by twenty-three countries, including many of the Allied states, was designed to spur international trade by reducing tariff barriers. Many of the GATT's provisions were derived from bilateral treaties negotiated by the United States under the Reciprocal Trade Agreements Act. The GATT was supposed to operate under the charter of the International Trade Organization, but failure of the U.S. Senate to ratify the International Trade Organization on the grounds it would cede too much sovereignty to an international body left the GATT as the only legal framework for international trade negotiations. The GATT contract embodied legal rights and obligations for member countries, including articles requiring most favored nations and national treatment, which were supposed to enable smaller, less developed countries to have equal trading rights and stature when engaging with large countries. In 1995, the GATT agreement evolved into the current 153-member World Trade Organization (WTO).

THE WTO AND REGIONAL TRADE AGREEMENTS

Although subsequent international trade agreements negotiated under the GATT/WTO put the world on a path to freer trade by substantially lowering tariff rates, it by no means rid countries of the political need for protectionism. Provisions in the GATT/WTO, such as the escape clause, which allowed for exemptions from principles of free trade, as well as other nontariff barriers not restricted under the agreement, replaced tariffs as a means of protecting industries worldwide. For example, protection through the implementation of WTO-sanctioned antidumping statutes has grown substantially around the world. *Antidumping* refers to a legal statute which allows for a remedy, namely, an import duty, to offset the effects of dumped imports, where *dumping* is defined as selling goods below cost of production or home market price. As of 1984 no developing or middle-income countries were using antidumping statutes; however, by the end of the 1990s over forty developing countries had enacted new legislation to administer such protection. By 2001, it was estimated more antidumping duties were levied within one year worldwide than were levied from 1947 through 1970.

In addition to the creation of the WTO, and perhaps to bypass pressures of a growing global economy, free trade agreements have proliferated around the world. While hundreds of these agreements are bilateral in nature, numerous multilateral free trade agreements, such as the North American Free Trade Agreement, the Economic Community of West African States, the European Economic Area, the Association of Southeast Asian Nations, and the South Asian Association for Regional Cooperation, promote freer trade among member countries, lowering barriers regionally, if not globally. While some argue these bilateral and multilateral agreements have created a chaotic and discriminatory system undermining free trade and the principles on which GATT and the WTO were originally founded, the proliferation of such agreements is expected to continue.

Freezing of Party Alternatives

The freezing of party alternatives is a concept that asserts that political party structures in democratic systems tend to block or freeze the emergence of additional competitive parties, especially in two-party systems. The idea was first developed

by Seymour Martin Lipset and Stein Rokkan in 1967. The two scholars argued that once party systems matured, they tended to self-perpetuate and block competitors. Lipset and Rokkan particularly stressed that the contemporary two-party system in the United States predated the electorate and may not have been able to adequately keep abreast of the political and social changes. The result is unchanging party systems in developed democracies such as the United States or the United Kingdom. Only during periods of significant political, social, or economic upheavals are alternative political groupings able to displace established parties. This is in sharp contrast to the proliferation of new parties in some parliamentary systems in western Europe. The freezing hypothesis argues that dominant parties in two-party systems tend to absorb or co-opt alternative political groupings, as the Republican and Democratic Parties did to the Progressive Party in the early twentieth century. Critics of the freezing hypothesis contend the concept is more a historical observation than a developed theory of comparative political parties.

Freire, Paulo

Paulo Freire (1921–1997) was a leading Brazilian educator and theorist. His life's work is an attempt to liberate the marginalized classes, who constitute a culture of silence in many parts of the developing world. His primary theoretical contribution is the philosophy of popular education that reflects classic Platonic tendencies, enriched by a Marxist, anticolonialist framework. Today, his work serves as the foundation for critical pedagogy and numerous popular and informal education programs around the world.

Born to middle-class parents in Recife, Brazil, Freire grew up knowing poverty and hunger during the Great Depression of 1929. In 1943, he studied law at the University of Recife. After passing the bar, Freire abandoned law and worked as a schoolteacher. In 1946, he was appointed director of the Department of Education and Culture of the Social Service in the State of Pernambuco. Working primarily with the illiterate poor in this post, Freire began to formulate a means of communicating with the dispossessed that would later develop into his dialogical method for adult education.

In 1961, he was appointed director of the Department of Cultural Extension at Recife University, where he was afforded the first opportunity for significant application of his theory of education. Freire's literacy program was an overwhelming success, with three hundred illiterate sugarcane workers learning to read and write in just forty-five days. In response, the government approved the creation of thousands of literacy programs across the country based on Freire's model.

In 1964, following the overthrow of the Goulart regime in Brazil, Freire was imprisoned for seventy days. After a brief exile in Bolivia, Freire worked in Chile under the Frei government. In 1967, he published his first book, *Education as the Practice of Freedom,* and in 1969, he took a visiting professorship at Harvard University.

During this period, Freire wrote his most influential text, *Pedagogy of the Oppressed* (1970), in which he described education as a path to permanent liberation, with two stages. The first stage, conscientization, is a process in which a learner moves toward critical consciousness, an awareness of being an oppressed "object" in a world where only "subjects" have power. This process is the heart of liberatory education and stands in contrast to what Freire termed "banking education," a dehumanizing method of education where learners are conceptualized as passive recipients of preselected knowledge. The second stage, praxis, comprises a dialogical cycle of action-reflection-action, in which critically conscious individuals seek to transform the social order.

After leaving Harvard in the early 1970s, Freire served as the assistant secretary of education for the World Council of Churches in Switzerland. In 1979, he was invited by the Brazilian government to return from exile, where he assumed a faculty position at the University of São Paulo. He also joined the Workers' Party in the city of São Paulo and acted as a supervisor for its adult literacy project from 1980 to 1986. When the Workers' Party prevailed in municipal elections in 1988, he was appointed minister of education for São Paulo.

Throughout his life, Freire joined in writing more than a dozen books, integrating strands of thinking about educational practice, critical theory, democracy, and liberation. Specifically, his emphases on dialogue, conscientization, praxis, the "naming of oppression," and the lived experience of participants are the core tenets of his "pedagogy of hope." Such innovations have had a considerable impact on the development of education practice and theorizing, especially in Latin America, Africa, and Asia.

French Political Thought

One view of French political thought is that it is a local version of a wider European intellectual phenomenon, one possibly so tied to European history that the notion of a separable French variant lacks focus. However, those who prefer to paint only on a European-wide canvas themselves make a case for a French variant. For example, they make the invidious comparison between Englishman John Locke's and

Swiss-born Frenchman Jean-Jacques Rousseau's versions of the social contract as the good and bad examples of a common European endeavor, continuous from Thomas Hobbes on, to construct an understanding of democratic sovereignty. Such comparisons ignore, however, the specific purposes to which Locke's and Rousseau's arguments were put in their national contexts. Interconnected though modern European and North American political thought may appear, it can be broken down into national histories because political thought is also a response to, and an effort to affect, the peculiarities of a country's institutions and practices.

TWO SPECIES OF CIVIL SOCIETY

To pursue the invidious comparison in question, it establishes a pejorative account of French political thought as the bad other of English thought, a cautionary tale for Lockean liberals of some of the ill-fated uses to which the contractualist vocabulary might tempt its adherents. French thinkers, beginning in the nineteenth century with Alexis de Tocqueville, got into this game as well in hoping that the potential in France for what we might call "illiberal liberalism" (whose roots were classically exhibited in Tocqueville's *The Ancien Régime and the French Revolution*) could be corrected by looking for instruction from abroad in England or the United States (as expounded in *Democracy in America*). The post–World War II French antitotalitarian liberals, beginning with Raymond Aron and Michel Crozier and culminating with François Furet, pursued the same line in seeking to correct the political habits of their compatriots by a timely transplantation of Anglo-American ideas.

On the other side of the ledger, Tocqueville's *Democracy* also shows the author's misgivings about America, starting with the famous chapter that considers the fate of blacks and Indians. Crozier eventually wrote a disapproving book, *Le Mal Américain* (The Trouble with America). In addition, Pierre Rosanvallon, a successor to Furet, has recently suggested (in a perhaps unintended homage to Louis Hartz) that a liberalism that is too sure of itself runs into its own pathologies. The history of the illiberal liberalism of the French can be turned on its head. France struggled harder than other nations to create a liberal civil society, but in compensation it may now be more on guard against utopian fantasies regarding its new-won achievement. If the history of French political thought has changed in recent decades, it is principally because of the felt need to highlight these concerns regarding the status of French civil society and the long struggle to find a space for it in the shadow of one of the principal republican legacies of the French Revolution: the Jacobin state and the idea of the nation as one and indivisible.

THE THREE ERAS OF FRENCH POLITICAL THOUGHT

French political thought falls into three eras: (1) the monarchical period, from the fifteenth to the seventeenth century; (2) the eighteenth-century nexus of Enlightenment and revolution; and (3) the republican period, from the nineteenth century on. The monarchical period tells a story in which the seventeenth-century growth of the absolutist state seemed initially a naturally protective response to the horrors and intolerant fanaticism of the sixteenth-century religious civil wars, despite the presence of an even older, fifteenth-century constitutionalist tradition that was helpless in the face of such terrors. Following Nannerl O. Keohane, this era exhibits an alternating rhythm, and occasional synthesis, of thinking that was respectively constitutional, from Claude de Seyssel and Francis Hotman to Fenelon, Duc de Burgundy; absolutist, from Jean Bodin and Cardinal de Richelieu to Jacques-Bénigne Bossuet; and individualist, above all Michel de Montaigne but also including René Descartes (*Passions of the Soul*) and the Jansenist and Jansenist-influenced variants (Blaise Pascal and the Duc de Rochefoucauld).

The three features of the first era were often interwoven. As an absolutist, Montaigne was no liberal constitutionalist. Nevertheless, he established a psychology of the self that was an important legacy to his fellow Bordelais countryman, Charles-Louis de Secondat et de Montesquieu. Together, Montaigne and Montesquieu constructed a distinctively French "liberalism of fear." In Judith Shklar's classic account, this French liberalism was focused not on English-style contractual right but simply on the human vices. Cruelty was without exception the worst vice and nearly the sole responsibility of states to eradicate, its being not otherwise the purview of liberal governments to tell people how to live. One can detect, as Stephen Holmes shows, liberal constitutional elements even in Bodin's absolutist model. Montesquieu works this paradox in another manner. The juridical definition of *monarchy* found in *The Spirit of the Laws* begins in agreement with Bodin ("in a monarchy the prince is the source of all political and civil power") but then subverts the claim by stressing a constitutional role for "intermediary bodies" that relies on aristocratic honor as a decidedly individualist instrument for civil disobedience to the crown.

The second period is the nexus of the French Enlightenment and the French Revolution (1789–1799) from the death of Louis XIV in 1715 to the final defeat of Napoleon Bonaparte in 1815. This was a century of transformative thinkers brought to bear on a decade of transformative actors. Among representative figures there was the dramatist and essayist Voltaire (François-Marie Arouet). There were the Encyclopedists Jean le Rond d'Alembert and Denis Diderot. Michael Sonnenscher reminds us that we must not forget the Abbé Sieyès, whose 1789 *Qu'est-ce que le Tiers État?* (What Is the Third Estate?) may have set the course for subsequent events. Among the actors there were the Gironde advocates of a federal republic such as Jean-Pierre Brissot standing in intransigent opposition to the Montagnards of the Jacobin Club, advocates of a unified, indivisible republic, such as Louis-Antoine de Saint-Just. One cannot understand French political thought without reflecting on how obsessively the French regarded the historical question of the influence, real or imagined (and if real, beneficial or malign), of the philosophes on the revolutionary generation of 1789 to 1799. On the recent account of Dale K. Van Kley, it may as much be the case that the story of revolutionary origins lay in religious crises. But the role of the secular Enlightenment

was simply too juicy for both celebrators and despisers of the revolution to ignore.

Two thinkers, neither typical, are iconic figures for considering the paths taken and not taken in the revolutionary years: Jean-Jacques Rousseau and Montesquieu. Montesquieu's beloved *parlements* overplayed their hand in the early 1770s Maupeou regime, discrediting the very instrument that Montesquieu's disciples had counted on for a British-style transition into constitutional monarchy. Although the revolutionary years witnessed a failed attempt in this direction, by then the ideas of Rousseau had rushed in to fill the ideological vacuum. The author of *Discourse on Inequality* and *The Social Contract* had in fact adopted both Montesquieu's egalitarian model of republican government and his anthropological insistence on customs and manners as the mainstays of regimes. In juridical terms, however, if Montesquieu's preferred form of rule—the reformed monarchical state—represented the domination of ancient constitutional elements over absolutist arguments, Rousseau presented a picture of the republic in which the idea of Bodinian absolutist sovereignty achieved its democratic formulation. The creation of the republic from the ashes of absolute monarchy did not lay to rest the absolutist hegemony of the state over society.

Rousseau has become a far more problematic figure in light of a renewed appreciation today of the relevance of his political concepts to the revolutionary founders of the Jacobin republic and in the perspective of feminist authors concerned about his attitudes toward women. Rousseau is not simply the great egalitarian democrat of two generations ago but also a misogynist antiliberal whose conceptual understanding of democracy played a role in blocking the establishment of a pluralist civil society. But as nineteenth-century political actors sought in the succession of regime changes for the right balance between state and civil society, they were often motivated by the suspicions borrowed from the Jacobin disciples of Rousseau for whom the central threat to the whole democratic community was posed by the contrarian opinions inherent in merely partial associations. There was no absence of perceived threats from civil society. Rousseau spoke to liberals who feared the hostility of the Catholic Church to the republic and to socialists who dreaded the growing powers concentrated in the owners of industry. Nevertheless, in the absence of any legitimacy for individuals who inhabit the intermediary bodies of civil society, which are necessarily partial and self-interested, there could be no legitimacy in the creation of a new regime, however universal its aspirations, because all would-be universal actors are also tainted by the fact that they too possess only a particular identity. The issue has survived in the contemporary controversy about whether veiled Muslim women should be allowed in French public schools as a sign of respect for their special cultural origins or (and quite apart from the feminist angle) whether the school should be honored as the last refuge for the young to learn—not how to defend their particular identities, but how to release the grip of partiality and group self-preference to develop more encompassing loyalties.

The original currents of thought of the nineteenth century either were inspired by the revolution or stood in some degree of unease with it. On the classic account of René Rémond, three successive regimes gave their names to abiding political ideologies. (1) Legitimism, born in the Bourbon restoration of 1815 to 1830, wedded parliamentary government to an *ancien-régime* monarchy that blurred the boundaries between state and civil society. Ironically, this reactionary philosophy helped to establish, Anne Sa'adah suggests, a more pluralist socialism, a *deuxiéme gauche,* among Catholics and other voters who in the 1980s had moved left but rejected the Jacobin state and its hard view of the boundary between state and society. (2) Orleanism, the signature *enrichissez-vous* creed of the 1830 to 1848 constitutional monarchy, was unique in lacking a popular nationalist base. It was, however, a French version of an individualist, procapitalist liberalism. (3) Bonapartism legitimated two empires (Napoleon, 1801–1815, and Louis, 1851–1870) by exalting executive authority as the embodiment of popular nationalism. Bonapartist appeal allowed Charles de Gaulle and the architects of the Fifth Republic (1958–present) to graft an American-style executive or presidential authority onto older models of parliamentary government found in the Third (1870–1940) and Fourth (1946–1958) Republics.

A host of liberal thinkers kept hopes for a republican regime alive by advocating a cautious, postrevolutionary moderation. Witness Madame de Staël or Benjamin Constant, who split republican theory down the middle and jettisoned the (to Constant) dangerous part that Constant identified as the participatory liberty of the ancients (and of the recent, troubling revolution) in favor of the personal, commercial, and intellectual liberties of regimes he dubbed "modern." But republican ideas found renewed sustenance in a great variety of nineteenth-century authors (to list only three, the liberal Catholic Félicité de Lamennais and the historians Jules Michelet and Edgar Quinet) who planted intellectual seeds that blossomed in the brief Second Republic (1848–1851) and the more enduring Third Republic.

The revolution also provoked originality on the extreme right—for instance, in Louis Bonald, the theocrat who claimed that the revolution was divine punishment for the sins of France. More striking was Joseph de Maistre, the passionate ultramontane absolutist who expressed the rage of the Jacobins themselves, although his fury was instead directed at the whole of Enlightenment and revolution. In Maistre one finds a violence of thought and manner that offers a foretaste of what the authoritarian nationalism of Maurice Barrès (author and activist) and Charles Maurras (leader of Action Française) were to provoke in the twentieth century: namely, Fascism.

France nurtured three original socialist minds, none inclined to the Marxist variant, which was too indebted to the French Jacobin tradition; each was distinct from the other, antiauthoritarian, and seeing initiative properly coming from below. Each also showed a Girondin affinity for decentralization: in local communities, the phalansteries of Charles Fourier; in the anarchist federal principle of Pierre-Joseph Proudhon; and in revolutionary syndicalism and the "general

strike" of Georges Sorel. We need only add to this pantheon the name of Louis Althusser, the original Marxist savant of the late twentieth century.

The prosecution for espionage and imprisonment of the innocent Jewish army officer Alfred Dreyfus (1894–1906) created yet another yawning division among the political clans, pitting army against the republic, right against left. And not incidentally, novelist Émile Zola's famous "J'accuse," addressed to the president of the republic, established the public ideal of the "engaged intellectual," of which the post–World War II writings of Jean-Paul Sartre and Simone de Beauvoir were such distinguished models. The rise of the Soviet Union divided the French left after 1920 between socialist and communist. These partisans aside, the horrific slaughter of trench warfare in World War I (1914–1918) also created a generation attracted either to never-again pacifism or to brute-force Fascism. The latter would prepare some members of this unhappy generation to collaborate in the Vichy regime (1940–1944) even as Vichy also provoked, famously, the Resistance, that strange coalition of communists and organized Christians. It also established after World War II (1939–1945) Christian democratic parties that in the Fourth Republic split the difference between left and right.

Beginning in the 1930s, the French political intelligentsia exhibited a remarkable fascination with German idealist and postidealist philosophy, principally Hegel, on whom Alexandre Kojève gave his famous lectures, and Nietzsche and Heidegger, a source not only for the poststructuralists, including Jacques Derrida and Michel Foucault, but for their predecessors among the phenomenologists and existentialists, figures such as Sartre, Maurice Merleau-Ponty, and Albert Camus.

THE FOUR PREOCCUPATIONS OF FRENCH POLITICAL THOUGHT

There are four ways in which French political thought as a whole may differ in its emphases and style from other national discourses. (1) From early on it was attentive to anthropological and psychological concerns—that is, it was more genuinely fascinated by the habits and manners of diverse peoples, despite the blindness of official Fifth Republic ideology to issues of ethnicity and religious origins. (2) Early and late, it was more historically oriented, or more inclined to find legitimization for practices in answers to historical questions. (3) A novel development, from Descartes and the Enlightenment to Henri de Saint-Simon, Auguste Comte, Ernest Renan, and Émile Durkheim, it was with varying degrees of conviction inclined to see in rationality and science a legitimization for public administration as either a supplement to or even a substitute for political representation. (4) As illustrated earlier, these preoccupations were often brought to bear on the constantly renewed debate about the proper limits of state authority with respect to the expanding or contracting limits, the independence or dependence, of associational life.

Anthropologist Claude Lévi-Strauss's identification with Rousseau in *Tristes Tropiques* came from the latter's famous

preference for the habits of hunters and gatherers over those of "civilized" Europeans, but where did Rousseau come by his sympathy for the alien and the remote? The answer is Montaigne. Skeptical and horrified in equal measure at Machiavellian politics and religious war, Montaigne achieved in the *Essays* an anthropological masterpiece of inversion, "Of Cannibals," which asserted the moral superiority of such tribes over allegedly more "civilized" Europeans. In addition, the *Essays* were psychologically performative. They helped generations of readers fabricate a modern—that is, mobile and private—self that could survive both political and religious overcommitment.

An intense appreciation for history was the second feature of a French manner of political thinking. It also played a role in supporting the anthropological and psychological outlook. When, in the last section of *Spirit of the Laws,* Montesquieu leans toward a modified form of the Comte de Boulainvilliers's *thèse nobiliaire,* and against the *thèse royale* that claimed that the French state was heir to the Roman Empire, he committed himself to anthropological sympathy for the barbarians of the north much as Montaigne drew our attention to the moral superiority of cannibals.

The disputed origins of France in either the Roman Empire or the barbarian conquest posed the fork-in-the-road historical question for monarchical France. Do the French identify with the defeated classical empire and inherit its failings, or do they identify with the uncivilized, still-pagan conquerors? On the *nobiliaire* view, the invasion of the barbarian Germans ("our fathers the Germans") that ended in the conquest of Roman Gaul not only legitimated the Frankish aristocracy but, because of the happy manners of the nomadic conquerors, put French government on the long, torturous road to political freedom. One sees hints of these archaic sentiments in Tocqueville's wistful look at the nomadic American Indians in *Democracy.* He imagines them as bearing a likeness to his own aristocratic ancestors.
