The republican era replaced the old historical questions with new ones. France had been refounded in revolution. Gallo-Romans and Germans disappeared from historical consciousness, but there was now a new fork-in-the-road question. On one hand, should one distill from the tea leaves of French revolutionary history a celebration of the legitimacy of revolution as the road to the liberation of peoples? Starting with Karl Marx's reading of French crises from the Great Revolution to the 1870 Commune, there were many revolutionaries in the next two centuries who, because they once lived in France, learned that revolution was a revelatory moment in the upward climb of humanity. On the other hand, should one begin from the prospect that revolution had been less than a success—even a disaster—but that, nevertheless, it was a new origin for France and an experience from which something useful had to be pried? This was more or less the perspective of Tocqueville and other liberals of the post–1815 generation.

The Enlightenment gave rise to a novel preoccupation that turned out to have a bright future—the ideal of reason or

rationality. The latter term is forever associated with the name of René Descartes—father of Cartesian rationality—although Descartes himself thought politics was too complex for science and recommended only a quiescent "provisional morality." Rationality is often in conflict with the other traditions. It is typically a rival to the historical view. As science and enlightenment depended on a view of the uniformity of human nature, neither subtle psychology nor attentive anthropology was quite the forte of the rationalist outlook either. But again there were iconic figures capable of playing all three parts. Montesquieu, master psychologist and skilled practitioner of *longue durée* history, was also in no small part a founder of the modern social sciences. However, he neither thought that scientists should rule nor that individual reason amounted to much. In free countries, he insisted, it matters not whether "individuals reason well or badly" but whether they are in the habit of freely speaking their reasons in public forums. Reason is the consequence of the mediation of institutions—in this case, the separation of powers that pits ambitious reasoners against one another—a cult of honor ("virtue" in republics, "merit" in England) that channels private desires into public interest and political representation that legitimates offering reasons (good or bad) in public.

In the nineteenth century the historian and politician François Guizot managed to eliminate representation from the formula. For him the "public reasons" that emerged from the mediation of institutions might well serve as a substitute for political representation itself. This manner of raising the authority of rational agents above representative institutions that depend merely on opinion follows in the tradition of eighteenth-century physiocrats—for example, François Quesnay and Pierre-Paul Le Mercier de la Rivière and, after them, reformers such as the Baron Turgot and the Marquis de Condorcet. As Rosanvallon has shown, in the rationalist school there was no right to make bad law. Legislatures could be discredited, much as scientists would be if they allowed error to substitute itself for truth. The guarantee of freedom and rights did not lie in the arbitrary or wild expressiveness of representative government but in rational procedures for collecting evidence that led to truth. This was, of course, a perfect ideology for the postrevolutionary survival of the ancien-régime state bureaucracy, as was exhibited in Napoleon's establishment of elite schools (*grandes écoles*) and scientific research institutes connected to the state.

Last but not least is the central theme in this account—the preoccupation of French thought with the sovereignty of the state and its potential for conflict with individuals and groups situated outside the state. To what degree should state authority legitimate independence for the partial associations, the intermediary bodies of society? To what extent can these associations become a threat to the purposes of the state and those it represents, whether that concerns its independence in the midst of religious war or in the midst of class war? A contrast suggests itself. In the Anglo-American world, civil associations are more often than not, and sometimes naively, regarded as presumptively good. In the traditions of French political thought, civil associations are more often than not, and sometimes ill-advisedly, regarded as presumptively bad.

Have any recent political thinkers broken with these traditions? The most likely candidates are Michel Foucault and Jacques Derrida. Foucault, however, preserved something of the older French intellectual habits. A critic of Enlightenment rationalism and the despotic practices it founded, he ended up adopting a guise toward democracy that was severe, skeptical, and watchful—not unlike Tocqueville's democratic pessimism. *The History of Sexuality* shows a thinker fully absorbed in anthropological comparisons. Like Montaigne, Foucault discovered in Greek antiquity the solace of a pagan ethics. The *Lectures at the College de France* of 1975–1976 ("Society Must Be Defended") was a defense of civil society. In resurrecting the Comte de Boulainvilliers's prerevolutionary fascination with the wars of the Barbarian conquest, Foucault argues that it was the French aristocracy (not bourgeoisie or proletariat) who invented a subversive historical discourse that was a weapon of self-defense for "peoples" and "societies" in an unending war with "officials," whose kindred weapons were the "disciplinary" human sciences. Foucault's subsequent interest in "governmentality," (a rethinking of the issues of *Discipline and Punish*) is but the classical French quest for discerning in remote but connected habits what Montesquieu called the "spirit that governs men"—now, however, displayed on the micro-level of "bio-politics." With all the severity of the Cartesian rationalist, Foucault cast an unflattering light on how precisely this Cartesian spirit has invaded and transformed these various practices of civil society.

Let us turn to Jacques Derrida's later and more explicitly political or ethical writings: *Force of Law, Specters of Marx, Politics of Friendship, On Cosmopolitanism and Forgiveness, On Hospitality, Rogues: Two Essays on Reason,* and *The Beast and the Sovereign.* In these writings we find an extreme but still-recognizable version of the Montaignian skeptic. Not unlike the sixteenth-century author, Derrida rediscovers in various domains, such as law, justice, and hospitality, a source of unease. They possess an ever-transformative internal dialectic that renders them both demandingly necessary and always undecidable—that is, impossible, or at least impossible to fully satisfy. In passing we mention Derrida's own taking up of the classical theme of national "spirit" (*Of Spirit*). Equally interesting is his return to the old French tension between an insistence on sovereign closure to malign external influences and cosmopolitan openness to diverse manners and customs. This whole drama of the postrevolutionary period, enacted as the always unhappy compromises between the Jacobin state and the society it would superintend, or the world in which it acted, is played out again in a new deconstructive philosophical key.

Among these master thinkers there is no doubt great novelty, but they are also recognizable iterations of traditional obsessions—symptoms, so to speak, that suggest continuities lurking in every effort to digress from the past.

Freund, Ernst

Ernst Freund (1864–1932) was one of the leading American legal thinkers at the turn of the nineteenth into the twentieth century. He was a practicing attorney, law professor, political scientist, writer, and social reformer. Freund was educated at the German universities of Berlin and Heidelberg and became a professor of administrative law and municipal corporations in 1892 at Columbia University in the United States. He received a PhD in political science while he was at Columbia, and in 1894 he accepted a position with the political science department at the University of Chicago in Illinois. In 1903 he joined the faculty of the new law school on the Chicago campus and was instrumental in developing and advancing its curriculum on social and public service, political science, and the law. Freund also helped establish the first graduate school of social service in the country. In 1915 he served as the president of the American Political Science Association.

Freund's most famous work was his highly influential 1904 *Police Power: Public Policy and Constitutional Rights.* This book constitutes the first methodical analysis and structured elucidation of governmental police power in the American context, and it had a profound impact on the way the country's legal and judicial systems considered the topic. At the heart of Freund's dissection of police power was an engagement of the question of the extent of the limitations placed on legislative power by the Fourteenth Amendment of the U.S. Constitution. Freund called for a structure of legal rules and regulations that would properly balance rights of the individual versus rights of businesses and property rights. He clarified what police power entailed—the authority of the government to advance the general, public welfare by regulating the use of property—and when and where such an exercise of authority is legitimate, such as in the securing of public health and safety, public morals, public order, and security. He saw police power as not frozen in time with a particular understanding but instead as a much more elastic and malleable concept susceptible to adaptations over time in accord with varying social, economic, and political circumstances and conditions. This book and other writings helped cement Freund's reputation as one of the foremost analysts and theorists of administrative law.

In 1928 Freund published another seminal work, *Administrative Powers over Persons and Property.* In this book, he articulates his concern over too great a growth and expansion of government power and calls for an appropriate reconciling and balancing of inherent respect for individual rights, social obligations and societal responsibilities of property, and the dominating demands of the public interest and common welfare. He importantly delineates here the differences and implications of power, authority, and leverage in society among governmental actors, individual citizens, and property. At the forefront of Freund's arguments is an unyielding need to marry the law, legislative enactments, and legal interpretations with actual social reality. That is to say, Freund saw a compelling necessity for the law to remain sensitive and responsive to genuine needs of actual persons, not to be caught in an impersonal vacuum of pure jurisprudential theorizing.

Freund was also a staunch defender of and strong advocate for free speech rights in both his scholarly writings and personal life. It was his essential belief that unfettered, open dialogue, debate, and discussion comprise a critical foundation of U.S. politics and society, and the American polity could only suffer if such speech rights were diminished and the range of discourse improperly narrowed.

Friedan, Betty

Betty Friedan (1921–2006) was an American writer and feminist known for being a founder of the National Organization for Women (NOW) and for her writings, public statements, and actions that helped change the perception of the role of women in American society.

Born in Peoria, Illinois, she attended Smith College and graduated with a major in psychology. At Smith, she became the editor of the campus newspaper, and under her leadership the paper editorialized in favor of the unionization of the maids on campus. Friedan then spent a year completing a master's degree in psychology at the University of California at Berkeley, where she became politically active and was involved in a number of left-wing causes.

After leaving Berkeley, Friedan moved to New York City and became a reporter. She wrote for the Federated Press, a news service that was controlled by the Communist Party. She then wrote for the *UE News,* the newspaper of the United Electrical, Radio and Machine Workers of America. She was fired by the paper because she was pregnant with her second child. In 1963 Friedan's *The Feminine Mystique* was published. An outgrowth of a survey of Smith College graduates that she had conducted for the fifteenth reunion of their class in 1957 (later extended to other female college graduates), the book discusses the role of women in industrial societies. It contends that the role of the full-time homemaker repressed and stifled women and that there was an absence of female role models who both worked and took care of a family. Friedan argues that women are as capable as men and can follow any career path. She asserts that restrictive laws and narrow social views were responsible for the limits on women's lives rather than any inherent weakness or incapacity and that women could find personal fulfillment outside of their traditional role as homemakers. The book became a best seller, is credited with launching the contemporary feminist movement, and became the catalyst for the passage of the Equal Pay Act of 1963 and Title VII of the Civil Rights Act of 1964.

In 1966 Friedan helped found NOW, serving as its first president until 1970. Under her leadership NOW lobbied for equal legal status for men and women. Among the organization's successes were a 1967 executive order extending affirmative action to women and an Equal Employment Opportunity Commission ruling that sex-segregated employment advertising was illegal. NOW was the first national organization to support abortion rights (Friedan was a cofounder of the National Association for the Repeal of Abortion Laws in 1968) and the Equal Rights Amendment. The August 26, 1970, Women's Strike for Equality, organized by NOW, culminated with a march on Fifth Avenue in New York City where more than fifty thousand participated. The following year, Friedan helped found the National Women's Political Caucus. The National Women's Political Caucus was intended to be a vehicle for women who wanted to work within the traditional political structure to increase the participation of women in politics. In 1973 she helped found and was a director of the First Women's Bank and Trust.

While lauded for her work in the women's movement, Friedan was criticized by some for focusing on the concerns of white, middle-class, married women while ignoring the issues of the poor, minorities, and lesbians. During the 1970s Friedan left NOW, claiming that the organization devoted too many resources to lesbian issues, which she believed was a private issue and not a women's rights issue, and that many feminists hated men. In 1977 she attended the National Women's Conference and supported a resolution on lesbian rights.

Friedan wrote five more books: *It Changed My Life* (1976), a collection of essays; *The Second Stage* (1981), in which she dealt with the issues of women attempting to balance the demands of career and home in the "post-feminist" age; *The Fountain of Age* (1993), which examined the challenges faced by older women; *Beyond Gender: The New Politics of Work and Family* (1997), which focused on economic justice; and *Life So Far* (2000), a memoir.

Friedan taught as a visiting professor at several universities and was also associated with the Institute for Women and Work at Cornell University where she was the director of the New Paradigm Program.

Fringe Parties

There is no universally accepted definition of what constitutes a fringe party. *Fringe party* is mostly used by journalists, politicians, and political scientists as a pejorative term to demarcate the boundary between "reasonable politics" and the "lunatic fringe," a label famously applied by Theodore Roosevelt in his autobiography (1922) to describe "the foolish fanatics always to be found in such a [reform] movement and always discrediting it." Consequently, some political scientists have argued that the term should best be replaced by more neutral expressions, such as *marginal parties, nonestablished parties,* or *nonmainstream parties.*

FRINGE PARTY CHARACTERISTICS

It is, however, possible to derive a set of common and interrelated characteristics of fringe parties from the way the phrase is used in political language. Fringe parties do usually attract only minor segments of the electorate, they are small in terms of party membership, their leadership does not (any longer) belong to the established elite groups of their respective political systems, and their party ideology either violates the political consensus or is simply considered irrelevant by most voters.

Put differently, fringe parties are not part of their countries' political mainstreams, and they are not normally electorally relevant parties. This statement does, however, require two qualifications. First, most new parties (e.g., the green parties) started out as fringe groups but became both electorally relevant and accepted by the more established parties and the majority of the citizenry over time. Second, some parties remain isolated and outside the political mainstream although they attract relatively large segments of the electorate (e.g., some Communist parties and some members of the extreme right party family).

Moreover, the ideological marginality of a party is not only conditional on time but also more generally conditional on political context. Within the boundaries of a liberal-democratic regime, parties that promote a dictatorship of the proletariat or biological racism are clearly beyond the pale because their ideology contravenes the system's most basic norms and values. Left- and right-wing extremist groups that aim to abolish or radically transform liberal democracy are therefore among the most prominent fringe parties in Western democracies. Within the context of a stable authoritarian system, however, a nascent grouping of Democrats would well be considered a fringe party while the dominant nondemocratic parties define the political mainstream.

TYPES OF FRINGE PARTIES

Most fringe parties are marginal not because they harbor extremist views but rather because they tend to campaign for a single issue that is not—at least not in itself—important enough to secure them sufficient levels of political support. Examples from Western democracies include, but are not limited to the following:

RELIGIOUS PARTIES

Historically, religious conflicts have had an impact on the formation of European party systems during the nineteenth century. In postwar western Europe, the Christian Democratic party family has been rather successful electorally, and Christian values have had an impact on the party ideologies of many other Western parties. Today there is, however, a number of tiny Christian parties that represent fundamentalist and/or evangelical views and try to distance themselves from both mainstream churches and Christian Democratic parties. Moreover, an even smaller number of non-Christian (mostly Islamic), spiritual, and New Age parties exist in Western countries. So far, they have had no electoral success whatsoever. In other countries where religious cleavages are more prominent (e.g., India or Israel), religious parties can be much more relevant and would not automatically be considered part of the fringe.

REGIONAL AND ETHNIC PARTIES

In many countries, ethnic and regional cleavages are simply not salient enough to sustain a single-issue party, rendering attempts to mobilize political support on the basis of some long-forgotten territorial unit futile. However, where they exist, ethnic parties are sometimes well integrated into the political system, such as the Swedish People's Party in Finland. They might even enjoy special privileges like the parties of the Danish and Sorbian minorities in Germany, which are exempted from the 5 percent electoral threshold. Therefore, it would be difficult to portray these parties and their constituencies as being on the fringe in any meaningful way.

In other countries, regionalist or separatist movements may have started out as fringe parties. But during the revival of regionalism after the Second World War (1939–1945), they became relevant political players that cannot be ignored by mainstream parties. This would include many of the regional parties in Spain, the Scottish National Party, or the various regionalist movements in Italy that merged to form the Lega Nord. Similarly, many regional and ethnic parties in India are too relevant to be considered genuine fringe parties.

SOCIAL GROUPS, SPECIFIC INTERESTS, AND FRIVOLOUS PARTIES

There is a host of rather colorful parties that claim to speak for large segments of society such as women, the elderly, or families with children. Normally, the interests of these groups are fairly well represented by mainstream parties of the left and of the right that cannot afford to ignore these groups. Consequently, women's/feminist parties, family leagues, and gray parties usually fail to attract relevant numbers of voters.

For more specific and concentrated interests such as hunting, farming, or even car driving, the incentive structure is slightly different because demands from these groups are more

easily ignored by the existing major parties. In most countries, however, agrarian and similar parties were either absorbed into mainstream parties or linger at (or beyond) the border of political irrelevance. The French Hunting, Fishing, Nature, Tradition Party is a case in point.

Other parties might campaign for a single political issue that is less obviously linked to a social group but nonetheless seen as marginal by most voters. An example would be the host of tiny and ineffectual eurosceptic groups in generally europhile countries such as Germany. It is, however, worth pointing out again that both the green parties and the anti-immigration parties of the extreme right began their ascendancy as marginal single-issue movements.

Finally, there is a bewildering host of frivolous parties that exist to make fun of real fringe or mainstream parties, either to get access to state funding or just for the fun of it. Examples include beer lovers' parties in several post-Soviet states, Canada, Germany, Norway, and Poland; parties that allude to grand (and often fictional) political and religious ideas (Imperial British Conservative Party, Scottish Jacobite Party, Church of Militant Elvis Party); parties that exist to challenge political correctness and the establishment (the Anarchist Pogo Party of Germany and the PARTY, which campaigns for rebuilding the Berlin wall); or the many British groups that play with the word *party* (Mongolian Barbecue Great Place to Party).

Fromm, Erich

Erich Fromm (1900–1980) was a German-Jewish-American psychoanalytic social critic, humanistic thinker, and social psychologist who first visited the United States in 1933 to lecture and then immigrated the following year to escape the rise of the Nazi state.

Closely associated with the Frankfurt school of critical theory, Fromm combined a deep nonreligious understanding of biblical texts with close readings of Marx, Freud, and others to produce an original body of work that highlights the contradictions and development of Western liberal democracy as it pertains to the mental health and well-being of its citizens. Fromm's basic insight is that the psychological toll of market economies' emphasis on competition and material accumulation has made individuals vulnerable to forms of authoritarian rule that paradoxically mirror their own fear of freedom. Fromm, however, was no social determinist or pessimist but argues that human community can be built on a reawakened sense of reason, solidarity, and love. Although underplaying the role of institutions and constitutional safeguards such as separation of powers, checks and balances, and civil liberties that might be invoked to protect the citizen from the state, Fromm's work nevertheless remains fresh and full of insight regarding the role of self-understanding and mass psychology in the contemporary world.

The most enduring of Fromm's books for political scientists is his 1941 tour de force *Escape from Freedom.* In recounting the emergence of the individual from the Middle Ages through the Protestant Reformation and the subsequent development of capitalism, Fromm posits a dynamic social-psychosocial theory that examines the personal and social structures that contribute to the making of an "authoritarian character." This emergence, recapitulated in an extreme form in the rise of Nazi Germany, includes personality types driven by economic social forces and unconscious pathological anxieties who would willingly give up the "burden of freedom" and submit to the manipulation of hateful and repressive leaders rather than face the ambiguities and uncertainties of being human in the modern world. Looked at from a historical and comparative perspective, what can be thought of as Fromm's political theory of collective action and human behavior in times of accelerated economic transformation and stress has important implications for understanding globalization and the rise of religious fundamentalism and reactions to it in the twenty-first century.

Having published more then twenty books and three hundred articles, Fromm continually explores the interplay of ideas and social structures on the formation and malformation of human personality and by implication politics. In *The Sane Society* (1955), Fromm argues that affluent democratic societies could be "sick" due to the constant bombardment of advertising and creation of personality types that act more like conforming robots than free and autonomous individuals. In *The Art of Loving* (1956), Fromm argues that in an alienated capitalist society, love is more often than not unconsciously confused with the buying and selling of goods, thereby transforming the beloved into an object of desire rather than a subject of mutual trust and respect. Fromm paid his most explicit theoretical debt to Freud and Marx in *Beyond the Chains of Illusion* (1962), arguing that human freedom lies in the awareness of the inner and outer constraints that bind the individual and society. Only in conscious choices can a more just and peaceful world be achieved.

The political theorist John Scharr, perhaps Fromm's sharpest critic, argues that Fromm is a utopian thinker whose

emphasis on human freedom avoids the difficult political choices of authority. Despite the criticism that Fromm offered no practical way out of the modern dilemma, he was active in politics in the 1950s and 1960s for a time as a member of the Socialist Party of America and a supporter of Senator Eugene McCarthy's run for the Democratic Party's presidential nomination. Fromm was also the author of *May Man Prevail? An Inquiry into the Facts and Fictions of American Foreign Policy* (1961) and cofounder of SANE, an activist peace group that called for a ban on nuclear weapons.

Functionalism

Functionalism (sometimes referred to as structural-functionalism) is a theoretical perspective and methodological strategy employed predominantly in sociology and anthropology, but it can be found in most social sciences. The English social scientist Herbert Spencer and the French sociologist Emile Durkheim explicitly laid the theoretical foundations of functionalism and provided the first empirical work applying the functionalist perspective. While both theorists assumed populations grew larger and denser leading to differentiated structures with distinct functions meant to handle the problems emerging from larger societal systems, each theorist tended to emphasize different processes of societal evolution. For Spencer, the emphasis was on the process of differentiation, which was a sign of societal adaptation staving off disintegration, conquest, or collapse. Conversely, Durkheim was more interested in understanding how these differentiated parts were integrated into the whole such that social organization and relations remained stable and potential competition or conflict was prevented. Ultimately, the idea that society was a whole with distinct parts that were mutually dependent on each other through a division of labor came to be the guiding principle of functionalist theory and analysis.

THE TENETS OF FUNCTIONALISM

Spencer initially drew an analogy between biological organisms and society, which he conceived of as a supraorganism. Essentially, organisms and societies are similar in that they grow in size, followed by differentiation of and growth in structure and function. Differentiation implies mutual interdependence as a division of labor emerges to deal with the increasingly specialized nature of the units constituting the greater whole, such that the whole often outlives the death of one or more of its parts. Spencer had in mind institutions—such as polity and kinship—when he referred to social units, but one could extend this analysis, as Talcott Parsons would,

to any structural element of society: norms, roles, or cultural patterns such as values.

Differentiation was driven by the fact that societies have needs or requisites that social structures function to meet. As a group grows larger, problems emerge, making these needs salient and pressuring specialized units to appear to better meet these needs. For Spencer, the most important needs were production of material/symbolic/human resources, distribution of these resources, and coordination/regulation of disparate social units; Durkheim, on the other hand, saw integration as a key problem and emphasized structures such as the economic division of labor in his work. Spencer's theory saw societies on the precipice of collapse, as they tended to keep growing, producing more pressures to differentiate, and eventually failing to successfully meet the new exigencies. At some point, a society or group would succumb to conquest from a bigger, better-organized group; collapse; or disintegrate.

Based on these assumptions, a functionalist asks the basic question, What does X look like, and how does X function for society? A second question, first posed by Robert Merton, would ask what a structure's manifest (or overt) function was vis-à-vis its latent (or underlying) function. All social phenomena can theoretically be analyzed asking these questions, including religion or government, slavery, stratification, or status positions. The methods are meant to be comparative and, if possible, historical. For instance, one could ask what the structural elements of slavery are in societies A and B, as well as how they function to sustain the social order in both societies. If the structure and function are similar, slavery can be argued to have universal or generalizable qualities; conversely, where it varies in structure and/or function, one would want to find more cases to determine if one form is an exception to a rule, or whether slavery depends on the sociohistorical context in which it is embedded. And indeed, Spencer's and Durkheim's insights fueled the British anthropologist tradition of the early twentieth century—exemplified by Malinowski and Radcliffe-Brown's work—which applied functionalist principles to ethnographic work on preliterate peoples; this work is still relevant today.

MODERN FUNCTIONALISM

Talcott Parsons is the father of modern American functionalism. His goal was to build a grand synthetic theory that drew from the insights of the masters. Society was a system; it had four needs: adaptation, goal attainment, integration, and latent pattern maintenance. Visually, he represented these four needs by drawing a fourfold box representing each subsystem that functioned to meet the society's larger needs. Each square internally differentiated into four smaller boxes representing the subsystem's creation of structures functioning to meet its internal needs. His model attempted to account for everything from the biological level (which was analogized as located in the economic sector, the primary location for adaptive structures) to the psychological level (where the polity was oriented toward collective goal setting and attainment) to the social level (where integration occurred through roles, status positions, and

expectations predicated on the other levels penetrating social life) to the cultural level (where values, ideologies, and beliefs were generated and imposed on the lower levels).

By the 1960s, a slew of criticisms emerged challenging Parsonsian functionalism. First, Parsons (and to a lesser extent Durkheim) was guilty of tautological reasoning: a social structure existed because it was necessary, and it was necessary because it existed. Second, the problem of power and conflict was noticeably absent from early functionalist thought; the dynamics of inequality were often peripheral. Third, by emphasizing the process of differentiation as the master pattern of change functionalists made the mistake of (1) reproducing nineteenth-century teleological notions of progress, (2) ignoring the multilinear and uneven evolution of societies, and (3) implying that society had a natural state of equilibrium.

Recently, neoevolutionary thought has been integrated with functionalism in an attempt to rectify the errors of the past. Jonathan Turner's work, specifically, avoids the idea of needs by reorienting our focus toward ubiquitous forces such as population growth or resource scarcity, pressuring individuals and groups to find ways to adapt or face problems of higher magnitudes. Success, for Turner, means that a society temporarily adapts to its environment but, in doing so, unwittingly plants the seeds for new logistical loads that it must again adapt to. His innovation comes from replacing needs with selection pressures, which divorces the causes and consequences of social structures while also avoiding the teleological assumptions made by Parsons because societies are not headed in a particular direction but innovate in often surprising ways.

Other sociologists have tried to revive functionalism either by calling it something new and changing much of the language (Niklas Luhmann and systems theory), by integrating it with Marxist arguments (Immanuel Wallerstein and world-systems analysis), or by throwing out much of what we recognize as functionalism and reorienting the entire focus of the lens (Jeffrey Alexander and neofunctionalism). What never changes is the underlying question that nearly all social scientists ask at the onset of their research: what is X, what does it look like, and how does it work?

Functional Representation

Functional representation is an alternative form of political representation in which legislators are chosen not by territorial units but by various other groups such as social class, occupation, or minority status. It was developed as a means to provide representation to groups that might otherwise be marginalized in the political process. In addition, it reflected concerns that traditional political systems created artificial divides between politics, economics, and society. Initially, functional representation was popular among industrial organizations that sought either direct election of representatives to national legislatures or the creation of consultative bodies that had a role in the policy process. For instance, several countries in western Europe developed consultative assemblies whose members were elected by socioeconomic groups. In contemporary Slovenia, the forty-member National Council is composed of representatives of employer groups, employee groups, farmers, trade groups, and so forth. In many modern systems, functional representation is used to ensure minority participation in the legislature. For example, in the Croatia House of Representatives, five of the delegates are elected to represent the country's minority groups. Opponents of functional representation assert that it creates legislators that serve very narrow special interests instead of broad segments of society.

Fundamentalism

Fundamentalism is notoriously difficult to define, as countless political science commentators have found. Part of the difficulty lies in the use of the term in a pejorative sense to describe those whose religious or political opinions lie outside the norm. Few groupings that are labeled as fundamentalist would willingly describe themselves as such. The 1992 *Merriam-Webster Dictionary* describes fundamentalism as either "an extreme Protestant position characterized by the belief that the Bible is a verbally accurate recording of the word of God" or "adherence to traditional beliefs of any kind." This definition incorporates many who could not be considered fundamentalist; however, in these two concepts lie both narrow and broad definitions of the term. The narrow definition traces fundamentalism to its Christian origins in the early twentieth century and has been described by George Marsden (1980) as "militantly anti-modernist Protestant evangelicalism" (p. 4). The broad definition seeks to expand the term to include other faith and nonfaith groupings that possess similar characteristics and ways of operating. Jeffrey Hadden and Anson Shupe (1989) provide a useful definition for this broader definition, describing fundamentalism as "a proclamation of reclaimed authority over a sacred tradition which is to be reinstated as an antidote for a society that has strayed from its cultural moorings" (p. 111).

CHRISTIAN FUNDAMENTALISM

In its narrow definition, *fundamentalism* refers to the movement in the United States and Britain that developed out of the teachings of Princeton Theological Seminary and a series of pamphlets published between 1910 and 1915 called *The Fundamentals,* which called Christians to return and adhere to a strict and literalist interpretation of an inerrant Bible, which emphasized belief in the deity of Christ and the virgin birth. The movement grew in opposition to prevailing trends in the church, inspired by German higher criticism and scientific discovery of modernism and liberalism. Those who clung to the fundamentals of a literal interpretation of the Bible saw themselves as the guardians of true Christianity against nominal Christianity and nonbelievers. They considered themselves a faithful remnant in a fallen world that had begun to infect the church. They spent the following six decades avoiding political involvement and cooperation with mainstream churches while building their own churches, schools, colleges, theological and evangelistic training centers, and publishing houses. In the 1970s the *Row v. Wade* decision on abortion and attempts to bring about the Equal Rights Amendment spurred fundamentalists to act politically in defense of what they perceived to be an attack on traditional values. They reemerged as a potent political and religious force in the 1980s with tens of millions of adherents. During the following three decades, the movement was to emerge as a dominant force in both American Christianity and the Republican Party.

CHARACTERISTICS OF FUNDAMENTALISM

The defining characteristics of Christian fundamentalism can also be used to understand fundamentalisms more broadly. Marty and Appleby's comprehensive "Fundamentalism Project" in the 1990s identified nine ideological and organizational characteristics of fundamentalism. Among five ideological characteristics, they note, first, fundamentalists' tendency to react against secular modernization and the perceived marginalization of religion. Second, attention is drawn to the selectivity of those aspects of tradition and modernity fundamentalists choose to reshape, reject, or embrace. Although modernism might be rejected, modernity with its technological progress is embraced to spread their message. Third, fundamentalists tend to have a Manichean worldview, a dualism that sees the world in absolutist terms of good and evil. Fourth, there is a belief in the inerrancy and absolutism of sacred texts. Finally, fundamentalists believe in the idea of millennialism and messianism, that there was and/or will be a golden age when they will be rewarded and nonbelievers will be punished. The four organizational characteristics include, first, the idea of an elect or chosen membership. Second, this membership needs to be separate and distinct from other members of society. Third, fundamentalist groups are typically male dominated and led by a charismatic or authoritarian figure; dissent is not tolerated and leads to schism rather than compromise. Women's roles tend to be subordinate and conform to traditional roles in a patriarchal society. Finally,

adherents' behavior is carefully prescribed and includes dress codes, drinking and eating, the type of entertainment that can be enjoyed, and the relationships that can be entered into.

FUNDAMENTALISM TODAY

Marty and Appleby's work is helpful in identifying the commonalities shared by different fundamentalist movements. Although the term remains contested, it is in common usage and as such is useful in designating groups that share such features. These ideological and organizational characteristics are shared by Christian, Jewish, Islamic, Hindu, and other fundamentalists. They possess different sacred texts and leaders but adopt similar approaches in claiming inerrancy for their interpretation of such scriptures and reacting against the marginalization of religion in a globalized era. They are comfortable using modern technology to disseminate their worldview while simultaneously attacking selective Enlightenment values. Convinced of their own right standing with their God, they adopt a dualistic view of the world and eagerly await the time when they will be rewarded for their obedience and faithfulness. Members of fundamentalist movements are set apart from others, made to believe they are special and different from the majority of the society in which they live. Accordingly, they may act and dress differently to identify themselves with other group members and to differentiate themselves from fellow citizens. The strong charismatic leadership of such movements retains control over members and shapes the ideological agenda, mobilizing support on behalf of the specific issues on which they decide to concentrate.

Fundamentalism has developed to become a feature of the modern political arena in ostensibly secular states such as the United States, India, and Turkey as well as more overtly religious countries such as Saudi Arabia and Iran, where no clear separation of religion and state exists. Fundamentalists have formed political parties that have gone on to govern, such as the Bharatiya Junata Party in India or Adalet ve Kalkinma Partisi in Turkey; others have infiltrated existing parties including the Republican Party in the United States. Yet other fundamentalists, such as al-Qaida, have eschewed the democratic process and pursued violent means to achieve their political and religious objectives. Others including Hamas and Hezbollah pursue violent, political, and social welfare means to advance their religious/political objectives. The wars and acts of terrorism of the early twenty-first century have thrust fundamentalism to the fore of political science discourse, a long way from its rather quieter beginnings a century ago.

Furnivall, John Sydenham

British academic John Sydenham Furnivall (1878–1960) was born in Great Bentley, Essex, United Kingdom. He attended Trinity Hall, Cambridge, and received a second-class degree in 1899 in Natural Science Tripos. In 1901 he joined the India Civil Service, arrived in Burma (present-day Myanmar) in 1902, and received multiple promotions, culminating in his appointment in 1920 as commissioner of land settlements and records. His work in Burma led to a lifelong interest in its political, social, and economic evolution. In 1910 he cofounded the Burma Research Society, in 1924 he founded the Burma Book Club, and in 1928 he founded the Burma Education Extension Association. After retiring in 1925, Furnivall returned to the United Kingdom. From 1936 to 1941 he was a lecturer at Cambridge University in Burmese language, history and law.

Furnivall's academic publications include *Netherlands India* (1939) and *Colonial Policy and Practice* (1948). In 1942 he wrote *Memorandum on Reconstruction Problems in Burma* for the soon to be independent government of Burma. During the succeeding two decades, he served as an advisor to the Burmese government, received awards from the Netherlands (the Order of the Orange-Nassau in 1948) and the Burmese government (Thado Thiri Thudhamma in 1949), and was awarded a doctorate by Rangoon University (in 1957).

Furnivall's analysis focuses on defining and explaining the conditions under which colonial "topical" societies could achieve economic progress and welfare. European conquests produce plural societies, in which different cultural groups coexist in the same geographic region and are under the same formal authority but have different institutional rules and supporting moral imperatives. Within an individual's own cultural group, he or she behaves by its rules. In other situations, in which interaction is with other groups according to market and contract rules, one's own cultural constraints do not apply, and the other groups can be exploited. In this context, economic progress and welfare are difficult to achieve and

uncertain. Economic progress is the expansion of production but is not the same as improving welfare. In Furnivall's analysis in *Colonial Policy and Practice* (1948), welfare is the creation and expansion of the social environment that allows the individual "to obtain both what he knows he wants and what he wants without being aware of it." Examples of these wants are safe food and water, fair commercial transactions, and honesty in legal presentations.

Furnivall believed welfare also included the enforcement of social obligations. In *Colonial Policy and Practice* he lists three principles of economic progress and welfare that summarize the contrast and potential conflict between the two. First, buyers "would pay twopence rather than threepence"; second, sellers want "threepence rather than twopence"; and finally, economic progress and welfare are conditional on the expression of a common social will—the acceptance by all members of society of a common set of political and social rules. For welfare to improve and progress to be made, the first and second principles must be limited by social will. The final requirement for the achievement of welfare is autonomy. Autonomy is the ability or political power of people in a society to develop their own criteria of welfare. Furnivall believed that while autonomy alone would not ensure the development of social will or economic progress, welfare could be achieved only when economic progress occurred with the development of social will and autonomy. His model presents progress as stemming not just from technologies or markets but, importantly, from the acceptance of the same concepts of welfare and norms of social interaction by all people within a nation. Rather than economic development's resulting in welfare, autonomy and welfare were prerequisites to economic development.

G7/G8 and G20

The acronyms G7/G8 (Group of Seven/Eight) and G20 (Group of Twenty) denote two informal interstate coalitions that coordinate the policies of nation-states in regularly held summits at the ministerial or heads-of-state level. This informal mode of governance contrasts the highly organized, formal decision-making mechanisms typically analyzed in international relations studies, such as in the United Nations, International Monetary Fund, World Bank, and World Trade Organization. Scholars observe increasing trends of informality in international relations since the cold war due to a shift in political decision making from formal forms of governance to informal bodies. This is the result of resistance to reform in formal institutions, a growth of informal groups within formal institutions, and the informal addressing of policies that were traditionally handled through formal agreements. Against these overall trends in international relations, the G7/G8 and G20 have become decisive institutions in certain key policy fields, although the two coalitions differ in regard to their history, composition, and policy contents.

The G7/G8 was created in 1975 following the 1973 oil crisis and subsequent global recession. Originally referred to as the G6, Germany, France, the United Kingdom, Italy, Japan, and the United States gathered annually to coordinate financial and economic policies for industrialized countries. In 1976 Canada joined the group, and since 1977 the European Union has participated in all of the group's summits without being a recognized member. The addition of Russia, which was officially invited in 1998 as the group's latest member, created the Group of Eight. However, Russia is not a full participant in all activities, because it is excluded from the G7 finance grouping.

Since the 1970s, the small gatherings of G7/G8 heads of states have evolved into annual summits that attract huge media attention, mass mobilization, and public consultation with key civil society stakeholders. The G7/G8 has broadened its agenda from pure financial and economic issues to wide-ranging policies, including foreign affairs, science and technology, financial markets, energy, environment and climate, and employment/labor. The original informal mode of governance has been steadily formalized through regular policy meetings and routinization of cooperation on the ministerial level. The annual summits of the heads of state remain the core of the cooperation. They are prepared for intensely, with representatives of the leaders, known as "sherpas," in constant contact throughout the year.

The success of the G7/G8 is variable, as some give the group good marks for implementing policy decisions and commitments, while others fault it as an inefficient club bent solely on representing the interests of the global North by largely excluding the global South from its decision-making processes. The crisis of the legitimacy of the G8 is due largely to the fact that the group fails to represent the most relevant economies of the global economy. Against this background, the enlargement of the G7/G8 by the economic powers from the global South, including Brazil, China, India, Mexico, and South Africa, is the subject of various political and academic debates. The financial crisis of 2008 and 2009 illustrated that the G8 countries alone may not be able to adequately respond to global challenges.

The G20 was created in response to the Asian financial crisis of 1997 and 1998, in recognition of the fact that not all relevant economies were integrated in the informal modes of governance on the global economy. In 1999, finance ministers and central bank governors from Argentina, Australia, Brazil, China, European Union, India, Indonesia, South Korea, Mexico, Russia, Saudi Arabia, South Africa, and Turkey met for the first time in Berlin at the invitation of G7 finance ministers, creating the G20. The choice of these countries was based on the size of their economies and populations, on the need for regional representation, and on traditional political ties of G7 countries. Since its inception, the G20 has played a moderate role in financial global governance; its role in coordinating global financial policies was strengthened by the global financial crisis of 2008 and 2009. Given the legitimacy crisis of the G7/G8, it is likely that the G20 will continue where the G8 has left off and become one of the central informal coordination mechanisms in global governance.

Game Theory

Game theory analyzes social situations in which parties choose actions in pursuit of their individual goals, each person knowing that his or her success depends on all the choices made. A player, X, tries to predict others' moves and considers their views of the situation. However, X realizes that they are likewise trying to predict X's move, so a circularity appears. The most important concept in the theory, the equilibrium of John Nash, is an attempt to escape the circle.

The analysis is conducted mathematically, so the details must be specified precisely. In the simplest case, parties know their goals and the consequences of their moves, and they know that the others are similarly informed. In more sophisticated games, the players may be uncertain about goals, moves, or outcomes, and their uncertainty is expressed as probability distributions. The use of mathematics ensures that all assertions have a clear meaning within the formal system and that the conclusions follow undeniably from the premises.

Game theory applications have yielded results that seemed odd at first but made sense when the logic was examined, and without the discipline of mathematics the analyst might have slipped back into the conventional thinking. The theory's precision does not mean that it can predict real parties' actions in specific contexts, since it is impossible to model all variables in play or measure all the parameters. The theory's contribution has been to clarify the structure of different kinds of conflict or coordination.

Game theory proper is distinguished in its applications. It is a mathematical enterprise guided by interest in abstract systems, following criteria that are basically aesthetic. The greatest number of applications are in economics, followed by political science, biology, computer science, law, linguistics, and the philosophy of ethics.

GAME THEORY IN PLAY

Game theory is different from rational choice theory, which assumes that parties pursue self-interested goals such as pleasure, resources, or power. Game models sometimes include these kinds of goals, but they often do not. John von Neumann and Oskar Morgenstern, the founders of the field, also initiated modern utility theory to provide a basis for measuring one's goals even when they are not money or any other quantitative commodity.

A *strategy* is a complete plan of action for the game, instructing a player what to do for any information that might arise. A *Nash equilibrium* is an assignment of strategies to the players, such that each player would be ready to use his or her strategy even if, hypothetically, the player learned the others' strategies. Whether this property should persuade sensible players depends on the situation. In the most favorable case, players' culture and history might give them shared expectations about each other's moves, and it follows that they would use a Nash equilibrium.

For a wide class of games, at least one equilibrium exists, but often a game possesses several. The theory's own logic thus shows it is not deterministic and leaves a role for outside factors like precedent or culture. To increase the theory's predictive strength and to eliminate certain nonsensible equilibria, writers have constructed requirements to reduce the set of Nash equilibria, for example, *subgame perfection, intuitive criterion,* and *forward induction.* They show the importance of beliefs about events that never happen, that is, of players' expectations about behavior on nonoptimal paths of play. Other work has contended that Nash's concept is too narrow and tried to generalize it, prominent concepts being *rationalizability* and *correlated equilibria.*

Behavioral game theory, a development of the past two decades, tests simple models in the laboratory. Other research has focused on certain elements from the beliefs-goals-strategies triad: *Interactive epistemology,* for example, studies knowledge about other parties' knowledge, and *the theory of games in coalitional form* considers only the values of the coalitions players can join and not the moves they might make to get into them. *Evolutionary game theory* drops the element of strategic thinking in favor of imitation or heredity, so that a certain rule that does well in one generation of players will be used more often next time.

A prominent application in political science studies the growth of trust and reputation in social institutions. *Repeated games,* where the same elementary game is played over and over, have a major role. Also fundamental are *signaling games,* in which an informed player makes a move from which another player draws information as a basis for action.

GAME THEORY IN APPLICATION

Game theory has been applied to nuclear weapons strategy, and some scholars have claimed that it set American policy during the 1950s or guided specific decisions. In fact, the nonformal strategy came first and the games later. The theory's real contribution has been generic knowledge about strategic issues, such as how to make a threat credible, when past resolved behavior provides a reputation that deters future challenges, how to reduce the mutual temptation to launch a preemptive attack in a crisis, whether building weapons sometimes signals resolve rather than increases military strength, what role emotions or lack of control plays in deterrence, and how states should deal with the security dilemma, where weapons built for defensive purposes also add offensive capability and

spark building by the adversary. Other research has studied the advantage of democracies in crisis bargaining, the regularity that democracies seldom get into war with each other, the greater difficulty of negotiating an end to a civil war compared with an international one, reciprocity in trade agreements, the effectiveness of economic sanctions, the design of international treaties, the role of honor and face in international affairs, and strategic aspects of terrorist recruiting.

In the analysis of governance systems, strategic questions arise from four viewpoints: that of founders who set up a constitution to achieve stability and fairness; that of candidates trying to get elected; that of voters who vote strategically rather than simply choosing their favorite; and that of legislators who assemble allies and construct clever motions. An early paper from a founder's perspective was Lloyd Shapley and Martin Shubik's 1954 proposal on measuring the power of a committee member based solely on the voting rules. Later examples have asked whether any voting methods exist that motivate voters to act sincerely rather than strategically, that is, to choose their most preferred candidate rather than consider, for example, "electability." (The answer is that the only such methods are bizarre and undesirable.) A literature has developed on how the median voter theorem holds up with strategic voters under various voting systems.

Gandhism

Gandhism may be defined as the ideology of Mohandas K. Gandhi (1869–1948). "Mahatma," or "Great Soul," was an honorific title bestowed on him by Rabindranath Tagore (1861–1941). It is significant that Tagore, a renowned Nobel Prize–winning poet of India, could hold Gandhi in such high esteem while also serving as Gandhi's most eloquent critic. Their extensive dialogue, public and private, signifies a stellar ability for expressing profound differences with utmost civility.

The voluminous writings by leading advocates of Indian independence reveal this civility. It consistently marked the divergent ideologies of the nationalist movement from 1885, when the Indian National Congress was founded, until liberation from British imperial rule came in 1947. An initial feature of Gandhism that deserves emphasis is how its spirit of tolerance nurtured such civility in the midst of vigorous debate about fundamental moral and political issues. This flowed steadily from 1919, when Gandhi assumed leadership of the

Indian Congress, until January 30, 1948, when he was assassinated by a Hindu fanatic, Nathuram Godse, who contended that Gandhi had betrayed Hinduism through his tolerance of Muslims and Islam.

TENETS OF GANDHISM: TRUTH AND NONVIOLENCE

The attitude of tolerance in Gandhism was consistent with Gandhi's idea of truth (*satya* in both classical Sanskrit and modern Hindi). This concept featured so prominently in his ideology that he titled his autobiography *The Story of My Experiments with Truth*. Consistently repudiating the connotations of "Mahatma," he characterized himself as "a humble but very earnest seeker after truth," as one who "often erred in my estimates and judgments" without "infallible guidance or inspiration." Indeed, he insisted that any "claim to infallibility would always be a most dangerous one to make."

However, Gandhi did claim to have found the way to truth. This path was the way of nonviolence (*ahimsa)*. The concepts of *satya* and *ahimsa* are so entwined in his ideology that he asserted his (fallible) belief that, as stated in his autobiography, "There is only one fundamental truth which is Truth itself, otherwise known as Nonviolence. Finite human beings shall never know in its fullness Truth and Love which is in itself infinite. But we do know enough for our guidance." Mistakes

will inevitably occur as we pursue truth. This is the connection to tolerance, because any leadership, movement, or government must respect the dignity of the individual, which "necessarily includes the power as much to commit errors as to set them right as often as they are made."

The most dire and dangerous error is the commission of violence. Gandhi called his theory and practice of nonviolence *satyagraha,* translated as the "force" of truth applied in a spirit of love. His pacifism is sometimes interpreted as qualified, because he sanctioned violence in exceptional cases of self-defense. The overwhelming spirit of his ideology, however, is expressed in clear pacifist statements like this one from his autobiography, made in direct refutation of Bolshevism and terrorism: "I do not believe in short-violent-cuts to success. I am an uncompromising opponent of violent methods even to serve the noblest of causes. There is, therefore, really no meeting ground between the school of violence and myself."

His reference here to "the school of violence" is particularly noteworthy, because it serves as a reminder that in the history of terrorist movements, India ranked high throughout the twentieth century. Gandhi frequently referred to being surrounded by two forces of violence: the oppression of the Raj or British government on the one hand, and, on the other, a well-organized group of Indian terrorists who possessed charismatic leadership and a sophisticated nationalist ideology.

SUCCESS AND FAILURE IN GANDHI'S LIFETIME

In March 1930 Gandhi announced a plan of action that would become India's and the world's most famous mass civil disobedience campaign: a dramatic resistance to the salt tax by marching to the western seacoast and collecting natural salt in a symbolic protest against the government's monopoly on its manufacture. He informed the British viceroy ten days before he started his march that his sole purpose was to set in motion the force of pure nonviolence. The so-called salt *satyagraha* did demonstrate the power of nonviolence by mobilizing millions of Indians against unjust laws and thus giving collective expression to the idea of a "duty to disobey" that Gandhi had derived in large part from the thought of American essayist and practical philosopher Henry David Thoreau. By the end of the year, hundreds of thousands of resisters had been arrested, following Gandhi through the prison gates in the cause of *swaraj* (national liberation).

Gandhi's movement to independence, however, eventually crashed in civil war and the partition of the subcontinent into two nations, India and Pakistan. Neither Gandhi's long tenure of charismatic leadership nor the ideology that he conceived and applied could prevent the horrendous civilian violence that engulfed northern India from 1946 to 1948, during which hundreds of thousands of Hindus, Muslims, and Sikhs were massacred. It was this terrible slaughter, unleashed even after Gandhi's scrupulous schooling of his country in the requirements of *satyagraha,* that led him to proclaim on August 15, 1947, as India celebrated its independence, that both he and his methods had failed. He was assassinated four and one-half months later.

GANDHI'S LEGACY

Gandhi and his legacy have gathered admirers worldwide. Writing on Gandhi's philosophy, American psychologist Howard Gardner commends his creativity among geniuses of the twentieth century, calling Gandhi a thinker of the highest order. Soon after Gandhi's death, American physicist Albert Einstein urged international emulation of his thought and practice. Pacifists like American civil rights activist Martin Luther King Jr., the Dalai Lama of Tibet, and Myanmar leader Aung San Suu Kyi expressed similar thoughts as they strove to pursue his model.

Gandhi's life and ideas resound in many arenas and in varied formats, from opera to environmentalism. When American composer Philip Glass discussed the thought behind his unique opera, *Satyagraha,* he commended Gandhi's relevance to the cause of saving the earth's resources. In a 2008 interview with the *New York Times,* Glass asserted that the environment and nonviolence made a perfect match, stating that if humans followed Gandhi's principles, the earth would not be plagued with so many problems.

Garbage Can Model of the Policy Process

The garbage can model was developed by Michael Cohen, James March, and Johan Olsen in 1972 to explain the decision-making process of "organized anarchies," such as universities. Organized anarchies are characterized by problematic preferences, unclear technology, and fluid participation. Participants involved in decision making often do not clearly define their preferences and may not have strong preferences on the issues under consideration. In addition, participants are often unclear about how the overall organization's processes work. They may understand their own functions well but usually do not grasp how their own responsibilities fit in with the larger organization. Instead of basing decisions on a comprehensive understanding of the organization's processes and functions, decisions are based on a trial-and-error approach and anecdotal evidence. Finally, participation in these choice processes is relatively unstable. Participants can enter and exit the decision-making process freely, and

variations in contributions stem from time and resource constraints rather than from features of the decision under consideration.

These characteristics of organized anarchies make a rational-comprehensive approach to decision making extremely difficult, if not impossible. Under a rational-comprehensive approach, problems and preferences are clearly defined, all alternative solutions are systematically evaluated, and decisions are made based on which alternative will best achieve the defined objectives and preferences. As described, organized anarchies are unable to utilize this approach. Instead, they operate as a "collection of choices looking for problems, issues and feelings looking for decision situations in which they might be aired, solutions looking for issues to which they might be the answer, and decision makers looking for work" (Cohen, March, and Olsen 1972, 2). Outcomes in these circumstances depend on the mix of problems, solutions, and participants that pertain to a certain choice opportunity (i.e., the content of the garbage can). Thus, context and timing are crucial factors in determining choice outcomes.

Although the garbage can model was developed in reference to universities, it has also been used to explain the governmental policy process. Perhaps the most well-known application of the model is John Kingdon's 1984 multiple streams model of governmental agenda setting. In this variant, the organization is more structured than an organized anarchy, but the traits of problematic preferences, unclear technology, and fluid participation remain. Kingdon argues that three independent streams run through the governmental agenda process: a problem stream, a solution stream, and a political stream. The problem stream consists of various actors measuring and highlighting certain policy problems for the government to address. The solution (or policy) stream consists of the development of and advocacy for public policy proposals and reforms. The political stream consists of contextual factors that influence government officials and other political actors, like election outcomes, public opinion shifts, and interest group pressure. Like participants in the garbage can model, participants in the multiple streams model are highly fluid and include politicians, academics, interest groups, and policy entrepreneurs. The governmental agenda responds to these streams when a "policy window" opens, providing an opportunity for a particular problem and/or solution to move to the top of the governmental agenda. In this model, policy entrepreneurs play a critical role, actively seeking to join the streams, matching policy proposals to problems and political opportunities. As with the garbage can model, governmental agendas are better understood as the outcome of timing and context rather than of a rational-comprehensive approach to decision making.

Garvey, Marcus M.

Marcus Garvey's (1887–1940) goal of black unity, pride, and self-determination made him a preeminent black nationalist leader in the early twentieth century. His philosophy echoed in the pan-African movements and anticolonial struggles of the mid-twentieth century and in the black power movement of the 1960s. His call for self-respect and pride can be heard in the lyrics of James Brown ("Say it loud, I'm black and I'm proud!") and reggae artists such as Bob Marley and Steel Pulse. His emphasis on a glorious African history that black people must reclaim lives on in the reparations movement, the Afrocentrism movement, and other cultural movements.

Garvey was born in the British colony of Jamaica in 1887. He left school at age fourteen, apprenticed as a printer, and edited several newspapers in various Central American countries before traveling to London, where he sharpened his oratorical skills and his interest in African history. He returned to Jamaica in 1914 and founded the Universal Negro Improvement Association (UNIA) under the banner of "One God, One Aim, One Destiny!" but garnered little support. In 1916, he moved to the United States and established the UNIA headquarters in Harlem.

Garvey claimed the UNIA had six million members at its peak, and critics concede that it had at least 500,000 members spread across more than 700 branches in thirty-eight states. His newspaper, *Negro World,* reached a circulation of about 50,000 in the mid-1920s. In contrast to the National Association for the Advancement of Colored People (NAACP), Garvey and the UNIA had greater appeal to the black masses, earning Garvey the label "Black Moses."

Garvey was critical of the NAACP for its middle-class and interracial leadership as well as its tactics of lobbying and litigation that did not adequately address the economic and cultural degradation of the majority of black people in the United States. While W. E. B. DuBois and other NAACP leaders viewed Garvey as an unrealistic and dangerous self-promoter, Garvey rejected their goal of equality and racial integration in the United States as a naive illusion.

Garvey's nationalism had economic and cultural dimensions. Economically, he was influenced by Booker T. Washington's strategy of self-help and racial uplift through education, skills, and businesses. Culturally, Garvey counteracted the mindset of subservience and self-degradation by drawing on a glorious African history to inspire self-respect, pride, and black unity with slogans such as "Africa for Africans" and "Up! You mighty race, you can accomplish what you will."

Garvey's grandest goal was the emigration of black people back to Africa, where he sought to create independent states that would ensure self-determination for African descendants throughout the diaspora and provide a basis from which black people could act as equals on the world stage. To carry this

out, he established the Black Star Line Steamship Company, which purchased ships by selling stock to UNIA members. This venture was a financial disaster, and in 1922 the U.S. government charged Garvey with mail fraud. Though guilty only of mismanagement, he was tried, convicted, and jailed in 1925. President Coolidge commuted Garvey's sentence in 1927, and he was deported to Jamaica. He died in relative poverty and obscurity in London in 1940, having never set foot in Africa.

Gatekeeping

Gatekeeping is a practice used by legislative bodies to allow only selected measures to be debated or voted upon. Gatekeeping is alternatively known as exclusive proposal power and jurisdictional dominance. It may take several procedural forms, including action by legislative committees to obstruct or delay measures, or actions by legislative leaders to prevent votes on bills. Gatekeeping can serve to force consensus on issues, but it can also serve to obstruct popular legislation. Systems in which gatekeeping occurs have strong institutional power vested in legislative leaders such as the speaker or committee chairs.

Gatekeeping is typically undertaken to prevent debate or votes on a measure that is opposed by committee chairs or members, who believe that the measure would otherwise be enacted by the full legislature. The practice may also be utilized to avoid debate on a contentious matter that could embarrass or undermine the majority party or grouping. Consequently, scholars have asserted that the most significant power of a legislative committee is the ability to say "no" or prevent action on a measure.

Gatekeeping can also occur at the supranational level. For instance, the European Commission has a gatekeeping function within the European Union and can prevent certain legislative acts.

Gellner, Ernest

Ernest A. Gellner (1925–1995) was an influential philosopher, historian, and social anthropologist who made major contributions to the study of Islam, nationalism, and modernity. He was a stalwart champion of critical rationalism and open systems of thought, defending them from, among others, Marxists, relativists, psychoanalysts, and dogmatic advocates of the free market.

Gellner was born in Paris but grew up in Prague. His Jewish family decided to move to Great Britain in 1939. At the end of World War II (1939–1945) he enlisted in the Czech Army, but after the war, foreseeing the communist takeover in Czechoslovakia, he returned to Britain to finish his studies, first at Oxford and then at London School of Economics (LSE), from which he received a PhD in 1961. A year later, thanks in large measure to the critical acclaim of his first book, *Words and Things* (1959), which attacked linguistic idealism and contained a foreword by Bertrand Russell, he became professor of philosophy, logic, and scientific method at LSE.

Gellner would maintain his post at LSE until 1984, when he left to become professor of social anthropology at Cambridge. In 1993, he returned to Prague as the research director for the Center for the Study of Nationalism at Central European University, where he would work until his death.

Throughout his career, Gellner published path-breaking books, earning a reputation as one of the most original and versatile scholars in the world and having command of numerous languages. *Thought and Change* (1964) was a penetrating analysis of modernity and theories of social change. *Saints of the Atlas* (1969) was an ethnographic study of Moroccan tribal people. *Muslim Society* (1981) was an influential tract in Islamic studies. *Nations and Nationalism* (1983) became a classic work in the burgeoning field of nationalism and ethnic studies and

is perhaps his more enduring study. In it, Gellner argues that nationalism arises as a product of modernity. Nations, in Gellner's terms, "'have navels,'" meaning they are born; they are not something eternal, as many nationalist partisans might argue. His *Plough, Sword, and Book* (1988) similarly emphasized the unique features of modern life, and, although his stages of history have similarities with those of Marxism, he steadfastly rejected many Marxist assumptions and stood against communism. Last, after the end of the cold war brought the possibility of democracy to Eastern Europe, he became a scholar and advocate for civil society, publishing *Conditions of Liberty: Civil Society and Its Rivals* (1994), which tried to explain the collapse of communism while also arguing against putting all one's faith in free-market ideology.

Gellner is hard to classify on ideological grounds, as he engaged in heated intellectual debates with those on the right and on the left. He made many enemies in the academy, at times seeing himself as the head of a one-man crusade against critics of rationalism and liberalism. One colleague, David Glass, remarked "that he wasn't sure whether the next revolution would come from the right or from the left; but he was quite sure that, wherever it came from, the first person to be shot would be Ernest Gellner" (Davis 1995).

Gender and Globalization

Gender refers to a set of qualities and behaviors expected from a female or male person by society. Gender roles are nurtured or learned, are socially determined, and can evolve over time. In contrast, an individual's sex has traditionally been thought not to change, being based in biology and "hard" science. Scholars in more recent years, however, have suggested that sex may be as socially constructed as gender. Feminine and masculine norms and ascribed behaviors vary widely across the globe, within and among cultures, and across time. More recently, the trends of globalization have affected gender. The term *globalization* here is used to mean the acceleration or intensification of economic, political, social, and cultural relations across state borders. Mainstream scholars often analyze globalism by using neoliberal concepts such

as free trade, deregulation, and privatization. However, these lenses tend to ignore the way that experiences of men vary with those of women. There has been a recent shift to recognize gender-differentiated vantage points and experiences due to globalization.

While neoliberalism scholarship emphasizes that globalization has improved the lives of some, recent feminist scholarship suggests that such gains can be differentiated by gender. Despite increased access to information, technology, goods, and services for many people, both women and men have suffered under political and economic globalization. The poorest and most marginalized people in the world are suffering more than they are benefiting under globalization, and women constitute a majority of this population. In areas such as conflict and security, economic access and poverty, health care, human rights, and political power, there is a gendered difference in the impacts of globalization.

Neoliberals emphasize that globalization has helped foster the spread of formal democracy. Feminist scholars have shown that this has not, however, directly translated into increased political equality and influence for women. Women have less numerical and substantive representation in formal political channels than do men. Legal standards established by constitutional provisions or statutes—such as electoral gender quotas or the international Convention on the Elimination of All Forms of Discrimination against Women (CEDAW), adopted internationally in 1979 and stemming from international work on human rights dating back to the 1960s—are important but have fallen short in leveling the political playing field for women.

The gendered gap between rich and poor is increasing due to certain features of globalization both across and within the global North and South. Women in the North are losing jobs as a result of outsourcing of jobs to the South. The dismantling of the welfare state in much of the South is a large burden on people—mostly women—who have lost health services, educational access, child care, and agricultural and economic supplements. Aid to Southern countries typically benefits men, providing extension training, agricultural inputs, and market access to male farmers. The informal economy, in which most women in the developing world work and from which they gain the means for the survival of themselves, their children, and their communities, is usually overlooked by formal economic assistance.

Active, armed conflicts under globalization have shifted in type (internal vs. international) and frequency (more regular), and this has had an unequally adverse effect on women. Reasons for the change in types and prevalence of violent conflict include the spread of arms, global climate change, and interactions of people in competition for scarce resources. Women bear a disproportionate share of the burden of this insecurity. An increasing number of conflict casualties (death, wounded, or displaced) are civilian rather than combatants, including women and those for whom they have charge: children, the sick, and the elderly. Women also suffer when tax revenues are shifted to military spending from social programs

on which they and their children depend. Militarism pollutes the environment, hurting the crops on which women depend to provide for their families and increasing health concerns to which women must attend. Finally, insecurity and violence in the public arena encourage active and passive violence against women in private. Women are increasing victims of wartime rapes and domestic violence correlating with global insecurity.

Far from being passive, women have redefined the aims and indicators of globalization and development through work under such initiatives as the United Nations "Decade for Women" (1976–1985) and global women's movements, such as women fighting for their own and their country's liberation in Chile, women fighting for the equal rights of all citizens in Australia, or women struggling against oppressive social norms and public policies that perpetuate gender oppression in the context of problematic caste and class issues in India. Although there have been significant gains in political, cultural, and economic benefits to women under globalization, on the whole, globalization has been detrimental to women.

Gender and Politics

The study of gender and politics in political science rests on an initial body of research that established women as a politically relevant group for political scientific analysis and sex as a political variable. A small number of early influential studies of women and politics can be identified, the best known of which is Maurice Duverger's *The Political Role of Women* (1955), a work commissioned in part in response to transnational feminist demands for empirical research on women's political and economic status. By the mid-1900s, developments such as quantitative databases based on large, nationally representative samples, the apparent ease of identifying the sex of survey respondents, and computer-facilitated quantitative analysis allowed for the generation of research on sex-related differences in mass political behavior and preferences. By the 1970s this research, increasingly informed by developments in feminist political thought and by feminist movement mobilization in North America and Western Europe, provided the foundation for moving from research on women and politics to a gendered analysis of politics. Although gender and sex are related concepts in political science research, their relationship continues to be debated among political theorists and empirical scholars in the discipline.

DEFINING SEX

It is worth noting that, for many decades, political science engaged primarily in single-sex research, in which sex was not a variable but a constant. Male political elites, male elected officials, and men as citizens and voters were the central focus of political science research and theory and, in some cases, the exclusive concern of the discipline. The development of a disciplinary subfield of women and politics research shifted the treatment of sex as a constant to sex as a variable; feminist theorizing made women visible in political theory.

In political science, as early as 1974, with Wilma Rule Krauss's article "Political Implications of Gender Roles," "gender" emerged as a variable distinct from "sex," with sex treated as "a biological fact" and gender expressed through "gender identity." The variable "sex" was based on state-assigned sex classification, generally at birth, as male or female. The variable of "gender roles," related to but distinct from "sex," was understood as sets of traits and behaviors considered to be "feminine" or "masculine." Sex as a dichotomous variable, operationalized as "male" and "female," was found to have limited analytical utility, however. Sex-based political research on women has served more to correct and to modify previous research concerning sex-related differences than it has to develop complex models of the political meanings of sex; nonetheless, it has provided the foundation upon which a gendered analysis of politics is being constructed. The distinction of sex and gender, as separate variables, has clarified, empirically, the socially constructed features of masculinity, femininity, sexualities, and structural meanings of gender, distinct from biological assumptions about sex and sex difference. As political scientists asked questions that could not be answered by employing sex as a political variable—for example, do party nomination rules structure internal party competition to advantage male rather than female candidates? Why do numbers of elected women increase in the aftermath of war?—they began to turn to gender as a concept for purposes of political analysis; they also turned to, and relied heavily on, gendered research in anthropology, history, labor studies, psychology, sociology, women's studies, and sexuality studies as well as on theoretically related work being developed in regard to race and research on the intersections of race, class, and gender.
A poster for women's suffrage calls for political equality for women, pointing to other areas in society in which women already participate. The role of gender in politics came to the fore in the mid-twentieth century.

DEFINING GENDER

Gender as a concept in political research is conventionally understood as sets of socially constructed meanings of masculinities and femininities derived from context-specific identifications of sex, that is, male and female, men and women. These meanings emerge from stereotypes about male and female behavior, from "characteristics people tend to associate with women and men, femaleness and maleness" (as Beth Reingold writes in her 2000 book *Representing Women,* p. 47), from normative assumptions about appropriate behaviors of men and women, and from social structures of power. As Nancy Burns noted in "Gender: Public Opinion and Political Action" (2002, p. 463–464), "Gender is a repertoire of mechanisms that provide social interpretations of sex, that enable sex to structure people's lives. Gender is a set of ways in which people and institutions make sex matter. Gender is a principle of social organization. Gender is a hierarchy." Gender represents both the outcomes and processes of human actors and institutions in developing meanings about a range of femininities and masculinities that are not "natural" but are identifiable social and political constructions. As Iris Marion Young concluded in her essay "Modernity, Emancipatory Values, and Power," "Gender is . . . a set of ideational and social structural relationships that people move through, rather than attributes they have attached to their persons" (p. 493).

Gender and the political are mutually constitutive, and hence a central question for scholars of women, gender, and politics is how gender and politics interact to construct hierarchies of political power. Gender produces and transforms political inequalities, privileging most men in relationship to most women but also privileging some women in regard to other women and to some men. At the same time, political institutions, laws, and political practices construct gender, identifying appropriate political actors as primarily (or exclusively) male, establishing masculine behaviors as normative and fitting political institutions to a model of the male actor. As Lisa Baldez writes in her 2007 work "Intersectionality," because "gender never . . . operates independently of other aspects of political life, . . . it is misleading to think of gender as an autonomous category of analysis" (p. 229).

Gender has multiple meanings that rely on context and that change across time. No universal content emerges from "sex" that gives single and universal meaning to gender; the identification of a person as male or female does not automatically indicate that person's political behavior, political preferences, or location in political hierarchies of power. As Laurel Weldon notes in her 2006 article on "The Structure of Intersectionality," "Gender norms and practices vary across groups of women and men as well as across nations, regions, generations, and cultural groups" (p. 238), and across age, race, and time. These norms and practices also have "multiple logics"; that is, their development, workings, and functions differ according to context. The political implications of gender, as a result, were different for white working-class women in the United

States in 1942 than they were for black women in the south-ern United States in 1962 or for northern Italian upper-class women in 1982 or for Hutu Rwandan women in 2002. In these examples, all individuals are "women," but the gendered political meanings and power for these groups of women differ substantially. How gender works for these women, and for other women and for men, cannot be assumed on the basis of sex. The extent to which women and men are differently politically empowered is a matter for empirical research and political theorizing.

Gendered meanings and structures, such as "welfare recipi-ent," "labor movement," "suicide bomber," and "Parent-Teacher Association," intersect with and mutually constitute those of, for example, race, class, and caste. It is not yet clear, however, how they do so. Intersections of gender with race, class, and other politically relevant categories have yet to be fully theorized and developed for empirical analysis. As Ange-Marie Hancock observes in the 2007 article "Intersectionality as a Normative and Empirical Paradigm," relationships among intersectional categories remain "an open empirical ques-tion" (p. 251), for the location of such intersections and for the identification of how such intersections function politi-cally in gendered terms. An appreciation of gender as multiple and intersectional responds to the theoretical and empiri-cal research undertaken in race studies and gender studies, although, according to Hancock, "a comprehensive intellec-tual history of intersectionality research" has yet to be pub-lished (p. 249), and its impact on gendered political research remains to be assessed.

GENDER IN POLITICAL RESEARCH

How does gender as a concept function in political science research? Gender, unlike sex, can serve as both an independent and a dependent variable. Gender and the political are recipro-cal in nature; in political science, scholars examine "the partic-ular and contextually specific ways in which politics constructs gender and gender constructs politics," as Joan Scott writes in her 1986 article "Gender: A Useful Category of Historical Analysis" (p. 1070). Insofar as gender is constructed by state and society—for example, who counts as a citizen, the exten-sion of nationality to spouses of men but not of women, the extension of rights to men but not women, policies protecting workers in male-dominated workforce that do not encompass work primarily undertaken by women—gender functions as an effect or outcome of human agency and politics. Because gender also serves to construct political choices and outcomes, it can function as a determinant of such phenomena. As Helen Irving writes in *Gender and the Constitution* (2008), "Formal equality can produce unequal results; where similar treatment is offered to persons who are not similarly situated, further disadvantage for the disadvantaged can be the outcome" (p. 2). Furthermore, gender can function both as a categorical con-cept and as a dynamic process concept for political research.

Employing gender as a category involves the "multidimen-sional mapping of socially constructed, fluid, politically relevant identities, values, conventions, and practices conceived of as masculine and/or feminine, with the recognition that mascu-linity and femininity correspond only fleetingly and roughly to 'male' and 'female,'" as Karen Beckwith writes in her 2005 article "A Common Language of Gender?" (p. 131). Gender as a category variable has utility in its classification of "feminine and masculine behaviors, actions, attitudes and preferences" and its impact on "particular outcomes, such as military interven-tion, social movement success, and electoral choice, among others" (p. 131). Recent research on gendered campaign strate-gies of women and men running for office, on gendered media behaviors of male and female candidates, and on gendered interactions among women and men in national parliaments are examples of the utility of gender as a category variable. For example, Dianne Bystrom and her coauthors, in *Gender and Candidate Communication* (2004), found that women running for elective office in the United States developed specifically gendered campaign styles designed to transcend—or to take advantage of—stereotypes about female candidates and women in politics. Kathleen Dolan, in her 2004 *Voting for Women,* found that voters held gendered assumptions about policy issues, about women's and men's likelihood of promoting some issues rather than others, and about ideology; in her 2008 review of the scholarship on female candidates in the United States, she found that "women candidates of both parties [are] seen as more liberal than their male counterparts but also they are per-ceived as more liberal than they actually are" (p. 116).

Mary Hawkesworth, in her 2003 article "Congressional Enactments of Race-Gender," for the U.S. Congress, and Joni Lovenduski, in her 2005 book *Feminizing Politics,* for the Brit-ish House of Commons, found structures and practices in each institution that shaped differences in access to power and influence between men and women in these national legisla-tures. Examples include differences in treatment by colleagues, where, as Hawkesworth found (pp. 538–539), female legisla-tors were explicitly excluded from Congressional committee press conferences and remained unrecognized for speaking by their male colleagues, and where female members of Con-gress employed techniques akin to "groveling" to influence their male peers, "[indicating] a power dynamic that Con-gresswomen of color must take into account in devising their legislative strategies" (p. 538). These indicate the ways in which gender can be identified and employed as a category variable for political analysis.

In contrast, gender as a process concept functions to iden-tify "the differential effects of apparently gender-neutral struc-tures and policies upon women and men, and upon masculine and/or feminine actors," as Beckwith observes (2005, 132), as well as the behaviors of individual women and men to shape structures and policies to a specifically gendered outcome. Examples of such research include studies of the gendered impact of electoral rules, nomination procedures, and policy-making and other decision-making processes, where structures, procedures, and practices produce outcomes that advantage some men and disadvantage some men. Lovenduski describes "a deeply embedded culture of masculinity that pervades politi-cal institutions in Britain . . . manifested in the agenda-setting,

formulation and implementation stages of the policy process" (2005, 48, 53), ranging from the adversarial debating style of parliamentary speeches to explicit, articulated sexism by members of Parliament (2005, 54–56). Other examples are the gendered outcomes of democratic transitions and other regime changes, of military interventions, of war and revolution, and of mass mobilizations such as strikes and protests, where the disruption of traditional gender roles, abolition of previous political institutions, dissolution of political party systems, and other major changes can create opportunities for women's political empowerment.

Gender as process is also evidenced, for example, in the strategic decisions and actions of women and men in constructing new political systems, drafting constitutions, negotiating party alliances, and organizing transnational social movement campaigns. Gender employed as a process variable moves beyond, for example, differentiating between foreign policy preferences of male and female elites to a focus on the ways in which institutional structures and practices shape the interactions, alliance formation, and discourses available to and influenced by male and female political elites in foreign policy decision making. Gender as a process variable also helps to reveal how states and institutions become gendered; that is, how states adopt and accommodate structures that create and confirm gendered political differences, such as an all-male military, girls' exclusion from state- or religious-based educational institutions, and workplace protections for industrial workers.

Joan Acker, in her 1992 article "From Sex Roles to Gendered Institutions," defines gendered institutions as those where "gender is present in the processes, practices, images and ideologies, and distributions of power in the various sectors of social life" and she recognizes that "the institutional structures of . . . societies are organized along lines of gender" (p. 567). Other state-focused gender research has turned to issues of gender in institutions and in political institutional development, how institutions structure gender and mobilize women, and how organized women actively work to restructure (and hence to regender) institutional structures. For example, Louise Chappell's book *Gendering Government* (2002) found, for Australia and Canada, that relatively similar feminist movements, facing different institutional arrangements, developed state-specific strategies to achieve their goals, strategies that included crafting changes within each state. As activist women responded to the political opportunities offered by state structures, they mobilized in ways that shifted each state in terms of gender, creating new avenues for women's influence. In Australia, with "high federal political capacity," effective women's policy agencies at the national level, and norms that accommodated advocacy of gender interests, organized women employed a strategy of internal, insider bureaucratic positioning and external lobbying vis-à-vis parliament (pp. 159–163, 173). In contrast, Canada offered different opportunities for advancing women's interests, primarily through constitutional measures, such as the Charter of Rights and Freedoms, which, as Alexandra Dobrowolsky shows in her 2003 chapter

"Shifting States," activist women helped to forge. Dobrowolsky found that activist women were particularly successful in developing new, women-friendly political institutions in Scotland with the opportunities afforded by the prospect of a Scottish Parliament (pp. 133–139).

Work of this type, analyzing the gendered nature of institutions, according to Acker, demonstrates the states' susceptibility to influence. Not only do states and other institutions express, practice, and shape gender; they are also responsive to the attempts by political actors to regender them; that is, to recast the terms and contexts of state and institutional arrangements, practices, and discourses in order to leverage political advantage and to increase strategic political opportunities and outcomes along gender lines.

Focusing on gender as a concept that functions independently and dependently, conceptualized as category and/or process, allows scholars, as Corrine McConnaughy writes in her 2007 article "Seeing Gender over the Short and Long Haul," to "[account for] the interaction of gendered identities and attitudes, social location, and political context" (p. 380). This permits us to treat gender as "a meta-concept, to construct meaningfully distinguished concepts within it, and then to model explicitly those concepts *and their interactions*" (p. 380; emphasis in original).

What gender as a concept does for political science is to provide an analytical strategy for the political and politicized relations of power between and among women and men that cannot be fully or clearly identified or analyzed by a reliance on sex as a variable. Research using gender and sex as variables still includes the counting of self-identified women and men, interpretation of regression analyses that include a sex variable (see Nancy Burns's 2005 article "Finding Gender"), and analyses of the presence of men and women in political institutions. Gender, however, has moved political research further toward the heart of disciplinary research, with foci on the social, activist, and legal constructions of empowered and/or disempowered women and men across intersectionalities of, for example, race, class, caste, sexuality, and nationality; on the imbrications of gender and power in institutions; and on the strategic employment of masculinities and femininities in constructing and gaining political power. Gender also makes clear the imposed, involuntary political differences and inequalities imposed upon (and often resisted by) women, revealing the gendered and racialized dichotomies of, for example, enfranchisement, access to office, legal status, and provision of government benefits.

CONCLUSIONS ABOUT GENDER IN POLITICAL SCIENCE

Although political science may not yet have a common language of gender, two common defining components are evident. First, *gender is socially constructed.* Despite some disputes concerning the relationship between sex and gender, or the utility of gender as a concept, scholars of women, gender, and politics concur that gender is a social construction of political import that marks neither natural nor essential qualities of individuals or institutions. As a result, gender can

be seen in—and is useful in analyzing—the construction of political institutions, the development of political practices, the crafting of new constitutions, and the resolution of wars and revolutions.

Second, *gender reveals power differences.* Scholars of gender and politics recognize that the effects of gender are not neutral. Gender constitutes a constructed set of differences among sexed persons in terms of relations of dominance and subordination that are systematic and structural, although the processes of their construction and their specific consequences are matters for empirical investigation. As Acker reminds us, gender signifies "the patterning of difference and domination through [socially and culturally constructed] distinctions between women and men that is integral to many societal processes" (1992, 565). Gender is worked to structure—or to undermine—power differences between and among women and men. As Scott concludes, "Gender is one of the recurrent references by which political power has been conceived, legitimated, and criticized" (1986, 1073).

A third defining component is emerging from research on gender and institutions (including the political economy): the recognition that a focus on gender, rather than sex, permits analysis of gender as structured in institutions, processes, and practices, independent from any specific human actors. As structures are developed through human agency, which individual human actors are at issue and how they are gendered become inscribed in the structures themselves. Such inscriptions have staying power and persist beyond the presence (and, often, lives) of the original actors. Institutions, processes, and practices developed primarily (or exclusively) by men are structured with identifiable masculinities which, developed in women's absence (or exclusion), persist in producing and replicating inequalities in political power. As Burns writes, where we "find gender" is not only in individuals, but in political and other institutions. Gender "is made and remade across . . . institutions in ways that build linkages across institutions. . . . Without taking simultaneous account of the host of institutions in which women and men operate, scholars are not likely to understand the causes and scope of disadvantage" (2005, 139).

For scholars undertaking gender and politics research, operationalizing gender as a category concept for empirical research continues to be problematic. Analyses of female and male political elites, and of women and men as, for example, voters, political activists, and members of the military and other state authorities, have had to continue to rely primarily on a dichotomized sex variable as a surrogate for the multidimensional variable of gender. As Reingold observes, employing the terminology of gender in such a context can result in

> evoking age-old sexual stereotypes: gender (the activities and values associated with women and men) gets affixed to sex (women and men in public office) as if it were an accurate and exhaustive descriptor of the actual behavior and attitudes of all such women and men. . . . Recognition of gender difference gets translated into expectations of dichotomous, stable and universal sex differences." (2000, 48–49)

Despite such risk, one strategy has been nonetheless to employ the terminology of "gender" rather than "sex" in such research, to signal a recognition of the nature of the social construction underlying the categories with which scholars are working and to disrupt any presumptions of the foundationality of sex for politics. A future project for gender and politics scholars will be the development of operationalizations of gender variables in contexts where sex currently must suffice.

Sex and gender continue to be linked conceptually and theoretically, even as they are conceptually distinct concepts. This is the case in part because political science still lacks a wide range of knowledge, especially comparative and longitudinal, about women's political behavior, political beliefs and attitudes, means of organizing, behavior in governmental office, experience in campaigning, response to power inequalities, and exclusion from political power—among other concerns. The subfield of women and politics research still requires this basic, investigatory, cumulative research. In this regard, our major concern with women and politics has not been precluded by, or surpassed by, a focus on gender. Fortunately, as Fiona Mackay reminds us in her 2004 article "Gender and Political Representation in the UK" (p. 114), feminist theoretical developments continue to inform and to hone gender as a political science concept, in order "to bridge the gap between sophisticated theorizing about gender and the operationalization of workable concepts for empirical research."

Gender Gap

The *gender gap* refers to a pattern of systematic differences in political attitudes, political behavior, and party affiliation between men and women. Theories of the origins of the gender gap have emphasized variation in the political socialization experiences of men and women that shape the political resources and perspectives of these groups.

From World War II (1939–1945) through the 1970s, a traditional gender gap—one in which women held more conservative political attitudes and were more likely to support center- or right-wing parties—appeared in most countries of the world. Societal differences between men and women, such as their longevity, labor force participation, and levels of religiosity, generally yielded these patterns.

However, beginning in the late 1970s, a new pattern emerged in the United States, in which women tended to hold more liberal positions on a variety of issues, such as the appropriate role of government, gender equality, and other issues that are particularly salient to women's experiences. The gender gap in voting—the difference in the proportion of women and men voting for any given candidate—has also been evident in the United States since 1980, with women being more likely to vote for and identify with the Democratic Party in comparison with their male counterparts. This modern gender gap has been the result, not of movement by women to more liberal attitudes and behavior, but of the increasingly conservative attitudes—and consequent voting behavior—of men.

Although it was first thought to be a reflection of American exceptionalism, the modern gender gap is now experienced in most advanced industrial societies, while preindustrial countries continue to demonstrate a traditional gender gap. Some scholars have suggested that the political socialization experiences of men and women in countries that have undergone the modernization process emphasize postmaterialist values, such as gender equality, feminist identity, and group consciousness. In agrarian societies, however, these values have not been incorporated into the socialization experience because of the lack of modernization. These patterns confirm that the modern gender gap is the result of differences in value orientation rather than differences in standard social and demographic characteristics between men and women.

In addition to being exhibited in differences in political attitudes and voting behavior, the gender gap is also apparent in levels of political activism and participation. Overall, women tend to be less politically active than men, particularly in agrarian societies. However, in the United States, women have voted at an increasingly higher rate than men since 1980, though they have not bridged the gap in other forms of conventional political participation—such as making campaign contributions, contacting governmental officials, or joining a political organization—nor have women reached the same level of representation in the federal legislature. In other postindustrial societies, women have gained increasing representation in their national legislatures; for example, women compose nearly 40 percent of the Norwegian Parliament. As these social trends continue in modern society, these patterns have caused some scholars to suggest that the gender gap in terms of political representation may weaken.

Gender Issues

Gender as a term has gained increasing usage in mainstream as well as academic discourse, often confused with *sex* and regularly thought to be a proxy for a focus on women. Sex, however, refers to biology and anatomy. Gender, by contrast, is a term explicitly meant to focus on both sexes and how they interact. Maleness and femaleness, in the sexual sense, are determined by biological and anatomical traits, including the presence of external and internal sex organs and secondary sexual development at puberty. Gender, on the other hand, refers to a set of qualities and behaviors expected from a female or male by society. Gender roles are nurtured or learned formally and informally, varying widely within and among cultures. The roles and expectations due to gender emerge in such areas as the economic, political, and sociocultural arenas. Lack of a gendered perspective on these issues thus misses truth.

PREVALENT DISCOURSE DISPROPORTIONATELY "MASCULINE"

The views and experiences that often find fullest expression in public and private discourse and action are male or fit culturally ascribed ideas of masculinity. Men have wielded public-sphere power, defined the agenda and content of national and global discourse, and created the world in which we live based on their own lived experiences. Thus, many of the policies and assumptions that guide our understanding of the lives of all human beings ignore the varied reality that women face. A focus on gender issues highlights the need to concentrate on women's realities to truly understand political, economic, social, and cultural realities.

Understanding the truth behind such pressing issues across the globe as unequal economic opportunities, the persistence of poverty, differing political voices, or measures for dealing with the growing HIV/AIDS pandemic requires recognition of the divergent and complementary experiences faced by men and women. Furthermore, data show that not only is truth gendered, but women's experiences are different from and disadvantaged in relation to those of men. The existence of gender differences in certain arenas often has adverse consequences on society's social, political, physical, and economic well-being, as well as on women's lives, families, socioeconomic status, and health. To combat this oppression of women, the areas in which their gender matters must be addressed.

ROLE OF GENDER IN ECONOMIC AND POLITICAL POWER

Examples of gendered issues abound, but there are certain areas that warrant particular mention. First, in the economic arena, including employment opportunities, labor requirements, and household provision, there is a root issue globally to which studies of gender turn: public versus private space. This dichotomy also affects a second area that requires gendered attention, and that is the political arena. Women's economic and political power is circumscribed relative to that of men due to the continued effects of the dichotomy of public-private space, separating men's productive and political/public arena activities from women's reproductive and personal/household activities. Cultural expectations, including those espoused by religions, reinforce the idea of man as the public earner and politically appropriate leader and woman as the opposite—a supplementary earner and politically inappropriate leader.

The recognition of economic gender differences is traceable to Esther Boserup, a Danish female economist. In the 1960s, Boserup studied reasons for the failure of international development efforts to have the anticipated positive results in developing regions. She noticed that women were central to economic life, especially in the subsistence agricultural sector, and that male decision makers in international development had created and implemented programs aimed at increasing the productivity of the male worker. Thus, development activities further disrupted gendered divisions of labor to women's detriment, as had colonialism and modernization policies.

Men were given access to money and resources to improve their cash-crop–focused economic activities. Women's agricultural work lost land and productivity. Women's work was, however, vital, because it included growing food to sell for supplementary income and for consumption. The nutrition and economic needs of women and communities were being undercut relative to the cash-crop farming of men. Women slipped further into poverty, and their workload within the home and in the labor economy increased.

Differences between men and women in the economic arena, with spillover effects in the domestic realm, continue today and exist in both developed and developing regions. Women continue to be undervalued and underpaid relative to men and bear the brunt of domestic work despite their employment status.

ROLE OF GENDER IN DIRECT AND STRUCTURAL VIOLENCE

Moreover, with an increasing prevalence and shifting nature of conflict around the world, it is imperative that the varied experiences of men and women in conflict situations receive attention. Women both participate in and bear the brunt of the effects of conflict. In the discipline of political science, conflict and security are viewed through the lens of direct violence, thereby overlooking the role of structural violence and insecurities generated by structural inequalities. Women have suffered under each of these types of violence. A gendered view of violence gives a more complete picture of the causes and consequences surrounding conflict and security by bringing the role of passive violence, which exists through structural violence, into the research and conversation. Women bear the brunt of the negative effects of conflict. Some factors of a gendered perspective include women's role in the care for those who are wounded and for the communities that are left ravaged by warfare, and, increasingly, women as the victims of rape and other sexual violence by combatants. This leads to social exclusion, increased birthrates, and exposure to diseases such as HIV/AIDS.

It also accounts for the role that women play in all forms of conflict, not just as victims but as "warriors" in such struggles as those in colonial Africa against the imperial powers. A perspective on violence that accounts for gender differences, therefore, does not see women only as victims of conflict, and it also does not separate violence at the international, national, and family levels. Gender-sensitive viewpoints on conflict see these as interconnected realms within which violence must be addressed concurrently to move toward true security. In contrast, gender-blind or gender-oppressive worldviews perpetuate poverty and resource scarcity in ways that propagate conflict.

GENDER IN HEALTH CARE

Finally, the lack of women's rights extends to health care issues. The HIV/AIDS crisis exemplifies gender differences in the health and health care arenas. Women bear the onus of care giving for sick family and community members in both developed and developing countries. This adds to women's

already heavy domestic and economic loads. Women in developing countries, where HIV/AIDS rates are highest, often have little control over sexual or procreation decisions (such as frequency of intercourse or use of condoms), leading to increased health risks for women. Women also risk contracting HIV/AIDS due to economic necessity if they choose or are forced into prostitution to make a living. There is a gendered difference in how health crises play out, and one must take this difference into consideration to truly understand the politics of health care.

Gender Mainstreaming

Gender mainstreaming has become the most common label used by academics and practitioners to describe any institutional strategy employed to incorporate gender issues into institutional practices, culture, and outcomes. As a result of its varying and widespread usage, however, there is no consensus or clarity about what gender mainstreaming is, what its potential is, or indeed whether efforts to implement gender mainstreaming have been a success or failure to date. There is more agreement as to a definition of gender mainstreaming. Emile Hafner-Burton and Mark Pollack (2002) cite the definition of gender mainstreaming used by the Council of Europe as the "(re)organization, improvement, development and evaluation of policy processes so a gender equality perspective is incorporated in all policies at all levels and all stages by key actors normally involved in policy-making" (p. 342).

Although gender mainstreaming first came to prominence at the Beijing Women's Conference in 1995 when governments and other actors were exhorted to "promote an active and visible policy of mainstreaming a gender perspective in all policies and programmes," its origins lie in the shift from the liberal "women in development" policies to "gender and development" policies among academics and development practitioners in the 1980s. Gender mainstreaming was identified as a mechanism that could help to ensure that development policies became more relevant to women. A decade after the Beijing conference, it had been widely adopted by international, regional, and national institutions such as the European Union, World Bank, United Nations Development Programme, and Inter-American Development Bank.

Various explanations account for the apparent ease with which gender mainstreaming has been adopted by a range of organizations. For example, Emile Hafner-Burton and Mark Pollack (2002) and Jacqui True (2003) include favorable political opportunity structures, the strength of women's transnational networking, effective discursive framing, and the activities of gender policy entrepreneurs within institutions. However, there has been considerable debate among scholars such as Teresa Rees (1998) and Sylvia Walby (2005) about whether gender mainstreaming is integrationist, transformative, or agenda setting. Namely, does it simply introduce a gender perspective without challenging the existing policy paradigm and therefore can be promoted instrumentally on the basis that gender mainstreaming will enable other policy goals to be achieved more easily and efficiently? Or does gender mainstreaming result in more profound change—transforming and reorienting existing policy paradigms, prioritizing gender equality, and changing decision-making processes? Is it therefore a technocratic tool that makes claims to gender equality less radical, or an important feminist strategy that can make significant changes, or both simultaneously? Can gender mainstreaming be implemented by existing policy actors, or does it require more deliberative democratic processes? Or can it be implemented, as Walby, claims by a "velvet triangle" of academics, feminist bureaucrats, and organized women?

The overall assessment of gender mainstreaming's potential and success as a strategy therefore varies tremendously, depending on whether analysts have an integrationist or agenda-setting/transformative view of it. Skeptics, often arguing from a transformative perspective, claim that it has allowed the mainstream to tame claims to equality, whereas others (often integrationists) believe that the implementation of gender mainstreaming has achieved significant improvements. But, when one analyzes the impact of gender mainstreaming, it is important to recognize that formally adopting gender mainstreaming as a strategy is not the same as implementing it. Increasingly, it is acknowledged that it is necessary to evaluate what has happened in practice. In 2005 Caroline Moser provided a framework of three categories with which to evaluate gender mainstreaming: It can evaporate (when positive policy intentions are not followed through in practice), it can become invisible (when what happens on the ground is not captured by monitoring and evaluation procedures), and it can be resisted (essentially, when political opposition creates mechanisms that block gender mainstreaming). Her study of international organizations finds that although there has been significant rhetorical change—because much has been achieved in the initial stages of adopting the terminology and

creating the policies—the subsequent stages of implementation and evaluation have been more circumscribed, and the impact of gender mainstreaming is often less than had been anticipated. Different institutions and policy domains also vary considerably in the implementation and outcomes of their gender mainstreaming strategies. From the research that has been done to date, the different political opportunity structures, ways that issues are framed, and roles of actors inside and outside the institutions all affect whether gender mainstreaming is adopted and what happens to it in practice.

Gender Quotas

Gender quotas are a corrective measure used by political actors (e.g., political parties) to enhance representation of women in political and public institutions such as parliaments, councils, and parties. They require women or female candidates constitute a targeted minimum of the members of a publicly elected or appointed political body. Gender-neutral quotas establish a maximum percentage held by either gender.

Two kinds of quotas exist: legally binding quotas and voluntary party quotas. Legally binding quotas force all parties to nominate a specific percentage of women on their candidate lists as established by a constitution or legislated by electoral laws. There are two subcategories of legally binding quotas: reserved seats and legislative quotas. Reserved seats allocate to women a set percentage of seats in an assembly or council. Legislative quotas oblige parties to nominate a certain number of women on their slates for electoral office. The latter category, voluntary party quotas, is a quota provision that is regulated and enacted at the discretion of the parties. Parties set targets for the nomination of women on candidate slates and/or for offices within each party.

When supported by a variety of international and transnational actors such as the European Union and the African Union, quotas can be an effective way to address the underrepresentation of women. Quota provisions have helped to increase the number of female legislators in the past fifteen years from 11.5 percent of the national legislators in the mid-1990s to 16.9 percent in 2007. Out of the twenty countries with the most female deputies, 90 percent have some kind of quota clauses.

Reserved seats are applied in sixteen (mostly African and Asian) countries. In some of these countries, such as Kenya and Nepal, these provisions are minimal, reserving respectively 3 and 6 percent of the parliamentary seats to women. Other countries, including Rwanda, which has the highest percentage (48.8 percent) of female deputies globally, reserve up to 30 percent of their parliamentary seats for women.

Thirty-nine countries throughout the world have adopted legislative quotas. For some states, such as Armenia and Niger, the required numbers of women nominated are rather low and do not surpass 10 percent. Other countries, such as Brazil and Serbia, require parties to nominate thirty or more women on their candidate lists, but many parties in these states have not completely implemented the quota clauses, and women's representation in the national assemblies lags at less than 20 percent. However, in countries like Argentina, Belgium, and Costa Rica, women's representation has dramatically increased due to quota rules. For example, in Belgium, following a 33 percent quota provision, the number of female legislators more than doubled from 15 percent in 1995 to 35 percent in 2005. Generally, parties enact a quota rule if they risk sanctioning for noncompliance. If parties are not punished for not implementing the clause, they are typically lax in following these provisions.

Voluntary party quotas are the most frequently employed gender quotas. In total, 159 parties in sixty-eight countries have adopted this measure. Required percentages of women range from 20 to 50 percent and, depending on the party, are anywhere from minimally to completely implemented. The ruling party's enactment of quota clauses will directly affect the overall representation of women. For example, the African National Congress in South Africa completely executes its quota rule of 50 percent women and significantly enhances women's representation in the national assembly, which is at 33 percent. In most cases, party clauses have a direct impact on the number of female legislators of the party that has implemented the clause and an indirect influence on the nomination of women in other parties. The enactment of quota rules by one or more parties may pressure other parties to also include more women on their slates. In general, left and center-left parties are more inclined to adopt quotas than are conservative or center-right parties.

Quota rules are the subject of normative controversy. Supporters of quota provisions generally advocate that quotas benefit women as a group, promote equality of results, and establish gender as a category of political representation. This view sees quotas as a precondition for the effective implementation of mainstreaming strategies such as abortion rights, childcare provisions, or equal pay. Opponents contest quota rules on the grounds that these rules privilege groups over individuals, infringe on the opportunity for equality, and ignore more pressing social issues. Some research also questions the utility of quotas. According to this view, quota rules may limit or detract attention from gender-sensitive policy making and gender-differentiated policy outcomes, because women elected through quotas may either not pursue women-friendly policy change,

or they may be perceived as merely token representatives who have been put in place solely to fulfill a legislative policy.

General Agreement on Tariffs and Trade (GATT)

The General Agreement on Tariffs and Trade (GATT) emerged as a "temporary" intergovernmental organization in 1947. It served as a negotiating forum promoting multilateral trade liberalization. Despite its small secretariat and uncertain status, it promoted significant reductions in tariffs, but it was supplanted in 1995 by the World Trade Organization in response to persistent shortcomings.

Following World War II (1939–1945), the Bretton Woods framers of postwar economic arrangements hoped to create a formal international trade organization (ITO) that would liberalize trade, regulate investment flows and international commodity agreements, and promote development. When negotiation to form an ITO broke down, smaller talks among fifteen leading western trading nations (led by the United States) became the de facto forum for discussion of multilateral trade liberalization. The GATT sprung from these talks. While only twenty-three countries, or "contracting parties," signed the first round of GATT tariff reductions in 1948, through successive rounds, the treaty expanded to include over 110 countries in the 1990s.

While the GATT was based in Geneva, its principle preoccupation was negotiating tariff reductions through a series of multilateral trade "rounds." Often these rounds were hosted elsewhere, giving the name to each negotiating round (e.g., the last two rounds were the Tokyo and Uruguay rounds). Each round was guided by a set of GATT principles intended to ensure liberalization; these included the principle of reciprocity, the "most favored nation" provision (which required that members give the same market access to all members that they give to their most favored trading partner), and "national treatment" (which required that states not discriminate against foreign goods). Within these principles, each round focused on binding states to further reductions in existing trade barriers.

Early GATT rounds were undoubtedly successful at achieving tariff reductions. Over the forty-seven year period in which GATT was the key multilateral trade IGO, trade consistently grew at a faster rate than did the size of domestic economies, suggesting that GATT promoted deeper economic integration, which many associate with economic growth. Indeed, most states flocked to join GATT, given its successes.

Prior to the conclusion of the Uruguay Round, however, the GATT appeared increasingly incapable of dealing with the competing agendas of developing and developed countries on politically sensitive issues such as agricultural trade and the expansion of GATT coverage. As tariffs were successfully reduced, negotiators from developed states turned to the removal of more complex forms of trade protectionism. These "nontariff barriers" proved harder to eliminate, because they required deeper coordination of domestic public policies in areas that were politically more sensitive. Demands that the GATT should also include trade in services, investment, and intellectual property only further overstressed its informal structures. Both the Tokyo and Uruguay rounds focused on these types of "post-border paradigm" concerns, and both took much longer to complete than earlier rounds, drawing attention to the shortcomings of the GATT system. Perhaps most problematically, the GATT lacked an effective dispute settlement system, meaning GATT rules were often violated.

Given these problems, the most important outcome of the Uruguay Round was the agreement to supplant the GATT with the more-formally organized World Trade Organization (WTO). The GATT remains the key treaty within the WTO structure, but it has now been joined by treaties covering services, investment, and intellectual property—all under the supervision of the WTO, with its larger permanent secretariat and more effective dispute settlement system.

General Assembly, United Nations (UN)

The United Nations General Assembly (UNGA) is the plenary and main deliberative organ of the UN. In the UNGA

and its six main committees, all member states of the UN (i.e., today this means practically all states of the world) are represented. While the size of national delegations is variable, each state commands only one vote. In addition, some nonmember states, liberation movements, and international organizations participate in the work of the UNGA without the right to vote. The UNGA combines a quasi-parliamentary operation mode and a quasi-legislative output with the substance of an intergovernmental agency in which representatives bound by imperative mandate carry out the will of their governments ("parliamentary diplomacy"). Sessions of the UNGA usually start in mid-September, and the main workload is done by mid-December. From the period 1946 to 2007, the General Assembly conducted sixty-two regular (annual) sessions, twenty-eight special sessions, and ten emergency special sessions.

The UNGA controls the budget of the UN, reviews annual reports from other UN organs, including the Security Council, and elects the Security Council's members (apart from its permanent members). The UNGA has the right to discuss any matters within the scope of the UN Charter or relating to UN organs, and—except for matters under consideration by the Security Council—it may make recommendations to the member states of the UN and to the Security Council. Therefore, the UNGA is primarily a general discussion forum used by the governments of the world, with foreign ministers and heads of government frequently participating in the general debate.

UNGA resolutions with an outreach beyond the UN sphere are nonbinding. Nonetheless, they entail a measure of moral obligation and normative standard, at least for the assenting states, in particular when a consensual decision has been made by all governments of the world. Decisions made by the General Assembly on important questions are reached by a two-thirds majority of the members present and voting. These questions include recommendations with respect to the maintenance of international peace and security, the election of members to UN organs, the admission of new members to the UN, and budgetary questions. Decisions on other questions, including the determination of additional categories of questions to be decided by a two-thirds majority, are made by a majority of the members. A frequently used instrument in the UN ballots is abstention. The practice of consensual decision making has gained ground in the UNGA since the 1960s due to its affinity with the principle of sovereign statehood and a widening gap between power in world politics and voting power in the UNGA.

In 1944, the initial great power proposals for the UN provided for a rather limited role of the General Assembly. As a result of the combined effort of other powers, the authority and scope of activity of the UNGA was strengthened at the UN Charter conference in 1945. Later, the stalemate of the potentially more powerful UN Security Council in the cold war made the UNGA the most important UN organ. In 1950, with the enactment of the so-called Uniting for Peace resolution, the UNGA even managed to change the constitutional order of the UN and enabled itself to bypass the

Security Council if that council failed to act because of the veto of a permanent member. However, when the process of decolonization changed the membership structure of the UN, the automatic UNGA majority of the United States faded to the benefit of a majority of developing countries (the "Group of 77"). This shift in voting power in the UNGA implied a detachment from economic and military power, limiting the influence and actual impact of the General Assembly. Since the 1990s, the revitalization of the UNGA has been a standing political catchword in the UN. This idea is related to the political economy of new public management, but it is not clear to what kind of vitality it refers.

In the UNGA, the tension between the principle of sovereign statehood and the representation of people has formally been solved to the benefit of the former: The vote of the government of Micronesia has the same weight as that of the government of China. Nonetheless, the UNGA is frequently referred to as the "parliament of man." Suggestions to apply the principle of weighted voting are legion and as old as the UN. They imply, apart from improved proportional representation, a better congruence of voting power in the UNGA and other types of power. Moreover, some proposals suggest the representation of various shades of political opinion within the single member states or that representatives be elected directly by the people. Similar suggestions concern the establishment of a "second assembly" or "UN parliamentary assembly" alongside the UNGA. While all such proposals are utopian, they give evidence of humanity's century-old dreams about a world polity and the central role of the UNGA for the imaginary surplus of the UN, pointing beyond the mere intergovernmental cooperation of now.

General Will

Although he was neither the first nor the last to use it, the concept of the general will is inextricably linked to the political thought of Jean-Jacques Rousseau (1712–1778). In a number of works, but especially his *Social Contract* (1762), Rousseau argues that a just political society is one in which the citizens promote and obey the general will. In developing this argument, Rousseau insists that the general will is not to be confused with "the will of all," that it is always right, that it is to be found on the side of the majority when votes are counted, and that those who refuse to follow it must be "forced to be free."

Such enigmatic and apparently outrageous claims have led to much controversy about the meaning and coherence of this concept in Rousseau's thought. Unsympathetic critics have long dismissed what he says about the general will as either vacuous or incoherent nonsense; some have deemed it downright dangerous. In *The Origins of Totalitarian Democracy,* for instance, Jacob Talmon (1960) charges Rousseau with "dangerous ambiguity" (p. 40), because the general will points toward both democracy, in its attention to the will of the people, and totalitarianism. The danger, Talmon says, is that Rousseau's general will "gives those who claim to know and to represent the real and ultimate will of the nation . . . a blank cheque to act on behalf of the people, without reference to the people's actual will" (p. 48; see also Lester Crocker's 1968 *Rousseau's Social Contract: An Interpretive Essay*).

Sympathetic interpretations of Rousseau's thought tend to begin with a fundamental distinction he draws between *man* and *citizen.* That is, Rousseau holds that we may think of every member of the body politic in two ways: first, as a unique individual with a particular set of interests—a human, and second, as a public person who shares a common interest in the welfare of the body politic—a citizen. As a human, everyone has a *private will* that aims at his or her particular good or personal interests, but as a citizen, everyone has a *general will* that aims at the common good or public interest. The general will is different from the "will of all," then, because the latter is the sum of private wills. If every voter decides whether to vote for or against a tax increase simply on the basis of personal costs and benefits, for example, the result of the vote will be the will of all. But if they all vote as citizens, in an effort to promote the common good, the result should be the general will.

Understood in this way, Rousseau's other statements about the general will seem less enigmatic and outrageous, if not always clear and compelling. Thus it happens that the general will is always right, for the will of the citizen by definition aims to promote the common good. The general will is to be found in the vote of the majority, moreover, because the majority is more likely than those in the minority to be right about which policies really will serve the common good (on this point, see Brian Barry's "The Public Interest," 1964). Finally, individuals who break the law must be "forced to be free," because their disobedience is the act of *humans* who act contrary to their will as *citizens.* People who know, as citizens, that paying taxes is necessary, yet nevertheless try to avoid paying their share, are refusing to obey the general will. Such a person, Rousseau says, hopes to "enjoy the rights of the citizen without wanting to fulfill the duties of a subject, an injustice whose spread would cause the ruin of the body politic" (see Rousseau, 1978, 55). Forcing such people to be free is thus a matter of being forced to obey the laws that they freely agree to as citizens.

Other philosophers who make significant use of the general will in their writings include Georg W. F. Hegel (1770–1831) and the British idealists T. H. Green (1836–1882) and Bernard Bosanquet (1848–1923), although all gave the concept a more metaphysical cast than Rousseau did.

Geneva Conventions

The Geneva Conventions are a series of treaties concerning the treatment of prisoners and civilians in times of war. The Geneva Conventions have a long history and were developed over many years and through a number of wars.

THE HISTORY OF THE GENEVA CONVENTIONS

In 1864, in Geneva, Switzerland, twelve European nations enacted the Convention for the Amelioration of the Wounded in Armies in the Field, formally known as the Red Cross Convention. It was ratified by most major powers by 1867 and later by the United States in 1882. The Convention provided basic protections for the ambulances, hospitals, and medical personnel of all armies, including civilian personnel treating wounded soldiers. It was the first treaty to recognize the red cross as a universal symbol to identify medical personnel.

In 1906, also in Geneva, thirty-five nations created the Convention for the Amelioration of the Condition of the Wounded and Sick in Armies in the Field. It, too, was formally known to as the Red Cross Convention. It superseded, yet maintained the effectiveness of, the Red Cross Convention of 1864. It expanded protections for soldiers who were sick and

wounded to include protection from robbery and ill treatment. It also required certain protections for the dead and for material used in the care of the sick and wounded soldiers.

The next of the Geneva Conventions treaties was enacted at The Hague on October 18, 1907, by forty-four nations. It was titled the Adaptation to Maritime Warfare of Principles of the 1906 Geneva Convention; it applied the principles adopted in the 1906 Geneva Convention to maritime warfare and outlined specific protections for hospital ships.

On July 27, 1929, again in Geneva, forty-seven nations, including the United States, enacted the Convention for the Amelioration of the Condition of the Wounded and Sick of Armies in the Field along with Convention Relative to the Treatment of Prisoners of War. Like the previous two meetings in Geneva concerning the treatment of soldiers and civilians during times of war, it was formally known as the Red Cross Convention. It superseded the Red Cross Conventions of 1864 and 1906, and it presented additional protections, including reporting of compliance with the protections to a neutral information agency, routine inspection of POW facilities by medical personnel, protection for medical aircraft, and suppression of abuse through domestic legal means. During World War II (1939–1945), this Geneva Convention was in force.

After the experiences of World War II, the major nations of the world met to improve the protections granted by the Geneva Conventions and the Hague Conventions. On August 12, 1949, in Geneva, Switzerland, the nations enacted the four current Geneva Conventions.

THE GENEVA CONVENTIONS TODAY

Geneva Convention I, the Convention for the Amelioration of the Wounded and Sick in Armed Forces in the Field, provided and expanded the protections of the Geneva Convention of 1929. Both medical and religious personnel were included in the protections, as were civilians and laborers attached to military forces in the field and those inhabitants of invaded areas who spontaneously took up arms to resist an approaching enemy. The Convention prohibited the military forces holding prisoners of war from discriminating based on the prisoners' sex, race, nationality, religion, and political opinion. The Convention also required that the military forces publicly identify the combatants or civilians who were being held in custody or who had died and that all prisoners of war had the right to a fair trial and defense if accused of wrongdoing.

Geneva Convention II, the Convention for the Amelioration of Wounded, Sick and Shipwrecked Members of Armed Forces at Sea, revised the Tenth Hague Convention of 1907 and applied the same protections expressed in Geneva Convention I of 1949 for maritime personnel and medical vessels, although restrictions were placed on hospital ships such that they could not be used for military purposes and could not use secret codes.

Geneva Convention III, the Convention Relative to the Treatment of Prisoners of War, incorporated Geneva Convention I, providing the same protections as the Geneva Convention of 1929 but clarifying and expanding them. It defined as a prisoner of war the following classes of captured persons: a member of the armed forces; a member of a militia or volunteer corps; a member of a resistance group that has distinctive emblems capable of being seen at a distance, openly carries arms, and acts in accordance with the laws of war; civilians or laborers attached to military forces; and civilians who spontaneously take up arms to resist an approaching enemy and who respect the laws of war. Prisoners of war were required to provide certain identifying information, which the captors were required to report to the prisoners' home nations. Prisoners had to be given reasonable food, water, shelter, clothing, and medical care; were allowed to be used for certain labor, but had to be removed from the war zone; and were allowed to make complaints but were subject to judicial or disciplinary proceedings for misconduct.

Geneva Convention IV, the Convention Relative to the Protection of Civilian Persons in Time of War, addressed how to treat civilians in a war zone, which had not been addressed by the previous Geneva Conventions. Under Geneva Convention IV, a civilian not taking active part in the hostilities was to be treated without violence, with honor, with respect for family rights, with respect for religious practices, and with no insults or humiliation. They were to be protected from coercion designed to obtain information about third parties and were to suffer no discrimination based on race, religion, age, sex, or political opinions. They could be compelled to work in occupations relative to necessary food, shelter, clothing, transport, or medical services, all of which had to be nonmilitary, and they had to be paid wages. Civilians could be interned, but only if absolutely necessary, and internees had to be allowed access to the courts. Internees were generally afforded the same protections presented in Geneva Convention I—they had to be allowed reasonable food, water, clothing, shelter, medical care, and religious activities and access to a canteen to purchase goods at market value. All internees had to be reported to the protecting power and were to be allowed communication and receive relief consignments. If they were charged with misconduct, they were to be given a fair trial and the right to appeal. The occupying power could requisition food, medical supplies, or other goods from them only when fair market value was paid and civilian needs were taken into account.

As with all political solutions to political problems, the Geneva Conventions have not fully solved the problems concerning the treatment of prisoners of war and civilians. Enforcement is difficult. However, they are an attempt to bring some humanity to the otherwise inhumane activity of war.

Genocide

A concept created by Raphael Lemkin in 1944, the term *genocide* was originally used for Nazi patterns of state violence against the European Jewish populations during World War II (1939–1945). The word combines the Greek prefix for race or tribe (geno-) with the Latin suffix for killing/murder (-cide). The most frequently cited examples of genocide include the Holocaust during World War II, the "killing fields" of Cambodia in the 1970s, the "100 days" in Rwanda in 1994, and the Srebrenica massacre in Bosnia and Herzegovina in July 1995.

In 1948, Lemkin's concept of genocide was codified and established as an international crime through the United Nations Convention on the Prevention and Punishment of the Crime of Genocide. The convention defined the term as "acts committed with intent to destroy, in whole or in part, a national, ethnical, racial or religious group, as such." It is important to note that the convention's definition does not include the targeting of political, ideological, economic, professional, or other groups. Genocide refers solely to groups one is born into, what Rudolph Rummel (1994) refers to as "indelible groups."

As defined by the convention, overt acts of genocide include (1) killing members of the group, (2) causing serious bodily or mental harm to members of the group, (3) deliberately inflicting on the group conditions of life calculated to bring about its physical destruction in whole or in part, (4) imposing measures intended to prevent births within the group, and (5) forcibly transferring children of the group to another group.

In addition to defining the crime of genocide, Article 1 of the UN (United Nations) Genocide Convention calls on signatories "to prevent and to punish" genocide whether it is committed in times of war or peace. The responsibility for the prosecution of genocide currently rests with the International Criminal Court (ICC). Created by the Rome Statute of the International Criminal Court in 1998, the ICC has jurisdiction over genocide, crimes against humanity, and war crimes.

The enforcement of the UN Genocide Convention and the prosecution of genocide are problematized by its definition. The concept, the behavior, and the designation of relevant actors, as such, are highly contested on numerous grounds. First, identifying and proving the intent of the perpetrator is extremely difficult. Because of the legal obligation to prove that the specific and targeted destruction of a group was the intended act of the perpetrator, governments and prosecutors have favored the more broadly defined charge of "crimes against humanity." Violent acts against a group without the intent of that group's total destruction could be prosecuted as crimes against humanity but would not meet the threshold of evidence necessary for the charge of genocide.

Second, the manifestation of genocidal behavior has been problematic to define. Although biased toward extremely violent, overt, short-term activities such as mass killing, the concept of genocide can also be applied to relatively less violent, covert, long-term activities such as depriving a group of access to water with the intent of that group's imminent destruction. The latter is similar to the "structural violence" discussed by Johan Galtung (1969). In addition to structural violence, systematic acts of targeted destruction such as mass rape are increasingly being considered for prosecution under the Genocide Convention.

Third, while the original focus of the crime is on the perpetration of genocide by political authorities (government officials, militaries, police, and militias), it is possible for actors unaffiliated with these authorities to undertake relevant genocidal activities (e.g., rebels and revolutionaries). The attention on governments is largely explained by their affiliation with the largest and most famous instances of genocide as well as the fact that to engage in relevant behavior, the perpetrator would generally need access to resources that only political authorities would have at their disposal: lethal weapons, extensive human resources, and large-scale administrative capability.

The concept, behavior, and designations of actors are not the only controversial elements involved. Exactly what is to be done when genocide is identified is another complex matter. Following World War II, there was an informal claim among advanced, democratic nations that they would "never again" allow something like the Holocaust to occur, but the record of stopping such abuse seems at face value to be lacking. Designations of genocide are few, and even when specific behavior has been so labeled by one member nation, there are ways that other signatories can block, delay, or completely undermine the initial effort preventing intervention and contributing to impunity.

Gentile, Giovanni

Giovanni Gentile (1875–1944) was an Italian philosopher, educator, and politician. As a neo-Hegelianist, he developed an extremely rigid form of idealism referred to as "actual idealism" or "actualism." He eventually considered himself the "philosopher of Fascism," even though he showed an interest for this movement only after the success of the 1922 March on Rome, which brought fascist Italian dictator Benito Mussolini to power. In fact, some of Gentile's most important philosophical works, such as *The Theory of Mind as Pure Act* (1916) and *Logic as Theory of Knowledge* (1917) were written before the rise of fascism in Italy.

Born in Castelvetrano, Sicily, Gentile soon discovered his vocation for philosophy, joining the faculty of the University of Palermo in 1906 and subsequently moving to Pisa (1914) and Rome (1917). Between 1922 and 1924, he held the post of minister of education and implemented a complete reform of the Italian educational system. While minister he also took on the challenge of developing an ideological and cultural agenda for the Fascist Party that would rely greatly on his own philosophical views. Following publication of his 1925 "Manifesto of Fascist Intellectuals," he became involved with a number of cultural and scholarly initiatives, including the National Fascist Institute of Culture, the National Institute for Germanic Studies, the Italian Institute for the Far and Middle East, and the National Centre for Manzonian Studies. He also edited the *Italian Encyclopedia* (1932).

Despite these associations, Gentile's relations with the fascist regime were uneasy at times. Gentile vehemently opposed the signing of the 1929 Lateran Pacts with the Holy See, and many of his works were eventually banned by the Catholic Church. He also opposed the 1940 alliance with Germany and Japan (the Tripartite Pact). However, he supported Mussolini and the Salò Republic until his assassination by communist partisans in April 1944, eleven months before Mussolini's own assassination.

Gentile's philosophical views supported the idea that only "concrete acts" can define reality, which on its own is simply an abstract set of unrelated phenomena. Reality is therefore an extension of the individual who sets its terms; it is not something exterior to the individual. Thought in action ("pure acts") implies the merging of subjects and objects, theory and practice, past and present. Countering materialism, realism, and positivism, Gentile rejected externalized historical dialectics and emphasized the confrontation between subjectivity (thesis), objectivity (antithesis), and philosophy (synthesis). Philosophy cannot be disassociated from life, or vice versa, as its purpose is to guide it through "thought in action."

In *Genesi e Struttura della Società* (1943), Gentile argues that the autonomous individual is nothing but a formal abstraction, because in reality, state and individual cannot be separated. His legal-naturalist views characterized the state as an eternal unifying and organic condition capable of overcoming individualized interests, thus providing a philosophical legitimization for fascist corporatism. Through the control of the state, fascism would shape a new antimaterialist and spiritual consciousness with mystical proportions. In spite of this, Gentile also considered himself a liberal, but he believed individual freedom could occur only within the authoritarian state capable of moderating and unifying divergent interests.

Geopolitics

The concept of geopolitics is widely used in the public domain by politicians, journalists, policy analysts, and academics. As a result of its broad usage, providing a precise, succinct definition of the term is nearly impossible. In the academic world, the concept of geopolitics is used in many disciplines of the social sciences. Political scientists, economists, geographers, and historians all use the concept widely as well, but with differing meanings.

In most general terms, the term *geopolitics* refers to simple visualizations of relationships or concepts in world politics. At the end of the cold war, for example, British Prime Minister Winston Churchill predicted that an "iron curtain" would come down over Europe virtually separating the East from the West. A more recent example is the "axis of evil," a term used by U.S. President George W. Bush in 2002 to describe the connections of Saddam Hussein's regime in Iraq to a group of rogue states. In short, geopolitical descriptions in this sense provide a geographical simplification of international relations.

Geopolitical activities, however, are not solely conducted by states and their governments. International organizations such as the United Nations (UN) or the North Atlantic Treaty Organization (NATO), nongovernmental organizations such as Amnesty International, private multinational businesses, and supranational institutions such as the European Union (EU) are also geopolitical actors. They not only influence international decision-making processes but also have a stake in world politics in terms of strategic, military, political, economic, social, and environmental issues.

Swedish political science professor Rudolf Kjellen first used *geopolitics* as a scholarly term in 1899. His approach to geopolitics can be termed the "realist approach"—he emphasized the role

of territory and resources in political decision making. World politics at the time was divided into states and empires as well as sea and land powers. Specifically, geopolitics was the intersection of politics and geography. British geographer Halford Mackinder then promoted the term to endorse the field of geography as an aid to British statecraft abroad. During the Nazi regime, models of *Lebensraum* (the need for more "living space," a justification for the German invasion of Europe during World War II) and autarky (a state's ability to be politically self-sufficient) were added to the concept of geopolitics. German political geographer Friedrich Ratzel presented the state as a natural organism that flourished or died with the struggle among states in an anarchic world. The term *geopolitics* was associated with fascist ideology of the 1930s and 1940s, so it is thus not surprising that after World War II (1939–1945) the concept fell into disuse.

With the beginning of the cold war in late 1949, the scholarly concept of geopolitics was transformed and the term acquired a new meaning. With the birth of the North Atlantic Treaty Organization (NATO) in 1949 and the ascendance of the doctrine of containment and deterrence, the term came to refer to geostrategy in pursuit of particular diplomatic and military goals. For the rest of the twentieth century, the scholarly concept of geopolitics was extended to strategic regions in the Middle East, Southeast Asia, and Europe. Particular attention was paid to the struggle between the two superpowers of the United States and the Soviet Union. With the end of the cold war in 1989, the concept of geopolitics was amended again, and the debate shifted from geostrategy to geoeconomics—the primacy of economics in international affairs—in the post–cold war era.

George, Alexander L.

Alexander George (1920–2006) was an American political scientist and scholar of international relations. He saw the role of the political scientist in a democratic polity as that of scholar-advisor to the policy maker. He was particularly concerned about the origin of foreign policy crisis and the management of crisis abroad by democracies. At the heart of this management advice was international relations theory, which he differentiated in terms of substance and process.

Substantive theory encompassed mediation and dispute resolution, deterrence, détente, and crisis management. It was always tied to specific historical events such as the Korean War (1950–1953) or the termination of World War I (1914–1918). Motivation for the development of such theory stemmed from the practical desire to understand why wars started, how they ended, or whether important diplomatic signals were missed.

Process theory involved the attempt to improve the quality of foreign policy decision making. A central task was to identify "malfunctions" in decision making. George rejected the assumption that all decision making was necessarily rational. Moreover, process theory distinguished two kinds of decision-making rationality: technical rationality and value rationality. Normative considerations could, and sometimes might have to, enter into theory via process.

While at the Rand Corporation from 1948 to 1968, and later at Stanford University, George focused on an evaluation of deterrence theory and its operation during crises such as the 1962 Cuban missile crisis, during which the Soviet Union sought to place missile installations in Cuba during the cold war arms race. In 1975 he received the Bancroft Prize for the book *Deterrence in American Foreign Policy* (1974) that he coauthored with Richard Smoke.

George tackled the subtleties of concept with very precise language. Illustrative of this is his use of the term *coercive diplomacy* for the concept of "compellence" proposed by American economist Thomas Schelling. George preferred the notion of coercive diplomacy, because he believed that it preserved the distinction between offensive and defensive uses of coercive threat, a conceptual delineation that ultimately held great significance for strategic literature.

Deeply psychological, George's analysis of decision making frequently employed case studies. He also offered a profound critique of structural realism. First, he argued that international relations theorist Kenneth Waltz's reformulation of the understanding of realism as espoused by German-born American political scientist Hans Morgenthau was not a theory in the sense that it could be invalidated or refuted scientifically. Second, George claimed that structural realism ignored the asymmetry of motivation that often allowed weaker states to eclipse the greater power of a stronger state. Third, he noted that the greater scope of interests of the larger state, often proposed as a positive characteristic of great power diplomacy, was actually a liability, because it discouraged focus and concentration of resources to achieve a maximum payoff.

Instead of neorealist, game theoretical, or rational choice interpretations of international politics, George advocated a three-fold approach to strategic assessment. He believed that "generic knowledge" of strategy was necessary. A model of actor-specific behavior was also essential. Finally, an abstract conceptual model linked to policy makers' judgment was no less crucial. All of this had to incorporate specific intelligence and information as well if it was to be of assistance to the policy maker. In the end, George was an influential voice favoring policy-relevant knowledge in international relations that would help prevent as well as manage foreign policy crises.

George, Henry

Henry George (1839–1897) was an American political economist whose works have influenced social and political theorists of the left and the right and whose books sold in the millions. An opponent of private monopolies in business and state interference in economic matters, George's primary influence has been on libertarian social theory. He is perhaps best known for his support of a single tax on land or land value tax.

George was particularly concerned about privately controlled resource enterprises, especially mining interests, and land speculators. His analysis suggested that private control over land explained why wealth and poverty under capitalism advanced simultaneously. As population in an area grows, the land also grows in value, thus requiring that those who work it pay more to do so. An opponent of natural monopolies, George called for taxation, regulation, and limited state ownership. He argued for state-operated telegraph services, control of railroad tracks, and municipal control of water supplies.

George's most influential contribution to economic theory is perhaps his advocacy of a single tax on land. For George, the economic rent gained from land should be shared socially rather than be controlled by private interests. In his best-known work, *Progress and Poverty* (1879), George argues that a large proportion of the wealth created through social and technological development in a market economy becomes concentrated in the hands of monopolists by way of economic rents, and this is the primary cause of poverty in capitalist economies. Collecting private profit by restricting access to natural resources upon which all depend for survival amounts to a system of theft and slavery. This is made even worse given that productive activity such as industrial works were burdened by taxes while land values were not.

George regarded natural resources as the product of nature rather than human labor or initiative and believed that as such, they should not provide the basis by which individuals acquire revenues. Nature as the common heritage of all humanity must be made a common property of society as a whole. George advocated taxation of unimproved land value as a way to share land wealth socially without employing a policy of land dispossession and nationalization. This single land tax would allow the state to remove taxes on all other, more productive, economic undertakings and transactions. George's ideas have recently been taken up by environmentalists who view the earth as the common property of all species. Such environmental economists are also seeking to reduce the economic practice of treating ecological damage as an externality in which private interests hold monopoly control over profits while shifting the social and economic burden of ecological harm onto society.

George's positions also reveal the contradictory nature of much of libertarian theory. His fondness for supposedly free markets did not include labor markets and the free flow of working people in search of employment. George was an active supporter of immigration restrictions, and the articles that brought him his earliest notoriety expressed his opposition to Chinese immigration into the United States. According to George, the willingness of poor immigrants to accept lower wages had the negative effect of driving down wages for all working people. While this argument has been taken up by contemporary conservative opponents of immigration, progressives and labor activists have pointed out that the real issue is one of working-class organization and power within the labor market, including immigrant and domestic workers, rather than immigration itself.

George's works have influenced generations of social and political theorists, both progressive and conservative. Prominent figures influenced include Fabian socialist and playwright George Bernard Shaw, anarchist author Leo Tolstoy, and Chinese nationalist and revolutionary Sun Yat Sen. American civil rights leader Martin Luther King Jr. took up George's call for a guaranteed minimum income as a defense against extremes of poverty, while conservative economists such as Milton Friedman praised George's views on free trade. Contemporary anarchists such as the market anarchists associated with the Molinari Institute claim George as an influence.

German Political Thought

German political thought is an equivocal concept that may be best understood in the way of a Wittgensteinian "family resemblance." While the adjective *German* can be understood to refer to a core of works written in German, by Germans, and reflecting the institutional, social, and cultural context of Germany, the use of *linguae francae* and the fragmented history of Germany prevent unambiguous demarcations. Additionally, the domain of the "political" does not coincide with contingent disciplinary boundaries: next to the political thinkers, theologians, jurists, economists, sociologists, and others have made important contributions. Therefore, who does and does not belong to German political thought will always be controversial. With these reservations in mind, one may trace certain currents of German political thought in their historical development (e.g., idealism, romanticism, critical theory) and perhaps even identify something "typically German" in each

author without succumbing to the illusion that the "typical" must be the same in all of them.

THE PROTESTANT TRADITION

A suitable starting point is the man who shaped the modern German language with his translation of the Bible: Martin Luther (1483–1546). Of course, the great church reformer was first and foremost a theologian, but his quest for a purified theology entailed the breakup of the medieval unity of theology, philosophy, politics, and law. In the context of his fights with papal and imperial authority, his distinction between a temporal and a spiritual regiment and his affirmation of both in *On Secular Authority* (1523) ended up serving the rise of national particularism and the territorial state. Authoritarian elements in his thought are undeniable: Because all men are sinners, God has subjected them to the "law and sword" of worldly authority; they must not revolt, not even against a tyrannical government. At the same time, by limiting the worldly regiment to matters of life, limb, and property, by insisting on the *Freedom of a Christian* (1520), and by advocating the "priesthood of all believers," Luther provided powerful figures of thought that could later be used to argue for freedom of conscience, the primacy of the moral law, and representative government. These achievements are derogated by the anti-Jewish diatribes in his last works, *On the Jews and Their Lies* (1543), which are often cited in attempts to explain why Germans succumbed to the anti-Semitic Nazi regime 400 years later.

The effort to extricate politics from its entanglement with theology, philosophy, and jurisprudence, while keeping it compatible with Protestant doctrine, also permeates the work of the Calvinist jurist Johannes Althusius (1557–1638). In his *Politica, Methodice Digesta* (1614), he propagates the idea of a "symbiotic" commonwealth or "consociation" that Michael Lessnoff (1986) described as a "'contractualized' version of Aristotle...."With this,Althusius originated the peculiar social contract theory of German natural law that the distinguished legal scholar Otto von Gierke (1841–1921) later tried to pass off as the standard version. Contrary to Hobbes, Locke, Rousseau, Kant, and Fichte, this tradition posits not one social contract but (at least) two: a treaty of association (*pactum unionis*) and a treaty of subjugation (*pactum subjectionis*).

NATURAL LAW

The German natural law tradition gained weight and widespread dissemination through Samuel von Pufendorf (1632–1694), who produced the most influential natural law philosophy of the seventeenth and eighteenth centuries. Writing against the background of the Thirty Years' War (1618–1648) and in critical appropriation of the ideas of Grotius and Hobbes, Pufendorf elaborated a system of rights and obligations pertaining to individuals and political associations under a secular natural law, emphasizing sociality as its basis: In order to be safe, humans must be sociable. In Germany, his work gave rise to an important natural law school that included Christian Thomasius and Christian Wolff. Abroad, Locke, Rousseau, Montesquieu, and Madison were among the authors who picked up some of his ideas.

GERMAN IDEALISM: KANT, FICHTE, HEGEL

In terms of international impact, arguably no one rivals the main representatives of what became known as German idealism: Kant, Fichte, Schelling, and Hegel. Although these authors never thought of themselves as a group or movement, they explored roughly similar approaches to fundamental philosophical problems by asking how the thinking subject should conceive of itself, the external world, and the relation between them. Political matters are discussed within this comprehensive framework and with quite different results by Kant, Fichte, and Hegel (and not much at all by Schelling).

Immanuel Kant's (1724–1804) contributions to political thought were undervalued for a long time, mostly because his groundbreaking treatises on theoretical and moral philosophy, including *Critique of Pure Reason* (1781/1787), *Critique of Practical Reason* (1788), and *Foundations of the Metaphysics of Morals* (1785), drew so much attention. This has changed, not least because of the homage paid by John Rawls, Jürgen Habermas, and others. Kant is the paradigmatic enlightenment thinker, believing in reason and progress. He viewed the social contract as an idea of reason, demanding that reason's moral law of justice and right—related to, but not identical with, the famous "categorical imperative"—set the normative imperative for politics. Reason requires (1) a republican constitutional order within states, (2) a republican order between states, and (3) a rudimentary cosmopolitan order beyond the state. Among other things, these demands made Kant one of the progenitors of democratic peace theory.

Like Kant, whom he admired, Johann Gottlieb Fichte (1762–1814) built an impressive philosophical system of which the legal and political philosophy forms an important but sometimes neglected part. In a characteristic "idealist" move, the fundamental principles of law and justice (*Recht*) that are to govern the analysis and practice of politics are deduced from the axiom that a finite reasonable being cannot comprehend itself without ascribing itself a free will. Fichte's attempt to show how the state ought to be reformed to conform ever more to reason's ideal results in the model of a "closed commercial state" where freedom is maximized by a socialist order and command economy.

The attempts to capture the world's totality in a single philosophical system find their climax in the work of Georg Wilhelm Friedrich Hegel (1770–1831), Fichte's successor at the University of Berlin. Convinced that he is living in a time of world-historical transformation (and not modest about his own role in it), Hegel aims for a philosophical system that gives truth its genuine form. His *Elements of the Philosophy of Right* (1821) is a classic of political thought in its own right, but his lasting influence has to be attributed equally to philosophical ideas developed elsewhere, especially the concept of *Geist* ("spirit" or "mind"), the *dialectic* as a logical and ontological principle, and the philosophy of history informed by these concepts. Hegel portrays history as the rational/reasonable process of *Geist* coming to realize itself by becoming ever more self-conscious, objectifying itself in particular forms of

social, political, and cultural life (e.g., the "rational" modern nation-state), and creating the external world, all in a series of dialectical moves. The intriguing breadth and depth of Hegel's philosophy—and its notorious complexity—continue to inspire and provoke. Diverse thinkers and movements owe it great debts, among them the Frankfurt school and communitarianism.

MARX AND ENGELS

Hegel's most influential disciple and critic, however, was Karl Marx (1818–1883). If judged by his own statement in *Theses on Feuerbach* (1845) that philosophers have only interpreted the world in different ways while the point is to change it, Marx has been vindicated. Even though one must not confuse Marx's ideas with Marxist ideology (Marxism), the works of Marx and his lifelong friend and collaborator Friedrich Engels (1820–1895) were fundamental for the socialist and communist movements that came to dominate the fate of so many.

The crucial shift in Marx's thinking occurred when he parted company with the "Young Hegelians" like Bruno Bauer and Ludwig Feuerbach and turned the critique of religion and philosophy into a critique of the socioeconomic conditions of human life. Drawing on German idealism, French utopian socialism, and British political economy, Marx and Engels then fashioned a view of history, society, economy, and politics that puts labor, the "conditions of production," and the concomitant class system at the center. For them, the "forces of production" define the relations of power and constitute the economic base of society, on which rises a political and legal superstructure that codifies and reinforces the domination of one class over the other. History is seen as a sequence of class struggles driven by material factors (dialectical materialism, historical materialism) that will find resolution only in a world revolution, the transitional "dictatorship of the proletariat," and the final stage of a classless and stateless society. Today, scientific socialism, Marx's and Engels's theoretical edifice, has been largely torn apart, but many of its building blocks are still in use, be it in the general political dictionary (alienation, surplus value, class, expropriation, bourgeoisie, etc.), or in the methodological toolkit of sociology and history, or in the antiglobalization movement that builds on Marx's analysis of capitalism.

GERMAN ROMANTICISM

Marx was not the first to step out of German idealism's shadow. Right on idealism's heels, a movement formed that shares pride of place with it among German contributions to the world of thought and culture: romanticism. While customarily regarded as a movement in literature and the arts, the romantics' insistence on the importance of individual feelings and the needs of the soul naturally led to political ideas of prime importance, most notably an organic conception of society that sought to combine the values of individual self-realization and community life.

From a political perspective, the pivotal members of the Romantic circle were the author Friedrich Schlegel (1772–1829),

the theologian Friedrich Schleiermacher (1768–1834), and the poets Friedrich Hölderlin (1770–1843) and Friedrich von Hardenberg, called Novalis (1772–1801). As much as romanticism was a reaction against idealism, the former was beholden to the latter, which is why Fichte and Schelling are usually mentioned in treatises on either one. Likewise, the romantics yearned to go beyond the classicism personified by Johann Wolfgang von Goethe (1749–1832), Friedrich Schiller (1759–1805), and Christoph Martin Wieland (1733–1813). On the periphery of their movement, one finds the fourth member of the quadrumvirate of "Weimar Classicism": Johann Gottfried Herder (1744–1803), who is customarily credited with creating nationalism and historicism as political theories.

NIETZSCHE

If Marx was the revolutionary who upended the great systematic constructions of German idealism by "standing Hegel on his feet," his near-contemporary Friedrich Nietzsche (1844–1900) was the subversive free spirit who tried to undermine its very foundations. Nietzsche casts into doubt the metaphysical certainties at the heart of Western civilization: "God is dead," Platonist philosophy and Christianity's "slave morality" have corrupted the entire culture, and nihilism reigns. What is called for is a heroic "reevaluation of all values" that acknowledges the inextricable uniqueness of individual human experience and the resulting "perspectiveness" of all judgments about right and wrong, true and false.

Nietzsche's style was antisystematic, epigrammatic, often puzzling, and sometimes disturbing. Racists like Houston Stewart Chamberlain (1855–1927) and the Nazi ideologue Alfred Rosenberg (1893–1946) took his talk about the "Übermensch" and the "blond beast" as grist to their mills. Still, Nietzsche has become a fixture of political and social thought in democratic circles. One main reason is that he was the archetype of the radical critic. His unrelenting questioning and unmasking of the powers that be—established concepts, norms, social structures—provoked and inspired modern moral philosophy, the philosophy of language (e.g., Wittgenstein), postmodernism, poststructuralism (e.g., Foucault), cultural theory, and other streams of thought. German poets and thinkers of all stripes have been influenced by him, including Thomas Mann, Martin Heidegger, Oswald Spengler, Max Weber, and Theodor Adorno.

THE EARLY TWENTIETH CENTURY: MAX WEBER AND CARL SCHMITT

Max Weber (1864–1920) is often named as one of the founders of sociology, along with Marx, Comte, and Durkheim. Actually, his methodological and substantive contributions have enriched the entire field of the social sciences and humanities. One key to Weber's methodological legacy is the term *Verstehen* (understanding). For Weber, sociology is a "science which wants to understand social action interpretatively and thereby to explain it causally in its course and consequences" (*Economy and Society*, 1922, 1). It can achieve this by identifying the rationale of actions as instrumental

(*zweckrational*), value-rational (*wertrational*), affectional/emotional, or traditional. These distinctions—which display Weber's debts to Kant and neo-Kantianism—also inform many of his substantive contributions, notably his interpretation of Western history as a process of progressive "rationalization"; his thesis that Protestantism promoted capitalism (*The Protestant Ethic and the Spirit of Capitalism,* 1904); his "ideal types" of traditional, legal, and charismatic authority; his ubiquitous definition of the state as a "legitimate monopoly on the use of force"; and, last but not least, his ethical instructions for scientists and politicians.

In the interwar period, Carl Schmitt (1888–1985) established himself as one of the leading legal theorists of Germany. His alliance with the Nazi party and ideology has made him a deeply problematic author but could not overshadow the fecundity of his ideas on sovereignty and the concept of the political, as the attention of even post–Marxist feminist thinkers like Chantal Mouffe in *On the Political* (2005) demonstrates.

LIVING THROUGH AND AFTER WORLD WAR II (1939–1945)

Entangled in the tragedy of Germany in the twentieth century are the life and work of Hannah Arendt (1906–1975). Raised in a liberal German-Jewish environment in Kant's hometown of Königsberg, Arendt was influenced as a student by the brand of German existentialism developed by her teachers Karl Jaspers and Martin Heidegger. She was forced to flee the Nazis and deprived of her German citizenship in 1937, yet the Nazi ideology and crimes provided her with the material for two of her best-known books: *The Origins of Totalitarianism* (1951), which traces the intellectual and social origins of Hitler's and Stalin's regimes, and *Eichmann in Jerusalem: A Report on the Banality of Evil* (1963), which was based on her trial reports for the *New Yorker.* She became an American citizen in 1951 but cherished the intellectual heritage of her native Germany. She translated some of her own works from English into German, including her philosophical magnum opus *The Human Condition* (1958), a neo-Aristotelian attempt to identify the practical human activity "action" as the basis of a true understanding of political life.

Arendt's fate of being forced to flee her homeland was shared by a group of German-Jewish social philosophers whose careers were conjoined by the Institute for Social Research, which was established at the University of Frankfurt in 1923, transferred to New York in the 1930s, and reestablished in Frankfurt in 1950: Max Horkheimer (1895–1973), Herbert Marcuse (1898–1979), Erich Fromm (1900–1980), and Theodor W. Adorno (1903–1969), today collectively known as the Frankfurt school. While Fromm advanced the psychological analysis of society, and Marcuse became an icon of the student revolutions of the 1960s, the lasting impact of the Frankfurt school must be attributed to the "critical theory" developed chiefly by Horkheimer (who coined the term in a 1937 essay on "Traditional and Critical Theory") and Adorno.

Well versed in the German idealism of Hegel and Kant, inspired above all by Marx, and spurred on by Nietzsche's nihilistic conclusion of enlightenment, Weber's gloomy analysis of the "iron cage of modernity," and Sigmund Freud's insights into the repressive nature of civilization, Horkheimer and Adorno expounded critical theory by exposing the self-destructive tendency of enlightenment. In *Dialectics of Enlightenment* (1944), they aim to show how enlightenment's aspiration to create a rational system of value-free, objective, and noncontingent knowledge leads to totalitarian claims in both science (where positivism "reduces the world to the blindness and muteness of data," p. 174) and society (where capitalism administers persons as things). The purpose of critical theory, instead, is to liberate human beings from the circumstances that enslave them. Sometimes, it seems to be this emancipatory attitude rather than any specific theoretical insight that has secured the Frankfurt school a place in the genealogical lineage of present-day academic movements like feminist theory, multicultural theory, theories of deliberative democracy, and the antiglobalization movement.

POLITICAL THOUGHT IN WESTERN GERMANY

In German political thought, the obvious heir to Horkheimer and Adorno's critical theory is Jürgen Habermas (b. 1929), a member of the "second generation" of the Frankfurt school who worked as Adorno's assistant from 1956 to 1959 but left the Institute of Social Research because of conflicts with Horkheimer. But Habermas's impact extends far beyond that. Works including *The Structural Transformation of the Public Sphere* (1962), the two-volume *Theory of Communicative Action* (1981), and *Between Facts and Norms* (1992) have established Habermas as one of the leading social philosophers in the Western world.

Despite the stupendous scope of his treatises, one can argue that a single powerful idea constitutes the gravitational center that holds them together: the idea that the pragmatics of language exact and reveal a "communicative rationality," which, first, conditions the ways in which one can talk about scientific, moral, legal, and political claims; and which can therefore, second, be used to construct a critical social theory that integrates systems theories with action-oriented theories. "Discourse ethics" and "deliberative democracy" are the logical corollaries of this idea.

In his attempt to develop a fundamental and comprehensive theory of social action that has something to say about matters of knowledge, ethics, politics, and (lately) faith, Habermas ingeniously incorporates ideas of tremendously diverse lineage: He borrows from the great systematic thinkers in the history of German thought, Kant, Hegel, and Marx; from the Frankfurt school; from sociological classics like Weber, Durkheim, and Parsons; from American pragmatism (especially George Herbert Mead) and the philosophy of language—all to create a system of thought that is unmistakably his own.

Habermas's main rival for the title of most influential German theorist after World War II and one of his productive interlocutors has been Niklas Luhmann (1927–1998). A student of Talcott Parsons, Luhmann devoted his life to the

elaboration of an all-encompassing systems theory of social life in which the primary units of analysis are not people or groups but the structures and operations (especially communications) of the diverse systems that constitute the overall system of society.

Among the younger generations of political thinkers in Germany, no one has so far matched the breadth and depth, let alone the international impact, of Habermas. This does not belittle the quality and originality of their writings. It simply means that the next chapter in the history of German political thought has yet to be written.

Gerrymandering

Gerrymandering, a pejorative term, earned its name from the fifth U.S. vice president, Elbridge Gerry (1744–1814). While Elbridge Gerry was serving as governor of Massachusetts from 1810 to 1812, the Massachusetts legislature, which was controlled by the Democratic-Republicans, changed the district boundaries in Essex County in order to weaken the political fortunes of the county's Federalists. After redistricting, a local newspaper said the new district had the shape of a salamander, so the newspaper creatively merged Elbridge Gerry's last name with the shape of the district and referred to it as a "gerrymander."

Political scientist Leroy Hardy defines *gerrymander* as "a technique used for partisan purpose in the creation of constituencies . . . [that entails] the consolidation of opposition strength [in an] arbitrary [or] unnatural" manner. The political party in control develops "safe seats" that cannot be challenged by their opponents, thereby limiting strength of the opposition.

Since its first use in 1812, the term has become commonplace in politics. The U.S. Constitution provides the states with the authority to redraw district lines in order to ensure equality of representation. Political parties and state legislators eagerly wait to redraw congressional and state districts in order to protect their partisan turf, weaken their opposition, stake out new territory for their respective parties, and disadvantage certain groups within the electorate.

If a district is redrawn for partiality on the basis of partisanship, race, religion, or economics, it has been gerrymandered, and the constitutionality of the new district is called into question. The U.S. Supreme Court determines whether claims of gerrymandering in redrawn voting districts are legitimate. This determination can be a difficult task, with the ultimate criterion being to ensure fairness. Technological innovations, such as geographic innovation systems (GIS), have made it easier for the politically savvy to devise various redistricting plans that undercut the strictest rules for impartial redistricting, allowing the system to continue to be manipulated to produce gerrymandered districts.

The U.S. Supreme Court has grappled with the issues of defining fairness and what constitutes a gerrymander, and no definitive definition has been provided for the latter. At one time the Supreme Court refused to hear cases that claimed political gerrymandering, because the justices believed that it was not the Court's responsibility to make decisions regarding political matters. However, since gerrymandering can encompass redistricting based on economics, race, and religion, the Supreme Court has begun to consider the constitutionality of redistricting efforts. In *Davis v. Bandemer,* 478 U.S. 109 (1986),

the Supreme Court began to consider the question of partisan gerrymandering in redistricting when they argued, "Each political group in a State should have the same chance to elect representatives of its choice as any other political group."

One should not confuse redistricting with gerrymandering. These are two different concepts. Redistricting can occur without resorting to gerrymandering; however, there can be no gerrymandering without redistricting. Redistricting takes place when a voting district's boundaries are redrawn for the purposes of equalizing representation among constituents. According to Mark Rush, a political science professor at Washington and Lee University, gerrymandering is more accurately

> the alteration of district lines in order to deny or impair the representational opportunity of a group of voters who, under other circumstances (i.e., a different districting plan), could, if they so desired, coalesce to ensure the election of a candidate who would serve as their delegate to a legislative assembly. (1993)

Gerrymandering is exemplified by the controversial redistricting that occurred in Texas in 2003. Tom DeLay, a Republican U.S. representative, assisted in redesigning his state's election districts in order to ensure that Texas's congressional delegation became more Republican.

Gilman, Charlotte Anna Perkins

A major American writer of the early twentieth century, Charlotte Perkins Gilman's (1860–1935) literary contribution to feminist theory was largely forgotten for several decades after her death. However, during the 1960s women's movement, a new generation rediscovered her writings.

Charlotte Anna Perkins lost her father shortly after her birth when he abandoned his wife and children. Perkins and her brother grew up in near poverty. As an adult, Perkins designed greeting cards and taught art to support herself. In 1884 she married artist Charles Stetson. After giving birth to their only child, Katherine Beecher Stetson, Perkins suffered from depression and was instructed by well-known physician Silas Mitchell to live a quiet domestic life caring for her husband and child

and to cease all writing and drawing. Nearly driven to insanity by her domestic captivity, Perkins left her husband and moved to California with her daughter.

Instead of causing a mental breakdown, writing enabled Perkins to challenge the nineteenth-century social restrictions that limited women. Her first novel, *The Yellow Wallpaper* (1892), explores the ordeal of a dutiful wife who undergoes Dr. Mitchell's rest cure. Determined to influence public opinion, she also became coeditor of *The Impress,* a women's journal, and contributing editor of *The American Fabian,* along with Edward Bellamy. She admired Bellamy's utopian novel, *Looking Backward* (1888), and gave public lectures on his ideal socialist society. Like Bellamy, Lester Ward, and other prominent social critics of the late nineteenth century, Perkins was optimistic that a greater understanding of Darwin's evolutionary laws would produce the fundamental economic and social changes she believed were necessary to truly liberate the human potential of women.

In 1898 Perkins published her most famous work, *Women and Economics,* which challenged the sexual and maternal roles of women. She argued that domestic duties and economic dependence prevented both women and men from realizing their full humanity. In her subsequent books, including *The Home: Its Work and Influence* (1904), she held that only women's economic independence could bring genuine social progress. Women's contribution to the social, or "human," sphere must be released for the next stage of human evolution. The author's utopian novel, *Herland* (1915), originally serialized in her monthly journal, *The Forerunner,* offered a preview of this next stage of human evolution through the eyes of three male travelers. *Herland*'s "new" women were conscientious agents of natural selection who had created a society of peace, beauty, and plenty.

In 1900 Charlotte Perkins married her first cousin, George Houghton Gilman, an attorney. They lived happily together until his death in 1934, two years after Charlotte Gilman was diagnosed with inoperable cancer. She moved back to California to live near her daughter and complete her autobiography, *The Living of Charlotte Perkins Gilman* (1935). She concluded the book with the line, "I have preferred chloroform to cancer." By the time of her suicide in 1935, Gilman's calls for a radical restructuring of society had ceased to influence the women's movement. But her conviction, stated in her 1911 work, *The Man-Made World,* that "women are not undeveloped men; but the feminine half of humanity is undeveloped human" has continued to inspire many American feminists.

Glasnost

The campaign for *glasnost* (meaning "openness") was the first sign that Mikhail Gorbachev, general secretary of the Communist Party of the Soviet Union, was serious about reform. Gorbachev used the word in his first speech after he came to power in March 1985. The next year, finding his economic reforms blocked by party conservatives, Gorbachev encouraged the media, still subject to close state censorship, to more openly discuss social problems. He hoped this would pressure bureaucrats to embrace reform. However, intellectuals seized the opportunity to raise issues way beyond Gorbachev's economic agenda, from the crimes of Joseph Stalin to the rights of national minorities.

Free speech initially took root in some intellectual journals, theatrical performances, and movies, and then spread to news magazines and eventually television. Pioneering editors, such as those at the weeklies *Moscow News* and *Arguments and Facts,* brought hitherto taboo topics into the public arena. By 1987 the elaborate system of state prepublication censorship had effectively collapsed.

August 1987 saw a wave of nationalist protests in Armenia and the Baltic republics, but Gorbachev refused to give in to conservative critics who were calling for a reversal of glasnost. On the contrary, he accelerated the pace of reform, introducing limited competitive elections in March 1989. A new June 1990 law on press freedom formally abolished censorship.

Glass Ceiling

The *glass ceiling* is a metaphor for the range of unofficial and artificial barriers that stop otherwise qualified individuals from obtaining promotions or top positions within an organization. These obstacles are usually not apparent or formal, hence the reference to a "glass" barrier. The concept was popularized in the 1980s and applied to the business sector, and wages in particular, following successive studies that revealed that men continued to dominate senior positions and earn, on average, higher salaries than women for comparable work. Since the term gained popularity over two decades ago, responses to economic glass ceilings have included attempts to diminish the wage gap through affirmative action legislation and both formal and informal quota systems, but inequity in both wage and opportunity is still among the most pervasive of contemporary social and political issues.

Within political systems, glass ceilings have prevented women and minority groups from obtaining elected office or governmental posts, even though legislation may exist that formally bans overt discrimination. In practice, a glass ceiling may exist within political parties and manifest itself in the selection of candidates to run for political office. It may also impact the selection of party or legislative leaders.

There have been a variety of responses to the phenomenon. Some systems require that political parties have a certain percentage of women or minority candidates. For instance, France requires that 50 percent of a party's candidates be women and India's INC (Indian National Congress) party maintains a 15 percent quota for female candidates, while Afghanistan's constitution ensures that 27 percent of seats in the Wolesi Jirga (Lower House) and 17 percent of seats in the Meshrano Jirga (House of Elders) are occupied by women. Other systems, including that of the United States, concentrate on enforcement of antidiscrimination laws.

Gleichshaltung

The German word *gleichshaltung* (meaning "synchronization" or "coordination") originally referred to the campaign by the National Socialists (Nazis) during the 1930s to have the Nazi party take complete control of the German state through the creation of a cult of personality around the party leader, Adolf Hitler. The ultimate goal was the establishment of a single, unified political state under the control of the dominant party. The Nazis undermined, outlawed, or replaced potential rival groups, including other political parties, trade unions, civic organizations, and the media. They also created parallel party structures that eventually superseded existing political bodies or agencies.

Central to Gleichshaltung was the notion that the "leader" represented the will of the people. All political, economic, and social power flowed through that leader into the institutions and structures established or captured by the party. Consequently, existent systems of checks and balances were eliminated or circumvented. Opponents of the process were identified as enemies of the state and subject to persecution and punishment. Within two years of their assumption of power, the Nazis had gained control over all major German institutions, with the exception of the Catholic Church. Gleichshaltung subsequently came to mean any effort by a political grouping to displace the state and install a monolithic, totalitarian single-party system.

Global Democratic Deficit

The phrase "democratic deficit" has been most frequently used in reference to the European Union, but it is applicable to any supranational organization to which states belong but of which their citizens do not have direct democratic control. International institutions raise at least two issues relating to democracy: (1) representation and accountability to individuals that live within states that are part of a supranational organization, and (2) the democratic equality of representation among state members themselves. The global democratic deficit usually refers to the first of these two concerns.

The central concern is that because of supranational rules and decisions, citizens of a democratic country are occasionally subject to domestic policies that they have not, or would not, put in place through their own domestic democratic processes. On such occasions, citizens may feel that they have been overruled by a supranational organization to which they have no direct recourse. There are at least three broad responses to this problem. Proponents of cosmopolitan democracy seek to extend the principles of democracy to the global level by shifting the foundation of global governance from sovereign territorial states and their executives to the political autonomy of individuals and global society. Some skeptics of cosmopolitan democracy agree with the basic concern about a global democratic deficit but propose a different set of institutional reforms. Supranational delegated democracy does have its defenders.

The European Union, although not a perfectly democratic institution, provides an example of a supranational organization with a directly elected parliament. Some cosmopolitan democrats propose the establishment of a global parliament or people's assembly. The concept is not new, and in fact a similar idea was proposed and rejected when the League of Nations was formed. Still, the United Nations (UN) remains governed by diplomats who are appointed by state executives, and there are no direct institutional links between the people of the world and the UN, which is the largest global governance institution. A movement to increase citizen electoral participation within and outside the UN has grown, and there have been numerous proposals for doing so.

In addition to the creation of an institutional assembly for the people, global conferences that include the participation of citizens, global civil society, and nongovernmental organizations may provide another avenue for strengthening global democracy. Citizen participation in global governance through conferences and other means of global or "new" diplomacy have been credited with significantly influencing the creation of the International Criminal Court and the establishment of an international convention prohibiting the use of landmines.

In addition to calls for increasing direct citizen participation in global institutions, pressures for improving nonelectoral accountability, such as transparency, and linkages to nonstate actors, such as nongovernmental organizations (NGOs) and global civil society organizations, have intensified. Increasing avenues of participation for NGOs and civil society organizations as representatives of "the people" has the potential to increase accountability of global institutions but would not create global democracy in the way that cosmopolitans seek. Still, institutional reforms improving transparency and creating closer working conditions between global nonstate actors and international organizations have been the most common and visible effects of the global movement to reduce the democratic deficit.

Most scholars agree that the perceived legitimacy of international decision making is important to its public acceptance and the continuation of multilateralism. However, the goal of democratizing global governance is not universally championed. All democratic systems of government involve some delegation, particularly when it would not be practical or optimal for decisions to be subject to popular vote. For example, when decision making is highly technical or best insulated from majority opinion in order to protect a minority, liberal democracies often decide to delegate decision making to a body that is not directly accountable to majority opinion. Many international institutions might be viewed in this way. Even if individuals do not have the opportunity to vote for or against individuals with decision-making power in international institutions, they do have the opportunity to influence the process through their domestic governments, which in turn have a voice in the affairs of the international institutions of which they are a part. In this way, multilateral institutions are democratic, if only indirectly.

Globalism

Globalism is a ubiquitous term often used in a sloppy manner to describe general globalizing trends as well as particular systems of ideas and values connected to various globalization processes. For purposes of analytical clarity, however, it is useful to distinguish between *globalism,* a political ideology that endows globalization with certain norms, values, and meanings—and *globalization,* a multidimensional set of social processes that extend and intensify social interdependencies across the globe. This distinction is not meant to suggest that globalism (the ideational package) exists in isolation from globalization (the material process). The complexity of actual social life admits to no such thing as political ideas and values isolated from their socioeconomic context and their institutional manifestations. But it is crucial not to lose sight of the considerable role played by ideas, beliefs, language, and symbols in shaping the conditions of the social world. A focus on the ideological dimensions of globalization allows a more extensive analysis of the production and worldwide circulation of ideas and norms.

Globalism, then, refers to powerful ideologies ranging across the left-right political spectrum both in support of and in opposition to the project of extending a free-market model of capitalism to all regions of the world. The dominant variant of globalism focuses on the concept of the "market." To be sure, the wide-ranging preeminence of "market" harkens

back to the heyday of liberalism in mid-Victorian England. And yet, the fundamental difference is that the idea of the market has moved beyond the political framework of national economies to an expanded vision of an integrated global economic exchange. In other words, while the grand ideologies of modernity—liberalism, conservatism, socialism—expressed a largely prereflexive *national* imaginary in compressed form as explicit political doctrine, the focus of the political belief systems in the early twenty-first century is the political articulation of a *global* imaginary. Naturally, the principal types of globalism contain some ideational components of the grand ideologies. However, most of these old concepts have been rearranged and hybridized with new concepts into novel ideational structures.

The public interpretation of the origin, direction, and meaning of the profound social changes that go by the name of globalization has fallen disproportionately to global social elites composed of executives of large transnational firms, corporate lobbyists, journalists, public relations specialists, intellectuals writing to a large public audience, state bureaucrats, politicians, and cultural celebrities. The public advocacy of market globalism involves five ideological claims that recur with great regularity.

Claim #1: Globalization is about the liberalization and global integration of markets. This claim is anchored in the liberal ideal of the self-regulating market as the normative basis for a future global order. The liberalization and integration of global markets are presented as both desirable and "natural" phenomena that promote individual liberty and material progress in the world.

Claim #2: Globalization is inevitable and irreversible. According to this assertion, globalization involves a spread of irreversible market forces driven by technological innovations that make the worldwide integration of national economies inevitable. The portrayal of globalization as some sort of natural force suggests that people must adapt to the discipline of the market if they are to survive and prosper.

Claim #3: Nobody is in charge of globalization. The claim of inevitability contains yet another implication. If the natural laws of the market have indeed preordained the course of history, then globalization does not reflect the arbitrary agenda of a particular social class or group. In that case, certain social elites are not in charge of globalization, but markets and technology are.

Claim #4: Globalization benefits everyone. This claim lies at the very core of market globalism, because it provides an affirmative answer to the crucial normative question of whether globalization should be considered a good or a bad thing. Market globalists assert that free trade and open markets provide the best prospect for creating jobs, spurring economic growth, and raising living standards around the world. While market globalists typically acknowledge the existence of unequal global distribution patterns, they insist that the market itself will eventually correct some of these "irregularities."

Claim #5: Globalization furthers the spread of democracy in the world. This claim is rooted in the assertion that free markets and democracy are two sides of the same coin. Persistently affirmed as "common sense," the actual compatibility of these two conditions remains nonetheless an open question.

The five central claims of market globalism constitute the foundation of a powerful wide-ranging regime that bestows political meaning on the process of globalization. Although market globalism has become the preeminent ideology of our time, it is worth remembering that no single ideational system ever enjoys absolute dominance. Even a hegemonic ideology contains small fissures and contradictions that threaten to turn into major cracks when confronted by persistent dissent. As both the terrorist attacks of September 11, 2001, and the massive antiglobalist protests since the late 1990s have shown, market globalism is increasingly challenged by social justice globalism and populist globalism—two ideologies that disseminate alternative meanings of globalization. And yet, these ideological challengers share with market globalism their common embeddedness in an overarching social imaginary centered on the global rather than the national. And so it appears that far from moving toward an "end of ideology," the twenty-first century constitutes a teeming battlefield of clashing globalisms.

Globalization

Since its earliest appearance in the 1960s, the term *globalization* has been used to describe a process, a condition, a system, a force, and an age. To avoid both the indiscriminate usage of these concepts and the sloppy conflation of process and condition that encourages circular definitions, it is necessary to draw meaningful analytical distinctions between causes and effects. For example, the term *globality* refers to global phenomena as a social condition, whereas globalization signifies a set of social processes that are thought to transform our

present social condition into one of globality. Indeed, like *modernization* and other verbal nouns that end in the suffix *-ization,* globalization captures the dynamic of development or unfolding along discernable patterns. At its core, then, globalization is about both new and intensifying forms of human interactions and interconnectedness that stretch across the planet.

At the same time, however, scholars have increasingly realized the dangers of conceptualizing globalization processes according to rigidly nested geographical scales separating the global from the national or the local. This crucial task of rethinking historically contingent categories of spatiality yields important insights into the nature of the mutual embeddedness of the global in the local, and vice versa. Hence, the fledgling academic field of global(ization) studies requires methodologies and theoretical models that engage not only global scalings but also attend to both national and subnational levels.

Since the first scholarly debates on globalization in the 1980s, globalization has remained a slippery and hotly contested concept. In spite of the remarkable proliferation of research programs, students of globalization have remained divided on the utility of various methodological approaches; the value of available empirical evidence for gauging the extent, impact, and direction of globalization; and, of course, its normative implications. The failure to arrive at a broad scholarly consensus attests not only to the contentious nature of academic inquiry in general but also reflects the uneven and contradictory nature of the phenomenon itself. Hence, there seems to be very little utility in forcing such a complex set of social processes as globalization into a single analytic framework.

The persistence of academic divisions on the subject notwithstanding, it is also important to acknowledge some emerging points of agreement. During the 2000s, in particular, there has been a noticeable convergence of scholarly views on the following three positions: (1) Globalization is actually occurring and can be defined according to certain characteristics. (2) Globalization is a long-term historical process that, over many centuries, has crossed a number of qualitatively distinct thresholds. (3) Globalization is a multidimensional set of social processes that cannot be reduced to its economic and technological aspects; it also contains crucial political, cultural, and ideological dimensions. The bulk of this essay will explore these three positions in some detail.

THE OCCURRENCE AND CHARACTERISTICS OF GLOBALIZATION

During the 2000s, it has become increasingly evident that neither so-called hyperglobalizers who link just about everything to some transnational process nor so-called globalization skeptics who contend that globalization amounts to little more than "globaloney" have offered convincing arguments for their respective views. While the skeptics' insistence on a more careful and precise use of the term has forced the

participants in the globalization debates to hone their analytic skills, their wholesale rejection of globalization as a vacuous concept has often served as a convenient excuse—frequently offered in the name of scientific precision—to avoid exploring the actual phenomenon itself. In the early twenty-first century, many social scientists have converged on the position that the global transformation of social relations is real and can be appropriately subsumed under the general term *globalization*. However, rather than constructing grand narratives, many researchers have instead opted for methodological middle-range approaches designed to explore specific manifestations of globalization.

These more modest research initiatives have made it possible to identify four central characteristics of globalization. First, globalization involves the creation of new and the multiplication of existing social networks and activities that challenge traditional political, economic, cultural, and geographical boundaries. For example, the creation of satellite news corporations is made possible by the combination of professional networking, technological innovation, and political decisions that permit the emergence of new social orders that transcend parochial arrangements.

The second characteristic of globalization concerns the expansion and the stretching of social relations, activities, and interdependencies. Modern financial markets stretch around the globe, and electronic trading occurs around the clock. Gigantic shopping malls have emerged on all continents, offering those consumers who can afford them commodities from all regions of the world—including products whose various components were manufactured in different countries. Aided by new technology and economic deregulation, even criminal networks like terrorist cells have sprung up in dozens of nations on all five continents, ultimately turning groups such as al-Qaida into global terrorist networks capable of planning and executing attacks on a heretofore unimaginable scale. The same process of social stretching applies to less sinister associations, such as nongovernmental organizations, commercial enterprises, social clubs, and countless regional and global institutions and associations such as the United Nations, the European Union, the Association of Southeast Asian Nations, the Organization of African Unity, the Common Market of the South, Doctors Without Borders, Amnesty International, the Union of Concerned Scientists, the World Economic Forum, Microsoft, and General Motors, to name but a few.

Third, globalization involves the intensification and acceleration of social relations. The Internet relays distant information in mere seconds, and satellites provide consumers with real-time pictures of remote events. The intensification of worldwide social interdependencies means that local happenings are shaped by events occurring far away and vice versa. The ubiquitous phrase that "globalization compresses time and space" simply means that things are happening faster and distances are shrinking dramatically. Indeed, the current rise of the global network society would have not been possible without a technological revolution—one that has been powered chiefly by the rapid development of new information and

transportation technologies. Proceeding at an ever-accelerating pace, these innovations are reshaping the social landscape of human life.

Fourth, the creation, expansion, and intensification of social relations do not occur merely on an objective, material level. Thus, globalization also involves the subjective plane of human consciousness. People become increasingly conscious of growing manifestations of social interdependence and the enormous acceleration of social interactions. Their awareness of the receding importance of geographical boundaries and distances fosters a keen sense of becoming part of a global whole. Reinforced on a daily basis, these persistent experiences of global interdependence gradually change people's individual and collective identities and thus dramatically impact the way they act in the world.

Thus, a comprehensive definition of globalization that reflects this general consensus on these four constitutive characteristics might look like this: Globalization refers to a multidimensional set of social processes that create, multiply, stretch, and intensify worldwide social relations while at the same time fostering in people a growing awareness of deepening connections between the local and the distant.

GLOBALIZATION AS A PROCESS

The answer to the question of whether globalization really constitutes a new phenomenon depends upon how far back in time one is willing to extend the chain of causation. Some researchers consciously limit the historical scope of globalization to the last four decades of postindustrialism in order to capture its contemporary features. Others are willing to extend this timeframe to include the path-breaking socioeconomic and political developments of the nineteenth century. Still others argue that globalization really represents the continuation and extension of complex processes that began with the emergence of modernity and the capitalist world system some five centuries ago. And a few remaining scholars refuse to confine globalization to time periods measured in mere decades or centuries. Rather, they suggest that these processes have been unfolding for millennia, since about 10,000 BCE, when humans first settled on all five continents.

No doubt, each of these contending perspectives contains important insights. The advocates of the first approach have marshaled impressive evidence for their view that the dramatic expansion and acceleration of global exchanges since the early 1970s represents a quantum leap in the history of globalization. The proponents of the second view correctly emphasize the tight connection between contemporary forms of globalization and the technological innovations of the Industrial Revolution. The representatives of the third perspective rightly point to the significance of the time-space compression that occurred in the sixteenth century with the capture of the Americas by European powers. Finally, the advocates of the fourth approach advance a rather sensible argument when they insist that any truly comprehensive account of globalization falls woefully short without taking into consideration ancient developments.

Regardless of one's preference for a particular perspective, it can hardly be denied that scholars have increasingly turned toward history to make sense of globalization. While researchers in the early 1990s tended to emphasize the novelty of the phenomenon—sometimes dating its origins as late as the 1989 collapse of the bipolar world—the prevailing view in more recent years has shifted toward the longevity of these processes while recognizing that globalization has undergone dramatic changes and qualitative leaps at certain points in history. As a result, new periodization efforts have yielded much revised chronologies that tend to eschew conventional Eurocentric historical narratives and instead present globalization not as a linear, diffusionist process starting in the West, but as a multinodal, multidirectional dynamic full of unanticipated surprises, violent twists, sudden punctuations, and dramatic reversals.

GLOBALIZATION AS A MULTIDIMENSIONAL PROCESS

A multidimensional set of social processes, globalization cannot be reduced to its economic and technological aspects. It must be complemented by sustained explorations of its political, cultural, and ideological dimensions. This final point of agreement affirms the importance of presenting globalization as a multidimensional process. From its beginnings in the late 1990s, the academic field of global studies has been dominated by accounts focusing on economic and technological aspects of the phenomenon. To be sure, a proper recognition of the crucial role of these factors should be part of any comprehensive interpretation of globalization. But it is equally important to avoid the trap of technological and economic determinism. The burgeoning literature on various nonstructural aspects of globalization attests to the growing recognition of the centrality of ideas, subjectivity, and symbolic exchanges in the current acceleration of globalization processes. In general, researchers have identified three major dimensions of globalization: the economic, the political, and the cultural–ideological.

Economic globalization refers to the intensification and stretching of economic interrelations across the globe. Gigantic flows of capital and technology have stimulated trade in goods and services. Markets have extended their reach around the world, in the process creating new linkages among national economies. Huge transnational corporations, powerful international economic institutions like the World Trade Organization and the International Monetary Fund, and large regional trading systems like the European Union and Asia-Pacific Economic Cooperation have emerged as the major building blocs of the twenty-first century's global economic order. Moreover, the liberalization of financial transactions has led to the deregulation of interest rates, the removal of credit controls, and the privatization of government-owned banks and financial institutions. Globalization of financial trading allows for increased mobility among different segments of the financial industry, with fewer restrictions and greater investment opportunities.

Most people associate economic globalization with the controversial issue of free trade. After all, the total value of

world trade exploded from $57 billion in 1947 to an astonishing $6 trillion in the late 1990s. During the 2000s, the public debate over the alleged benefits and drawbacks of free trade reached a fever pitch, as wealthy Northern countries have increased their efforts to establish a single global market through regional and international trade-liberalization agreements such as the North American Free Trade Agreement and the General Agreement on Tariffs and Trade. Free trade proponents assure the public that the elimination or reduction of existing trade barriers among nations will enhance consumer choice, increase global wealth, secure peaceful international relations, and spread new technologies around the world. While there seems to be some evidence for the increase of productivity as a result of free trade, it is less clear whether the resulting profits have been distributed equitably within and among countries. Many studies show that the gap between rich and poor countries is widening at a fast pace. Hence, free trade proponents have encountered severe criticism from labor unions and environmental groups, who claim that the elimination of social control mechanisms has resulted in a lowering of global labor standards, severe forms of ecological degradation, and the growing indebtedness of the global South. The emergence of large-scale social protests around the world attests to the pervasiveness of these dissenting views.

Political globalization refers to the intensification and expansion of political interrelations across the globe. These processes raise an important set of political issues pertaining to the principle of state sovereignty, the growing impact of intergovernmental organizations, and the future prospects for regional and global governance. Obviously, these themes respond to the evolution of political arrangements beyond the framework of the nation-state, thus breaking new conceptual ground. Contemporary manifestations of political globalization are apparent in the partial permeation of old territorial borders, in the process also softening hard conceptual boundaries and cultural lines of demarcation. Emphasizing these tendencies, hyperglobalizers have suggested that the period since the late 1970s has been marked by a radical "deterritorialization" of politics, rule, and governance. Considering such pronouncements premature at best and erroneous at worst, globalization skeptics have not only affirmed the continued relevance of the nation-state as the political container of modern social life but have also pointed to the emergence of regional economic and political alliances as evidence for new forms of territorialization. As each group presents different assessments of the fate of the modern nation-state, they also quarrel over the relative importance of political and economic factors.

A third group has tried to offer a synthesis that captures important insights from both hyperglobalizers and skeptics. Conceding that globalization has exerted a considerable influence on most national economies to follow the Anglo-American model, they nonetheless insist that there remain important differences among national economies. In short, capitalism does not develop toward a one-size-fits-all model but comes in several varieties. Members of this third group, who focus on Europe, have furnished empirical studies suggesting that the rise of the new global economy in the late 1980s neither led to the destruction of some of the central features of the traditional European welfare state nor eliminated the fiscal powers of nation-states. Thus, these scholars conclude that globalization appears to have had a differential impact on social and industrial policy in Europe.

Out of these disagreements, however, there have emerged three fundamental issues and themes that probe the extent of political globalization: (1) the curtailment of the power of the nation-state by massive flows of capital, people, and technology across territorial boundaries; (2) the search for the primary causes of these flows; and (3) the possible emergence of forms of global governance and extensive network of nongovernmental groups often described as "global civil society." Indeed, political globalization is perhaps most visible in the rise of supraterritorial institutions and associations held together by common norms and interests. In this early phase of global governance, these structures resemble an eclectic web of interrelated power centers such as municipal and provincial authorities, regional blocs, international organizations, and national and international private-sector associations.

Cultural globalization refers to the intensification and expansion of cultural flows across the globe. The exploding network of cultural interconnections and interdependencies in the last decades has led some commentators to suggest that cultural practices, not the economy, lie at the very heart of contemporary globalization. Facilitated by the Internet and other new technologies, the dominant symbolic systems of meaning of the global age—individualism, consumerism, and various religious discourses—circulate more freely and widely than ever before. Since images and ideas can be more easily and rapidly transmitted from one place to another, they profoundly impact the way people experience their everyday lives. In the early twenty-first century, cultural practices frequently escape fixed localities such as town and nation, eventually acquiring new meanings in interaction with dominant global themes. The thematic landscape traversed by scholars of cultural globalization is vast, and the questions they raise are too numerous to be fleshed out in this short essay. Some of the most important issues include the tension between homogenization, difference, and hybridization within and among various cultures; the crucial role of transnational media corporations in disseminating popular culture to all parts of the planet; the globalization of languages; and the impact of materialist and consumerist values on Earth's ecological systems. Finally, cultural globalization contains important ideological aspects involving various norms, claims, beliefs, and narratives about the phenomenon itself. The heated public debate over whether globalization represents a good or a bad thing highlights the importance of ideology. As a result, various ideologies of globalism compete with each other in the struggle to shape public opinion around the world.

No doubt, the terrorist attacks of September 11, 2001, and the ensuing political fallout have given an unexpected jolt to the contemporary struggle over the meaning and the direction of globalization. In general terms, one can discern

two possible future trajectories of globalization. First, the expanding "global war on terror" might stop, or at least significantly slow down, even such a powerful set of social processes as globalization. There are already some early warning signs. More intense border controls and security measures at the world's major air and seaports have made travel and international trade more cumbersome. Since 2001, calls for the tightening of national borders and the maintenance of cultural distinctiveness have been heard more frequently in public discourse. Second, it is also possible that the ongoing efforts to contain these violent forces of particularism might actually increase international cooperation and encourage the forging of new global alliances. As a result, there is the possibility that globalization may actually intensify. Given these conflicting prospects, it seems entirely appropriate to end this essay with the observation that the future of globalization hangs in the balance.

Globalization and Development

Globalization is an increasingly important phenomenon affecting the world in political, economic, social, and cultural arenas. In her 1999 article "Gender and Globalization," Valentine Moghadam describes globalization as "a complex economic, political, cultural and geographic process in which the mobility of capital, organizations, ideas and discourses and peoples has taken on an increasingly global or transnational form" (p. 367). Further, globalization in both practice and ideology concerns the growing and deepening global relationships in governance, capital flows, trade, civil society, migration, and other areas.

Development is part of and affected by globalization. Broadly defined, development includes the social, economic, and political structures and processes that enable all members of a society to share in opportunities for education, employment, civic participation, and social and cultural fulfillment as human beings, in the context of a fair distribution of the society's resources among all its citizenry. For example, some people or communities may lack the resources, facilities, or networks available to other community members necessary to benefit from development projects. Educational opportunities necessary to access created jobs or investment programs may vary across communities. Development is also affected by gender relationships and structures, social relationships and hierarchies, family arrangements, and networks that affect the distribution of resources and the information offered through political and economic development programs. Although globalization can overcome the downsides to such structures through exchanges of ideas or social norms across national or cultural groups, it has also facilitated development led by developed countries, with their perspectives on gender issues, economic productivity, and institutions or social networks. Programs are often planned with these perspectives yet applied in quite different contexts. Furthermore, globalization is often dominated by liberalization policies that can place undue burdens on the poorest residents of developing countries by removing economic and political safety nets.

Development studies, especially post–World War II (1939–1945), held basic tenets that included the third world and its inhabitants as homogenous, a belief in a linear concept of progress, and the nation-state as the central unit of analysis. Beginning in the 1980s and 1990s, globalization challenged this approach. Diverse experiences in development, such as those of oil-producing states, of the Asian Tigers (Hong Kong, Singapore, South Korea, and Taiwan), of Latin American countries with respect to the role of their militaries, and of the newly independent African states contested any theories that previously tried to capture all developing countries under one umbrella. This largely resulted in an end to the belief that development was an inevitable, linear path toward modernization as experienced in industrialized nations and to a shift away from postmodern thinking, such as dependency theory. The new priority became micro-level, actor-centered research.

In light of the varied development experiences in the developing world and the growth of globalization, both macro/institutional and micro/local actor aspects had to be included in the conversation and planning of development. Thus, an understanding of development must include considerations of economic and political policies and institutions as well as educational levels, resource access, and social networks available to individuals and communities. A realization of the

increasing gap in development between first- and third-world countries, and of the presence of higher levels of environmental destruction and the use of abusive labor practices that led to development in industrialized nations in the first world, called into question the inevitability or desirability of other nations replicating the same path of development.

Key events of globalization underpin this shift in thinking. Economically, the debt crisis across the developing world in the 1970s and the fall of the Bretton Woods system led the International Monetary Fund (IMF) and the World Bank to become debt collectors and capitalist economic modernizers. Politically, the cold war and its political pressures intermixed with the IMF and World Bank structural adjustment programs in the developing world. These events encouraged an assessment of development in light of globalizing political and economic forces.

This assessment includes various themes that bridge the fields of development and globalization, including global economic policies such as trade regulations through the World Trade Organization; environmental impacts of development across water, air, and land that are not confined to one national entity; and migration of people in and out of country due to economic realities or safety/conflict situations that require the response of multiple state governments. Globalization has led to certain realities that shape these themes: the predominance of the neoliberal, capitalist economic viewpoint; the results of structural adjustment programs in developing countries; international multinational corporations and nongovernmental organizations' efforts; and global resource changes due to climate change, lived-poverty requirements, and the increased flow of people and goods. Globalization thus requires the field of development to ask such questions as the following: How should people live? What should states and economies look like? How are the economic, social, political, and cultural actions of people in one part of the world linked to and affected by the activities of people in other parts of the world? How does culture affect the interplay of development and globalization? How is good governance defined? What determines access to and control over the flow of globalized technology? How is knowledge controlled across the globe?

Knowledge is an increasingly important purveyor of development, and access to expert knowledge and the control of intellectual capital are crucial determinants of development inequality. The state is taken as the necessary central actor in the international arena in dependency, modernization, and world-system theories of development. With the increase of globalization, this centrality as part of development is challenged. What role is there for state sovereignty given the increasing impact of inter- and intrastate actions? Political (international accords), economic (deregulation), and cultural nationalism (identity) all challenge state sovereignty.

Godwin, William

Political philosopher William Godwin (1756–1836) was born in Cambridgeshire, England, to middle-class parents. His father was a Nonconformist minister, a profession for which Godwin was initially educated. His life was at times turbulent; he was declared bankrupt in 1825 and was scorned and satirized by former friends and in the conservative press for both his political views and his personal life. In his later years, his troubled reputation led him to publish under pseudonyms.

Godwin married protofeminist and social critic Mary Wollstonecraft in 1797, an act that surprised many, given his controversial claim, as stated in his 1832 *Fleetwood: The New Man of Feeling,* that "marriage, as now understood, is a monopoly, and the worst of monopolies." Wollstonecraft died that same year, shortly after the birth of their daughter Mary, who would become the author Mary Shelley. Godwin's candid biography of Wollstonecraft, *Memoirs of the Author of a Vindication of the Rights of Woman* (1798), added to the notoriety of both. Godwin remarried in 1801 and raised five children, three of them stepchildren.

Godwin published work in biography, fiction, children's literature, history, and drama in addition to his noted writings in political philosophy. He also campaigned on behalf of some of his fellow Jacobins—those sympathetic to the aims of the French Revolution (1789–1799)—when they were charged with treason.

In his political writings, Godwin was deeply preoccupied with the ways in which institutions, particularly those of the state, undermine personal autonomy, and he became widely regarded as an important figure in the anarchist tradition. Like John Locke, he was also strongly empiricist in his approach, and to an extent embraced the idea of the perfectibility of humanity, a project that he hoped could be achieved through social policy as well as on an individual basis. He is therefore also considered to belong to the utilitarian tradition.

Godwin's optimism about the future in relation to the possibility of increasing standards of living was a target for Thomas Malthus's criticism in the latter's *Essay on the Principle of Population* (1798). In reply, Godwin published *Of Population* in 1820, in which he rebutted the generalizations on which he believed Malthus's figures regarding population growth were based. Godwin was also an early advocate of the idea that social injustice could be exposed in fiction, and he wrote several novels that embodied his political ideas, the most successful of which were *Things as They Are or the Adventures of Caleb Williams* (1794) and *Fleetwood* (1805).

Enquiry Concerning Political Justice and Its Influence on General Virtue and Happiness, published in 1793, is the best known of Godwin's political works. Along with Edmund Burke's *Reflections on the Revolution in France* (1790) and Thomas Paine's *Rights of Man* (1791), Godwin's *Political Justice* was one of the most widely read and discussed responses to the French Revolution.

In later years, Godwin developed friendships with notable writers of the Romantic period, such as Samuel Taylor Coleridge and Charles Lamb. Like Jean-Jacques Rousseau, by whom he was greatly influenced, Godwin wrote about themes that spanned the Enlightenment and romanticism, particularly in his later works, which combined a belief in rational judgment as the key human ability with studies of human psychology and the impact of emotion on human action.

Goldman, Emma

Emma Goldman (1869–1940) was an anarchist, socialist activist, speaker, and writer born in Lithuania (then part of the Russian empire) and active in the United States, Soviet Union, and several Western European countries.

Goldman worked in the garment industry in St. Petersburg and, after emigrating in 1885, in Rochester, New York, where she married Jacob Kershner and became a U.S. citizen. Inspired by the story of the 1886 Haymarket tragedy, in which labor strikers and police clashed and several people were killed, she became an anarchist through self-study. After leaving her husband, Goldman moved to New York City in 1889, where she first worked with Johan Most and then, after her views diverged from Most's, she studied the works of Pyotr Kropotkin. During these years, Goldman entered into a political and romantic relationship with fellow anarchist Alexander Berkman, whom she defended after he was imprisoned for the attempted assassination of industrialist Henry Clay Frick in 1892.

Goldman lectured widely, at political demonstrations as well as in lecture halls, advocating socialism, anarchism, absolute freedom of the individual, modern drama, and free love. She played a major role in making the freedom and gender equality of women part of generally accepted anarchist principles. She applied these standards to her own life, having long-term liaisons with Ben Reitman and possibly Hippolyte Havel as well as with Berkman.

After Berkman's release from prison, he and Goldman published a monthly journal, *Mother Earth,* from 1906 to 1917, when its offices were raided by government agents and its subscription lists seized under the provisions of the Espionage Act. During this period Goldman's major essays were collected in *Anarchism and Other Essays* (1911).

Goldman was imprisoned from 1893 to 1895 for inciting to riot after she led a march of 1,000 people to Union Square in support of free bread for hungry workers. She was imprisoned twice more, in 1916 for distributing birth control literature and in 1917 for obstructing the draft. Her U.S. citizenship was revoked in 1908, and she and Berkman were deported to the Soviet Union in 1919 during the Palmer Raids.

Goldman had hoped to find a land ruled by workers in the Soviet Union, but she became a strong critic of the lack of personal freedom under Communist rule. She left the Soviet Union after two years and published her opinions in two volumes, *My Disillusionment in Russia* (1923) and *My Further Disillusionment in Russia* (1924). Her two-volume autobiography, *Living My Life* (1931, 1934), is an important statement of her views as well as a memoir of her activities through 1927. Her other major book, *The Social Significance of the Modern Drama* (1914), is a collection of essays on thirty-two plays by nineteen European playwrights, including Anton Chekov, John Galsworthy, Gerhart Hauptmann, Henrik Ibsen, Maurice Maeterlinck, George Bernard Shaw, August Strindberg, Leo Tolstoy, and William Butler Yeats; this volume helped to popularize modern drama in the United States.

Emma Goldman advocated anarchism, socialism, and individual freedom. She spoke out in favor of gender equality and was imprisoned in 1916 for distributing pamphlets on birth control.

In 1925, Goldman married Welshman James Colton in order to acquire a British passport so that she could travel freely in Europe and visit the United States. She went to Spain in 1936 to support the antifascist struggle and affiliated with the Federación Anarquista Ibérica (CNT-FAI) in Barcelona, publishing an English-language bulletin for them and then serving as their representative in London. She died in Toronto in 1940 and was buried in the Waldheim cemetery in Chicago, Illinois, near the graves of the Haymarket martyrs.

Good Governance

The concept of governance is as old as human civilization. In their 2002 article, "Comparing Governance across Countries and Over Time," Goran Hoyden and Julius Court note that there are those who view governance, on the one hand, "as concerned with the rules of conducting public affairs, and on the other, those who see it as steering or controlling public affairs" (p. 12). In essence, *governance* means the process of decision making and the procedure by which decisions are carried out, or not carried out, by those who govern. It is distinguished from *government,* which refers to an institution consisting of a set of instruments through which people of a state govern themselves by means of laws, rules, and regulations enforced by the state apparatus. Good governance is a subset of governance, and its essential ingredients depend on such fundamental values as accountability, transparency, justice, fairness, equity, and ethics as practiced in a liberal democratic polity. Good governance is also part of a government's goal of sustaining a good quality of life for its public. Ultimately, governance links an administrative system to a collaborative arrangement with interest groups, citizens, industry, legislators, and a judiciary, creating legitimacy of the public domain while letting each group share its perspective on governance with the rest.

GOOD GOVERNANCE

"Good governance" has become a catchphrase used widely by various international agencies such as the United Nations, the World Bank, and the International Monetary Fund (IMF). It means "governing well" by establishing a system of clean governance to achieve the anticipated goals and objectives of the public and the government. In essence, the concept is based on at least ten values:

1. democratic pluralism, which is essential to maintain cultural sensitivity in a pluralistic society to ensure empathy and tolerance of diversity, fundamental freedom and equality for all, and universal participation in the governing process;
2. legitimacy in the eyes of the public under the law of the land, that is, through constitutional instruments such as free and fair elections;
3. consensus among competing interests and equity in approach;
4. public participation in decision making;
5. rule of law to ensure fairness and nonpartisanship;
6. responsiveness of the governing systems toward the needs of the various stakeholders;
7. efficient and effective accountability of the institutions responsible for the governance, so that power is not misused and outcomes are delivered as anticipated or planned;
8. transparency in action to build confidence in the state or other institutions;
9. moral governance, which refers to public service ethics and moral accountability in the process of governance; and
10. a strategic vision for sustainable long-term human development.

In summary, good governance refers not only to the institutions of government, but also to all the players involved in the process of governance, the values listed above, and ethical conduct, incorruptibility, and sensitivity, which are key factors.

A fundamental principle is that those who govern are accountable to those who will be directly or indirectly affected by their decisions or actions. Transparency and rule of law are prerequisites for ensuring accountability. Moral or ethical behavior is essential for sustainability of the dynamic relationships formed during the conduct of the governance. Incorruptibility requires a clean conscience and keeping the public good above the private. These factors, including various impediments to good governance, are equally pertinent in the resource-starved developing world, where corruption further impoverishes the state, affecting the poorest of the poor.

IMPEDIMENTS TO GOOD GOVERNANCE

Among major impediments to good governance, corruption and corrupt behavior among public officials constitute a most insidious challenge; however, institutional or bureaucratic hurdles and inadequate compliance mechanisms are equally responsible for bad governance.

The biggest challenge to good governance faced by many countries is inefficiency in the implementation of various policy programs and effective delivery of service. While a country may have adequate legal mandates to solve problems, the gaps in policy implementation mechanisms indicate that enforcement of policies is rather weak and at times nonexistent. In addition, there always exists jurisdictional fighting across levels of government and among various ministries desperate to safeguard their jurisdictions, so policies and programs enthusiastically initiated by one ministry or department may be considered unnecessary or problematic by others and, thus, are slow to be embraced.

Many poor nations have crafted various laws concerning social welfare, environmental protection, and economic development, but they are rarely enforced because of insufficient financial, technical, and administrative resources. Powerful interest groups are often able to influence the regulatory system or bypass compliance measures that are in place. Finally, for government regulators, the cost of enforcement in time and resources is higher than the cost of nonenforcement. Government officials thus suffer from a negative public image and lack of public credibility, both of which contribute to a level of inertia that can inhibit good governance.

DETERMINING GOOD GOVERNANCE

Two standards are used to suggest what is required to craft good governance: one for developing nations and another for industrialized countries. International aid institutions, such as the World Bank and IMF, developed the standard that applied to developing nations, whereas the standard applied to industrialized nations mimics the features of liberal democracy found in Western societies. Critics question the validity of a standard, because they believe it imposes values that are "a cover for extending Western influence" (Hoyden and Court 2002, 23).

Despite the fact that in some developing nations, as in industrialized nations, resources may be diverted from the purpose originally intended for them, developing nations often suffer disproportionately from direct political interference in the administrative and enforcement process; policy goals deflected and responsibilities for achieving policy mandates evaded; and rampant reliance on tokenism by a government administration to fill ministry positions rather than talent. Nevertheless, the tenacity of some administrators and political leaders is such that they are able to keep a system of good governance functioning. And so, it would be erroneous to conclude that the various impediments facing these nations are such that they preclude the establishment of good governance.

Goodnow, Frank Johnson

Frank Johnson Goodnow (1859–1939) was an American professor of administrative law and political science, a university president, and a progressive social reform advocate. Cofounder

and first elected president of the American Political Science Association, he is considered the "father of public administration." His prolific scientific work—he authored a dozen books and more than sixty articles—did not preclude him from engaging in frequent public service efforts.

A graduate of Amherst College, Goodnow received a law degree from Columbia University Law School in 1882. He completed his education with a year of study at the École Libre des Sciences Politiques in Paris and at the University of Berlin. In 1884, he was appointed to the Columbia School of Political Science. He remained affiliated with Columbia for thirty years before accepting the post of president of Johns Hopkins University in 1914, a position he left only to retire in 1929.

His first book, *Comparative Administrative Law: An Analysis of the Administrative Systems, National and Local, of the United States, England, France and Germany* (1893), followed a mainly legalistic approach but brought at least two major contributions to the political science of his time. It was the first of a long series of volumes in which Goodnow initiated the systematic study of public administration as well as a pioneer work in the United States for the use of a comparative method of inquiry.

His classic, *Politics and Administration: A Study in Government* (1900), is an influential analysis of the American political system. It also triggered one of the most enduring controversies in political science. Following U.S. president Woodrow Wilson, Goodnow carved a dichotomy between two distinct functions of government, *politics* as the sphere that "has to do with the guiding or influencing of governmental policy" and *administration* as the sphere that "has to do with the execution of that policy," that has been fiercely debated. Severely criticized by Dwight Waldo in his *Study of the Administration* (1955), the discredited separation between politics and administration has now been replaced in the work of public administration specialists like James H. Svara by the notion of interrelationship. However, Samuel C. Patterson and other contemporary scholars who argue that Goodnow has been misinterpreted are rehabilitating the distinction. According to them, he intended the "typological distinction" for analytical purposes only.

Goodnow's acknowledged expertise in public administration and his taste for public service earned him numerous appointments to commissions and boards. In 1900, he helped redraft the New York City charter. In 1911, he served on President Howard Taft's Commission on Economy and Efficiency, and in 1913 he took a leave of absence to become legal adviser to the president of the Chinese Republic. Goodnow was a trustee of the Institute for Government Research and the Brookings Institution. He is remembered as a proponent of progressive policies and a tireless critic of political corruption.

Goodnow also dedicated part of his life to the institutionalization of political science as a discipline. Already a founding editor of the *Political Science Quarterly* (1886), Goodnow took part in the creation of the American Political Science Association and was chosen to serve as its first president for two consecutive terms in 1904 and 1905. Even though he was a vocal progressive advocate himself, during his presidency Goodnow was particularly concerned with building the reputation of scientific objectivity and the nonpartisan image of the association.

Gosnell, Harold Foote

Harold Foote Gosnell (1896–1997) was an American political scientist and social science methodologist. He is remembered for bringing quantitative methodology into the mainstream of political science, using both experimental and statistical methods. In his 1933 essay, "Statisticians and Political Scientists," he advocated for the use of statistics in the fields of political parties, public opinion, citizenship, legislative behavior, and political psychology. Gosnell is associated with the influential Chicago school of social science, which saw behavior as a function of social structure and environment rather than personal characteristics. His innovative work on voter turnout, black politics, and Chicago's Democratic machine left lasting substantive legacies.

Gosnell earned his bachelor's degree in 1918 from the University of Rochester, which later created a graduate fellowship named in his honor. He received his doctorate in political science from the University of Chicago in 1922. He joined the faculty there and was promoted to assistant professor in 1926 and associate professor in 1932.

Gosnell's dissertation, *Boss Platt and his New York Machine* (1924), broke new ground in its use of survey research, comparisons, statistics, and political psychology to study the political leadership of former New York senator and representative Thomas C. Platt. Reviewers of the book praised it while pointing out that it was unconventional and unlike typical biographies.

Gosnell's next books, *Non-voting: Causes and Methods of Control* (1924), coauthored with Charles E. Merriam, and *Getting out the Vote: An Experiment in the Stimulation of Voting* (1927), are considered by many as landmarks in political science and are recognized in particular for their use of a multimethod approach. Gosnell and Merriam conducted interviews with party officials, officeholders, and election activists, and gathered data on the characteristics of voters and nonvoters. They interviewed a random sample of nonvoters and, as Karl D. Berry notes in his 1974 book *Charles E. Merriam and the Study of Politics,* produced the "first major study in political science to use both random sampling and the statistics of attributes,

the book combine[d] new methodology and familiar concern in a fashion which startles the profession." In *Getting out the Vote,* Gosnell provided the first use of experimental methods to study voter turnout, finding that mailing reminders regarding upcoming elections to potential voters increased turnout. Another of Gosnell's works, *Machine Politics: Chicago Model* (1937), was the first book to use correlation, regression, and factor analysis in political science.

Gosnell is also remembered for his forward-thinking substantive research. *Negro Politicians: The Rise of Negro Politics in Chicago* (1935) was the first book on the subject of African American politics, and his *Why Europe Votes* (1930) provides an early account of cross-national voting.

After Robert M. Hutchins, a critic of behaviorialism, became president of the University of Chicago, Gosnell left the school for a position at the Office of Price Administration in Washington, D.C. He also served at the Bureau of the Budget and Department of State. Gosnell later served as an adjunct professor at American University, visiting professor at the University of Washington, and professor of political science at Howard University. He published four more books during this time, *Grass Roots Politics* (1942), *Democracy: The Threshold of Freedom* (1948), *Champion Campaigner: Franklin D. Roosevelt* (1952), and *Truman's Crises: A Political Biography of Harry S. Truman* (1980).

In 1995 the Harold F. Gosnell Prize of Excellence was established to honor his influence and legacy in the field of political methodology.

Governability

Governability can be defined as the capacity of governors to steer the ship of state toward its policy objectives. Policies depend for their success not only on what governments do but also on the responses of others that government can influence but not completely determine. First of all, policies must be framed within the limits of resources. Second, policies must be acceptable to those whose endorsement is required to turn intentions into law. Third, policies must secure cooperation from all involved in implementing them. If all of these conditions are met, then the actions of governors are effective, and the political system appears governable. If these conditions are met to some extent, then governability is difficult but achievable.

Ungovernability occurs when a policy exceeds the limits of resources, consent, and implementation. In extreme cases, maintaining order and protecting national boundaries are beyond the control of government. A government invaded by a stronger foreign army may be defeated, as happened to Iraq in 2003. However, the governability of an occupied country also depends on the support of domestic institutions and the cooperation of its citizens. In the extreme case of the East German Communist regime in the months after the fall of the Berlin Wall, ungovernability arose from the open defiance of its authority by East Germans who realized that their repressive government would no longer shoot or jail those who protested against it.

A MATTER OF DEGREE

The capacity of a government to achieve its policy objectives depends on its choice of goals, its political institutions, and the behavior of its citizens. Obstacles to governability are usually matters of degree. Each condition varies from one area of public policy to another as well as from country to country. Hence, societies and political problems are more or less governable.

The realistic choice of policy goals is a necessary condition of governability. What is realistic is affected by resources. The inability of low-income countries to finance major social benefits on the scale of Scandinavia is an obvious illustration. Low-income countries often lack the personnel to provide high-standard services to all their citizens. Some governments lack the transparency and integrity to administer foreign aid without favoritism and corruption.

Within a developed country, the annual budget cycle matches policy intentions with the money at hand. If there is a gap, governors have the choice of raising taxes to make more money available, scaling down their policy intentions, or inviting inflation by increasing the money supply. Population size affects personnel. A rich but small country such as Luxembourg lacks the people to carry out major large-scale scientific projects, while the European Union offers small countries the opportunity to pool resources to conduct big projects. Countries with hundreds of millions of people can mobilize resources selectively to achieve major goals. While the income of individual Chinese is low, the aggregate resources at the command of the one-party government of the People's Republic of China are very large.

The endorsement of policy intentions is more readily secured in a dictatorship than in a democracy. An arbitrary despot can threaten those who disagree with the loss of office, wealth, or liberty. Democracies vary in the extent to which institutions act as checks on the initiatives of the leaders of government. Federalism often requires approval at two levels of government. The separation of powers between the American president and Congress requires two federal institutions to agree. In the British parliamentary system, control of the executive and legislature is in the hands of a prime minister holding that office because he or she has the confidence and disciplined support of the majority in parliament. In parliamentary systems elected by proportional representation, government is usually a coalition,

thus requiring the endorsement of two or more parties before a policy proposed by the prime minister can become law. This makes governing more difficult as well as more consensual.

INTERDEPENDENCE

National government is part of an interdependent system that determines policy outcomes. It can influence but not control entirely what others do. For example, the governability of the education system depends not only on what policy makers decide and the resources it allocates but also on what teachers do in their classrooms and how their students respond. The success of a crime policy depends not only on what the police and courts do but also on the behavior of criminals.

Government policies for managing the economy have always depended on the response of a multiplicity of actors in the marketplace. These include business firms, trade unions, financial institutions, and individuals in their roles as workers and as consumers. Government can design policies to promote economic growth and full employment, but success depends on what economic actors do as well. The increasing internationalization of economic activity has made managing the national economy into an "intermestic" problem, because the economy is much affected by what happens outside national boundaries as well as domestically. Public institutions such as the European Union and the International Monetary Fund operate across national boundaries. Major banks now have offices in New York, London, and Tokyo, and automobile manufacturers have plants on three continents. Each institution has the capacity to influence one part of the global economy; collectively, they create obstacles to any government being able to command and control what happens in the international economic system.

Interdependence is even more important in determining the consequences of a national government's foreign policy; a foreign policy without foreigners is an empty domestic political gesture. In international relations, governments are very unequal in resources. Nonetheless, governability often depends on how others, state and nonstate actors such as al-Qaida, respond to the initiatives of the strongest powers.

To describe governability as a political problem is misleading if this is taken to mean that there is a solution. Instead, governability is better understood as a condition of contemporary governance. Challenges to governability have increased because the intentions of governors and popular expectations have expanded as well as resources.

Governance

Good governance requires representation and effectiveness. A representative government, if it is not effective at decision making, may generate frustration and conflict among different groups. In turn, administrative effectiveness, if it is not based on fair representation of the society, can be counterproductive, since it may produce arbitrary governmental decisions against the citizens' majority preferences. However, the neologism *governance* emerged in political science and public administration studies in reference to a set of institutional rules, coordination, and decision-making processes aimed at attaining effectiveness in defining collective goals, making priorities, and producing outcomes as, in a similar way, one can talk of private corporate governance, rather than of representative government.

Concern with governance has grown with changes in the environment of existing governments and the subsequent worsening of their performance. Recent processes of increasing internationalization, usually labeled "globalization," and intensification of societal complexity have indeed undermined the basis of traditional territorial jurisdictions and hierarchical, top-down coordination mechanisms. They have caused different forms of state decline, state restructuring, or state failure. In the new environment, good governance requires larger and more diversified territorial scopes of public policies and a new functional specialization and fragmentation of policy-making and political institutions.

CAUSES OF UNGOVERNABILITY

Put in more theoretical terms, recent concerns with governance reflect a decreasing fit between institutional structures and recurrent patterns of behavior in the environment of these structures—a situation that may emerge in human history in different places and times. The current perception of a decreasing performance of state-centered governance can be attributed to three different processes: (1) increasing internationalization of human exchanges and relationships; (2) state failures, provoked by excessive demands on governments, excessive state intervention, and the fiscal crisis of the state; and (3) the failure of certain states.

INTERNATIONALIZATION

Increasingly, the world is becoming organized into a number of vast transnational areas of "imperial" size going beyond the limits of traditional nation-states. First, broad military and security alliances, such as the North Atlantic Treaty Organization (NATO), provide an international umbrella for collective security that makes traditional state armies inefficient or even unnecessary. The change of scale is especially necessary in order to face new threats from international terrorism and the diffusion of weapons of mass destruction. Second, transnational trade agreements proliferate, such as the European Union (EU), the North American Free Trade Agreement (NAFTA), the Southern Common Market (Mercosur), and the Association of South East Asian Nations (ASEAN). Virtually no country in the world remains outside some formal

international trade agreement, especially under the sponsorship of the World Trade Organization (WTO). Widespread currencies, such as the dollar and the euro, and international monetary policies make traditional states obsolete in their task of shaping and protecting markets and inefficient in governing the economy.

Dramatic reductions in the costs of transport, especially by air, and of communications, especially by telephone and the Internet, have greatly favored these new developments. Just as other technological changes in the past (like gunpowder or railways) induced the formation of relatively large states and made them viable, others are now creating larger areas of human relations that make traditional states too small for efficient performance.

At the same time, transnational processes create new opportunities for local political units of small size to develop their self-government. Specifically, the larger the markets, the more regionalized the economic activity tends to be. In general, economic differences across the territory increase with internal integration, which tends to foster territorially differentiated political demands. Also, *linguae francae,* such as English and others, permit human beings to develop broad communications while maintaining their own local languages and cultures and avoiding the costs of forced homogenization typically imposed by large nation-states. Indeed the number of independent countries has increased dramatically since the early twentieth century, leading to an overall decrease in the size of countries, a process that has developed in parallel to the diffusion of democracy across the world. Decentralization of large states, diverse forms of asymmetric federalism, and the independence of small political units, while they undermine traditional nation-states, also favor the introduction of new forms of democratic governance.

STATE FAILURES

Warning calls regarding the problems of the state to cope with the tasks with which it was confronted began to rise during the 1970s. They were triggered by both increasing political unrest in mature democracies and a new period of economic stagnation. An early report on the governability of democracies, which was addressed to the Trilateral Commission dealing with problems in Western Europe, Japan, and the United States, remarked on the "overloading" of government. The authors identified at the time three main sources of concern: increasing demands from diverse social groups, increasing public expenditure, and the decomposition of political party systems, provoking the vanishing of single party majorities in legislatures (and "divided government" in the United States). They concluded that "the demands on democratic government grow, while the capacity of democratic government stagnates."

A specific failure was the management and performance of state-owned enterprises. Especially after World War II (1939–1945), many private companies were expropriated and managed by government officers, not only in communist-dominated countries but also in a number of Western European democracies under labor or social-democratic governments, most

prominently in Britain and France. It can be estimated that in the peak year of 1982, counting both communist and non-communist countries, about one-third of total world output was produced by state-owned enterprises, while more than 40 percent of the world's wage earners were state employees. In noncommunist countries, state-owned enterprises experienced lower productivity increases than private enterprises, as could be observed when they were compared with private enterprises of the same sector in other countries. The average deficit of state enterprises was about 19 percent of their output by the mid-1970s. In order to maintain activity and employment, state enterprises received huge amounts of transfers and subsidies from central governments, and this money had to be extracted from resources in other sectors of the economy.

More generally, a new strain of academic literature focusing on state failures remarked that not only state-owned enterprises but also most state agencies formed to provide public services were oversized and socially inefficient, because they were controlled by self-interested politicians and high-level bureaucrats interested in expanding the state. In this approach, it is assumed that while politicians usually do not give priority to economic efficiency (but rather to political power), nonaccountable bureaucrats tend to expand the size of the bureaucratic apparatus and inflate personnel, which, like any inefficient monopoly, produces low production and absorption of profits. "State failures" became the other side of traditionally identified "market failures" in the provision of public goods.

Finally, as a consequence of its overload and excessive size, the state experienced a fiscal crisis, as has been identified since the 1970s from different and even opposite intellectual platforms. From a perspective critical of the capitalist system, it was remarked that the requirements of "capitalist accumulation" contradict those of "legitimation," given the sustained tendency for public spending to outpace revenue. From a new conservative perspective, criticism of tax-and-spend policies provoked political and electoral revolts against parties and politicians favoring high taxation. Currently, the bulk of public expenditure in most European countries depends on broad social security systems, especially old-age pensions. Specifically, in continental Europe, social spending amounts to more than 30 percent of gross domestic product (GDP). The state has the dilemma of choosing ever increasing tax burdens—a choice that encounters political resistance—or cutting back public spending programs.

FAILED STATES

As reviewed above, bad governance can be linked to some blatant state failures, especially in high-income countries. But in other parts of the world, rather than state failures, there are failed states. In contrast to the former, the latter are undersized and insufficiently operative states.

The better-established states are the few units that have been accepted as members of the Organization of Economic Cooperation and Development (OECD), since, according to the organization's criteria, they must share a commitment to democratic government, good governance, and a market economy. In total, there are thirty such states, of which twenty-three are

in Europe, three in North America, two in Asia, and two in Oceania. Elsewhere, the attempts to build sovereign and effective states have been much less successful. Good governance in a state requires indeed an extremely costly initial accumulation of resources into the hands of the public authority, a condition detrimental to the opportunities for private initiatives, at least at some foundational stage. Building a new public administration able to impose order, guard the borders, and collect taxes over a large territory requires heavy, labor-intensive investments, which may imply net losses for the economic activity of the subjects. Only when the size of the bureaucracy is sufficiently large can it be more technology intensive and produce outputs with net social benefits. Many countries have not reached such an advanced stage of statehood development. In particular, a number of former colonies and other deprived territories without administrative resources have been unable to achieve minimum levels of state effectiveness and governance.

In several dozen countries at the bottom of the scale of statehood, the government has actually ceased to function, if ever it did. This implies that the central rulers have no control over most of the state's territory; they are ineffective in collecting taxes; they do not provide even the most basic goods and services (not even money coinage, for instance); there are epidemic diseases, widespread crime, disorder, rebellions, ethnic civil wars, and frequent interstate border conflicts; natural disasters become highly destructive; and masses of people emigrate, up to the point that emigrants' remittances become the first source of income for natives. There are several accounts of failed states in the current world, including the World Bank's list of between thirty and forty "fragile, collapsed, or failing states," its list of states in internal conflict called LICUS (low income countries under stress), and Britain's Department for International Development's list of forty-six "fragile states" of concern. Most of these states are located in Central and West Africa, the Middle East, Asian territories of the former Soviet Union, Central America, the Caribbean Sea, and the Andean region.

NEW GOVERNANCE

The decline or failure of governance in the framework of traditional states implies economic inefficiencies, bad governmental performances in providing public services, and democratic deficits in the form of low levels of rulers' control and accountability. Subsequent responses have attempted to address these concerns.

INTERNATIONAL GOVERNANCE

Increasing relations beyond the traditional limits of nation-states require certain worldwide institutional arrangements, including international organizations such as the International Monetary Fund (IMF) and the WTO, interstate agreements, and common practices such as arbitration. But as transnational exchanges and relationships develop within large world regions, such as North America, Europe, or Asia, rather than as true "globalization," it also makes other complex institutional arrangements highly relevant. At continental scale, multilevel governance implies a set of overlapping jurisdictions in which

no authority rules with exclusive powers. Rather, the central government may rule indirectly through local governments, the latter may develop self-government on important issues, and power sharing can be widespread.

The EU is a case in point in order to discuss how to overcome the so-called democratic deficit. At the European level, the Council of Ministers, which represents the citizens of each country through their own institutions, can be considered an upper chamber of territorial representation of a federal-like type. Accordingly, the council is increasingly made up of representatives of not only the state governments, but also the substate, regional governments and parliaments. Likewise, the European Parliament, whose members are chosen directly in Europe-wide elections, can be considered the lower chamber, the representative institution of the European citizens. In fact both chambers, the council and the parliament, develop significant legislative powers and mutual vetoes. Since the council and the parliament are elected separately and by different rules, they tend to have different political party majorities, and the corresponding interinstitutional decisions tend, thus, to be based on very broad agreements. In turn, the European Commission, which is appointed by the two parliamentary chambers, can be considered the EU's executive, but it shares powers with those at the other levels.

The current institutional arrangements of the EU create new opportunities for representation and decision-making power of different territorial governments. The officially adopted principle of "subsidiarity" favors the allocation of decision-making power to the smallest political unit capable of dealing effectively with the corresponding issue, although the subsequent distribution of powers is subject to case-by-case specifications. Transnational cooperation also develops across state borders, leading to the formation of euro-regions and leagues of cities. As borders, customs, police controls, and exchange offices have vanished, neighboring regions located on either side of state frontiers tend to coordinate their common interests and develop "good practice" solutions.

In this multilevel framework, traditional interstate direct relations and cooperation, based on a mutual recognition of sovereignty, are being replaced with more complex relations among states, euro-regions, regions, metropolitan areas, cities, and other structures. The traditional model of the sovereign state was a Procrustean bed pretending that one size fits all. In contrast, different territorial scales appear to be efficient for the provision of different collective goods to be consumed and financed by human groups of different size.

NEW PUBLIC MANAGEMENT

In response to state failures, a number of proposals to improve corporate management of public administration in the provision of public services have been highlighted since the 1970s and 1980s. Specifically, there have been widely diffused proposals to introduce private sector management methods and market rules into the public sector. State managers should be made more accountable (a problem previously identified regarding managers of big private companies), public agencies should compete among them, and state-owned enterprises

should be required to produce returns as if they were private firms operating in competitive markets, especially through contracting out, quasi-markets, and consumer choice.

With this, both politicians and citizens (or consumers) were bound to ask why, if state-owned enterprises were to work like private enterprises, should they be state owned at all. A new proposal was, thus, *privatization* (in fact, in many cases, re-privatization), a word that had been coined with this purpose in 1968. State governments have been indeed downloaded and downsized. During the 1980s and 1990s, there were more than 4,000 privatizing transactions, valued at more $1 trillion, in more than 100 countries. By 2000, the share of state-owned enterprises in the gross domestic product had been reduced to less than half its previous value in high-income countries (from 10 to 4 percent), less than one-third in low-income countries (from 16 to less than 5 percent), and less than one-sixth in former communist European countries (from more than 90 to less than 15 percent). Divested firms almost always became more efficient and more profitable, increased their capital investment spending, and became financially healthier than state-owned enterprises (with the major exception of Russia), according to a review of twenty-two empirical studies on privatization.

In a parallel campaign, international organizations, private think tanks, and certain political leaders argued that the civil service should reduce staffing, introduce budgetary discipline, decentralize administration, and make greater use of nongovernmental organizations. In a number of countries, public officers and bureaucrats were submitted to performance measures such as managing by results, value for money, and closeness to the consumers.

The creation of networks has been highlighted as a particularly innovative way to improve service delivery systems. *Networks* in this sense are combinations of government with the private and voluntary sectors, including local authority, central government, unions, and business. They can be conceived of as a form of social coordination and allocation of resources based on trust and cooperation among varied actors, and they differ from traditional models of policy making based on either hierarchy or markets. Networks are self-organizing and develop diplomacy, reciprocity, and interdependence. However, they have also been blamed for being unrepresentative, closed to outsiders, unaccountable for their actions, and prone to serve private rather than public interests.

Finally, the fiscal crisis of the state was responded to with claims for fiscal responsibility. The policy of balanced budgets—that is, to equate the public revenues with public expenditures over the business cycle—was adopted as mandatory by most states of the United States during the 1980s and the 1990s. The EU requires member states using the euro to have an annual deficit of no more than 3 percent of gross domestic product. The IMF has made balanced or near-balanced budgets a condition of aid to some low-income countries.

SUCCESSFUL STATES?

Among other virtues, the recent discussion on governance has challenged certain traditional statements about the advantages of statehood. Contrary to some conventional knowledge,

sovereign statehood does not appear to be a necessary condition for good democratic governance. Indeed, democracy—in the sense of free elections and control of rulers by broad layers of citizens—had already existed in numerous local communities in the ancient and medieval world, long before the notion of state was invented, and democracy is now practiced in many private organizations, in several hundred democratic but nonsovereign local and regional governments, and in transnational institutions such as the European Parliament.

Historically, most of North America, Russia, and Asia kept very large compound republics or empires for long periods and were unacquainted with the Westphalian model of sovereign nation-state. It was in Western Europe that a few large, robust states were built by affirming their own sovereignty vis-à-vis other states. But, after long periods of continuous interstate and civil wars and conflicts, only in the second half of the twentieth century did Europe achieve an institutional equilibrium able to provide democratic governance, peace, and prosperity by building a very large union based on military, commercial, monetary, and political cooperation among states.

In large parts of Latin America, Africa, and the Arab region, former European colonies tried to replicate the Western European model of sovereign nation-states, but the failure of a high number of states in those regions seems unquestionable. Bad governance in these countries implies not excessive intervention, as is claimed for high-income countries, but lack of rule of law and insufficient provision of public goods. So far, institutions such as the Organization of American States (OAS), the African Union, and the League of Arab States have been revelations of intention and hope more than effective organizations. But, in the absence of operational states, building and putting into effect large institutional networks of this sort might be, as it was in Europe, the best way to attain stable good democratic governance in those parts of the world.

Governor

In the United States, each of the fifty states has a governor who serves as the leader of the executive branch. The power and influence of the governor varies from state to state. In general, the governor has the authority to veto legislation, activate the state's National Guard, and grant pardons.

One area of great variance among the states is the ability of the governor to appoint members of the executive branch of state government. The governor in 48 states may appoint members of the executive branch with state senate approval; in Massachusetts, such appointments may be made with the approval of the state's Governor's Council or no other approval, and in New Hampshire, such appointments may be made with the approval of the state's Executive Council. Some states allow the governor and lieutenant governor to run on the same ticket, while other states have separate elections for the two offices. Other important state offices such as those of attorney general, state auditor, and secretary of state are often elected positions. The powers of governors and other elected officials in each state's executive branch are typically defined by the state's constitution and vary among the states.

Over the past fifty years, the nature of governorships has changed due to a push during the progressive era to increase the state executive's power. Examples include a lengthening

of terms; only two states have governors serving terms of less than four years. In all states except Virginia, a governor can run for reelection. The governorship is increasingly becoming a stepping stone to the U.S. presidency. In each presidential election since 1976, a governor has been one of the two major parties' nominees for president or vice president.

Gramsci, Antonio

Antonio Gramsci (1891–1937) was an Italian journalist, activist, and theorist who developed an alternative Marxist political analysis. Although the concepts Gramsci contributed were somewhat obscure during his life, they were later viewed by many as the most important developments in Marxist thinking of the twentieth century.

As a young journalist, Gramsci wrote and edited a number of Italian socialist papers focusing on political developments such as the rise of fascism. Later, after being arrested in 1926 and imprisoned by fascist dictator Benito Mussolini, Gramsci wrote his famous *Prison Notebooks* (1929–1935), which are more philosophical than his earlier works and are the basis for the contemporary assessment of his ideas. As these works demonstrate, his major theoretical break with early forms of Marxism was that he rejected economic determinism, or the notion that economic factors drive social and political changes. Instead, he placed more emphasis on the roles of culture, ideology, and human agency in explaining historical development.

Gramsci explored the social basis of ruling class domination in society, suggesting (in perhaps his key insight) that it was grounded in hegemony. For Gramsci, hegemony combined traditional forms of economic and coercive (or violent) forms of domination with intellectual and moral leadership that made domination seem "natural" to the dominated. He also believed hegemony had to be constructed and struggled over, as it was possible for other classes in society to pursue their own hegemonic ambitions. Indeed, Gramsci felt that for the working class to challenge the hegemony of capitalists, they would need to organize ideological alliances with other societal groups supportive of the interests of the working class—a counter hegemony. Espousing a theory perhaps more appropriate to modern democratic societies then other Marxist political strategies, Gramsci argued that through a war of position, the working class, engaged in a long ideological and organizational struggle, could undermine the cultural domination of the ruling class.

This focus on ideas and culture as key sites of social struggle also led Gramsci to place considerable emphasis on the role of intellectuals (allied to different classes) in helping to construct or undermine a particular hegemony and also to develop the distinction between civil society (the nonstate sphere of the social world) and the state in capitalist hegemony—challenging capitalism required ideological organization in civil society.

The twenty-first century popularity of Gramsci in political science and international relations is due to the fact that his

Marxist analysis fits well with other contemporary currents in political philosophy—in part because Gramsci influenced later thinkers like Michel Foucault. Gramsci's ideas seem not only a more accurate description of the world as it works (compared to economically deterministic Marxism) but also appeal to other social theorists who emphasize the role of culture and ideology in political struggle. However, views of his most important intellectual contribution vary. For cultural historian Raymond Williams, a popularizer and critic of Gramsci's ideas in cultural studies, Gramsci's focus on culture and ideas is key. For political philosopher Renate Holub, Gramsci's value is the extent to which he overcomes some of the limitations of much postmodern political thought. For scholars of international relations, like Stephen Gill, Gramsci's primary contributions are the crucial concepts, like those of hegemony and civil society, that are used to understand contemporary global order.

Great Power

For centuries, scholars have noted the international importance of powerful states. Today scholars differentiate international systems according to the number of great powers. Most scholars agree about how great power should be measured and which states are likely to be great powers in the coming decades. Debate centers on why individual great powers rise and fall and on how the rise of new great powers will affect international conflict and cooperation.

THE IMPORTANCE OF GREAT POWERS
According to structural realists, great powers matter for three reasons. First, as Kenneth N. Waltz explains in *Theory of International Politics* (1979), in the absence of an international sovereign, powerful states "set the scene of action for others as well as for themselves" (p. 72). In other words, as Thucydides noted in his account of the Athenian conquest of Melos in 415 BCE, "The strong do what they can and the weak suffer what they must" (*History of the Peloponnesian War,* bk. 5). The suffering caused by powerful states can be deliberate or inadvertent. Great powers frequently conquer and coerce weak

states. In addition, they often seem like the proverbial bull in a china shop—insensitive to the damage they do.

Second, as Waltz explains, "Great power gives its possessors a big stake in their system and the ability to act for its sake" (1979, 195). Given international anarchy, there is no guarantee that great powers will accept this role or, if they do so, that their approach to collective goods problems will be satisfactory. Power is not the same as control. But powerful states are the actors best situated to address collective goods problems such as "the four '*p*'s"—poverty, population, pollution, and proliferation" (Waltz 1979, 209).

Third, in pursuing their interests and molding the international system to their liking, great powers often threaten other states, which respond by trying to balance their power. Thucydides noted this phenomenon in the Peloponnesian War (431–404 BCE), when the Athenian conquest of Melos stoked Sparta's conflict with Athens. Together, the temptation to use power and the inability to foresee the consequences of its application have led scholars to characterize the actions, interactions, and fates of powerful states as tragic or paradoxical.

Structural realists are not alone in seeing great powers as the main actors on the international stage. For neoliberal scholars such as Robert O. Keohane and Joseph S. Nye, constraining great powers and helping them solve the security dilemma is essential to global governance. According to hegemonic stability theorists such as Charles Kindleberger, a robust international economic system requires a powerful state willing to establish and enforce economic rules and pay a disproportionate share of the costs.

POLARITY AND THE RISE AND FALL OF GREAT POWERS
Because individual great powers have the capability both to wreak havoc and to spearhead collective efforts, international conflict and cooperation are strongly affected by how many great powers exist in a particular era. Scholars distinguish among systems of three or more great powers (multipolarity), two great powers (bipolarity), and one great power (unipolarity). Within each system, individual great powers may rise and fall.

What causes great powers to rise and fall is a matter of debate. Some scholars, such as Amy Chua, argue that states become great powers when they espouse certain political, social, or cultural norms such as tolerance. By contrast, Robert Gilpin, George Modelski, and William R. Thompson argue that certain states initiate waves of technological innovation that crest with military and industrial dominance and then dissipate with emulation. Other scholars, such as Paul Kennedy, argue that great powers fall because they overreach.

MEASURING POWER AND ANTICIPATING THE RISE OF NEW GREAT POWERS
According to Waltz, which states are great powers is more or less self-evident, with states ranked according to "how they score on *all* of the following items: size of population and

territory, resource endowment, economic capability, military strength, political stability and competence" (1979, 131). Since the decline of the Soviet Union, the United States has been far ahead of all other states in terms of Gross Domestic Product (GDP), military spending, and worldwide military and diplomatic presence.

Although realists are often described as only or primarily concerned with military power, most realists actually measure power at least partly in terms of economic capability, which can be converted into military, diplomatic, and other capabilities as needed. But even economic power does not tell the whole story. Today the European Union (EU) surpasses the United States in GDP. But the EU does not have the political capability either to speak with one voice or deploy its military under one authority. Similarly, although the Chinese and Indian economies are growing rapidly, the former is more likely to face internal constraints than the latter, due to its aging population.

By reflecting on international history and sifting through the economic, military, political, and other capabilities and attributes of contemporary states, most analysts have come to the conclusion that, over time, the United States will lose its unipolar status. This could occur in one of three ways: through the absolute decline of the United States (the erosion of its economic and military capabilities); through the relative rise of today's middle powers (their economic growth and commensurate political and military involvement); or through some combination of the two. When and how this will occur are open questions.

According to realists, in the nuclear era, the rise of new great powers is likely to be met with less military resistance than the rise of great powers in the conventional era, when wars related to power transition were common. This is because the declining great power, the United States, is a nuclear state, and all of the middle powers that could rise in the medium term—China, the EU/Germany, India, Japan, and Russia—either have nuclear weapons or could quickly develop them. Thus, like the United States and the Soviet Union during the cold war, the old and new great powers are likely to limit their military encounters to proxy wars on the periphery of international politics, that is, in the contested territories of the world.

According to liberals and constructivists, the relations of twenty-first century great powers will be most strongly affected not by polarity or nuclear weapons but by their internal attributes (for example, their democratic or authoritarian institutions) and by the norms and institutions of the emerging international system.

Great Society

The Great Society was the general term for U.S. President Lyndon B. Johnson's package of domestic reforms, which were enacted by a Democratically controlled Congress in the mid-1960s. The Great Society programs were initially proposed in 1964 as part of the president's efforts to improve racial equality and eradicate poverty in the United States. Many of the economic and social programs enacted became part of Johnson's War on Poverty. The Great Society programs were designed to complement and expand on the New Deal of Franklin D. Roosevelt as well as to finalize a number of policy initiatives begun under President John F. Kennedy.

A series of measures were enacted to improve racial and gender equality, including the Civil Rights Act of 1964, the Voting Rights Act of 1965, and the Civil Rights Act of 1968. Over a three-year period between 1964 and 1967, more than $3 billion—an enormous sum at the time—was spent on poverty reduction programs, including education and worker training initiatives as well as the creation of the U.S. Department of Housing and Urban Development and the Office of Economic Opportunity. The Great Society also included the creation of public health care insurance programs for the elderly (Medicare) and the poor (Medicaid).

Greek Democracy, Classical

Etymologically, the term *democracy* stems from *demos,* "the people" and *kratos* "rule." In the long history of democracy, ancient Greek forms were distinctive in providing their members with direct rule, unconstrained by

representatives. There were many Greek democracies, and there were significant differences between them. But in most if not all instances, rule of the people was effected through large political institutions open to male citizens, generally a public assembly and public courts. Democratic cities also had magistrates and other officials, but these generally served short terms and, at the end of their terms, were subjected to public examination. At these sessions, any citizen could lodge a complaint. In addition, magistrates were generally chosen by lot, as the Greeks viewed election as an oligarchic practice, since it favored candidates from well-known or wealthy families.

DEMOCRACY AND DEMAGOGUES IN ATHENS

The largest and most important democracy was Athens, about which we also have the fullest information. In Athens, democratic reforms were initiated in the sixth century BCE by Solon and Cleisthenes. All adult male citizens were eligible to attend the assembly and to speak and vote on the fundamental matters of state that were decided upon after a few hours of open debate. The assembly's agenda was overseen by a Council of 500, members of which were chosen by lot from Athens' ten tribes. This body was divided into ten parts or committees (*prutaneis*). Each committee sat for one-tenth of the year, with one member chosen by lot to be in charge and to be, formally, head of state for a single day.

Service on juries was open to all male citizens, with service on these large bodies—up to 2,000 members—also determined by lot. In the absence of an appeals process, decisions by juries were final. Magistrates were generally chosen by lot, but on the whole exercised little power. The main exceptions were ten generals, who were elected annually and combined important military and political functions. All magistrates were under additional popular control, through scrutiny before selection and through examination at the end of their terms. Over the course of its history, the Athenian democracy became increasingly democratic. Additional functions were turned over to popular institutions, while political participation increasingly came to be paid. Pay for jury service was initiated by Pericles (ca. 462 BCE) and payment was later extended to participation in the assembly and eventually for attending the theatre.

Given the large size of major political institutions, decisions in democracies were decisively influenced by the ability to make speeches and so to sway these bodies. One term used to refer to politicians was *rhetors.* Demagogues—literally "leaders of the people"—were able to influence policies, mainly through their ability to sway the assembly, which in turn depended heavily on the demagogues' prestige and reputations for providing sound advice. In Athens, it was through these factors rather than the offices he held that Pericles dominated politics for some thirty years in the mid-fifth century (ca. 461–429 BCE).

ANTIDEMOCRATIC PHILOSOPHERS

Because the major Greek political philosophers—Thucydides, Plato, and Aristotle—were from elite backgrounds and held generally antidemocratic sentiments, the tradition of ancient political philosophy is highly critical of democracy. These figures generally viewed democracy as rule by the poor and uneducated, which was not only inherently unjust to their betters but also led to unsound political decisions. Especially bitter criticism is presented in Plato's *Gorgias.* Plato criticizes the politics of oratory. Political success is based on catering to people's appetites, telling them what they want to hear, rather than offering sound advice. In Athens, this generally meant favoring imperial expansion and increased public employment, contributing to a bloated, festering city.

Along similar lines, a major theme of Thucydides' *History of the Peloponnesian War* is the irrationality of the demos, which led to disastrous policies and contributed heavily to Athens' eventual defeat. In Thucydides' eyes, Athens' power and greatness resulted from the restraining hand of Pericles. Though Athens was officially a democracy, during this period, it was actually ruled by its first citizen. Thus Pericles' death—in the beginning years of the war—ushered in a period of decline along with infighting among his would-be successors.

Aristotle too is critical of extreme democracies. In the course of analyzing myriad Greek democracies, he distinguishes different kinds based on how inhabitants live. His preference is for cities that are heavily pastoral or agricultural, because citizens' work draws many of them away from the city center and prevents them from attending the assembly. The worst form is encountered in large commercial cities, which effectively turn over political power to the mob. According to both Aristotle and Thucydides, the best constitution Athens enjoyed is the moderate oligarchy that was instituted for a time in the closing years of the Peloponnesian War (431–404 BCE), in which the franchise was restricted to the 5,000 wealthiest citizens.

CONCLUSION

This barrage of criticism, at least in regard to Athens, must be recognized as unfair—although the extent to which similar factors held in other cities is subject to debate. Like other democracies, the Athenian system gave the average citizen unparalleled rights of political participation. A large percentage of the citizens were active in political affairs, in accordance with the Greek ideal that ruling and being ruled in turn is one of the highest forms of life. On the whole, the Athenians exercised their power well. In spite of the overall turmoil of the Greek political world, Athenian democracy was generally stable for some two centuries. The main outbreaks of instability were oligarchic seizures of power in the closing years of the Peloponnesian War, in 411 and 404 BCE. When the oligarchs had been defeated, in 403 BCE, the Athenians enacted a generous amnesty, which quickly restored a measure of social harmony.

Direct participatory democracy in Athens and other cities was made possible by their small size. Population estimates are necessarily rough. A reasonable estimate for Athens at its peak would be 30,000 to 40,000 male citizens. Including women and children, this figure would be 110,000 to 150,000. The entire population, including metics (foreign residents) and

slaves was perhaps 300,000, while the populations of other cities were much smaller. In Athens, as in other Greek cities, citizenship depended on birth. Athenian citizenship required that both parents be Athenians and was virtually impossible otherwise to attain. Accordingly, although democracy provided enormous advantages to male citizens, they were a relatively small percentage of the overall population. In spite of its inclusiveness, Greek democracy excluded most inhabitants.

Greek Political Thought, Ancient

Ancient Greek political theory originally centered on the *polis,* the distinctive Greek city-state. Greece is naturally divided into relatively small, self-contained territories, many of which are islands in the Aegean Sea. Each area formed its own politically independent society, the polis. The polis was generally viewed as a moral union. Its educational function was to raise its citizens to the conception of virtue embodied in its laws or customs. The Greek word *nomos* (plural, *nomoi)* means both "laws" and "customs," which by traditions were divinely rooted. The small size of Greek communities allowed many to develop direct democracies and so to give rise to the Greek ideal of ruling and being ruled in turn as one of the highest forms of human life.

Because of the centrality of the polis, when Greece was conquered by Macedon, in the late fourth century BCE, and the no longer autonomous polis ceased to be the center of existence, Greek political theory underwent a fundamental shift. The Hellenistic period (in contrast to the earlier "Hellenic") dates from the loss of Greek independence. The date conventionally used is the death of Alexander the Great (323 BCE). The term *Hellenistic* is from the Greek *hellenizein,* to speak Greek. The conquests of Alexander united much of the Mediterranean world in large political units or empires. This area literally began to speak Greek, as Greek culture spread throughout this overall region, and moral and political

Plato, left, and Aristotle walk the halls of the School of Athens and discuss philosophy. The two men's political teachings emphasized ethics in politics.

theorizing was carried on by the great Hellenistic schools, the Stoics and the Epicureans.

Hellenic political theory, epitomized in works of Plato and Aristotle, provides conceptions of the relationship between the individual and society sharply different from those of contemporary Western views. While the liberal tradition conceptualizes the individual apart from society, endowed with rights that are not granted by society, the Greeks integrated the individual much more into society. As classically argued in Aristotle's *Politics,* the polis is "prior to" the individual. Because he can achieve full development only as a member of a polis, a man is a "political animal." Remove a person from the polis, and he is no longer really a person, as a pawn removed from a chess set is no longer a pawn but simply a piece of wood.

Degrees of individualism varied in different societies. Commercial, democratic Athens had a thriving culture, with individuals—only adult male citizens—given a certain degree of freedom to live as they pleased. On the opposite pole was highly militarized Spartan society, which devoted enormous efforts to turning its citizens into indomitable soldiers. In Sparta, children were taken from their families at the age of five or six to be raised and educated communally under harsh conditions that would ensure toughness. Citizens had plots of

land, farmed by helots—essentially serfs—while they devoted themselves to military training. Commerce was minimal, and gold and silver forbidden. Meals were eaten at common tables, while the state intruded into family life in many other ways. As a result of this system, Spartans were famous throughout Greece for their bravery and their willingness to place the interests of their community before their own. Plato and Aristotle, the greatest Greek political theorists, were from upper-class backgrounds. Highly critical of extreme democracy, they were attracted to Sparta and its ideal of state-inculcated virtue. The influence of Sparta is apparent in Plato's *Republic* and *Laws.* Especially as described in Plutarch's life of Lycurgus, Sparta has epitomized a virtuous society ever since.

BEGINNINGS

The tradition of Western political theory began in ancient Greece. An impulse similar to that which led early philosophers such as Thales and Anaximander to inquire into the nature of the universe led other thinkers to raise questions about the nature of political association and the laws and customs of societies. One factor prompting questions about the nature and status of nomoi was contact with other societies, which led to the discovery that many Greek norms differed from those of other peoples. A common effect of such contact was moral relativism, a belief that nomoi rested solely on convention. Traditional Greek norms of justice required not oppressing the downtrodden, as commanded by the gods. But these claims were called into question by relativism. A sophisticated relativistic position was advanced by Protagoras of Abdera, perhaps the greatest of the Sophists, itinerant Greek teachers of rhetoric and other arts, who played an important role in the development of democracy. Protagoras declared that "man is the measure of all things" and doubted our ability to know about the gods because of the difficulty of the subject combined with the shortness of human life. In regard to standards of proper conduct, Protagoras argued that there is no truth beyond social conventions, and so one should adapt to those of one's society.

But other thinkers searched for moral norms rooted in something more substantial than convention and so opposed "nature" (*physis*) to nomos. The Sophist Antiphon argued that the only sanction of human norms was fear of punishment, while by nature, every creature seeks its own advantage. Therefore we should adhere to social norms only for fear of being caught; if we can break the rules undetected, we should do so. An alternative to the traditional view of justice was visible in the animal kingdom, and so thinkers argued for the naturalness of the law of the jungle. A full-fledged immoralist doctrine is expressed by Callicles, a probably fictional character in Plato's *Gorgias.* What we regard as rules of justice were devised by the weak to prevent the strong from oppressing them. Genuine moral standards require that the strong allow their natural tendencies to be unleashed. They should subordinate the weak and have more—have large appetites and the ability to satisfy them. The first occurrence of the phrase "law of nature (*nomon . . . ton tês physeôs*)" in Greek prose occurs in a one of Callicles' speeches in the *Gorgias.*

Evidence of the influence of such views is found in Thucydides' *History of the Peloponnesian War.* As presented by Thucydides, figures on both sides of the conflict defend their objectives with norms of power politics. This attitude reaches its peak in a dialogue Thucydides recounts between representatives of Athens and of the island of Melos. The Athenians demand that the Melians submit to them and so forfeit their independence, supporting their position by appeal to the rule that everyone recognizes in such cases: The strong do what they will, and the weak suffer what they must.

SOCRATES AND PLATO

Countering relativism—not only moral but epistemological—was central to Socrates' philosophical endeavors and to the mission of moral reform to which he devoted his life. According to Plato, Socrates claimed to be ignorant, not to possess the all-important moral knowledge he sought. However, he was superior to other Athenians in recognizing his own ignorance and so knowing that he should seek it. Socrates therefore attempted to waken his fellow citizens to their ignorance, so they would join his search. Although Socrates was similar to the Sophists in various ways, he broke with them in believing in somewhat traditional rules of justice. More than this, he claimed that justice is both necessary and sufficient for happiness. In the *Gorgias,* Plato has him argue that to do wrong (*adikein*) is worse than to suffer wrong (*adikeisthai*), because wrongdoing damages one's soul. Socrates himself steadfastly refused to do anything he viewed as wrong, and so he allowed himself to be executed rather than commit the injustice of escaping from prison.

Although Socrates apparently did not develop a systematic political philosophy and, as an exclusively oral teacher, did not produce a conventional body of philosophical works, he did have important political views. His faith in the power of knowledge found expression in sharp criticism of Athenian democracy, because its method of distributing political offices through a lottery system turned over important matters of state to people unqualified to deal with them. Socrates also criticized democracy, because the people were volatile and easily swayed by emotion. This is one reason he avoided public life, approaching his fellow citizens in a private capacity, like a father or an elder brother. On one occasion when he served in the Athenian Council, he unsuccessfully attempted to prevent the assembly from taking a popular but clearly illegal action, at considerable risk to himself.

Greek political theory achieved its culmination in the works of Plato and Aristotle. In his autobiographical *Seventh Epistle,* Plato describes his desire to enter politics as a young man but how he was disillusioned by successive regimes he viewed as unjust in the closing years of the Peloponnesian War. In this epistle, Plato claims that, given the corruption of existing societies, the only possible good society is one that combines political power and wisdom, and so in which philosophers rule as kings. The overall pattern for Plato's political theory is visible here. He was sharply critical of Athenian democracy, and throughout his life, he proposed different alternatives in which the polis would return to its

traditional role of educating citizens to make them as virtuous as possible.

Irresolvable problems of interpretation follow from Plato's use of the dialogue form, with Socrates generally as his main spokesman. The "Socratic problem" is the problem of distinguishing between Plato's representation of the historical Socrates and his use of Socrates as a spokesman for his own ideas. The influence of Socrates appears most strong in Plato's early works, many of which end in puzzlement or *aporia*. Following the pattern of the historical Socrates, the Socrates of these dialogues raises questions about the nature of moral knowledge, and he is frequently depicted as unsuccessfully attempting to define different virtues. These dialogues also develop Socrates' criticisms of democracy. An especially bitter denunciation is presented in the *Gorgias,* which examines rhetoric through Socrates' questioning of Gorgias, a famous teacher of this art. Socrates unmasks rhetoric as a kind of pandering. It is an art of telling people what they want to hear, rather than what is good for them, and works only because they are too ignorant to understand their real interests. In a contest before a jury of children, the physician who tells people unpleasant truths will always lose to the rhetor, who offers them sweets. Much admired politicians—Miltiades, Themistocles, Cimon, and Pericles—were successful because they catered to people's appetites. The results of their efforts are a city that is corrupt and swollen, stuffed with harbors and arsenals and similar trash.

Plato's search for securely rooted moral standards is combined with his criticism of existing political systems in the *Republic.* In the course of attempting to provide a definition of justice and to counter a series of immoralist claims for injustice, Socrates constructs a just city to enable himself and his interlocutors to observe justice on a large scale. The city is divided into three classes: Philosophers who rule are supported by auxiliaries, who are the city's fighting force, and the third class is farmers or craftsmen, who make up the bulk of the population. The rulers and auxiliaries constitute the Guardians. Plato's main argument for the superiority of justice to injustice is based on an elaborate analogy between cities and souls, which, he argues, have corresponding parts and corresponding virtues, which depend on relationships between the parts. Justice is a condition in which each part fulfills its proper function. The superiority of justice to injustice is proved by contrasting the harmonious just city and its corresponding soul with forms of unjust cities and their corresponding souls. The unjust forms are ridden with conflict and faction, and so they are clearly inferior to the just city and soul.

Plato's political theory is single-minded. The purpose of the city is to promote virtue—balance and harmony in the soul, which requires that the philosophers control the environment and shape the entire city to this end. Because of the recalcitrance of appetite and Plato's belief that people are most susceptible to conditioning when they are very young, the just city is dedicated to lifelong education—although whether for Guardians alone or all citizens is a question on which scholarly opinion is divided.

Plato believes strongly in the psychological power of art and so devotes a great deal of the *Republic* to detailed criticism of poetry, which at that time was the chief Greek artistic medium, especially that of Homer. Because most people are not able to master their appetites themselves, they must be subjected to philosophic rule—"enslaved to the philosophers," though this form of "slavery" is for their own benefit.

For the two classes of Guardians, the rulers and auxiliaries, Plato introduces distinctive institutions of community of family and of property, which are intended to ensure the Guardians' undivided loyalty to the city and to eliminate sources of conflict between them. According to Plato, philosophers alone are qualified to rule, not only because of their superior knowledge, but because of the elevation of values that accompanies the acquisition of knowledge, the ordinary temptations of ruling hold no attraction for them. They rule only out of duty to the city, and as an alternative to being ruled by people inferior to themselves. One of Plato's striking innovations is to have the Guardians include women as well as men. And so his commitment to "philosopher-kings" is, strictly speaking, a misnomer. But in spite of the fact that Plato was undoubtedly a pioneer in regard to women's equality, this was limited to superior women who would qualify as Guardians. Traditional families are maintained outside of the Guardian class.

In the years following the *Republic,* Plato apparently lost faith in the possibility of philosopher-kings and the unchecked political authority their existence allowed. In his later works, the *Statesman* and, especially, his last work, the *Laws,* he appears to reject outright the idea of rulers with superhuman qualities. He retains his central commitment to educative states but is far more reliant on traditional institutions, especially the rule of law. In the *Laws,* Plato's attention to education is arguably more extreme than in the *Republic.* He argues that, in order to successfully educate someone, the process must begin before birth. Pregnant women should perform rhythmic exercises to instill rhythm and harmony in the souls of future citizens.

The ideal city in the *Laws* is a colony to be founded in Crete. The Athenian Stranger, the work's main spokesman—Socrates is absent from the *Laws*—proposes a detailed system of government, modeled on Athenian democracy but with extreme democratic elements modified. There is an elaborate system of institutions that includes numerous checks and balances, and a social system, modeled on Sparta, that deemphasizes the role of wealth. The tedious detail of Plato's construction somewhat disguises the vast knowledge of Greek history and institutions and ingenious attempts at reform that went into his designs.

ARISTOTLE

Although Aristotle was Plato's student for twenty years, he broke from the high idealism of the *Republic*—although less so from the *Laws,* which Plato was probably writing during the time Aristotle was at the academy. Aristotle's ethical teaching is clearly indebted to Plato, as is evident in his interest in psychic balance and harmony, achieved through lengthy habituation and conditioning. Aristotle viewed "ethics" and "politics" as a single subject, and in his corpus, the *Nicomachean Ethics* and

Politics form a continuous treatise. The connection lies in the fact that the virtue Aristotle explores requires that the subject be raised in a properly governed polis.

Subjects examined in the *Politics* range from the best imaginable polis, to the best that could be constructed under particular conditions, to existing political forms and measures that would make them more stable. Aristotle's argument that man is a political animal is found in Book I. In Book II, he examines ideal states in theory and practice, including a series of harsh—although frequently mistaken—criticisms of Plato's *Republic* and *Laws*, generally in regard to what he views as those works' excessive utopianism. But then, paradoxically, in Books VII and VIII, Aristotle presents an ideal state of his own, which is clearly modeled on the *Laws*.

The bulk of the *Politics* is a detailed examination of numerous Greek cities and their political forms. In composing the work, Aristotle drew upon studies of 158 different Greek constitutions—one of which, a book-length study of the Constitution of Athens by either Aristotle or his students—is extant. Aristotle shows clear mastery of the history and workings of different democracies, oligarchies, and tyrannies, and he discusses numerous instances of each. His analysis of causes of stability and instability emphasizes economic elements, although not exclusively. Democracy, which is rule of the poor over the rich, becomes unstable as the rule of the poor becomes extreme. Oligarchy, rule of the rich, becomes unstable with extreme rule by the rich. In general, in order to make these cities more stable, one should counter tendencies toward extremism. In Book IV, Aristotle presents a relative ideal, the best city one may realistically hope for, in rule by the middle class, which is the most stable state. Connections that Aristotle draws between rule by the middle class and political stability have been largely confirmed by subsequent history, including conditions in contemporary industrial democracies.

HELLENISTIC PERIOD
With the Macedonian conquests, the formerly autonomous polis became an administrative unit in a much larger political form. Political activity retreated from the center of human life, and the Greek conception of a citizen became more passive. The free citizen was no longer self-governing but was relatively free of direct domination by others. Important commentators argue that the gap between Hellenic and Hellenistic views is one of the largest in the history of Western political thought.

With political affairs in the ordinary sense largely removed from most people's lives, Hellenistic political theory has little direct political content. In regard to moral philosophy, the Hellenistic schools provided philosophies of life, helping individuals to bear up during this troubled period. The Stoics preached the imperturbability of the wise person; the Epicureans preached peace of mind, and similar attitudes were upheld by other schools.

The Stoics were the most influential Hellenistic philosophical school. Believing in moral norms rooted in nature and accessible through reason, they developed the conception of natural law that was central to subsequent political theory for 2,000 years. As moral laws were rooted in nature, so was society. The Stoics viewed people as driven to enter society because of natural urges. A watered down form of Stoicism attained enormous influence from the second century BCE onward, as perhaps the most influential philosophy of the Roman Republic and then empire. When Christianity arose in the Roman Empire, it was largely lacking in social and political philosophy and so adapted dominant ideas of the times. Through Christianity, aspects of Stoicism were passed on to the modern world.

The Epicureans were less influential than the Stoics, and they opposed the Stoics on basic doctrines. Materialists, the Epicureans believed the universe was matter in motion, combining and recombining entirely by chance. In their view, neither moral norms nor society itself is rooted in nature. Rather, these are constructed by people seeking advantage in terms of pleasure and pain. Society comes about because people agree to live together, while rules of justice are purely conventional, practiced because of their utility. While the Stoics' influence is apparent in the subsequent natural law tradition, the Epicureans lived on in the materialism and social contract theory of Thomas Hobbes and later doctrines of the conventional nature of justice.

Green Parties

Green political parties are formally organized around the principles of Green politics. They were born out of the 1960s protest movements and the 1970s peace movements in response to what some perceived as politics without real participation, a disrespect for other nations' sovereignty, a single-minded and one-dimensional pursuit of money, and more. At first composed primarily of well-educated young people in their twenties and thirties living in the United States and Europe, green movements, or green environmental movements, have worked to dispel the widespread misconception that to be "green" did not mean to support only nature at the expense of everything else. On the contrary, to be green meant to very well include everything else but to see it through a green lens. Hence, on the agenda of green movements across Europe were new issues related to the environment and sustainable growth as well as more traditional issues such as social security

in graying societies, education, technology and science, poverty, urbanization, and population growth.

Green movements increased their influence from that of a social phenomenon to that of a political one through the creation of green political parties. Green parties' appeal to younger generations benefited the green movements in terms of major recruitment potential and supportive voters. For example, European party systems are frequently proportional, allowing small political groups access to and influence in the government system, even if they represent only a fraction of the population. Not only could green parties emerge under these systems, they could also become coalition partners of the so-called establishment parties, and this occurred in Germany, Finland, Belgium, France, and the Netherlands in the 1990s. The United States' two-party majority system, on the other hand, does not provide the same opportunity and thus limits the political influence of the American green movement.

GREEN PARTIES' SUCCESS

How far have the green parties come? If their success is measured in terms of public support—a yardstick entirely compatible with the original claim of the green movements to create politics with real public participation—then the record is mixed. For example, green parties have become a permanent fixture of their respective European political systems and have expanded into Latin America, Asia, and Africa in the early twenty-first century. However, they seldom share power in the government. (A notable exception was in Germany during the Green Party's coalition years with the Social Democrats, 1998–2005.) Green parties are part of the legislature and wield political power. To the degree to which coalition politics is a reality, green parties have become a real option, even in coalitions that as recently as the 1990s seemed impossible. Green parties, however, have not been able to become big political parties that alone can count on more than 15 to 20 percent of the popular vote.

Another way to measure the success of green parties would be to ask how much they have changed politics, and, by extension, society. Here the record is also mixed. On one hand, it is clear that traditional parties have become "greener" and more concerned with environmental issues—and not just because traditional parties are today aggressively offering coalition status. In politics, education, schools, and science, in short—as the green movement originally argued—the environment is not just a utopian issue, it is a political, social, economic, and humane one. To the degree to which the twenty-first century reveals major environmental challenges, it is not a small measure of success if those countries that have witnessed green movements and green parties since the 1980s are, in the 2000s, better prepared to face these issues.

At the same time, as much as green parties have changed politics, politics have also changed the green parties. The German Green Party, founded in 1979, realized early on that the decision to join the establishment may come with a high cost. The party eventually split into the so-called *realos* (*realpolitik*) and the fundis (the fundamentalists), the former convinced that if the party joined the political system it would have to adopt certain practices and beliefs, including the need to become political experts or experts in politics. This idea of political expert was anathema to the fundis, who were convinced that it was dangerous to become too vested in the political system and were concerned about remaining loyal to the movement's roots. This difference between camps within green parties may be exemplary of the larger issues, including how much green parties have changed or deviated from their original objects and if they have now become victims of their own success

Grotius, Hugo

Hugo Grotius (1583–1645) was a Dutch jurist. He is most famous for having written *De Jure Belli ac Pacis* (*The Laws of War and Peace,* 1625), a text commonly acknowledged to have ushered in the modern natural rights tradition and the study of international relations. Grotius held legal and administrative posts in the government of Holland until 1618, when he became embroiled in a religious conflict within the United Provinces. He was charged with treason and sentenced to life imprisonment at Loevestein Castle. Grotius famously escaped from Loevestein in 1621 in a chest of books and fled to France, where he was granted a royal pension by Louis XIII. Grotius left France in 1631, and, after failing to secure repatriation to the United Provinces, became the Swedish ambassador to France. He lived in Paris in this capacity until 1645, when he died in a shipwreck.

The religious and political conflict in his native Holland, the Eighty Years War (1568–1648), and the Thirty Years War (1618–1648) all shaped Grotius's approach to jurisprudence and international relations. He sought not to eliminate religious differences and armed conflicts, but rather to construct a theory of natural law that could speak to different Christian denominations and to develop a theory of international relations that both justified and regulated the practice of war.

De Jure Belli ac Pacis, which Grotius began writing in prison, represents a break with the Scholastic tradition of natural law and ushered in a new natural jurisprudence consistent with humanism and Protestantism. Grotius's approach to natural law is essentially rationalist, that is, he attempts to derive natural law from human reason and human experience rather than from the will of God. Grotius's depiction of human beings as rational creatures moved by instinctive drives for self-preservation and for sociability consequently forms the foundation of his political and jurisprudential thinking. The natural law theory of *De Jure Belli* marks the first significant conception of natural law as a series of rights belonging to individuals and to states; Grotius shifts the meaning of *ius* from a law to which

individuals are subject to an enforceable right possessed by the individual. These include a right to self-preservation and the possession of property (the individual's *suum*), and infringements upon these rights are punishable by force.

In perhaps his most significant move, Grotius argues that states have no powers but those natural to the individuals who compose them, and, as a result, states possess the same natural rights as individuals. Consequently, Grotius ultimately understands states as rights-bearing institutions that may punish violations of the natural law through war. War, when it seeks to redress violations of the natural law, is just and justifiable. *De Jure Belli* outlines the principles of natural law and the just causes of war and rightful conduct in war, and it seeks to ground a just war theory in the principles of natural law and natural justice. In the process, Grotius created a new way of thinking about natural law that paved the way for the rights-bearing liberal individual and the social contract tradition as well as for a new science of international relations that shaped the Westphalian system of sovereign and equal states.

Group Cohesion

Group cohesion describes the way individuals are bound together in a group and feel mutual attraction. Pressures and constraints, both external and internal, act on the group and its members to maintain the group's norms and the group as an entity

DEVELOPMENT OF THE CONCEPT

Early research in the 1940s and 1950s led to the first theory of group cohesion to explain dynamics in small groups. This theory posited that group cohesion is determined by the level of attraction among group members and the extent to which the group mediates among members and fulfills their needs and goals. When these levels were high, membership continuity and adherence to group norms resulted. Later research tended to focus strongly on intragroup forces and the aspect of mutual attraction of group members, while ignoring external forces.

The understanding of group cohesion was further developed by incorporating theories of social identity (in 1979) and

self-categorization (in 1985). Both theories differentiated interpersonal and group processes from one another. Social identity theorists use self-inclusive social categories such as nationalities to show how those categories constitute part of the self-image while impacting the perceptions and behavior of members. The own group, and thus the self, is enhanced. Self-categorization theory emphasizes perceptions of difference from other groups and reduction of differences within the group. Social attraction was determined by the social relationships of an individual, by how much others were seen to be similar, and by whether or not the boundaries or differentiations among various groups were seen as permeable and legitimate.

Research initially focused on the cognitive processes of group members regarding their particular group, but it was expanded to include any collectivity an individual person thought of belonging to. In the early 1990s, new insights included groups being also seen in structural terms (from network theory) and a greater focus on the role of emotions. Research suggested that emotional attachment to the group increases as the individual's sense of control increases, a dynamic especially present in smaller groups. The concept of relational cohesion as an enforcer of group cohesion entered the analysis. Relational cohesion focuses on exchange patterns within a group that lead to positive emotions, uncertainty reduction, and the creation of behavioral commitment of members. Equal power relations and high group density increase cohesion, solidarity, and the perception of a shared experience within a group. Recent research has focused on the connections of group members and their impact on social consensus in groups.

Work on group cohesion mainly comes from sociology and psychology. Sociologists have focused mostly on the individual's connection to a group and on emotional reactions, and psychologists have focused on larger social categories and the aspect of cognitive self-categorization. The ecological theory argues that a group is maintained when member characteristics in the group spread by keeping members or recruiting new ones who fit those characteristics. Different groups may also compete for members and affect each other's development. Research has often neglected the influence of the external environment on group cohesion. Critics also charge that the focus of group cohesiveness has been reduced to interpersonal processes or attraction within a group, which does not achieve theoretical expectations.

THE IMPACT OF COHESION

The more intense and frequent the connections among group members, the greater group stability and cohesion. The closer the members are to the core of the group, the longer will they remain members. Cohesion is connected with conformity. Processes of conformity in groups develop due to the importance of group membership to individual members, group influence on members, and group size. As the first two factors increase, so does conformity. But size impacts conformity more in smaller groups. The greater the level of cohesion, the more members will seek to recruit similarly thinking people for membership. Cohesion and high performance of a group

can also promote one another. However, when good relations among group members are seen as more important, cohesion can also hinder high performance.

Very cohesive groups typically contain members who are more energetic in group activities and more concerned about the well-being of the group, aligning their own state of feeling with that of the group. As cohesiveness impacts the quality and quantity of group interaction, the behavior of group members, and their satisfaction, cohesiveness represents a powerful potential for a group's development.

Group Relations

Group relations describe the inner dynamics and interactions of people within a group. They are formed and maintained because group membership satisfies a number of human needs.

Groups vary in size and character and exist for a common purpose. A group consists of two or more persons who can interact and impact each others' needs and aims. Humans enter into relations to satisfy a basic need of belonging, stemming from evolution, where group membership assured important advantages and one's own survival. Humans have a need to control that part of the social environment that concerns themselves.

Groups reduce the complexities of life via providing information, helping to shape individual identity, and developing social norms regulating behavior. They exhibit a certain degree of inner homogeneity. Aside from norms, there are also social roles describing how people in a certain position within the group should behave. Social roles can also have negative effects, for example, when people act beyond the expectations of the role, giving up their own identity, or when people do not act according to the role.

In their groups, humans tend to categorize, identify, and compare as well as differentiate their own group from others—these processes were explored by Henri Tajfel, among others, in social identity theory. Also, various processes of control, persuasion, social facilitation, or social loafing take place. Conformity in groups largely depends on the level of importance of group membership to members, the level of group influence that a member is subject to, and the group size. The greater the first two factors, the greater the conformity. Size will impact conformity more in smaller groups, but less so or not at all in larger groups. Pressure to conform increases for members holding minority opinions. The more collective the group, also within the frame of the national culture, the greater is the inherent conformity.

Group cohesion is another important aspect of group relations, providing for connections among members and the promotion of mutual affection. Cohesion is important for group maintenance and can also improve the group performance.

Group membership can also lead to de-individuation, however, such as in cases where an individual member starts to act in a way that is against social norms and that he or she would never do alone (e.g., mobs among soccer fans or lynching incidents). This dynamic can develop because persons within a group feel less responsible for their own behavior and potentially act more aggressively. When de-individuation takes place, individual actions are more oriented along the norms of the group.

Group dynamics may further lead to information and process losses, which weaken good decision making. In such cases, important information and minority opinions are often ignored. Groupthink can develop when group cohesion and solidarity are seen as important. The level of risk taking within a group also increases the more risk is seen as cultural value in a given society. A further aspect is group polarization, describing group members making more extreme decisions when in their group than when alone.

Group relations vary across cultures due to different norms and expectations. The different dynamics can be experienced to a certain degree when entering or interacting with someone from another culture. Differences in group relations also affect modes of cooperation and conflict within as well as among groups.

Group Theory

Group theory constitutes the intellectual precursor to pluralism and was originated by Arthur F. Bentley in his *The Process of Government* (1908). The theory was built upon and refined further by David Truman in his *The Governmental Process* (1951). Thus, group theory and its offspring of pluralism and other competitor group-based theories (such as elitism and neocorporatism) are closely entwined, and discussion of one necessitates discussion of the others. Both Bentley and Truman recognized the prominent political role of interest groups in American liberal democracy and realized that giving that type of societal institution a more salient position in social scientific theorizing would result in improved and more accurate analyses of the democratic political process in America. Truman's fundamental declaration that politics is best understood by examining the interaction of groups resides as the cornerstone of this analytical orientation. Thus, at the heart of group theory is the recognition that politics is understood best as the action of groups. The pressures exercised by organized interest groups greatly influence the activities and actions of government—as groups pursue their varied interests, they become the basis of public policy and the essence of politics. These manifested pressures and influence are considered not to be democratically problematic; instead they are important elements that make up the actual strength and vigor of American democracy.

PLURALISM

Pluralism sprung from this group theory orientation, and pluralists conclude that the wide variety and diversity of interest groups and the decentralized quality of so much of governmental decision making allows a great number of groups to have impact and relevance in the public policy-making process. So in group theory and pluralism, the primary political actors are groups, not individual citizens, and this is interpreted to be a strong positive, not a negative, in the American system of governance. This pluralism of groups serves as a useful and effective check on potential governmental tyranny. In other words, American democracy works quite well precisely because of the benevolent effects of the enormous and active universe of both actual and potential groups in the country. Thus, pluralism derives from group theory and is one of the leading schools of thought in this type of political analysis.

Robert Dahl's seminal 1961 study of local politics in New Haven, Connecticut, entitled *Who Governs?,* constituted the high point of pluralistic theorizing. As his analysis adduces, government plays the role of a competitive arena where interest groups battle with each other for influence over political officials and the direction of public policy in a particular issue area. The state does not systematically privilege one set of interests over another or favor one group above others either. For pluralists, there is no inherent bias inside of government—instead, politics is a wide-open, free-ranging marketplace where leaders or representatives of various groups bargain, negotiate, and compromise with each other and political officials in the halls of power, with government acting as broker or neutral umpire.

As new interests come into being, evolving from inchoate to actual, groups develop to represent those fresh interests. Membership in these groups is open, so there is much access available for all citizens in the system. Of note, political influence or clout may not be perfectly distributed, but power still remains widely dispersed. With political power so widely dispersed, those who exercise power in one kind of decision area are not the same people exercising power in another—no one single individual or group could dominate the entire decision-making process in all areas of public policy. Different sets of groups will direct decision making in different policy areas, depending on their differential levels of intensity of preferences. The reality of group politics forces elected officials, in their unrelenting endeavors to cultivate favor to assist in reelection efforts and to consolidate their own power stakes, to reach out to a variety of groups out of necessity. Thus, pluralism works to decentralize and fragment governmental decision making across policy sectors with the result that no one single cabal of elites dictates all policy—democratic decisions are duly obtained.

CRITICISMS OF PLURALISM

As time has passed, a variety of criticisms from other group theory competitors have arisen to contest the accuracy and validity of pluralism's insights. The first major criticism came from the sociologist C. Wright Mills, who produced power elite theory in 1956. In the American context, Mills contended that the leaders of business, academia, military, and government compose a small cadre of power elites who dominate policy making. They do not compete for influence or power with each other, as the pluralists argue across issue areas, but instead are all generally on the same page ideologically and politically. The shared commonality of the interests of this power elite results in public policy debates occurring only at the margins and a slight tweaking of policy minutiae, with the probability of transformative policy change being quite slim. For Mills (and other critics as well), policy disagreements, political disputes, and partisan battles amongst political actors are mere façades—pluralism (and the ostensible fragmentation and decentralization of governmental decision making) is little more than a masquerade obscuring how decisions are truly made in the halls of power.

Another leading critique of pluralism in group theory is best captured by E. E. Schattschneider's famous statement that "the flaw in the pluralist paradise is that the heavenly choir sings with an upper-class accent." Schattschneider's point is that there is an inherent bias in the American interest group universe that strongly favors business, industry, and the generally better organized—not every group or every set of interests has the same chance to influence policy that the more moneyed ones have. Some are clearly and consistently more favored by government officials than others, and this structural skewing undermines the pluralist contention of a level playing field for all interests and groups.

Similarly, the neocorporatist view of interest group activity posits that the idea that the government is simply and solely an arena where interests come to do battle does not adequately capture the true role of the state in these interactions. Government officials will and do choose groups and interests to favor in their decisions, and these choices end up impacting the shape and hierarchy of the interest group community and the relative strengths of specific groups in that community. Neocorporatism essentially sees a cooperative relationship between government and certain interest groups (typically peak associations and broad organizations representing business and labor) so as to more effectively and efficiently stabilize the formulation and implementation of public policy (primarily in the economic realm). So, government should not be interpreted to be the neutral, low-impact variable in the policy process that pluralism posits. The state is a relevant and important factor that does necessarily affect policy outcomes; it is not just a neutral arena. This debate between pluralism and neocorporatism continues to be one of the most salient in group theory and has been so for several decades.

CONCLUSION

Group theory remains a vitally important aspect of analysis of politics in the American context as well as elsewhere. Pluralism continues to be the major focus of such theorizing, with important competitors arising over time in the form of the elitist and neocorporatist analytic schools.

Groupthink

Groupthink, a termed coined by Yale psychologist Irving Janis, refers to a dysfunctional mode of decision making in which members of exceptionally cohesive groups strive for unanimity in opinion to the extent that they prematurely agree on a particular course of action and fail to consider more suitable alternatives. Although teams generally make better decisions than individuals, in-group pressures for solidarity, loyalty, and uniformity in beliefs and behavior can interfere with beneficial group dynamics. For these reasons, teams interacting over long periods of time can become too cohesive and too focused on agreeing with each other.

Amicable groups seeking too much agreement may fail to carefully evaluate their initial decisions and focus too narrowly on a small set of alternatives. Such groups may not see the importance of obtaining viewpoints and information from outside sources. The absence of external feedback tends to obscure the potential negative consequences of decisions and the obvious ways the plans are destined to fail. The likelihood of groupthink increases as external stress on the group increases. Therefore, groupthink is more likely to occur in the context of budget crunches, recent setbacks, or urgent time pressures.

Several additional factors predispose group members to groupthink. Groups characterized by a groupthink dynamic often believe they are immune to error and that they are too intelligent or too experienced to make poor decisions. Beliefs in the inherent morality of their positions, coupled with stereotypes of other groups as evil and immoral, also lead to faulty decision making. Groupthink is more likely to occur when group members erroneously believe that they are in unanimous agreement. This illusion of unanimity is sustained by members' self-censorship of their doubts and by so-called pluralistic ignorance. Pluralistic ignorance comes into play when team members who have serious doubts do not openly express them, leaving others to think they are alone in their disagreement. In the event that one or two individuals risk expressing their concerns, others apply direct pressure to persuade them to change their dissident opinions. In addition, "mind guards" shield the group from information that contradicts their conclusions. Mind guarding can involve suppressing external or internal information. Finally, group members engage in selective perception by ignoring information that does not conform to their preconceived ideas. As a result, members with special expertise or information may find their input is rejected. Small group psychologists agree that groupthink is more likely to occur when more of these factors are present.

Scholar Rebecca Cline maintains that groupthink is more apt to occur in the White House than elsewhere due to the president's high status and the awe inspired by the position. Persons with unpleasant information or contradictory opinions may be particularly unwilling to present such information to the president. Groupthink has been linked to several catastrophic domestic and foreign policy decisions, including the Watergate cover-up, the Iran-Contra scandal, and the Challenger space shuttle launch. Most recently, political pundits have suggested that the U.S. decision to invade Iraq should be analyzed in terms of groupthink.

The ill-fated launch of the Challenger shuttle—despite evidence of serious design flaws, weather concerns, and engineers' warnings that the primary o-ring could fail in cooler weather—is a classic example of the groupthink phenomenon. In this case, internal memos questioning the viability of the primary o-rings in cool weather were not circulated. In addition, engineers who expressed concern about the launch were silenced by direct pressure from other members of the team.

The Bay of Pigs invasion, in which President Kennedy and his cabinet uncritically accepted and supported an ill-conceived CIA plan to send Cuban exiles into Cuba to overthrow dictator Fidel Castro's government, is an often cited example of groupthink. Historical analysis indicates that at least two Cabinet members failed to express their own doubts about the mission. In contrast, historians praise President Kennedy's handling of the Cuban missile crisis, noting that he managed essentially the same team in a very different manner. To avoid another foreign policy fiasco, Kennedy altered his behavior in several important ways. He suspended the usual rules of protocol, adopted an impartial stance, assigned the roles of critical evaluators and devil's advocate to various cabinet members, and brought in outside experts to critically evaluate the group's plan. Finally, to foster a climate of independent thinking, he did not attend some group meetings.

Leaders play a pivotal role in fostering a climate that is antithetical to groupthink. In assigning tasks, leaders should avoid being too directive or indicating their desired result. They should also take special pains to elicit minority points of view. Leaders can guard against premature agreement by avoiding arbitrary termination of discussion and timelines. In addition, they can call a follow-up meeting where members can raise doubts after reviewing the decision outside of a pressure-filled environment. Finally, dividing members into subgroups to discuss the same issue can lessen the pressure to conform, especially if high-status individuals are separated from low-status individuals. Members can then be brought back together to report the outcomes of their discussion and resolve their differences.

Guest Workers

Guest workers are people who sell their labor in a country other than their country of citizenship. As the term implies, guest workers are different from immigrants in that guest workers are in a host country strictly to work and are expected to eventually return to their home country. The term also implies that the temporary migration is voluntary.

Although various historical forms of temporary migration could be described as examples of guest workers, contemporary usage of the term generally refers to explicit policies that facilitate temporary migration for labor purposes, often bilateral agreements between sending and receiving states. Examples include Mexican agricultural workers in the United States under the bracero program from 1942 to 1964, West Germany recruiting guest workers from Italy and the Mediterranean (especially Turkey) from the mid-1950s to 1973, and Persian Gulf oil-exporting states utilizing large numbers of Asian guest workers from the mid- to late 1970s to the present.

POLITICAL ECONOMY OF GUEST WORKERS

States seek guest workers for a variety of reasons, a prime motivation being a shortage of labor at particular skill levels for a particular wage. This could be a lack of unskilled workers willing to take up what is often referred to as "3D" work—difficult, dirty, and dangerous—at a relatively low wage, or a lack of highly skilled workers able to meet the demands of particular industries, such as information technology or health care.

While the demand for guest workers is often driven by market forces, it is essential to recognize how guest workers are often a form of "unfree labor" exempt from market determination of wages and working conditions. In a well-functioning labor market, where workers are free to leave their current job in search of better conditions elsewhere and employers have the recourse to hire and fire workers, workers and employers are, in a sense, in a constant negotiation over wages and working conditions. In contrast, many guest workers are severely limited in their ability to contest the conditions of their employment, as they are legally obligated to honor a contract made with a specific employer, usually for a specific period of time. Contracts and/or work visas essentially render the guest worker a captive of the employer, with the worker having a choice only between, on the one hand, continued employment under conditions provided for in the contract, or, on the other hand, leaving the country, often with financial penalties. While it could be argued that workers are free to negotiate contracts before departure to a recipient country, there are significant information asymmetries involved, especially for workers with no overseas experience.

Another common concern about guest worker programs is the possibility they will lead to permanent migration. While guest worker programs are consciously designed as a form of labor supplementation that is short of permanent migration, history demonstrates that liberal societies are reluctant to cross the invisible line of denying basic civil liberties and human rights that would be required to locate and forcibly deport guest workers who have overstayed the conditions of their employment.

HOST COUNTRY POLICIES

A good example of the above phenomenon is the West German guest worker program that formally ended in 1973 after the first oil shock. West Germany had begun recruiting

seasonal guest workers for agriculture in the 1950s, but by the 1960s the rapidly growing export economy led to recruitment of guest workers for industrial production. The guest worker program was designed to have workers rotate by going home after a year or two and did not encourage family reunification in Germany. However, guest workers learned that rotation could be delayed with the help of employers and that relatives of current guest workers could be requested by name through their employers. After the 1973 OPEC-induced oil shock, the global economy slowed and West Germany ended the formal program of guest worker recruitment. However, in the following decades, the West German government came to realize that even offering financial incentives to leave would do little to reduce the guest worker population, which in the early twenty-first century remains relatively large in Germany.

There have been suggestions that the United States should embrace some sort of guest worker program as a way to deal with undocumented migrants from Mexico, but it is doubtful that such a program would actually succeed in maintaining a fixed level of rotating guest workers. Much more likely is a repeat of the German experience, where guest workers eventually become permanent residents. When this happens, the guest workers, and their descendants, face some longer-term problems, including the lack of eligibility for citizenship, children being born and raised in the host country, and identity issues. States that are not committed to a liberal identity and liberal values, such as the oil-exporting states of the Persian Gulf, are much more likely to maintain an effective guest worker program and to discourage permanent migration.

REMITTANCES AND WELFARE-ENHANCING EFFECTS

While much attention is paid to the policies of receiving states, it is important to recognize that sending states often have an explicit policy of encouraging guest worker migration. The paradigmatic example is the Philippines, with some eight million Filipinos having migrated (nearly 10 percent of the population). Many other Asian states and an increasing number of Latin American states have more or less explicit policies to support, encourage, and sustain emigration. The primary reason that less-developed countries encourage emigration is the promise of remittances—money that migrants send home to family and friends. Remittances are a particularly valuable form of external finance, because they are in the form of hard currency. They are stable in that remittance income does not decline in a financial crisis in the sending state, and, unlike loans or foreign direct investment, there are no corresponding future foreign claims on state finances.

Economists generally think of migration, whether permanent or temporary, as welfare enhancing for both sending and receiving countries. A particular economic argument for the increase of guest workers relates to the declining fertility rates and aging populations of many wealthy countries like Italy and Japan. Migration of guest workers to these economies would provide more economically active workers to help support the social welfare programs from which an older,

retired population receives income in pay-as-you-go taxation systems. However, economic logics do not capture the full complexity of societal reactions to large numbers of guest workers in receiving countries. Additionally, a static analysis of the immediate benefits of migration for sending and receiving states does not address the dynamic long-term effects of sending countries losing skilled workers either temporarily or permanently.

Guild Socialism

Guild socialism is a political movement advocating for workers to control industry through a system of national guilds that operate in an implied contractual relationship with society and consumers. A. R. Orage, Arthur J. Penty, Samuel Hobson, and ultimately G. D. H. Cole are all associated with guild socialism.

Guild socialism originated from seventeenth-century British philosophers John Ruskin and William Morris and their monastic-order vision of labor and the productive process, in which the role of the wage earner is transformed into one of producer and integral member of a community. Ruskin and Morris argued that economic theory and capitalism per se had no moral implications for the essential dignity of labor as self-creation. In the weekly British literary magazine *New Age* (1907–1920), British editor A. R. Orage wrote about an emergent guild socialist sensibility, a left–Nietzschianism that charted a separate course from both syndicalism, with its tendency to pit the potentially tyrannical self-interest of producers against the general needs of the community, and state socialism, with its technocratic planning where the workforce is deprived of its right to organize work creatively on a day-to-day basis.

Guild socialist writings continued to draw upon similar theories, including Russian anarchist Peter Kropotkin's writings on mutual aid (1902); the theories of Fernand Pelloutier, leader of the 1800s French trade union *Bourses des Travail;*

French writer and historian Georges Renaud's *Guilds in the Middle Ages;* and German historian Otto von Gierke's theory of the real personality and fellowship of producers' associations (*Genossenschaft*). In *Restoration of the Guild System* (1916), English writer Arthur J. Penty stressed the need to return to small-scale production, decentralized forms of control, and personalized relations to restore democracy to spheres of human activity. Guilds and cooperatives were understood as centers of mutual aid, education/apprenticeship, regulation of standards of quality, regulation of workshop health, and safety, training, and socializing interactions.

A formal political theory of guild socialism was formulated between 1913 and 1920 by Samuel Hobson and George Douglas Howard Cole. Hobson presented a national-scale projection beyond decentralized craft production in *National Guilds: An Inquiry into the Wage System and the Way Out* (1914); and *National Guilds and the State* (1920). Hobson demonstrated Fabian and Nietzschian perspectives in moving beyond medievalist origins and ideals and stressed "mastership," differentiating function from ability, expertise, and leadership qualities beyond the "profiteering spirit." In *Guild Socialism Re-Stated* (1920), Cole presents a thoroughly worked-out blueprint for "social self-management" based on participation and dialogue, resisting both Fabian and Bolshevik plans to reduce producers to implementers of plans formulated by technical experts outside the shop floor.

Cole proved to be the most prodigious and consequential writer of the new theory of guild socialism: He produced *World of Labor* (1913), *Self-Government in Industry* (1917), *Labor in the Commonwealth* (1918), and *Social Theory* (1920). Cole stressed the need to transcend French philosopher Jean-Jacques Rousseau's attack on partial associations; for it is possible for non-statist associations to pursue their interests in a way that does not necessarily bring them into conflict with other associations or the state. In his 1914 article, "Conflicting Social Obligations," Cole noted that "the state cannot fully express the associative will of men." The state is but one of many *functional* associations that must be coordinated by some *federal* national commune of the associations. It may be guided by the general will of all its members, but it should not express their will. The state needs to be contained in the world of groups rather than vice versa.

Cole argues for social theory rather than political theory. In his work, sovereign institutions of government are deemphasized and replaced with the sovereignty of associational life in general, as a reflexive governance functionally representing the division of labor taken as a heterarchical rather than a hierarchical whole.

With the collapse of the guild socialism movement in the 1920s, Cole—impressed with trade unions' cooperation during World War I (1914–1918) and saddened by their partiality in the 1926 coal mining industry's general strike—began to appreciate the sense of underlying harmony necessary for the redistribution of material inequality and the state's "true nature." In *The Next Ten Years* (1928), Cole moved from themes of communitarianism and *mutualité* to a more pronounced functionalism involving workers' control within a strengthened trade unionism rather than a centralized collectivism.

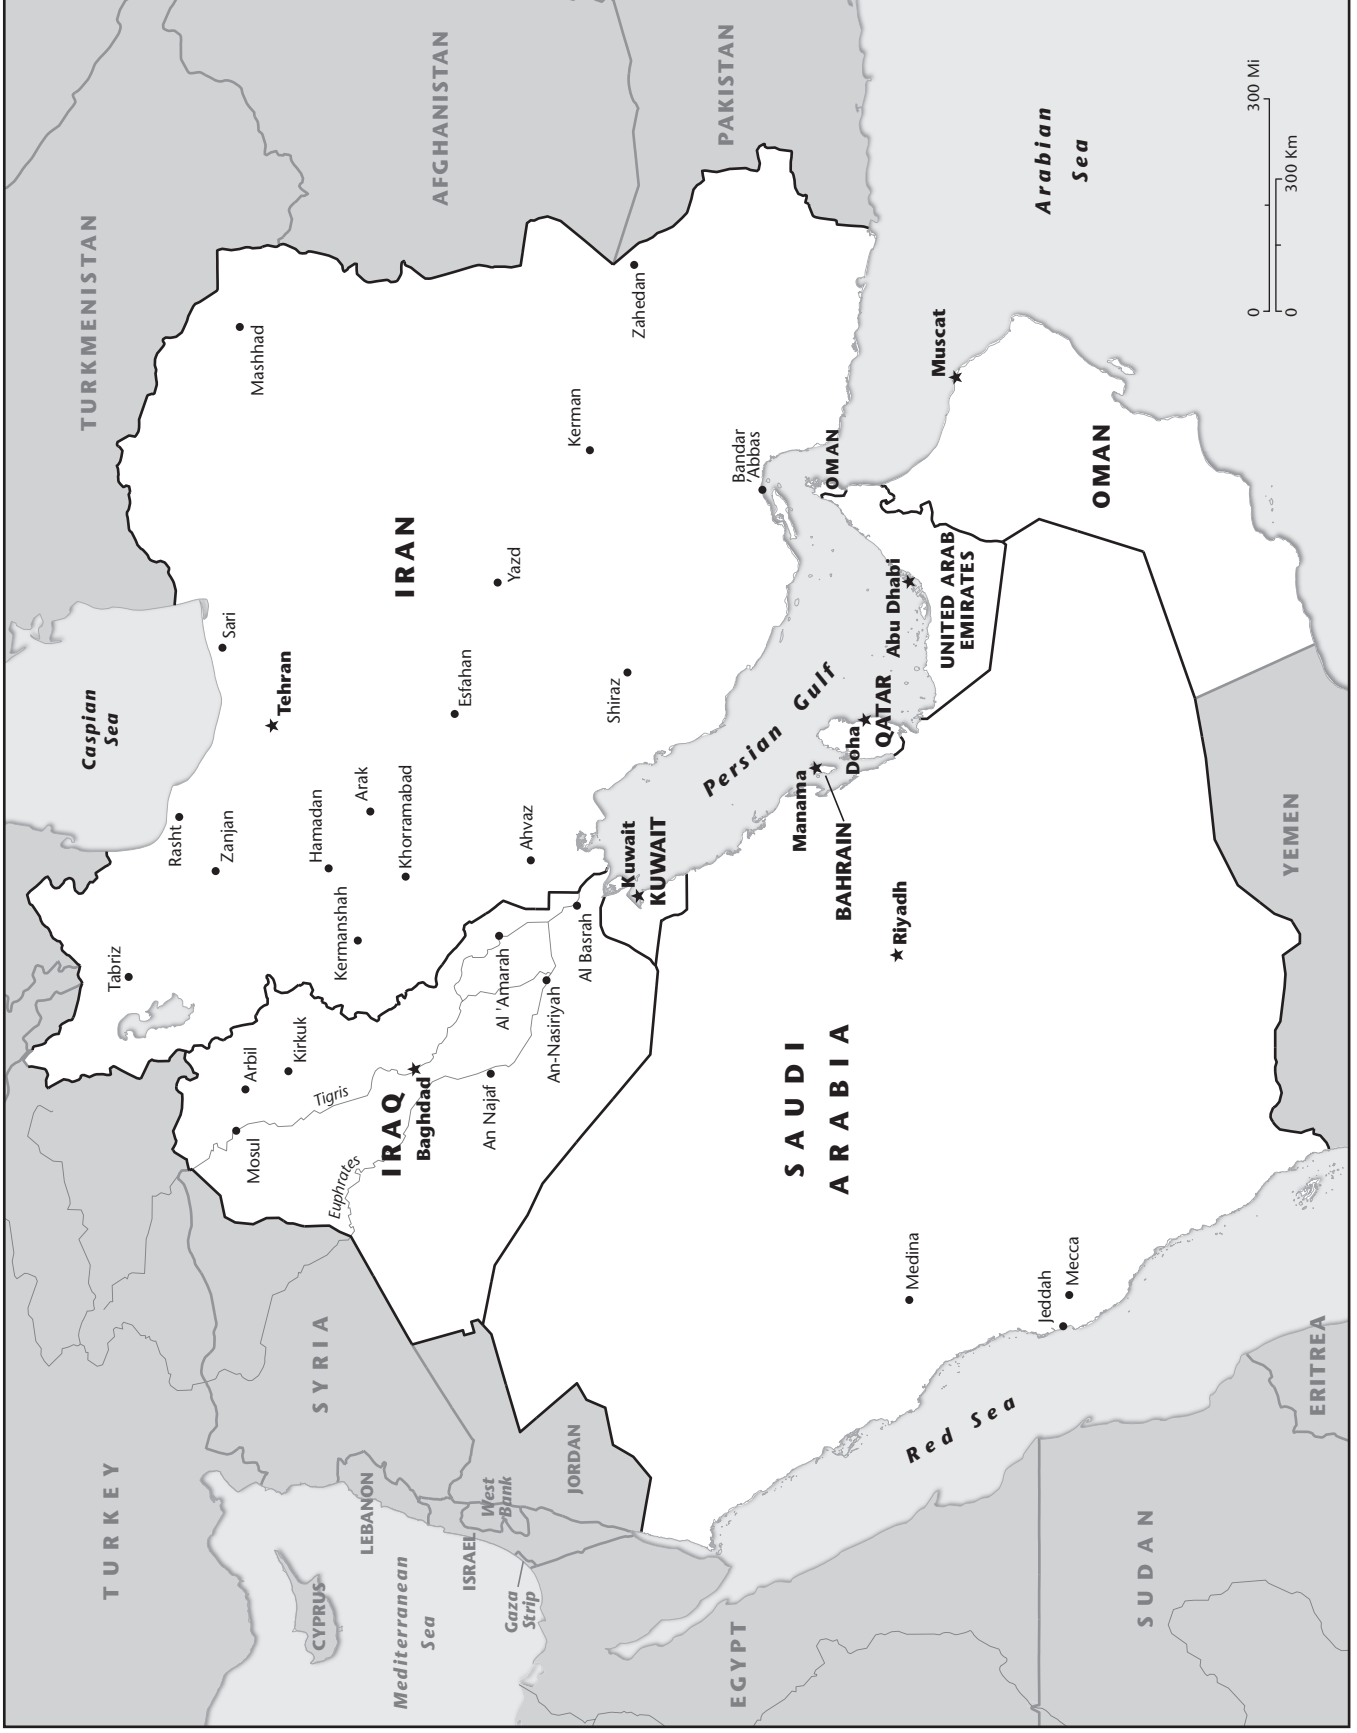
Gulf States

The gulf states are the countries in the Middle East that border the Persian or Arabian Gulf: Iran, Oman (the small exclave of Musandam), the United Arab Emirates (UAE), Saudi Arabia, Qatar, Bahrain, Kuwait, and Iraq (the Tigris-Euphrates river delta: the Shatt-el-Arab). The name of the gulf is disputed because of its geopolitical connotation. The United Nations (UN) officially recognizes the "Persian Gulf" as the standard geographical designation, and history names the gulf the "Pars Sea" or "Persian Gulf" because of the influence of the Persian Empire. Since the 1960s and the rise of nationalist pan-Arabist movements in the region, however, Arab states have adopted the term "Arabian Gulf." This name is controversial because of its political implications and also because the term "Arabian Gulf" is an ancient name for the Red Sea.

CLEAVAGES

The gulf naming dispute is the tip of an iceberg of linguistic, religious, historical, political, tribal, and economic cleavages between and across the gulf states. Iran's official language is Farsi, and the majority of the population is Shiite Muslim, while the official language of Oman, the United Arab Emirates, Saudi Arabia, Qatar, and Kuwait is Arabic, and the majority of their population is Sunni Muslim. Arabic-speaking Iraq has a Shiite majority but with a big minority of Sunni Muslims, while Bahrain has an important Shiite minority.

Various tribal loyalties throughout the region are frequently divisive and are exacerbated by religious differences. Tribal lineage, family, and clan connections affect the political system of the gulf states to different degrees: Saudi Arabia, the UAE, Qatar, Kuwait, Oman, and Bahrain are monarchies based on tribal leadership with no significant level of democratic participation, while Iran and Iraq are republics. Historically, the development of the states as independent entities and their


The Gulf states border the Persian, or Arabian, Gulf in the Middle East. The term for the gulf—Persian in reference to its history or Arabian in acknowledgment of pan-Arabism—is often in dispute.

administration system has also been influenced (except for the Iranian case) by the British colonial system.

Islam plays an important role in the political organization and the public life of the gulf states societies. Sharia law is applied to different degrees in all the states, and societies are generally conservative. Examples of religious conservatism are the 1979-instituted Shiite revolutionary government in Iran and the Wahabi (an Islamic sect) regime in Saudi Arabia. A counterexample was Iraq under the Baath party (Saddam Hussein's) regime: In the name of Arab nationalism, religious differences were downplayed, and Iraqi society was considered comparatively more liberal. The effect of wealth has also created contrasting trends and social changes in most of the gulf states.

Also divisive is the foreign policy outlook of the gulf states: A common stance against the recognition of Israel is counterweighted by differences in relations with the United States and the West, with some accepting the friendship and others, like post-1979 Iran, having a confrontational attitude.

From an economic perspective, the gulf has been an important waterway since ancient times. Merchant trade with India, China, and Southwest Asia was the major economic activity of the region, and after the discoveries of massive onshore and offshore oil deposits in the twentieth century, it has acquired strategic value in terms of world oil production and transportation. Collectively the gulf states possess 57 percent of the world's oil reserves and 45 percent of the natural gas reserves. In particular Saudi Arabia, the United Arab Emirates (Abu Dhabi), Qatar, and Kuwait have profited from this wealth of natural resources, and they are engaged in modernizing their economies and societies. Iran and Iraq, because of political strife, have lagged behind in this oil-driven economic development, while Bahrain and Oman do not possess enough oil and gas deposits to transform their economies. This is also why Bahrain and Oman are the only two gulf states that are not members of the Organization of Petroleum Exporting Countries (OPEC).

POWER COMPETITION AND TENSIONS

The unequal distribution of natural resources and wealth and the competition for regional power, fueled by the growing importance of oil in the world economy, have heightened cleavages and caused a number of conflicts in the region. In addition, the political and economic interests of major world powers and their involvement in the affairs of the gulf states have contributed to make the region a security powder keg.

The Iran-Iraq War (1980–1990) was initiated by Iraq's invasion of western Iran. Saddam Hussein sought to seize control of the rich oil-producing Iranian region of Khuzestan, to reassert Iraqi sovereignty on both banks of the Shatt-el-Arab, and to preempt attempts by the Iranian Islamic revolutionary government to incite rebellion among the Iraqi Shiite majority. Iraq was financially supported by Saudi Arabia, Kuwait, and other Arab states and tacitly backed by the United States and the Soviet Union. However, the war resulted in a stalemate,

and in 1988, beleaguered by economic problems, Iran accepted a UN-brokered ceasefire. In the late summer of 1990, the two countries reestablished diplomatic relations and agreed on the withdrawal of Iraqi troops from occupied Iranian territory, division of sovereignty over the Shatt al-Arab waterway, and a prisoner-of-war exchange.

On August, 2 1990, Iraq annexed Kuwait, accusing Kuwait of damaging Iraq's economy by not respecting the production quotas set by OPEC and by illegally pumping oil from the Iraqi Rumaila oil field. This action prompted the so-called first Persian Gulf War (January-February 1991): the UN-authorized armed intervention of a coalition of 32 countries commanded by the United States (Operation Desert Storm) to liberate Kuwait. Iraqi forces retreated from Kuwait, but the UN continued sanctions against Iraq, including the oil-for-food program, the no-fly zones interdiction of aerial sovereignty on northern and southern Iraq, and UN weapons inspections. These sanctions were meant to protect the Kurd and Shiite populations from Saddam Hussein's repressive attacks (which in the 1980s included the use of chemical weapons) and monitor the regime's development of weapons of mass destruction. Iraq's defiance of the sanctions led to a number of bombing campaigns.

The Second Gulf War (or Iraq War) refers to the invasion of Iraq in March 2003 by the U.S.–British led "coalition of the willing" motivated by the failure of the Iraqi government to comply with the UN weapons inspection regime. In the context of the U.S. "war on terrorism," which followed the September 11, 2001, terrorist attacks on American soil, Iraq was also accused of supporting al-Qaida and terrorism. The stated aim was to effect a regime change, the fall of Saddam Hussein, and the rise of democracy, but some critics suggested that Iraq's vast oil fields were the main attraction of U.S. and international interest. Violence between Sunnis and Shiites threatened to tip the country into civil war, but a surge in the number of American troops and more involvement by the Iraqi government and military reduced violence significantly and increased stability. Much of this violence was believed to have been fomented by groups and governments outside of Iraq. In particular, Iran has been accused of financially and militarily supporting the Shiite majority in order to advance its regional power and to heighten the confrontation with the West regarding the proliferation of nuclear weapons.

REGIONAL COOPERATION

Despite the troubles in the region, some cooperation does exist between gulf states. The Gulf Cooperation Council (GCC) was created in 1981, and its members include Bahrain, Qatar, Kuwait, Saudi Arabia, Oman, and the UAE. With the aim of establishing a common currency by 2010, the GCC has successfully instituted a common market and harmonized regulations in various fields such as economy, finance, trade, customs, tourism, legislation, and administration. The attraction of national sovereignty to young independent states (most of the states gained their independence in the 1960s and 1970s) as well as the cleavages and the divergent interests

discussed above are major obstacles to the development of more coherent political cooperation.

Gulick, Luther Halsey, III

Luther Halsey Gulick III (1892–1993) is considered to be one of the most important leaders in the practice and study of public administration. Deemed the "dean of public administration," Gulick promoted the creation of several institutions that furthered both the professionalism of public managers and the study of public administration. These organizations include the Brookings Institution, the International City/County Management Association, the American Society for Public Administration, and the National Academy of Public Administration. Although he was a prolific author, Gulick once proclaimed that his interest was in the promotion of ideas into practice, rather than into print. Among his publications are *Better Government Personnel, Report of the Commission of Inquiry on Public Service Personnel* (1935); *Administrative Reflections from World War II* (1948); *Modern Management for the City of New York* (1953); and *The Metropolitan Problem and American Ideas* (1962).

Gulick had a culturally diverse upbringing. He spent the first twelve years of his life in Japan; then his family's missionary work took them to California, Germany, and eventually back to the United States.

As a young man, Gulick gained early admission into Oberlin College, where he graduated in 1914 with high honors in political science. At commencement he met keynote speaker Charles Austin Beard, a foremost authority in American history and political science. Gulick's passion for the study of public administration was inspired by Beard's commencement address, and Gulick continued his studies at Columbia University's graduate program in political science, which was headed by Beard.

Concurrently, Gulick enrolled in the Training School of Public Service of the New York Bureau of Municipal Research (BMR). There he was eventually employed by the BMR after serving as an intern. After a short time with the federal government during World War I (1914–1918), he returned to the BMR as director of the Training School. These organizations were later absorbed into the National Institute of Public Administration, with Gulick becoming its director. He served this organization in various capacities for over sixty years.

Gulick provided assistance and direction on projects outside the scope of municipal research. He conducted work on pensions and social security in the state of New York for Governor Franklin D. Roosevelt. This relationship continued throughout Roosevelt's presidency and led to Roosevelt's 1936 appointment of Gulick to the President's Committee on Administrative Management, also known as the Brownlow Commission. Gulick's work on this committee led to his seminal piece, *Notes on the Theory of Organization* (1937), in which he outlined the functions of the chief executive. These functions are represented by the acronym POSDCORB—planning, organizing, staffing, directing, coordinating, reporting, and budgeting.

Although Gulick's professional life focused primarily on the study of government organizations rather than practice, he did serve as the first city administrator for New York City from 1954 to 1956. Frustrated by the political realities that slowed implementation of administrative reforms, he resigned after only two years. Gulick served for many years thereafter as a consultant on federal, state, and local projects. He remained a devoted public servant and an active participant in the study of public administration until his death in 1993.

Gunboat Diplomacy

Gunboat diplomacy refers to the practice of making threats against another state by the visible demonstration of warships. The term is associated with the early twentieth century use of small coastal or river warships to enforce the interests of the great powers in places such as Latin America and China, usually involving issues of trade and the treatment of nationals. More broadly in international relations, gunboat diplomacy is the use of conspicuous displays of military strength, or limited use of military force, other than as part of an act of war, to coerce a target state to submit to a particular foreign policy objective. Gunboat diplomacy is therefore an alternative to war, and it can be described as having failed if war erupts as a result of the demonstration.

Gunboat diplomacy has four variants. Definitive force is the exercise of force to secure or challenge a fait accompli. Purposeful force aims at changing the policy or composition of a target government or group. Catalytic force increases the policy options for leaders by deploying the flexibility of a naval force. Finally, expressive force is the demonstration of naval power to show commitment, usually by dispatching a warship into an area of interest.

Habeas Corpus

Originating in England at least eight hundred years ago, *habeas corpus* is an ancient common-law concept strongly connected to the Magna Carta. The name denotes a court order that commands those holding another in custody to produce that individual before the court, so that the court can assess the legality of the detention. A judge or court frequently petition for a writ on behalf of someone in police custody to either force the authorities to charge the detained person with a crime, or to release the person from custody. *Habeas corpus* is considered a fundamental safeguard of liberty and by using this writ, an independent judiciary works to reinforce due process of individuals' legal protection, and intervene when states improperly detain individuals. Typically referred to as *the great writ*, this remedy exists predominately in countries springing from the Anglo-American legal tradition, but other countries with alternative legal systems have also implemented parallel protections recognizing this foundational limit on governmental power. In political systems in which personal liberty is highly valued, *habeas corpus*, or something similar to it, exists.

By the time of the American Revolutionary War (1776–1783), the right to *habeas corpus* had become a fundamental protection of individual liberty in the British colonies of North America. Upon independence, the new nation included it in the U.S. Constitution. Article I, Section 9, declares that "the Privilege of Habeas Corpus shall not be suspended, unless when in Cases of Rebellion or Invasion the public Safety may require it." In this American context, the writ of *habeas corpus* demonstrates two distinct historical trajectories: the first deals with testing military authority over civilians during times of war; the second involves using the writ as a source for indefinite review of both state and federal criminal convictions.

With the first trajectory, suspending the right to *habeas corpus* essentially permits the military or other government agents to incarcerate, without judicial intervention, any person considered to be a threat. The inevitable questions arise here: Who possesses the constitutional authority to suspend this writ? Is it the president or Congress or some combination thereof? This issue came into sharp focus during the American Civil War when President Abraham Lincoln issued an 1861 executive order granting Union military commanders the power to suspend the writ as deemed appropriate. The U.S. Supreme Court weighed in on this controversy in the case of *Ex Parte Merryman* (1861) and Chief Justice Roger Taney declared that only Congress holds this suspension authority, not the executive. Lincoln disregarded this judicial enunciation, and in 1863, at Lincoln's request, Congress subsequently authorized the suspension of *habeas corpus* for the remainder of the war. The majority of modern scholarly opinion concludes that such a suspension necessitates approval by Congress—this constitutional question remains particularly contentious in light of President George W. Bush's response to the September 11, 2001, attacks on the United States. The Bush administration's unwillingness to allow *habeas corpus* for suspects (both foreign and domestic) held in federal custody generated several important Supreme Court decisions, as seen in *Hamdi v. Rumsfeld* (2004), *Rasul v. Bush* (2004), *Hamdan v. Rumsfeld* (2006), and *Boumediene v. Bush* (2008).

The second trajectory traces to 1867, when Congress statutorily broadened *habeas corpus* to bestow federal courts the authority to release anyone from custody who had been detained in violation of the Constitution or laws of the United States, even if the detention could be considered justifiable under state law. This 1867 statute is the mechanism by which both state and federal prisoners convicted for criminal offenses can request federal *habeas corpus* review. In the 1960s, with the Supreme Court's expansive views on the constitutional rights of criminal defendants, prisoners challenging their convictions filed a multitude of *habeas corpus* petitions. In these matters, federal judges issue the writ primarily on the court's lack of jurisdiction where the conviction occurred or some violation of the petitioner's constitutional rights during the legal proceedings that brought about the conviction. For instance, a writ may be issued following the use of inadmissible evidence obtained by an illegal search and seizure, or police's failure to inform the accused of Miranda rights, thus violating the privilege against self-incrimination.

Outside of the American context, a variety of other countries safeguard *habeas corpus* or something similar to it. Such protections from arbitrary and illegitimate government action commonly characterize liberal democracies. *Habeas corpus* persists in the constitutions or statutes of countries that directly experienced the English system of common law as British Crown colonies—including Canada, Australia, New Zealand,

India, and Malaysia. *Habeas corpus* is also visible in nations that were never part of the British Empire, but find such a potential bulwark against government misbehavior important—including Spain, Poland, Portugal, and the Philippines.

Habeas corpus may also be invoked in circumstances outside the arena of criminal prosecutions—for example, child custody cases, drug addicts seeking release from confinement for the treatment of their addiction, detention pursuant to health quarantines, and the status and deportation of aliens.

Hamilton, Alexander

Alexander Hamilton (1755–1804), born on the island of Nevis in the British West Indies in 1755, was the son of a Scottish merchant. His father, James Hamilton and his mother, Rachel Lavien, were not legally married, and his illegitimate birth was commonly used by his enemies to tarnish his reputation. Hamilton's father abandoned him at the age of eleven, and three years later his mother died, leaving him an orphan. The local community, at the urging of a Presbyterian clergyman, soon recognized young Hamilton's talents and provided for his passage to New York to be formally educated. He arrived in New York in 1773 and began his studies at King's College (Columbia University). Two years into his studies, Hamilton found himself immersed in the hostilities then developing between Britain and the colonies. By 1776, Hamilton was a captain of a New York artillery company. His talents were again readily recognized and at the age of twenty-two, he elevated to lieutenant colonel and joined General George Washington's staff. In 1780, Hamilton married into a wealthy and prominent family with his nuptials to Elizabeth Schulyer.

After a disagreement with Washington, Hamilton resigned his post in 1781. Washington reluctantly accepted the resignation and gave Hamilton command of a light infantry battalion. By 1781, Hamilton left the military to study and, later, practice law in Albany. However, he became restless and found public service more compelling. After being elected to the Continental Congress in 1782, New York sent him as a delegate to the Annapolis Convention in 1786, where he was one of the most vocal supporters of the Constitutional Convention, and one year later, chosen as a delegate for the event. Hamilton, frequently absent from the deliberations, was not instrumental in the drafting of the Constitution. However, he proved determined to seek its ratification and collaborated with James Madison and John Jay in writing pro-Constitution essays published collectively in 1788 as *The Federalist*.

George Washington's administration offered Hamilton the position of treasury secretary, and he proved quite skilled at placing the fledgling country on a sound financial foundation by proposing a national bank, assuming war debts of the states, fostering manufacturing, and managing the nation's debt. Despite thriving in this position, family and financial reasons forced Hamilton to hand in his resignation. Although no longer serving in public office, Hamilton still exerted a great degree of power in national politics. When Thomas Jefferson and Aaron Burr locked in a tie in the 1800 presidential election, Hamilton used his influence to Jefferson's advantage with his public support. In 1804, Hamilton also proved instrumental in defeating Aaron Burr's attempt to become governor of New York. Offended by Hamilton's actions and insulting remarks, Burr challenged Hamilton to a duel in Weehawken, New Jersey on July 11, 1804. Hamilton was mortally wounded and died the next day.

Hamiltonianism

Hamiltonianism describes the public philosophy associated with Alexander Hamilton (1755–1804), the first secretary of the U.S. Treasury. As President George Washington began to distance himself from other key advisers, such as James Madison and Thomas Jefferson, Hamilton came to play the role of "prime minister" to Washington. Hamilton recommended sweeping economic reforms designed to address the government's immediate financial crisis and to establish a foundation for future prosperity. Hamilton hoped the success of these policies would build confidence in the new government and establish its authority. Hamilton's brilliant economic reports recommended that the national government assume the war debts of the states; engage in a complex refinancing

of the national debt; create a national bank; and introduce new taxes, including a controversial excise tax. Hamilton also recommended, yet failed to enact, a plan for government to systematically encourage manufacturers to guarantee national self-sufficiency in defense-related industries, as well as to grow a domestic market for agricultural produce.

Hamilton's economic recommendations grew from his broader views on government. An early and persistent critic of the Articles of Confederation, Hamilton strongly drove the adoption of a new constitution. He organized and contributed almost two-thirds of the essays to *The Federalist*, the classic defense and interpretation of the Constitution. He believed that a much stronger national government was needed, not only to keep the states in check but to accomplish the essential purposes of government. Hamilton made the case for the Constitution's broad powers of taxation and regulation. He also argued for a strong executive who would ensure an energetic administration and could, when necessary, serve as a check on both the legislative branch and on popular passions. When Hamilton was later forced to defend the constitutionality of a national bank, he argued for a "broad" or "liberal" construction of the Constitution's grants of powers. Where a power is granted, he reasoned, all the means necessary for accomplishing the ends or purposes of the power must be assumed to have been granted as well. Furthermore, the so-called necessary and proper clause means "necessary" in the sense of "convenient" rather than "strictly necessary." The cloud that has always hung over Hamilton's reputation is the question of the depth of his attachment to republicanism. At the Constitutional Convention, Hamilton declared his opinion that the England's constitution was the best in existence and wondered whether anything short of it would do for the United States.

Thomas Jefferson's election to the presidency in 1800 meant the effective end of Hamilton's influence and that of his party, the Federalists. Still, Republicans, and later the Whigs, adopted many of his policy ideas. After the American Civil War (1861–1865), there was a greatly renewed respect for Hamilton, which lasted until the New Deal of the 1930s. Believing Hamilton to be undemocratic and too favorably disposed to the wealthy, President Franklin D. Roosevelt deliberately cultivated the image of Jefferson as a symbol of national unity. But again, Hamilton's twentieth-century critics embraced many of his ideas regarding active government and an energetic executive.

Harrington, James

James Harrington (1611–1677) was an English political writer most famous for *The Commonwealth of Oceana* (1656), considered one of the most systematic treatises to emerge from the English republican movement.

There is little reliable biographical information about Harrington's early life; he provided loans to Parliament in the early 1640s and was politically aligned with them, but he apparently was also a companion of Charles I prior to Charles I's execution. Unlike many of the other English Republicans, Harrington was not particularly active in terms of political service; instead, he worked on *Oceana.* Subsequently, Oliver Cromwell suppressed the work and imprisoned Harrington, who was not able to secure his release and the right to print *Oceana* until 1656. This was the first of two tenures in prison; Harrington was imprisoned again for a period after the Restoration.

In *Oceana,* Harrington initially establishes some basic principles of politics grounded in what he terms "ancient prudence." He praises the ancients for employing "an empire of laws, not men," and accuses philosopher Thomas Hobbes of advocating for the modern mode of "an empire of men, not laws." After describing modern prudence with a mix of history and mythmaking, Harrington sets forth the model for *Oceana.* Assuming an agrarian or natural economy and a tribally divided society, Harrington describes a number of offices and their method of election. Over three days, the citizenry elects the magistrates to govern them. Harrington also provides methods for senatorian elections and the election of certain posts via scrutiny. Ultimately, Harrington breaks the population down into thirty orders, creating many opportunities for citizen service and activity in the commonwealth.

Because of the completeness of *Oceana* and its provision of new institutions for voting and distributing duties among magistrates, it has attracted a considerable amount of attention in modern scholarship. J. G. A. Pocock is considered the leading contemporary authority on Harrington's work, and his introduction to *The Political Works of James Harrington* (1977) is often cited as the leading summary and treatment of Harrington's thought. However, the work of scholars such as Jonathan Scott, who highlights the role of motion in Harrington's work and thus focuses on similarities between Harrington and Hobbes, offers a well-developed alternative to Pocock's study.

Pocock's examination of Harrington in *The Political Works of James Harrington* places Harrington firmly in the civic republican tradition and discusses the links between Harringtonian republicanism and the classical tradition of Aristotle and (especially) Niccolò Machiavelli. Pocock pays particular attention to the importance that Harrington places on arms, and argues that adopting Machiavelli's conception of the citizen-solider allows Harrington to level his greatest critique against the feudal monarchy of England. As quoted in Pocock's work, the feudal system "clearly displays the subjection . . . of individuals whose capacity to be masters, citizens, and equals can be simultaneously displayed with equal clarity." For Harrington, the citizen-soldier cannot be justly subjugated, and must be

provided with the opportunity to function in a common-wealth constituted with a mind toward the ancient prudence that Harrington found neglected.

Harrington's work influenced many important figures in the late seventeenth- and eighteenth-century commonwealth movements; these in turn affected the political thought of the American colonies and the early American republic.

Hartz, Louis

Louis Hartz (1919–1986), an American political scientist, had a major influence on how scholars of the 1950s and 1960s viewed American political culture. Born in Youngstown, Ohio, on April 7, 1919, Hartz was the third son of Russian Jewish immigrants. He grew up in Omaha, Nebraska, where his father was a grocer. Hartz was accepted to Harvard in 1936 on a scholarship from a local newspaper. He completed his SB in 1940 and after a year of traveling returned to the university on a teaching fellowship for graduate study in government. Prior to completing his PhD in 1946, he married Stella Freinberg and they had one son. He then joined the Harvard faculty and quickly became a popular teacher and respected scholar.

Hartz's first book, *Economic Policy and Democratic Thought: Pennsylvania, 1776–1860* (1948), challenged critics who claimed that government intervention in the economy violated America's long tradition of free enterprise. Hartz presented evidence that early postcolonial Pennsylvania adopted considerable government legislation in response to the demands of vying business and labor groups. In fact, both businesses and workers benefited from government assistance in the areas of education and transportation. Contrary to the opinions of free market proponents, Hartz's findings suggested that the New Deal was hardly a radical departure from the past.

A few years later, Hartz completed his most famous and widely discussed book. In *The Liberal Tradition in America* (1955), he argued that Americans never had to rid themselves of the feudal traditions and class hierarchies associated with the Old World of Europe, so never experienced a confining social order. Hartz found a liberal outlook—an outlook that was distrustful of any government not sanctioned by the people, that valued individual rights over duty, and that upheld the sanctity of private property—permeated American political thought and practice. Both major U.S. political parties, it follows, are liberal at their most basic level. This "consensus" thesis also

explained why neither aristocratic conservatism nor a socialist movement had many followers in America. Hartz's book was awarded the Woodrow Wilson Prize from the American Political Science Association in 1956.

Hartz would later extend and revise his argument to include an analysis of other new nations. In *The Founding of New Societies* (1964), Hartz maintained that former European colonies had adopted "fragments" from the whole of Europe's political culture. American and English Canada, for instance, had adopted the liberal fragments, while French Canada embraced the feudal fragments. His fragment theory became influential in comparative studies of developing countries.

By the mid-1960s, Hartz began work on his most ambitious book, titled *A Synthesis of World History* (1983), which applied his colonial fragments theory to five great "cultural areas": Christianity, Islam, Hinduism, Confucianism, and African totemism. During the early 1970s, Hartz's writing and personal life were disrupted by ill health. He became estranged from his family and friends and resigned from Harvard in 1974. Nevertheless, he continued his scholarly work, traveling frequently until settling in Turkey where he died from an epileptic seizure in 1986.

Hate Speech

Though hate speech comes in many forms, liberal democracies in the earlier twentieth century concerned themselves primarily with speech that vilified or criticized individuals and groups based on the categories of race, nationality, and religion. In the 1920s, the term *race hate* was the preferred label for such expression, while *group libel* emerged as the predominant designation in the 1940s and 1950s. By the 1980s and 1990s, gender and sexual orientation were among items added to the list of categories considered hate speech. Human Rights Watch provides a typical contemporary definition of hate speech as "any form of expression regarded as offensive to racial, ethnic and religious groups and other discrete minorities, and to women."

Hate speech and its regulation pose a dilemma for liberal democracies. On the one hand, hate speech threatens social order and the security (or sense of security) of targeted individuals and groups. On the other hand, prohibiting hate speech can threaten freedom of speech, especially if such expression

Hate Speech 715

is defined too broadly and the causative link between expression and harm is not direct. While liberal democracies have an obligation to protect the security of all their citizens, overly broad hate speech laws can stifle honest criticism of religion and identity groups—a result that is problematic for democratic legitimacy. College speech codes that typically prohibit "demeaning" or "degrading" comments are prime examples of overly broad restrictions.

RESTRICTING HATE SPEECH

Of the arguments for restricting hate speech, four stand out. First, depending on the circumstances, hate speech can directly harm the safety and security of discrete individuals or groups, mainly when the comments directly incite harmful action or constitute a concrete threat. Second, hate speech is often very offensive, hurting the esteem or sensibilities of its targets, and leading to a sense of exclusion and second-class citizenship. Third, holding long-term consequences, hate speech can contribute to the eventual rise of hate groups and societal discrimination. Some scholars point to the alarming example of Adolph Hitler's hate speeches in Germany in the 1920s, which they consider an important causative factor in the emergence of national socialism in that country in the 1930s. The fourth argument for restricting hate speech is as much logical or normative as it is empirical: liberal democracies have an obligation to prohibit (or at least no duty to protect) the speech-related activities of individuals and groups who espouse decidedly antidemocratic ideas, and who are dedicated to destroying democratic principles and practices if they were to enter the realm of political power.

The state must decide which harms of hate speech call for remedial action of the criminal law, and which harms can be properly dealt with by voluntary responses in the marketplace of ideas. For example, targeting a swastika, burning cross, or similar symbol at a private residence with the intent to intimidate or instill fear constitutes a threat that merits criminal law enforcement. On the other hand, making a general (nontargeted) racist remark in a newspaper or public forum typically causes a less immediate, discrete harm; this thereby lessens the need for legal intervention. Accordingly, there are two major models of regulation. The group libel model maintains that the criminal law should be concerned with all or most of the four harms. Consequently, this model endorses laws prohibiting general hateful rhetoric that might lead to harmful action down the road (indirect causation is a sufficient basis for prohibition), and offend or demean individuals or groups based on the categories of race, sexual orientation, and similar categories. In the decades following World War II (1939–1945), most liberal democracies reacted to the battle against fascism by adopting a form of this model. Germany's Basic Law, for example, protects "militant democracy" by prohibiting antidemocratic parties from forming and speaking. In addition, the Canadian Supreme Court ruled in *R. v. Keegstra* (1990) that the Canadian Charter of Rights and Freedoms does not protect the willful promotion of hatred against an identifiable group because such speech goes against multiculturalism in Canada and the charter's basic principle of equality. In the first

decade of the 2000s, nations such as France have prosecuted Holocaust denial as a form of hate speech.

FREE SPEECH JURISPRUDENCE IN THE UNITED STATES

The United States, however, has traveled a different legal path. Many U.S. states passed group libel laws beginning in the 1940s. In 1952, a divided Supreme Court in *Beauharnais v. Illinois* upheld the constitutionality of Illinois's typical group libel law, which punished speech that defamed any class of individuals based on race or creed. A few years later, however, the Supreme Court launched what would amount to a sea change in free speech jurisprudence. In reaction to the emerging civil rights movement and other challenges to authority in politics and society, the Court developed a decidedly libertarian free speech jurisprudence (the libertarian model) that liberalized all areas of free speech doctrine.

The Court designed this jurisprudence to protect the speech rights of all dissenters, regardless of the content of their views. Supporters defended the rise of this "viewpoint neutrality" principle because they believed this approach was the best way to accommodate democracy, dissent, and cultural pluralism in the United States. Today, racist and other hateful forms of expression are protected unless they pose a direct harm to individuals or society. The three major forms of unprotected hate speech are concrete threats, direct incitements to imminent lawless action that is likely to occur, and fighting words directed toward an individual (hateful speech likely to lead to an immediate disturbance of the peace). Thus, hate speech is protected by the First Amendment unless it constitutes one of these forms of direct harm. In 1969, for example, the Supreme Court in *Brandenburg v. Ohio* upheld the First Amendment right of Klan leader Clarence Brandenburg to deliver a racist speech in a cornfield in Ohio. Brandenburg's call for "vengeance" and race war against blacks and Jews fell short of constituting a direct threat or an incitement to imminent lawless action; nor did Brandenburg's speech amount to fighting words, for it was not made face-to-face with a hostile target.

During the 1980s, punitive policies based on the group libel model made a comeback of sorts in higher education, as numerous colleges and universities in the United States adopted speech codes punishing expression that demeans people based on race and related categories. Courts have consistently invalidated such codes, though they persist on many campuses. Regardless, this movement has not gained headway in larger society, which remains committed to the libertarian jurisprudence of the Supreme Court.

Critics of the libertarian model continue to maintain that the harms of hate speech merit broader prohibition. Meanwhile, advocates of this model in the United States point out that hate speech and hate are widely condemned in the United States, thereby indicating that the marketplace of ideas is doing its democratic job by providing convincing counterarguments to the views of racists, sexists, homophobes, and their kin. In addition, government and society possess ample alternative tools to fight hate in contexts in which the causative link between speech and action is indirect or attenuated.

Education, government programs, surveillance of hate groups, and the rigorous law enforcement for crimes motivated by hate are four such tools.

Hayek, Friedrich August von

Friedrich August von Hayek (1899–1992) is best known as a leader of the Austrian school of economics, but he also made important contributions to political theory. He was a staunch advocate of the free market, and from that position he developed his larger notion of spontaneous order—the idea that social orders work best when they evolve out of the apparently chaotic interaction of individuals, with no central control by the government and no central planning by scientific experts. Hayek maintained that, compared to governments, markets better discover and coordinate the vast amount of fragmented and dispersed knowledge in a society—a process vital to society's progress.

Hayek was born on May 8, 1899, in Vienna, Austria. At the University of Vienna, he met Ludwig von Mises, the chief representative of the Austrian school, who turned him from a prosocialist to a procapitalist position and became the most significant influence on his intellectual development. Hayek's technical work in economics centered on issues of monetary theory, the capital structure of production, and the business cycle. In 1931, he joined the London School of Economics and later taught at the University of Chicago and the University of Freiburg.

In 1944, Hayek published what became his most famous and widely read book, *The Road to Serfdom.* At a time when Europe seemed polarized between fascism and communism, he reminded people that both are species of socialism. The book created enormous controversy by suggesting that all forms of socialism inevitably become totalitarian and thus are incompatible with political freedom and democracy. Hayek remained controversial throughout his life, but his growing reputation as a major social thinker solidified when he won the Nobel Prize in Economics in 1974. His most important books from a political standpoint are *The Constitution of Liberty* (1960) and *Law, Legislation and Liberty* (1973, 1976, 1979). In the former, Hayek advances the classical liberal ideal of the social order, especially its principles of limited government, rule of law, private property, and economic freedom. In contrast to Mises, however, Hayek makes several concessions to the principles of the welfare state. In *Law, Legislation and Liberty,* he offers his fullest articulation of the idea of spontaneous order. He defends the British common-law tradition against legislative utilitarianism. Hayek endorses principles of justice that have evolved over time in judges' responses to concrete legal situations, and rejects the idea that the law should be handed down by a legislature based on abstract reasoning about the just social order. In his preference for the concrete over the abstract and for what has stood the test of time, Hayek harks back to the political thinking of philosopher David Hume and political theorist Edmund Burke.

By the time of his death on March 23, 1992, in Freiburg, Germany, Hayek was generally credited with being—along with American economist Milton Friedman—the intellectual driving force behind the free market revolution in government policy led by President Ronald Reagan in the United States and Prime Minister Margaret Thatcher in Great Britain in the 1980s. Having predicted the collapse of communism, Hayek became a hero to many in East Central and Eastern Europe striving to create a postcommunist world after 1989. Rejecting the utopian notion that government can solve all human problems, Hayek was one of the foremost critics of collectivism and champions of economic and political liberty in the twentieth century.

Health Care Policy

A health care policy is a type of social welfare policy. Like other social policies, it aims to improve the general welfare of citizens. A health care policy also distinctly aims to promote the physical and mental well-being of individuals in society.

Health care policies can operate in a variety of different ways. Some policies attempt to expand access to services; others try to improve the quality of medical benefits; some others focus on funding medical services. Health care policy operates in various ways in nations around the world, and major controversies surround the provision of health care in contemporary society.

DIFFERENT TYPES OF HEALTH CARE SYSTEMS

One way to categorize different health care policies, at least at the national level, is to focus on the degree of government involvement. Using this criterion, there are three general types of systems. National health systems, such as those in Great Britain and Sweden, depend heavily on government involvement to provide benefits to all citizens. National health insurance systems, present in nations including France and Germany, rely on the government to establish general policies, but the private and nonprofit sectors play a key role in the process. Private health care systems, like those in the United States, depend almost extensively on the private sector for the provision of medical benefits, with only minimal involvement from the public sector, primarily to help finance medical services for particular subgroups of the population.

Although this typology is still used to describe different national health care policies, it is difficult to fit most health care systems neatly into one of these three categories. Each national system has its own structure and character, reflecting the particular context in which it has developed. Moreover, many national health care systems have changed over time—expanding or reducing the role of government, changing the scope of services, altering the covered populations, or adjusting the reimbursement mechanisms. As a result, other ways of describing the variability in health care policy are necessary.

VARIABILITY IN HEALTH CARE POLICY

Even when governments are involved in health care policy, their role is not the same in every nation. The government can serve as a regulator to determine minimum levels of quality and service, as in the Netherlands. A government can provide the financing so that health care services are available, such as in the United States. Or, government can actually provide health care benefits directly through publicly owned facilities, a practice in Great Britain and Portugal. These various governmental roles are not mutually exclusive of each other; governments typically assume several of these roles within the same political system.

Health care systems differ in terms of who receives care. In some nations, health care policies are universal in nature—all citizens are eligible to receive benefits. Universal health care policies can be found in Japan, Canada, Mexico, France, and Sweden. Alternatively, other health care policies are more limited in scope. In such systems, health care benefits are restricted to particular subgroups of the population, such as the elderly people and veterans, or to specific "needy" groups (low-income families, populations with special needs, etc.). The Medicare and Medicaid programs in the United States are examples of limited health care policies.

There are also noticeable variations in how health care policies across political systems are financed. Some countries, such as Great Britain, Sweden, Australia, and New Zealand, rely on tax collections and government funds to finance health care. Other nations, like Germany, France, and Japan, use employer and employee contributions. Still others, like the United States, depend heavily on individual contributions to private health care plans in order to fund health care benefits for the majority of their citizens.

Health care policies also differ between those that are curative versus preventative in nature. Preventative policies try to address medical problems before they arise (or worsen). These include the use of vaccines to prevent the spread of diseases and routine checkups to identify problems in earlier stages before they become more serious. On the other hand, curative policies focus on dealing with medical problems after they have developed. These can include a range of typical medical treatments, such as hospitalizations and long-term care.

CONCERNS AND CONTROVERSIES

Since the 1980s, health care policies have received an increasing amount of attention because of the rising costs associated with providing medical services. Data from the Organization for Economic Cooperation and Development (OECD) demonstrate, quite clearly, the growth of health care expenditures. From 1991 to 2001, the growth of health care spending exceeded the growth of the total gross domestic product (GDP) in all thirty of the OECD nations. On average, health care expenditures now consume 8.9 percent of the GDP in the thirty democracies that make up the OECD.

Health care spending has increased around the world as political systems have expanded program coverage to include more groups of the population, as more advanced (and expensive) medical procedures have become available, as demographic changes have produced older populations in need of more medical services, and as citizens' expectations about necessary health care benefits have expanded. Hence, all nations struggle with rising health care costs and seek ways to decrease health care expenditures while maintaining services to their populations.

Health care policies also do not act in isolation from other public policies. For example, environmental policies affect the quality of drinking water which, in turn, influences the health of a population. Similarly, business policies can make the workplace a safer environment; for instance, requiring stricter standards and regulations improves the health care status of workers. Additionally, income support and assistance policies can provide citizens with the finances they need to maintain healthy diets and eating habits. Therefore, the impacts of health care policies often link to those of other public policies.

Health care policies can also trigger additional policy problems. Many health care policies aim to improve the life expectancy of the population. If successful, these policies will increase the size of the elderly population. Larger elderly populations possess greater health care needs, and they also require other, quite expensive, types of social services, such as retirement benefits and housing support. Similarly, health care policies that restrict benefits to certain population groups or problems may leave other segments of the population without adequate medical coverage. This, in turn, can put pressure on employment programs and other social services.

Heckscher, Gunnar

Gunnar Heckscher (1909–1987) was a major right-wing political scientist in Sweden during the period between World War I (1914–1918) and World War II (1939–1945). The son of economic historian Eli Heckscher, he was born in Danderyd in Stockholm County. He studied at Uppsala University and received his PhD in 1934 with his thesis, "Konung and Minister of State in the Constitutional Act of 1809." Later, as an associate professor of political science, he wrote a thesis on the development of Swedish conservatism and the representative system's reform. During the 1940s and 1950s, Heckscher authored many groundbreaking works, including *State and Organizations* (1947), *Swedish Government at Work* (1952), and *Study of Comparative Government* (1957).

Heckscher became an associate professor at Stockholm University in 1941 and a full professor in 1948. He also served on the boards of several government commissions and, from 1945 to 1954, was a rector at the Social Institute. He was considered a moderate conservative and was chair of the right-wing youth organization of the Moderate Party. He was elected to the second chamber of the Swedish Riksdag in 1957 and became vice chair of the National Federation of the Right.

In 1961, Heckscher took over the presidency of the Moderate Party after Jarl Halmarsson's resignation. Heckscher encountered much opposition within his own party because of his moderate position on social issues. His main achievements were the admission of Ireland to the European Union and rallying the Conservatives after their defeat in the 1964 elections. He resigned as party leader in 1965. The Social Democrats had regained power in 1964 and the non-Socialist alliance was in total disarray.

Heckscher occupies a unique niche in the Scandinavian political spectrum. He was a Jew and an atheist in a primarily Lutheran nation and a Conservative in a largely Social Democratic political system. Even among Conservatives, he was a genuine moderate who followed his intellectual instincts. As an academician active in electoral and legislative politics, he represented a generation of moderate conservative leaders of the post–World War II generation such as West German chancellor Konrad Adenauer, Italian prime minister Alcide De Gasperi, and French president Charles De Gaulle.

Heckscher was also an astute student of politics and government. His *Swedish Government at Work* (1952) introduced interviews to the study of government, and *State and Organizations* (1947) presented the role of associations in the political process. His most notable work was *The Welfare State and Beyond* (1984), a conservative critique and analysis of the Scandinavian welfare state, which functioned as a middle system between capitalism and socialism. The failure of this Scandinavian experiment raised serious questions regarding the viability of political institutions that attempt to change social behavior. Since the publication of Heckscher's book, the welfare state has been discredited in almost all countries and it has ceased to be a viable political option. Heckscher's other books include *The Swedish Constitution* (1959), *The Role of Small Nations* (1966), *The Budget as an Instrument of Administrative Efficiency* (1971), and *Asian Power Game* (1977).

Heckscher-Ohlin Theorem

The Heckscher-Ohlin (HO) theorem is the cumulative work of two Swedish economists, Eli F. Heckscher and his student Bertil Ohlin, first published in the early twentieth century. The theorem revolutionized economic explanations of international trade, replacing classical accounts found in the work of Robert Torrens and David Ricardo. The theory purports to explain the conditions under which international trade takes place and what patterns of international trade to expect. Though it has been subject to some degree of criticism, the HO theorem, along with revisions from other economists,

represents the foundations of contemporary thinking and policy making concerning foreign trade.

The centerpiece of the theory is relatively straightforward. The theory assumes that production-factor endowments of countries are different and that different industries use different factors with different intensities. The model concludes that countries will export those goods for which they have greater factor intensities. Hence, assuming two factors of production, such as labor and capital, countries with greater labor intensities relative to capital will export labor-intensive goods, while countries that exhibit greater capital intensity will export capital-intensive goods. In effect, the relative intensity of each factor gives each economy a comparative advantage in producing those kinds of goods.

One criticism of the theorem is that it rests upon several oversimplifications, such as identical production functions in different countries, making trade patterns in the real world inexplicable within the theorem's parameters. Several empirical studies have shown that, in some instances, labor-intensive economies export capital-intensive goods, while some capital-intensive economies import capital-intensive goods. For example, Wassily Leontif (1953) found that in post–World War II America, the United States, a capital-abundant economy, imported capital-intensive commodities. Still others have argued that patterns of trade are best explained by economies of scale and strategic interactions in economic policy.

Defenders of the theorem argue that despite occasional anomalies or paradoxes in the empirical evidence, the HO theorem remains useful for explaining how international trade can occur in the context of the unequal geographic distribution of different resources.

Hegedus, Andras

Andras Hegedus (1922–1999) was a Hungarian politician who served as his country's youngest prime minister from 1955 to 1956. He signed the treaty establishing the Warsaw Pact as well as the document requesting the help of Soviet troops to crush the Hungarian Revolution of 1956. He later criticized and opposed Soviet intervention in Czechoslovakia in 1968, and was expelled from the Hungarian Communist Party in 1973. Hegedus was a Social Democrat and a member of the Budapest school, which developed a variant of Marxism known as critical Marxism that opposed Stalinist deformative politics.

Born in Sopronfelsoszentmiklos into a peasant family, Hegedus became an active member of the Communist Party during World War II (1939–1945). At the end of the war, when the Communists seized power, he became a member of the party's Central Committee and secretariat and quickly rose to become first deputy prime minister and agriculture minister under Prime Minister Imre Nagy. In 1955, Hegedus was appointed prime minister but the next year, he was forced to leave the office and exiled to the Soviet Union. He returned to Hungary in 1958 as a member of the Hungarian Academy of Sciences Institute of Economics. In 1962, he became deputy president of the Central Statistical Office, and in 1963, head of the Sociology Research Group at the Hungarian Academy of Sciences and editor in chief of the journal *Valosag* (Reality). In 1966, he began to teach at the Karl Marx University of Economics. Two years later, following his condemnation of the Soviet intervention in Czechoslovakia, he was dismissed. Thereafter Hegedus became one of Hungary's best-known dissidents and denounced Soviet atrocities until the fall of communism in the late 1980s.

Hegedus worked to develop an alternative socialist model involving a pluralist society in which the bureaucracy was tempered by popular control. This would require a profound process of self-reform, including the reform of the electoral system. Hegedus's society depended on the growth of non-bureaucratic structures and autonomous networks with the means to oppose state bureaucracies. According to Hegedus, economic reforms are not enough and should be accompanied by ideological revision, since when ideologies become rigid, there is always the danger of repression and suppression of ideas. However, progress will be incremental. Bureaucracies do not give up power easily, but they can be persuaded to slowly relinquish small parts of power in order to gain greater legitimacy in the eyes of those they rule.

Hegedus's works include *Socialism and Bureaucracy* (1986) and *The Humanization of Socialism* (1976).

Hegel, Georg W. F.

Philosopher Georg Wilhelm Friedrich Hegel (1770–1831) was born in Stuttgart, Germany, in 1770. He was educated at the Tübinger Stift, where he became close friends with Friedrich Schelling and Friedrich Hölderlin. During their time in Tübingen, they were inspired by the outbreak of the

French Revolution (1789–1799) but horrified by the Reign of Terror that took place during it, in which ideological struggles between rival political factions led to mass executions. After serving as a private tutor in Switzerland, Hegel went first to Frankfurt where Hölderlin lived, and then in 1801 assumed a lectureship in Jena where Schelling was teaching. Together Hegel and Schelling edited the *Critical Journal of Philosophy,* an organ for their new speculative philosophy. While in Jena, Hegel also wrote his *Phenomenology of Spirit* (1807). With the closure of the university following the battle of Jena on October 14, 1806, Hegel became a newspaper editor in Bamberg and then the head of a college preparatory school in Nuremberg. After publishing *Science of Logic* in 1816, he obtained a professorial position at the University of Heidelberg and published his *Encyclopedia of the Philosophical Sciences* (1818). During the same year, Hegel was called to Berlin where he taught until his death in 1831. While in Berlin, he published the *Philosophy of Right* (1822) and delivered lectures on the philosophy of history, religion, aesthetics, and the history of philosophy—all published after his death. At the time of his death, he was considered one of the most influential philosophers in Europe and exercised a profound influence on many of the greatest thinkers of the nineteenth and twentieth centuries.

Hegel is best known for the development of a dialectical philosophy that combines a Kantian notion of consciousness with a notion of historical development derived from French political thinker Charles-Louis Montesquieu, Irish philosopher Edmund Burke, and others. In the *Phenomenology*, Hegel traces the development of consciousness as a historical phenomenon, demonstrating that the human intellectual project came to its end in his own time with the realization and reconciliation of everything that had previously been considered dichotomous—subject and object, individual and society, human and nature, and human and divine. This was achieved through what Hegel called absolute knowledge or science. He spelled out the conceptual foundations for this science in his *Logic,* which constituted the basis for his practical philosophy.

Hegel's political philosophy is laid out in his *Philosophy of Right*, which combines a theory of natural or abstract (property) rights, a modified Kantian moral theory, a communitarian notion of the family, a Smithian notion of economic life or civil society, and a bureaucratic model of a rational state that resembles the constitutional monarchy of England. In his *Philosophy of History* (1837), Hegel attempts to show that history is a dialectic of freedom beginning with the master and slave relationship and ending with universal citizenship; it passes from oriental despotism to Greek democracy, and Roman aristocracy to the monarchical world of modern Europe. A human's historical task, in Hegel's view, comes to its practical end in the realization of such rational states, and to its spiritual end in the completion and perfection of knowledge as the systematic science of all that is.

Hegemony

The term hegemony means domination with consent. From the Greek *hegemonia,* it denotes leadership of an alliance by a single leader, or hegemon. Although ancient hegemons tended to possess great power, their allies conceded them leading roles due to other qualities, such as skill and virtue, as well as the policies they embraced. The tendency toward domination without consent, however, has led many international relations scholars to equate hegemony with domination that does not respect the independent existence and autonomy of allies, thus providing a different definition of the term.

In the twentieth century, political theorist Antonio Gramsci renewed interest in the concept of hegemony when he used the term in the context of domestic politics rather than international relations. Gramsci sought to understand the formation of alliances among groups to achieve domination, and he stressed the important role of ideology in convincing followers to support a leadership. Gramsci assigned a distinctive role to intellectuals as formulators of ideas that link leaders to followers. At the same time, he stressed that political struggle continued as subordinate groups sought to achieve a position of domination through a counterhegemony. This implies that some groups, instead of being enlisted in a hegemonic enterprise, are suppressed, sometimes with force. Thus, hegemony in this interpretation is a system of domination with minimal violence.

HEGEMONIC AND NONHEGEMONIC DOMINATION

With respect to both international and domestic politics, a distinction can be made between hegemonic and nonhegemonic domination, that is, between alliance and empire and between democracy and tyranny. Both employ ideology to justify themselves and to provide policy guidance. In nonhegemonic alliances and tyrannies, the dominant leader or group exercises power over others without their consent and employs ideology largely to rationalize or justify its domination. In contrast, in hegemonic alliances and democracies, leaders employ ideology to convince others to follow, and followers extend their consent to domination, implying that they retain the freedom to withhold consent. Furthermore, a hegemonic system always includes politics in which discussion and debate are possible. A nonhegemonic system, in contrast, is based solely on violence and other coercive means.

Hegemony presumes ongoing debate and discourse, dominant states or groups exerting leadership to retain their power, and allies or subordinate groups striving to shape the policy

direction of the leadership. Beyond policy matters, allies or subordinate groups sometimes strive to overturn the dominant states or groups through struggle, or counterhegemonic activity, and to establish a different hegemonic order. Thus, hegemonic arrangements involve continuous contestation. Counterhegemony arises from the ideological framework of a hegemonic arrangement, but its triumph relies upon crisis and the addition of new ideological beliefs that are combined with those from which it arose.

AUTONOMY AND PERSISTENCE

The distinctive feature of hegemony is autonomy. There are three types: autonomy within hegemony, autonomy from counterhegemony, and autonomy based on an opposed hegemony. Within hegemony, groups can advocate and implement deeply opposed policies within the context of the prevailing hegemonic system; for example, within the same system, a shift in fundamental economic policy could occur from one based upon Keynesian principles of state intervention in the private economy to one based upon Friedrich von Hayek's commitment to minimizing the state's participation in the economy. Change with counterhegemonic autonomy involves a deeper shift in which once subordinate groups forge an alliance that brings a radically different hegemonic arrangement, as exemplified in the shift in Germany in 1933 from a republic to a dictatorship, or in the shift in Eastern Europe at the end of the cold war from communist systems to liberal democratic, capitalist ones. An opposed hegemony provides a foundation for a different sort of autonomy, for example, in the cold war in which the Soviet Union retained its autonomy outside the hegemonic system dominated by the United States.

Hegemony thus refers to long-term and persistent political arrangements within which a state or a coherent group provides leadership and direction over others. At the same time, allies and subordinate groups retain their scope for participation in, and even rejection of, the leadership. Leaders have a tendency to dominate without consent, but allies and other states tend to check or balance those aspiring to a position of dominance in international relations, and subordinate groups within a society struggle to affect policies and to achieve leadership within the society. So long as these autonomous activities are sustained, hegemony can be said to persist. When allies and subordinate groups lose their scope for free participation, hegemony ends, and empire or tyranny begins.

Heidegger, Martin

Martin Heidegger (1889–1976) was a highly influential German philosopher and thinker. With all that has been written by and about Heidegger, there is much that remains an enigma about both the man and his philosophy. Educated as a Catholic with the hope of going into the priesthood, he instead became a professional philosopher whose work would give little comfort to those who find faith in religious dogmas or the ideology of what Heidegger considered instrumental reason. The biggest puzzle regarding Heidegger is his relationship to politics and power and why a philosopher of nearly undisputed genius would lend his office as rector of the University of Freiburg in 1933 to support the rise of national socialism and the early triumphant stages of Adolf Hitler's dictatorial leadership. There is also the question of legacy and whether or not Heidegger's difficult style of writing and philosophizing clarifies more than it conceals about the human condition and the essentially political nature of human relations. It is, in part, because there are so many dimensions to Heidegger's life and ideas that his thinking (if not his choices) remain as provocative as they are controversial.

Heidegger's most well-known contribution to philosophy (and one with important implications for postmodern political theory) is his first book, *Being and Time* (1927). From the book's opening question—whether the true meaning of "being" is understood—to its closing query—whether being exists outside time—*Being and Time* offers a revolutionary way of thinking about what it means to be a person, or what Heidegger calls *Dasein.* Heidegger's central thesis is that people are beings who can never fully be explained rationally or scientifically, but are instead historical agents whose awareness, guilt, and anxiety over the absolute nature of death leads to a choice: lead an authentic existence in the resolve to care—often in the face of great danger—or live inauthentically by substituting nonthinking everydayness for commitment.

For Heidegger, therefore, Dasein is never a static being, but is always in the process of "becoming" through the questions asked and the choices and commitments made. Though he resisted the label of existentialist, Heidegger's *Being and Time* is considered foundational to modern existentialism, influencing such thinkers as Jean-Paul Sartre and Albert Camus.

The problem with Heidegger's phenomenological method of analysis, a method that suggests truth is best revealed as a

German philosphor Martin Heidegger posited that humans cannot be rationally understood and are instead historical agents who may choose to live authentically.

product of choice and interpretation, is that there is no way to objectively verify (or falsify) reality, or what empirical social scientists call data. Second, when applied to politics, the danger of Heidegger's methodology is that anything is possible because reality is indeterminate and commitment is based on resoluteness rather than ethics. As a result, Dasein can be equally authentic in choosing evil over good; in Heidegger's case, this may have resulted in his choosing the promise of nationalism to revive the German spirit rather than the inherent messiness of liberal democracy. Finally, Heidegger's method of investigation led him to a radical critique of technology, which he believed further alienated humanity from its roots.

Heidegger's clearest statement of his contempt for a modern world built on instrumental reason and technology is found in his 1935 lecture, "The Fundamental Question of Being," later published in 1959. Disillusioned with Hitler and the direction of contemporary society, and dealing with

a nervous breakdown and public censor at a 1945 denazification hearing (during which he was banned from teaching until 1950), Heidegger spent his remaining years living, writing, and receiving visitors at his beloved "hut" at Todtnauberg in the Black Forest of southern Germany. Scholars have since recognized an aesthetic turn away from Heidegger's earlier concern with being to a greater emphasis on the importance of place (dwelling) and poetics during this period.

Heidegger's close readings of the ancient pre-Socratic philosophers, Aristotle, medieval scholasticism, Soren Kierkegaard, and Friedrich Nietzsche influenced him early in life. His teacher Edmund Husserl at Freiberg University and the writings of the seventeenth-century Japanese Zen poet Matsuo Basho also significantly impacted the development of his worldview. As a professor at the University of Freiberg, Heidegger taught numerous students who would make important contributions to political theory, including Karl Lowith, Hans-Georg Gadamer, Hannah Arendt, Leo Strauss, Hans Jonas, and Herbert Marcuse.

Herzen, Alexander I.

Alexander I. Herzen (1812–1870) was a Russian writer, philosopher, and political activist. Considered by some to be the "father of Russian socialism," Herzen spent much of his life in exile, agitating for political change in tsarist and autocratic Russia. Born in Moscow as the illegitimate son of a rich Russian landowner and a German woman, he completed his studies at Moscow University. In 1834, he was arrested for attending an event upholding views against the tsar. He was found guilty and exiled to a small town outside of Russia.

Herzen returned to Moscow in 1840 and was drawn into socialist literary circles. He worked as a state official in

St. Petersburg and in Novgorod, sent to the latter as punishment for a critical remark about police violence. In 1846 his father died, leaving him a large fortune. In 1847 he left Russia, never to return. In the same year, his first major literary work, *Whose Fault?,* appeared, examining the emergence of new ideas in Russia through fictional characters.

In Europe, Herzen became a supporter for socialist causes, despite his disillusion with many in the socialist movement, including Karl Marx. Settling in London, he began publishing works critical of the system of government in Russia. In addition to his essays, the periodical *The Bell* (*Kolokol*; 1857–1867), which he edited with assistance from the anarchist Mikhail Bakunin, gained a wide following and established Herzen as a leading voice for reform in Russia. In particular, Herzen attacked the institution of serfdom, the stifling Russian bureaucracy, and the lack of individual freedoms. It was said that the tsar himself read Herzen's works.

As a socialist, Herzen is usually assumed to be one of the earliest of the Russian Westernizers, a group opposed by more traditional Slavophiles. While it is true that Herzen advocated individual freedom and did admire the French Revolution (1789–1799), after witnessing the failed revolutions in Europe in 1848, he became skeptical about violent uprisings, the subject of his work *From the Other Shore* (1850). Despite entreaties from more radical figures in Russia and in exile, Herzen did not use his writings to call for violence. Instead, his vision of Russia tilted toward peasant-based socialism, in which rural communes would live free of obtrusive government interference. In this respect, by putting faith in the peasantry, he shared much in common with the Slavophiles.

Herzen's full agenda—including creation of a national parliament—was not realized in his lifetime. His decision in 1863 to support the demands of the Polish rebellion led many Russian liberals, who patriotically lined up with the tsar, to make a break with him. *The Bell* ceased publishing in 1868, and by the time of his death in Paris in 1870, Herzen had lost much of his earlier importance.

Herzen would, however, influence later Russian figures, particularly populists in the 1880s and 1890s who attempted to rally the peasants for political change. Although Herzen was a socialist, his humanistic ideas were not adopted by more revolutionary figures such as Lenin. Herzen did not, as the British philosopher Isaiah Berlin noted with admiration, seek to sacrifice individuals on the altar of abstractions—a charge sometimes levied at Lenin and his followers. The famous Russian novelist Leo Tolstoy praised Herzen as an extraordinary individual, and Herzen's autobiography, *My Past and Thoughts* (1867), is considered a classic in Russian literature.

Heuristics

Heuristics (or heuristic algorithms) are problem-solving procedures that, while may yield acceptable results in practice, provide no guarantees of yielding "good" solutions in general. Specifically, an algorithm is called heuristic if it cannot be shown to yield a result to be correct, correct within a known error of approximation, or correct with known probability.

Generally, heuristics are used for problems that are too difficult to be solved correctly, or where a provably correct procedure is too expensive, time-consuming, or cognitively complex. In political science, heuristics are used for both solving statistical models and developing political-behavior models.

Political methodologists often use complex statistical models to analyze political phenomena. While simple linear models and simple, globally concave nonlinear models are usually straightforward to solve exactly, statistical functions with many discontinuities or local optima may require heuristics for practical solution.

Cognitive heuristics, pioneered by Daniel Kahneman and Amos Tversky's Nobel Prize-winning work on prospect theory, are often incorporated into models of political and social behavior. These heuristics represent alternatives to standard models of rational choice for individual behavior, in which individuals are assumed to possess unbounded rationality, attention, and problem-solving ability. However, while it is plausible that people often behave heuristically, there are a large variety of theoretically plausible cognitive heuristics, especially where the decision-making environment is complex; thus social scientists face a significant challenge in discovering which heuristics adequately capture or predict real behavior.

Hierarchical Modeling

Hierarchical models, also commonly called multilevel models, hierarchical linear modeling, nested models, and multilevel analyses, are structures that consist of multiple units of analysis, one "nested" within the other. This type of model is useful in political science because often the effect of an independent variable on the dependent variable, observed at one level, is influenced by variables observed at another level. For example,

household income might affect the amount one donates to a campaign. However, the degree to which politicians practice clientelism across nations, such as giving privatized benefits to certain constituents, may also influence the effect of income on campaign donations. A hierarchical model, in this case, affords the researcher the opportunity to account for variance in individual campaign donations by considering information at all levels of analysis.

Traditional methods of statistical analysis, such as ordinary least squares (OLS), ignore the nested structure of hierarchical models by assuming observations are independent when they are not. That is, OLS assumes residuals to be independently distributed and, to the extent that observations in groups (e.g., voters in nations) share common characteristics, their residuals correlate. Violating this assumption causes the underestimation of standard errors, thus placing the researcher at risk for committing Type I errors. Adding dummy variables to flag a voter's citizenship mitigates the problem. This allows the calculation of differences in the intercepts between voters of different nations, but it does not allow the explanation of these differences with information in the set of data. Using robust standard errors, which allow residuals within groups to covary, also provides a fix for standard errors, but again, the robust standard errors do not allow one to model differences between groups.

Hierarchical models allow the information in the data set to model the phenomenon of interest as well as differences between groups on intercepts and slope coefficients. Using the example above, campaign donations can be modeled as

$$y_{ij} = \beta_{0j} + \beta_{1j}x_{ij} + \varepsilon_{ij}$$

where individual i is contained within nation j and is affected by explanatory variable x_{ij} (household income). The second-level effects of the nation can then be modeled by the coefficients β_{0j} and β_{1j} as follows:

$$\beta_{0j} = \gamma_{00} + \gamma_{01}z_j + \delta_{0j}$$
$$\beta_{1j} = \gamma_{10} + \gamma_{11}z_j + \delta_{1j}$$

Here the γ-coefficients are fixed parameters, z_j is a second-level predictor (the degree to which politicians practice clientelism in the example above), and the δs are the disturbances. The coefficient γ_{00} is referred to as the *grand mean* and represents the level-2 intercept. This specification allows the researcher to explore the phenomenon in question along with differences in the intercept or slope coefficients, by nation. The model expands to include more independent variables or, if necessary, to account for variables measured at higher levels of aggregation.

Hierarchical models provide several advantages to researchers, but there are weaknesses worth noting. First, the stability of any given hierarchical model decreases as more predictors are added. Second, multicollinearity is a more acute concern in a hierarchical model relative to an OLS model. Last, hierarchical models are typically estimated using either restricted maximum likelihood or empirical Bayes/maximum likelihood; both are computationally intensive.

Hilferding, Rudolf

Rudolf Hilferding (1877–1941) was a leading Austro-Marxist theorist and political figure in the German Social Democratic Party (SPD). Author of *Finance Capital: A Study of the Latest Phase of Capitalist Development* (1910), classical Marxism's most important political economy work after Marx's *Capital* (1867), Hilferding introduced the term *organized capitalism*. He served twice as finance minister in SPD-led coalition governments in the Weimar Republic and was the leading theorist and key advocate of the Republic in the SPD.

Hilferding was born in Vienna, Austria-Hungary, on August 10, 1877, into a liberal-Jewish bourgeois family. He studied medicine at the University of Vienna, leaving with a doctorate in 1901 to become a general practitioner. By the early 1890s, he had become radicalized and joined with like-minded others into a reading and study group that later became the nucleus of the school of Austro-Marxism. The iconoclasm of Austro-Marxism—blending historical analysis, neo-Kantian philosophy, the Marxian critique of political economy, and contemporary developments in sociology and economics—influenced his thinking for the rest of his life.

After receiving an invitation from August Bebel, founding leader of the SPD, and Karl Kautsky, the party's leading theorist, Hilferding moved to Berlin in 1906. He was initially a leading voice against Eduard Bernstein's revisionism and he defended revolutionary politics in the debate on the mass strike.

Hilferding's *Finance Capital* begins by examining the financial market and its institutions, money, and banks, and makes the case for a new phase and type of capitalism. This new capitalism becomes organized into cartels dependent on and led by finance capital (the banking sector) and is ultimately incapable of a final economic breakdown. However, the new capitalism is also intrinsically linked to a political compromise between old (aristocratic) and new (bourgeois) order and includes imperialism as the necessary outcome. The work thereby stands both analytically and politically in stark contrast

to Bernstein's *The Preconditions of Socialism* (1899); it also highly influenced Nikolay Ivanovich Bukharin and Lenin's theory of imperialism. The antirevisionist stance is even more apparent in Hilferding's formulation of organized capitalism in response to Germany's World War I (1914–1918) political economy. Under this system, the state organizes and dominates capitalism but does so in the service of war (war economy) and thus precludes democratic reforms through parliamentary means.

Hilferding never quite associated himself with the radical left that converged around Rosa Luxemburg, however. He also kept his distance, despite an initial political friendship with Leon Trotsky, from the Russian radical left (Bolshevists), and opted for democratic socialism instead. Although Hilferding was openly critical of the SPD's embrace of World War I and eventually became the leader of the antiwar Independent Social Democrats, he had a rather pragmatic-realist view of the German Revolution of 1918 to 1919. To aid the Weimar Republic, Hilferding radically reformulated his concept of organized capitalism into a kind of parliamentary welfare state regime, a precursor to neo–Marxism's capitalist democracy, to substantiate and legitimize SPD support and actions in the Republic.

When Adolf Hitler came to power, Hilferding fled Germany. His last political intervention was the exiled SPD's radical Prague Program in 1934, which called upon the German working class to rise up against the dictatorship. His final, unfinished work, *The Historical Problem* (1940–1941), presents his departure from classical Marxism. In it Hilferding anticipates the idea of the relative autonomy of the state and a move from "class" to the concept of "social groups." He also asserts the importance of psychology in understanding social phenomena. Hilferding was arrested in Marseille, Vichy France, extradited, and died in Paris on February 10, 1941, after being tortured by the Gestapo.

Hindu Political Thought

Hindu political thought has shifted throughout history. On the one hand, the classical Hindu tradition contains almost a disinterest for political issues; on the other hand, the modern phase of Hinduism includes a strong growth of political Hinduism.

THE ROLE OF POLITICS IN CLASSICAL HINDUISM

Of the numerous classical Hindu texts, some can be identified as a core: the *Vedas,* the *Upanishads,* and the *Agamas,* together known as *sruti.* In these texts, and in contemporary comments to them, one can find the discourse on Hindu political thought. Compared to the deep philosophical discussions found in classical Hinduism, however, the debate on political issues is sparse. Most political texts from the classical period (usually dated 500 BCE–500 CE) describe existing political systems and offer advice on how to implement the religious order, rather than independently analyze political problems. The existing social order is usually taken for granted, and the caste problems discussed are mostly practical aspects regarding how to rule a society based on these cleavages, rather than on the possible fairness and justification of the system. Classical Hindu political thought tends to emphasize duties rather than rights, and central for almost all writers is the concept of *dharma,* which translates as duty, path, or law. The dharma is individual and depends on one's status in the cosmic order, and this order is also dependent on all individuals correctly following their particular dharma.

The primary task of the political leaders in the classical Hindu states was to ensure that dharma was always followed, and to support their efforts, a number of writers presented treatises on the issue of government. The best known of these treatises is the *Arthasastra* by Kautilya, written in the fourth century BCE, in the early years of the Mauryan Empire (321–185 BCE). Kautilya is widely believed to be synonymous with Chanakya, the prime minister serving Chandragupta, the first Mauryan emperor. Some critics point to variations in the texts, which would indicate that the book had several authors, and that some sections of it were written later. The Arthasastra includes detailed instructions on how the ruler must act to uphold the social order; some of the chapters are dedicated to the administration, others to foreign relations and the economy. The treatise is in some senses cynical in its worldview, as at times it seems that the primary purpose is to ensure the survival of the king, and comparisons are often made with the European Renaissance treaty, *The Prince*, by Niccolò Machiavelli.

The Arthasastra of Kautilya is not unique; other similar treatises were written in the classical period, and these texts also emphasized the necessity of a firm social order and a caste system. In *Manusmrti* (Laws of Manu), believed to have been written no later than 200 CE, the creation of the world links to the prevailing social system, based on caste. The book gives detailed instructions on how the social order is to be upheld and recommends severe punishment to those who break the caste rules.

MODERN DEVELOPMENTS OF HINDUISM IN POLITICS

In the modern era, liberal and socialist ideas have dominated India's political field, resulting in the almost general acceptance of a secular state, separating religion and politics, and thereby reducing the scope for religious political thought. This secular solution was accepted by the Indian National Congress, the dominant freedom movement of British India,

and later influenced the framing of the new Indian constitution. As a reaction, a new form of Hindu political thought established itself in the early twentieth century: *Hindutva* or Hindu nationalism, an ideology influenced by both classical Hinduism and modern forms of nationalism. In his book *Hindutva,* first published in 1923, the Hindu nationalist ideologist V. D. Savarkar defined Hindutva as a feeling with a political content, and encouraged all Hindus to unite and to build a Hindu state. A follower of Hindutva, for Savarkar, is a person who sees India not only as the fatherland, but also as the holy land. The target of Hindu nationalist agitation has usually been the religious minorities of India, most importantly Muslims, who constitute 12 percent of the population.

The Hindu nationalist movement draws on traditions and concepts within classical Hinduism and often refers to *ramrajya,* a mythical Hindu kingdom, as its political ideal. The Hindu nationalists also reinterpret concepts from classical Hinduism, and transform dharma from a moral to a political concept, allowing for the possibility to brand political opponents as non-dharmic, or working against peace and social order. The Hindu nationalist movement in India, sometimes referred to as the *sangh parivar,* includes a number of associations; most important, the Rashtriya Swayamsevak Sangh (RSS) formed in 1925 to assert the natural rights of Hindus in their homeland.

Savarkar's Hindu nationalism can be seen from the perspective of Mahatma Gandhi's ideas. Both Gandhi and Savarkar denounced British imperialism, shared a dislike of certain aspects of Western culture, and both advocated a form of Indian nationalism. But while Savarkar emphasized the differences between Hindus and Muslims, Gandhi urged his followers to find the similarities in all religions. Gandhi expressed his protests against the British oppression in religious terms, but never tried to incite hatred against his opponents, and when he used religion as a tool in his political struggles, it was coupled with nonviolence. The strategy of the Hindu nationalists was more or less the opposite, and they often dismissed Gandhi as being impractical or even treacherous to the Indian nation.

The ideas of Mahatma Gandhi remain respected worldwide, and in India his legacy has produced a long range of groups, mainly active within social work and education, but surprisingly little within the political field, and as of the early 2000s, no political party of size in India can be said to forward a Gandhian political ideology. The Hindu nationalist movement drew little popular support in the decades after Indian independence in 1947, but experienced an upsurge in the 1980s and 1990s. It established itself as a central force within the Indian democracy, but was also accused of possessing a fascist streak and of instigating religious riots afflicting both Muslim and Christian minorities. The prime political outlet of the movement, the Bharatiya Janata Party (BJP), formed a coalition government at the national level after both the 1998 and 1999 elections, but was voted out of power in 2004.

Historical Interpretation

Historical interpretation is a scholarly approach to issues that emphasizes the study of the past to develop solutions to contemporary problems. It is based on the efforts to explain past events and analyze them in order to provide an understanding of cause and effect or cost-benefit analysis. Historical interpretation dominated the early study of politics, but with the rise of other approaches to political science, the field expanded with methodologies centered on quantitative and statistical analyses. Nonetheless, it continues to be an important component of political science research. In particular, comparisons to current circumstances with case studies of past political events, trends, or situations allow examination of a policy's full course of cause and effect. Historical interpretation also continues to be a significant factor in comparative politics, where it is used to explain the evolution of individual states and the idiosyncratic factors in political or social development.

Political movements use historical interpretation to motivate their members' pursuit of the movements' goals and objectives. For instance, leaders during the civil rights movement used interpretations of past experiences to provide critical discourse on the race struggle in the United States. Likewise, Karl Marx used the approach to delineate "shared interpretations" and "observed cultural meanings" to develop his theory of class struggle. Historical interpretation has been criticized as an approach by numerous scholars, such as Jürgen Habermas, who argue that interpretations are often portrayed through "privileged" or biased "self-interpretation" excluding representation of critical perspectives, demonstrated by the past dominance of Eurocentric models.

Historical Method, Comparative

The comparative historical method approaches social science research involving the over-time exploration of long processes *within* as well as *between* a small number of cases. The goal is to arrive at generalizable theories concerning the

origins of macrophenomena, such as revolutions, the welfare state, and political regimes. This method contains two essential elements. First, because comparative historical studies focus on slow-moving structural changes, they are, according to Edwin Amenta's 2003 article "What We Know about the Development of Social Policy," necessarily "situate[ed] within the relevant historical contexts." This means that the practitioner "takes a sophisticated approach to historiography, thinks seriously about issues of process, timing, and historical trajectories, and gains a deep understanding of the cases" (94). Second, because the aim is theory building, the researcher also engages in explicit comparisons across cases to transcend the idiosyncrasies of any single case. Cross-case comparisons are vital for theory building, since, as Dietrich Rueschemeyer notes in the 2003 article, "Can One or a Few Cases Yield Theoretical Gains?," "Going beyond the boundaries of a single case can put into question seemingly well-established causal accounts" (332). This allows the researcher to evaluate hypothesized cause-and-effect relationships identified in the first case by assessing how these variables play out across a small number of similarly contextualized cases.

The comparative historical method has a long pedigree, going back at least as far as sociologist Max Weber and historian Otto Hintze, during the late nineteenth and early twentieth centuries, in their writings on the origins of the modern state. In a generation of scholars from the mid- to late twentieth century, political sociologist Barrington Moore Jr. wrote that the democratic-, fascist-, and communist-regime types were determined by interactions between the state's premodern regime and its process of industrialization. Later, sociologist and political scientist Theda Skocpol used the cases of France, Russia, and China to demonstrate that social revolutions were driven by a complex interplay of elite splits, economic dependency, and international threats. In the 1990s, sociologist Rogers Brubaker explained the differences between modern French and German citizenship policies as the outcome of different legacies of nation-building. Similarly, political scientist Kathleen Thelen has examined vocational training regimes in contemporary Germany, Britain, the United States, and Japan, showing the marked differences among them result from nineteenth-century employer-union-artisan political settlements. A casual review of this scholarship suggests that comparative historical analysis is particularly well-suited for testing hypotheses that emphasize the importance of founding moments, path dependence, critical junctures, and causal complexity in explaining macrophenomena.

There are at least three major criticisms of the comparative historical method. The first, made against all small-n studies (or studies with a small studied population), is that there are simply too few cases (or data points) to arrive at generalizable inferences. The second problem relates to the comparability of cases, in that it is extremely difficult to identify those cases with a comparison that can adequately control for confounding variables, particularly when it comes to large-scale processes or superstructures. Finally, given the massive scope of their subject material, practitioners of the comparative historical method must rely to an unusual degree on secondary sources, which may result in biased conclusions.

Nonetheless, practical steps can be taken to minimize these concerns. Attending to the causal mechanisms within each case—often called process tracing—generates additional data points within each case, lending greater validity to the causal inferences derived from historical case analysis. Biases in the secondary source material might be guarded against by investigating the scholarly debates surrounding these sources and allowing the researcher to construct the least tendentious account of the case. Lastly, triangulating or drawing on several different sources can increase confidence in the validity of the researcher's interpretation of key events in each case.

Historicism

Historicism maintains that all human thought rests on indemonstrable presuppositions that are unknown to the thinker—presuppositions that vary from one historical epoch to another. It is a powerful paradigm that underlies much of social and political inquiry since the beginning of the twentieth century. In political theory, historicism is evident in the rejection of natural right or rational norms in favor of a relativist theory of values. In the history of political philosophy, it is via the belief that all previous universal statements about the nature of politics and of the good society should be traced

back to particular social situations in which these statements were made. In political science, critique of behavioral political science for ignoring value judgments in favor of allegedly objective study of facts is another example of expressions of, or developments influenced by, historicism.

The first philosopher who insisted on the dependence of philosophy on history was Georg Hegel, but he was not a historicist. In contrast with historicism, Hegel believed that at one moment in time, history had revealed the absolute truth. The origin of historicism can be better traced to the German historical school of law, which developed as a reaction to the attempt to impose the Napoleonic code on German territories in the early nineteenth century. According to the proponents of this school, modern natural right teaching is too abstract and therefore not applicable to every place; the true norms are those discovered through studying the history of a people. The hope that one can discover valid but historically relative norms, however, was eventually abandoned because it rested on assumptions—the belief that historical peoples are natural wholes or the belief in laws of historical evolution; these assumptions were not supported by an unbiased study of history.

Further, the study of history made it clear that the particular norms from the past always had a reference to universal principles and no universal principle can oblige one to accept the norms of every historical community. Although scholars continued to believe that history, and not unhistorical philosophy, was the door that gave access to humankind's true situation, it became evident in the course of the nineteenth century that history cannot provide a substitute for universal principles. The thinker who first saw clearly that the modern turn to history leads to nihilism is Friedrich Nietzsche, who described the fluidity of all concepts as a deadly truth in his *Use and Disadvantage of History for Life* (1874).

Since historicism denies both the notion of progress and the possibility of discovering a permanent truth in the past, the basis of historicism is a historical critique of human thought showing, first, that all "advances" in human thought occurred at the expense of forgetting important insights and, second, that earlier human thought could not, in principle, anticipate possibilities that were developed later. The first such philosophical-historical critique was Nietzsche's teaching of the human mind as not a mirror of reality, but a complicated expression of a basic instinct of life, which he called the will to power. Nietzsche, however, wavered between presenting his doctrine merely as his interpretation of reality and as a transhistorical insight into the nature of reality.

The most thoroughgoing historicism emerged in the thought of philosopher Martin Heidegger, who, by rejecting the naturalistic interpretation of Nietzsche's teaching, broke with the metaphysical tradition going back to Plato. Instead of giving another answer to the question of what is being, Heidegger's confrontation with the tradition of Western philosophy led to the conclusion that being is fundamentally elusive. According to Heidegger, the history of Western thought has proved to be a series of attempts to understand various

different beings while becoming increasingly forgetful of the problem of being. Technological progress, then, has been made at the expense of forgetfulness of a fundamental problem. Since philosophy or science as the pursuit of knowledge assumes the world is fundamentally intelligible—an assumption that historicism maintains erroneous—philosophy or science tends to identify the world with what is intelligible and, therefore, it tends to dogmatically disregard everything that resists being made into an object. From the historicist viewpoint, philosophy or science impoverishes the world instead of truly clarifying it.

Although not all forms of historicism are indebted to Heidegger, doubts about the modern science's capacity for understanding and guiding human life seems to be the common motive that animates historicism in general. On the other hand, resistance to historicism in various quarters has resulted from the persistent power of natural science, or the connection between human life and the natural mechanism supporting it; the evidence that there is a permanent structure underlying the variety of human languages; and renewed arguments in favor of the necessity and meaningfulness of the question of the good society. Nonetheless, by insisting on the perspectival character of all human thought, and denying that there can ever be a view from nowhere, historicism remains one of the powerful intellectual orientations of late modernity.

Hobbes, Thomas

Born in Malmesbury, England, Thomas Hobbes (1588–1679) was a philosopher and political theorist widely renowned for his 1651 book *Leviathan,* arguably the single-greatest work of political philosophy in the Anglo-American tradition. *Leviathan* brings together parts of Hobbes's previously published writings, including the 1642 Latin work *De Cive* and the 1640 *Elements of Law, Natural and Political.* Hobbes was also author of *A Dialogue Between a Philosopher and a Student of the Common Laws of England* (1666); *Behemoth: Or the Long Parliament* (1668); and various essays on free will, optics, geometry, and moral philosophy.

Hobbes's influence on modern philosophy and social science has been prodigious. Although he was not the originator of the idea of a social contract, as is sometimes believed, his account of how individuals emerge from an inhospitable state of nature and create government by mutual agreement is now regarded as definitive.

There is considerable debate about whether Hobbes's political theory should be characterized as liberal or authoritarian. On the one hand, Hobbes argues that government arises from the consent of the governed, and that subjects retain an inalienable right to life. From this inviolable right to self-preservation come other rights such as the right to defend one's self, the right to food and other basic sustenance, and the right to not be compelled to testify against one's self in court. Whenever possible, Hobbes's sovereign would ideally allow subjects an even greater array of liberties within what he called the "silence of the law." Hobbes also advocated a liberal policy of religious toleration, arguing that because the beliefs of individuals are known only to themselves, the sovereign should allow them to think as they see fit, so long as they conform their external actions to the law.

On the other hand, Hobbes's argument defends absolute government, and he opposed traditional liberal provisions like divided government and constitutional limits on the power of the sovereign. While he speaks of a virtually unlimited right of nature existing in the state of nature, his account of the origins of law effectively collapses the Thomistic distinction between natural law and positive law, suggesting that the laws of the sovereign are right by definition. His adamant claim that virtually any government, no matter how oppressive, is preferable to the incommodities of the state of nature and civil war tends to lend support to the status quo.

Hobbes is credited with some of the central concepts in contemporary social and political science. The first is his notion that individuals are to be regarded as rational and self-interested economizers. For Hobbes, reason operates as a "scout" for the "desires." While his complex theory of human nature is irreducible to models of *homo economicus* prevalent in neoclassical economics, rational choice theory, and game theory, Hobbes is often read this way. Second, Hobbes is widely cited as the originator of the *state of nature* concept. Absent some powerful sovereign or state authority, the civil order almost immediately devolves into a war of all against all; Hobbes famously described this in *Leviathan* as "solitary, poor, nasty, brutish, and short." Lastly, Hobbes theorizes government as arising from a social contract struck between all members in the state of nature wherein if one person agrees to alienate all individual rights, save the inalienable right to self-preservation, to a third party, every other individual will do so on precisely the same terms. Although subsequent social contract thinkers envisioned a contract between the subject and sovereign, Hobbes adamantly denies that the sovereign is a party to this original agreement.

Hobhouse, Leonard Trelawney

Leonard Trelawney Hobhouse (1864–1929) was an English political theorist, sociologist, and activist. In addition to being the leading thinker of new liberalism, he was one of his era's most engaged public intellectuals and was instrumental in the establishment of sociology as an autonomous academic discipline.

Born on September 8, 1864, in St. Ive, Cornwall, Hobhouse was educated at Marlborough College and Corpus Christi College, Oxford. Although already engaged in progressive politics, he initially pursued an academic career, becoming a fellow of Corpus in 1894. Shortly after publishing *Theory of Knowledge* (1896), a realist critique of contemporary British epistemology, Hobhouse left Oxford in 1897 to join the editorial staff of the *Manchester Guardian.* In this capacity, as well as in his journalistic career after moving to London in 1902, he wrote hundreds of articles urging domestic reform and denouncing imperialism. At the same time, Hobhouse involved himself deeply in the nascent field of sociology. His *Mind in Evolution* (1901) and *Morals in Evolution* (1906) proposed an interpretation of evolution notable for its rejection of Spencerian instinctualism in favor of viewing social change as driven by the progressive growth of "general intelligence" coordinating public action. These works led to his appointment in 1907 as professor of sociology at the London School of Economics, the first chair of its kind in the English-speaking world and a post he occupied until his death. As before, Hobhouse split his efforts between academic social theory and public commentary. Having revived his association with the *Manchester Guardian,* he became director of its company in 1911. His later years were marked by continued contributions to Britain's progressive journals as well as the completion of his mature sociological system in a series of works collectively entitled *The Principles of Sociology* (1918–1924).

Liberalism (1911) is considered Hobhouse's most lasting intellectual achievement, where he argues that classical liberalism's laissez-faire doctrines rested on a falsely atomistic conception of the individual. To Hobhouse, classical liberals denied the fundamental interrelatedness of human life, resulting in a negative characterization of freedom as the absence of state intervention in the society and economy.

Hobhouse set out to reconcile this individualist foundation with social solidarity, arguing that negative liberty alone could not enable the self-development he saw as "the heart of Liberalism." Since self-development requires the capacity to pursue a good life, not merely freedom from state intervention, economic redistribution and social welfare necessarily afford all individuals the positive capacity for human flourishing.

As in all of his work, Hobhouse's attempt to reconcile individuality and solidarity predicates on an organic image of society as a symbiotic whole: the suffering of any particular social segment harms the body politic at large. Against criticisms that this political ontology obviates individuals, Hobhouse took pains to distinguish his organicism from competing holisms and often attacked what he considered the potentially tyrannical political implications of British idealism. These efforts notwithstanding, much subsequent discussion of Hobhouse's social theory concerns whether his own organicism ultimately collapses into an anti-individual collectivism.

Hobhouse died on August 21, 1929, leaving a body of work prefiguring many later developments in social theory. His focus on the social nature of freedom foreshadowed both perfectionist liberalism and communitarianism, and his contributions as a public intellectual to the foundations of the welfare state were unparalleled. Despite his important role in the founding of academic sociology, however, his voluminous output in this field has fallen from favor due to its strongly teleological assumptions, and thus remains of interest primarily to historians of the discipline.

Hobson, John Atkinson

John Atkinson Hobson (1858–1940) was a British political economist and theorist who sought to defend liberalism while attaching a social element to it. His move to London in 1887 and his exposure to the plight of the urban industrial poor awakened his interest in the problems of unemployment and poverty as endemic to capitalism. This interest informed the course of his work over the next four decades. Hobson's most lasting contributions pertain to two areas of study—his development of new liberalism and his work on the dynamics behind imperialism.

Hobson was a leading figure in the development of new liberalism, along with T. H. Green and L. T. Hobhouse. New liberalism sought to defend and upgrade liberal theory in light of the industrial revolution and the rise of socialist thought by finding justification within its principles for redistribution and a welfare state. The new liberals, including Hobson, were strongly influenced by the thought of John Stuart Mill, who defended individual liberty by appealing to its contribution to the common good. Liberty, they believed, was needed for individuals to develop their moral powers and capacities, upon which the well-being of society ultimately depended.

In furthering the idea of the individual and political community's strong interdependence, the new liberals defended a "radical ideology of the cooperative commonwealth," with unique capacities to justify specific economic rights and duties. The cooperative commonwealth view of the nation rests on the rather peculiar notion of the organic society. By employing the imagery of organicism, Hobson accounted for society as a thing naturally created by humans, much the same way that bees naturally create the beehive. This model of society contrasted with the passive view of society as a "mere aggregate, an accumulation of human atoms, incapable of any really organic action" (Hobson, 79). With the "discovery" of society and the social dimensions of wealth, Hobson's new liberalism justified limits to individual rent-based income and redistribution to social elements of value, including individuals—in essence, a right to social property must exist alongside private property rights.

Hobson's theory of imperialism was very influential and was endorsed and modified by diverse figures such as Lenin. Hobson sought to understand why the British Empire grew at such a phenomenal rate during the final decades of the nineteenth century (adding almost 5 million square miles [12.95 million square kilometers] of territory between 1870–1900), and he found the answer in the structural dynamics of late capitalist production. To Hobson, imperialism was ultimately an economic phenomenon. Due to the problem of underconsumption in advanced capitalist nations, monopoly capital had surplus capital and sought to invest it abroad. This new "creditor class to foreign" countries sought certainty and diminished risk in foreign investment sites, compelling their home governments to continually expand their empires. It is thus investment, and not trade per se, that mainly drives territorial expansion in Hobson's theory of imperialism.

Holcombe, Arthur N.

American Arthur N. Holcombe (1884–1977) was one of the twentieth century's most prolific and respected political scientists. He received his doctorate in 1909 from Harvard University and taught there until his retirement in 1955. He also served at national universities in China, the College of Europe, Claremont College, the University of Michigan, and the Massachusetts Institute of Technology. He contributed to a number of government agencies, including the U.S. Bureau of Efficiency (1917–1919), the President's Committee on Administrative Management (1936), and the War Production Board (1942–1945).

Early in his career, Holcombe focused on state government and party politics, publishing *Foundations of the Modern Commonwealth* (1923) and *Political Parties of Today* (1924). A visiting professorship in China led to a book on Chinese politics in 1930. Later his interests turned to international peacekeeping and the United Nations (UN). His enduring interest, however, was the U.S. political system. Throughout his career he promoted the concept of public interest, which he saw as the mediating element in conflict resolution and the animating element of a democratic society promoting civility and moderation—two cardinal civic virtues. He believed that political parties should be organizationally strong but not doctrinaire and partisan. Holcombe viewed the middle class as the repository of middle-of-the-road and moderate value systems and thus the key to the functioning of a successful democracy.

Holcombe applied the same concepts to a study of the United Nations. In his work, *A Strategy of Peace in a Changing World* (1967), Holcombe advocated the development of a two-party system within the organization as part of which members would sacrifice some of the elements and prerogatives of sovereignty. By curtailing national sovereignty, he felt the UN could become an effective world government. Holcombe was the chair of the Commission to Study the Organization of Peace and authored the commission's report, *Strengthening the United Nations* (1957), which contained numerous recommendations for the institutional reform of the UN.

Holcombe's lasting legacy is in the field of political behavior and political institutions, especially in the United States. His early work, *State Government in the United States* (1928), compares varieties of state government practices and programs.

He found that two-party systems are more desirable in promoting public interest because they enable large segments of the population to come together to serve common purposes.

Holocaust

The capitalized term Holocaust emerged in the 1950s and, over the next two decades, gradually replaced the German term *Endlösung* (final solution) for the macrokilling project of European Jews by Nazi Germany. Holocaust originally possessed a sacrificial meaning as a burnt offering and, because of its misleading sacred connotation, became frequently substituted by the Jewish concept of Shoah, referring to the Nazi extermination of Jews. Some authors have used the expression holocaust in reference to other mass-killing events, such as genocidal policies against Native Americans in the United States (nineteenth century), Tutsis in Rwanda (1994), and Muslims in Bosnia (1992–1995).

The genocidal project of the extermination of European Jews received scarce attention by political scientists in the United States and other Western countries after World War II (1939-1945). With the exceptions of Hannah Arendt, Raul Hilberg, and Daniel Jonah Goldhagen, the overwhelming American and international scholarship on the Holocaust was and still is conducted by historians. This scholarly deficit of the political science profession regarding one of the major planned-killing events in human history can extend to the coverage of the other killing regimes in the twentieth century.

The historical understanding of the Nazi killing project underwent substantial changes with the shift from the perpetrators' language of Endlösung to the victim- and survivor-centered symbolic concepts of Holocaust and Shoah. Both terms refer to experiences of calamity and catastrophe and have a long conceptual prehistory. The current alternating and capitalized use of these symbolic expressions indicate the primacy of the Jews as a target population for destruction, though other victim populations were included in the genocidal policies of Nazi Germany, such as Sinti and Roma (the so-called Gypsies), mentally and physically disabled people, homosexuals, Russian

prisoners of war, Polish intellectuals and priests, war-wounded people, and political opponents. The inclusion of non-Jews in the killing record of Nazi Germany has affected the discussion about the claim of uniqueness connected with a specifically Jewish Holocaust. The estimated 6 million Jewish victims are part of an overall estimated 21 million victim population.

The claim that the Jewish Holocaust was a unique historical phenomenon of selecting one people and its culture for destruction became a unifying feature of the historical literature. As a broader cultural and political discussion in the 1960s and early 1970s, it gained almost universal acceptance. Yet, with the rise of the Khmer Rouge regime in Cambodia (1975–1979) and the growing knowledge of the 1.7 million victims of their killing fields, the mass murderous wars in the disintegrating Yugoslavia of the early 1990s, and the death toll of 800,000 Tutsis in the politically organized cleansing rampage in Rwanda in 1994, this claim has been revisited by scholars who had originally established it. The intellectual historian Norman Cohn expressed the general ideas behind killing projects like the Holocaust best when he spoke in his 1975 work, *Europe's Inner Demons*, of "the urge to purify the world through the annihilation of some category of human beings imagined as agents of corruption and incarnation of evil."

CONTROVERSIES

In 1984, scholars debated the question as to whether the Holocaust was an intentional mass killing project designed and ordered by Adolf Hitler himself, or the result of contingent circumstances and opportunities offering themselves during the course of World War II. The division lay between the *intentionalists*, on one hand, who believed in an original design and, occasionally, also a written *Führerbefehl* (order) from Hitler himself, and the *functionalists*, on the other hand, who considered it more probable that the extermination policies became enacted as functions of the development of the war. The opposing lines have since become blurred by authors who combine intentional and functional arguments in their research. Agreement, however, has been reached that the search for an original Führerbefehl is an ideological red herring.

The claim of the uniqueness of the Holocaust as a killing event has not only been challenged by the killing record of regimes such as Pol Pot's Khmer Rouge in Cambodia (1975–1979; 1.7 million deaths) and the Rwandan massacre of Tutsis (1994; 800,000 deaths), but also by the massive death tolls resulting from Russian leader Joseph Stalin's Gulag camps (1924–1953; 30 million or more deaths); mass executions in Ukraine (1932–1933; 7 million deaths); and Chinese premier Mao Zedong's revolutionary campaigns (1966–1976; 30 million or more deaths). Comparative studies of mass killings in the twentieth century and history in general have tremendously expanded knowledge about ideologically motivated and politically legitimated killing regimes.

Homeland Security

The issue of homeland security took on new meaning in countries around the world after the attacks on the United States on September 11, 2001 (9/11). The surprise attacks proved that at-will countries could be successfully attacked if they were not prepared to defend themselves. The attacks occurred when al-Qaida forces hijacked four commercial airliners for use as instruments of mass destruction. Two attacks on the World Trade Center in New York City and a third attack on the Pentagon in Washington, D.C., were successful. However, passengers averted a fourth attack by driving United Flight 93 into the ground in rural Pennsylvania. Before the day was over, nearly three thousand people, including nine from the al-Qaida network, had lost their lives, and the safety of the civilized world had been challenged.

Concerns over militant attacks throughout the twentieth century were primarily restricted to national or regional threats, such as those from the Irish Republican Army in Northern Ireland, the Red Brigades in Italy, and Hamas in the Middle East. Prior to 9/11, groups halfway around the world had not successfully carried out an attack on a distant target.

AFTER 9/11

Within days of the September 11 attacks, the U.S. Congress passed the USA PATRIOT Act (Uniting and Strengthening America by Providing Appropriate Tools Required to Intercept and Obstruct Terrorism), giving the national government unprecedented powers to fight terrorism. The following year, Congress expanded government counterterrorism powers with the passage of the Homeland Security Act. In the most far-reaching government reorganization since World War II, the Department of Homeland Security (DHS) was charged with coordinating the activities of twenty-two government agencies, including Customs and Border Protection, the Secret Service, Citizenship and Immigration Services, Immigration and Customs Enforcement, Federal Emergency Management Agency, and the Coast Guard. DHS was also given the responsibility for overseeing the gathering and sharing of intelligence among government agencies and for coordinating responses to national emergencies among private industries and state, local, and regional governments.

DHS was specifically created to identify potential terrorist threats and avert future attacks. In practice, however, the

Central Intelligence Agency (CIA) and the Federal Bureau of Investigation (FBI) have retained control of antiterrorist activities. Critics of DHS contend that the agency has not been successful in responding to natural disasters such as Hurricane Katrina, which devastated the Gulf Coast in August 2005. DHS is perceived as more successful in working with states to enhance defensive capabilities and in establishing national warning systems.

While the United States responded to 9/11 with heightened government powers and an aggressive new military policy (preemption), European nations, in addition to pledging support for the United States, strengthened their existing security measures and passed new antiterrorism legislation that, in large part, focused more on prosecution than militarily driven action. The issue was particularly relevant in Europe, where groups such as the Basque Separatist Movement in Spain and the Baader–Meinhof Gang in Germany had long made terrorism a concern. The European Union (EU) responded to 9/11 by creating a joint policing authority and taking measures to coordinate counterterrorism activities among member nations. These measures included the sharing of intelligence and police information, issuing warrants across national boundaries, strengthening border controls, and cooperating with the United States.

Despite its heightened security efforts, Europe has proved to be vulnerable to attacks since 9/11. On March 11, 2004, forces likely linked to al-Qaida exploded ten bombs on the commuter train system in Madrid, Spain. At least 192 people were killed, and 1,500 others were wounded. A few weeks later, after an unsuccessful bombing attempt on April 2, police trapped suspected individuals inside a home where they committed suicide. One police officer was also killed.

To battle the problem, rather than reorganize its homeland security systems as the United States had done, the Spanish government chose to draw on laws designed to fight domestic terrorism. Authority over homeland security activities remained in the hands of the secretary of the interior. The new strategies Spain announced were an expansion of antiterrorism resources, improved coordination within and among security and intelligence agencies, and heightened security at vulnerable points.

Another major attack took place on the London commuter system during the morning rush hour on July 7, 2005, when three bombs exploded. A fourth bomb was detonated on a bus one hour later. Overall, 52 people were killed and 700 were wounded. Four suicide bombers also perished in the attacks. Two days later, on July 9, a second set of explosives was set off, but no casualties were reported. These perpetrators, who were suspected of having links to al-Qaida, were later arrested.

A year before the 9/11 attacks, the British parliament had enacted a new antiterrorism package that expanded the government's authority for dealing with suspected terrorists both legally and financially. This strategy stressed enhanced information sharing, immigration monitoring, and tightened security at laboratories and aviation, civilian, and nuclear sites. After 9/11, the government chose to leave the responsibility for homeland security dispersed among several departments. In 2004, the government announced a new antiterrorism strategy, CONTEST, designed to focus on prevention, pursuit, protection, and preparation.

Homelessness

The term homelessness implies the lack of a fixed, regular, stable, and adequate nighttime abode. The *homeless*, as defined by the U.S. Department of Housing and Urban Development, include persons whose primary nighttime residences are in transitional housing. In most societies, cultural perceptions determine the terms used to label the homeless. Labels such as hobo, tramp, transient, bagman or bagwoman (United States), sturdy beggar (Nigeria), vagabond, and bum have been used to categorize a person with no permanent residence, often with negative societal connotations. By the late twentieth century, the terms *houseless* and *no fixed abode* (NFA) emerged to refer to homelessness and the homeless in a way that avoided the undesirable stereotypes of other terms. Similarly, the use of houseless deemphasizes the negative connotations generally associated with the homeless—unemployment, mental unbalance, drug addiction—and instead stresses the concrete problem of not having a house or apartment in which to reside. Advocates and persons who have experienced homelessness tend to use these terms as well, while NFA is used for legal purposes. Furthermore, terms such as family homelessness, youth homelessness, veteran homelessness, domestic violence homelessness, and reentry homelessness have evolved to classify different categories of the homeless.

Considered an urban phenomenon, homelessness, a global problem, has existed since at least the sixteenth century, when England first tried to address the problem of vagrants on its streets. The industrial revolution in the eighteenth century, which greatly influenced the socioeconomic conditions of society, also intensified the occurrence of homelessness. Homelessness affects all genders, regardless of socioeconomic

status, race, age, or geographical location. In 1995, the United Nations classified six hundred million people as homeless or residing in low-quality housing, most of them women and dependent children. However, a census of the homeless is problematic. Double counts, hidden homelessness, mobility of homeless persons, and service-system paradox (where service providers tend to report higher counts) all affect homeless estimates.

Mitigating or eliminating homelessness requires understanding and identifying its causes. Researchers have largely identified three principal questions in the effort to resolve homelessness: What causes homelessness? Why does homelessness exist? And, who is at risk of becoming homeless?

In some cases, homelessness can be voluntary. Religion, culture, and an established way of life constitute the decisional basis to live without a permanent residence or place of abode. For example, the spiritual convictions of yogis in Asia, social customs of nomads in Africa, and lifestyle preferences in the developed world signify a conscious resolution to be homeless. In the United States, however, greater poverty and the lack of affordable housing since the 1980s are the principal reasons contributing to the increase in the number of homeless individuals in the early 2000s. On a global level, political conflicts and natural disasters, continued urbanization, economic programs resulting in an uneven distribution of wealth, and the collapse of traditional family support systems are all causes for homelessness. Other causes can include domestic violence, unemployment, low-paying jobs, lack of affordable housing, substance abuse, mental illness, changes and cuts in public assistance, and the difficulty of reentering society after incarceration.

The interaction between these complex sets of circumstances forces many people into poverty and drives them to prioritize and make difficult choices between provisions, shelter, and other essential human needs. As housing costs increase, more and more people cannot afford to pay for a permanent abode nor for other important provisions, such as child and health care. Policies and programs that concentrate on reducing poverty not only help the homeless find a stable residence; they also help increase access to other necessities.

Resolving homelessness relies on effectively addressing the responsible factors. The costly endeavor of homelessness management once was the exclusive domain of the public sector. However, by the end of the twentieth century, the public, private, and nonprofit sectors had formed broad partnerships to address issues of homelessness. Subsequently, there have been shifts in strategies to resolve homelessness, primarily to focus on its prevention. Economically, it is more efficient to prevent homelessness than to resolve it later. As a result, strategies to ensure livable incomes, improved availability of affordable housing, rapid rehousing, and systems that facilitate the provision of required services for low-income people are now prevalent.

Homophobia

Homophobia refers to aversion, bias, or discriminatory actions, attitudes, or beliefs directed toward individuals who either have or are perceived as having nonheterosexual identities such as gay, lesbian, bisexual, transgender, and queer people (GLBTQ). The term came into its contemporary usage in the late 1960s and early 1970s, when it was used to describe what Kenneth Smith called "a fear of homosexuals" and the anxiety that one may be perceived by others as homosexual. Homophobic fear and anxiety are seen to be negative attributes, and in this regard, the term links to other social prejudices such as sexism, racism, anti-Semitism, xenophobia, and classism. In this regard, GLBTQ groups have used the term to organize against discriminatory public policies and cultural attitudes. The term *internalized homophobia* relates to anxiety about or aversion to one's own homosexuality or nonnormative sexuality. Internalized homophobia has been linked to low self-esteem and suicide in GLBTQ individuals.

Examples of homophobia include name-calling, harassment, social exclusion, job and housing discrimination, criminalization of homosexual sexual practices, and violence. The criminalization of homosexual sexual practices can be seen as state-sponsored homophobia. According to the International Lesbian and Gay Association (ILGA), those arrested for offenses related to same-sex sexual practice are subject to the death penalty in 5 countries and to imprisonment in 72 countries. The 1998 torture and murder of Matthew Shepard in the United States brought national and international attention to the problem of homophobic violence. A bill known as the Matthew Shepard Act passed the U.S. Senate in July 2009, and is expected to pass into law. This act expands the 1969 U.S. hate-crime law to include crimes motivated by a victim's actual or perceived gender, sexual orientation, gender identity, or disability. According to the U.S. Federal Bureau of Investigation's 2007 *Hate Crime Statistics*, 16.6 percent of the hate crimes documented in 2007 were motivated by bias against a victim's perceived or actual sexual orientation.

Closely related terms to homophobia are *heteronormativity* and *heterosexism*. Heteronormativity refers to the assumption that heterosexuality is and should be the norm. Heterosexism (also sometimes called compulsory heterosexuality) refers to the array of attitudes, actions, and institutions that structure heterosexuality as the norm. The issue of same-sex marriage illustrates some of the differences between the terms.

The institution of marriage, to the extent that it privileges and attaches benefits to certain kinds of relationships such as marriage between opposite-sex couples, is a heterosexist one. Next, prohibiting gays and lesbians from marrying each other could be considered homophobic. Finally, the assumption that opposite-sex marriage is "natural," along with the pervasiveness of opposite-sex-only marriage within society, are reflections of its heteronormativity.

Feminist theorists have explored ways that homophobia closely links to sexism. Suzanne Pharr, for example, calls homophobia "a weapon of sexism" in that it is one important way, along with violence and economics, that rigid gender roles are imposed and enforced. According to Pharr, heterosexism and homophobia work together to uphold male dominance by both vilifying and making relational intimacy choices, other than the heterosexual nuclear family, institutionally difficult.

In addition to working to designate homophobic violence as a hate crime, GLBTQ groups around the world have pursued several strategies to organize against homophobia. These have included efforts to decriminalize homosexual acts and to mobilize the state in working against homophobia. These efforts have met with some success: in 2009, for example, the Supreme Court of India decriminalized homosexual acts and in 2006, the European Union passed a resolution against homophobia.

In 2005, May 17 was designated as the International Day Against Homophobia and Transphobia, and since then, the date has been recognized in over forty countries with demonstrations, rallies, educational events, and other actions aiming to raise awareness about the problem of homophobia. The date itself commemorates the day that the World Health Organization removed homosexuality from its list of mental disorders in 1990. Organizers distinguish the International Day Against Homophobia from another event, the annual LGBTQ Pride Day, by explaining that while Pride Day "emphasizes that Lesbians, Gays, Bisexuals, and Transsexuals are proud of their identity and refuse to be shamed," the international recognition against homophobia on May 17 "highlights that in reality it is homophobia that is shameful and must be deconstructed in its social logic and fought against openly."

Hook, Sidney

Sidney Hook (1902–1989) was an American philosopher, Marxist, and exponent of pragmatism. Born in Brooklyn, New York, he graduated from City College in 1923 and received his PhD from Columbia University in 1927. While at Columbia, he absorbed the tradition of American pragmatism from one of his professors, John Dewey. Hook then joined the philosophy department at New York University, where he remained until 1972. After World War II (1939–1945), Hook became involved with the Congress for Cultural Freedom, an organization designed to influence intellectual opinion away from communism and which later was revealed to have received CIA funds. As the 1960s unfolded, Hook became horrified by the assault of student radicals for academic freedom on campus. In response, he helped establish the University Center for Rational Alternatives and its journal *Measure.* In his 1987 book, *Out of Step: An Unquiet Life in the 20th Century,* Hook described the purpose of the organization and journal as "to defend the relative autonomy of the university and to resist attacks against the freedom to teach and freedom to learn from without and from within."

Despite his long career of anticommunism and his abhorrence of campus radicalism, Hook remained on the left in domestic matters. He never accepted free market economics and the notion that capitalism for all its flaws is the most rational system. In 1985, Hook was given the Medal of Freedom by President Reagan. His final institutional affiliation was with the Hoover Institution in Stanford.

Hook was a pragmatist and a naturalist who belonged in the tradition of Dewey, Charles Sanders Pierce, and William James. Hook also attributed significant influences in his development to American philosopher Morris Cohen and British philosopher Bertrand Russell. One simple principle stands at the core of Hook's thought from which radiates all his secondary views: his rejection of metaphysics and his insistence that all true knowledge is practical and contingent rather than purely theoretical and unchanging. For Hook, there could be no eternal verities apprehended by the exercise of the purest rationality, and he absorbed the insight of Scottish philosopher David Hume, who Hook believed had shown that pure reason did not exist. A clear statement of Hook's position is given in his 1989 *American Scholar* review of American author and philosopher Allan Bloom's best-selling *The Closing of the American Mind* (1987). "The difficulty with Bloom's position," Hook says, "is that, like Leo Strauss, he has not emancipated himself from the Greek notion that the cosmos is an ethos, and that

what is good and bad, right and wrong for man is essentially related to the cosmic order rather than to the reflective choices of men and women confronted by problems of what to do." It is "consequentialism" then, or the "rational modification of interests and passions," and not the conformity of conduct to certain transcendent standards which constituted Hook's standard of morals.

With the rise to prominence of American philosopher Richard Rorty, who died in 2007, the debate over the meaning and contemporary relevance of pragmatism is again near the top of American philosophy's agenda. With these changes, it is possible Hook may receive the kind of attention impossible during the fractious days of the 1960s and 1970s and not seen since Hook's tenure as one of the world's foremost authorities on Marxism.

Hooker, Richard

Richard Hooker (1554–1600) was one of the preeminent Anglican theologians of the sixteenth century and is still considered one of the most influential expositors of the Anglican ecclesiastical, social, and political vision.

Born in 1554 in Exeter, England, Hooker attended Exeter Grammar School and entered Corpus Christi College, Oxford, in 1569, under the patronage of John Jewel, bishop of Salisbury. Hooker completed his BA degree in 1574 and his MA in 1577. In 1579, he took holy orders as a deacon in the Church of England and was appointed deputy professor of Hebrew at Oxford. Hooker left Oxford to become rector of St. Mary's church, Drayton Beauchamp, in 1584, and master of Temple Church, London, the following year. Temple Church was an influential London parish attended by many of the nation's political elite, and it was at Temple that Hooker engaged in his noted controversy with his Puritan assistant (and cousin), Walter Travers. The Temple years were unique ones, with Hooker delivering morning sermons defending the Anglican *via media* (middle way) between Puritanism and Roman Catholicism, and Travers taking the afternoon lecture and

forcefully defending the Puritan call for further reformation. Nonetheless, Hooker and Travers remained on good terms personally; their differences led Hooker to begin work on his *magnum opus,* the six-volume *Laws of Ecclesiastical Polity,* the first four books of which were published in 1594.

Hooker married Joan Churchman, daughter of a leading London merchant, in 1588. In addition to his posts at St. Mary's and Temple Church, Hooker served the church in a number of positions, including as subdean of Salisbury Cathedral from 1591 to 1595 and rector of St. Mary's Bishopsbourne from 1595 to 1600; during this tenure, he passed away on November 3, 1600.

Deeply influenced by the religious turmoil of Elizabethan England, Hooker sought to articulate Anglicanism as a middle ground between Catholicism and Puritanism or Presbyterianism. On the one hand, Hooker, like all Protestants, decried the many medieval corruptions that he saw in the Catholic Church of his day, and he justified the break with Rome in terms of the search for a more faithful approximation of the primitive Christian Church. On the other hand, Hooker dissented from the view of English Puritans, generally referred to as the *party of Geneva*, or *party of Calvin*, who denounced the English Church for its failure to completely purge all "Romish" ceremonies and insisted that church government must not include any aspect not explicitly laid out in scripture. Hooker considered such a belief too restrictive, overlooking the fact that God had made humans both rational and social creatures and that thus reason and custom, considered alongside scripture, represented legitimate sources of knowledge about church polity.

Most political theorists are aware that English philosopher John Locke quotes Hooker more than a dozen times in his 1690 work, *Second Treatise of Government.* Hooker's influence on English social, political, and religious thought was profound, and he is generally listed alongside Thomas Cranmer, archbishop of Canterbury and adviser to King Henry VIII, as being responsible for the enduring power of Anglicanism as a comprehensive and inclusive body of thought.

Horkheimer, Max

Max Horkheimer (1895–1973) was a German philosopher and sociologist. His name is primarily linked to the Frankfurt school, of which he is considered to be one of the founding fathers. Born in Stuttgart to a Jewish family, Horkheimer studied philosophy and psychology in Munich. He then

moved to Frankfurt where, under the supervision of neo-Kantian philosopher Hans Cornelius, he wrote his habilitation dissertation entitled "Kant's Critique of Judgement as Mediation between Practical and Theoretical Philosophy" (1925). In 1930, he became chair of social philosophy at Frankfurt University and was elected director of the Institute for Social Research. The latter attracted important Marxist scholars of the time whose work has become known as that of the Frankfurt school.

Horkheimer's role as director of the institute was crucial. In his contributions to the *Zeitschrift für Sozialforschung,* the institute's main intellectual organ, he promoted the sort of multidisciplinary intellectual endeavour he named *critical theory*. This became a point of reference for the members of the institute and, later on, for all those pursuing a critical theory of society. Horkheimer defined critical theory as a theory that seeks to liberate human beings from the circumstances that enslave them, and, as such, he opposed it to a *traditional theory*, which is contrarily aimed at perpetuating these enslaving circumstances.

After the rise to power of Adolf Hitler, Horkheimer went first to Switzerland in 1933 and then to the United States in 1935, like many of the other members of the institute. At first, he lived in New York, and the whole institute was relocated to Columbia University. In 1940, Horkheimer moved to California. He came back to Frankfurt in 1949 after the end of World War II (1939–1945). One year later, the institute reopened after thirteen years of exile.

Prior to the war, in Frankfurt, Horkheimer also met philosopher and social critic Theodor Adorno, the other major animating personality of the Frankfurt school. Adorno's friendship and intellectual collaboration were crucial to Horkheimer. During their exile in the United States, Horkheimer and Adorno together wrote the *Dialectic of the Enlightenment,* a few copies of which were first published in 1947 in Amsterdam before becoming a very influential work in the 1970s. The book, which reflects the authors' experience of the advent of Nazism and the rise of American mass society, puts forth a radical critique of Western rationality, by arguing that the latter, far from realizing the Enlightenment's promise of emancipation, had turned into a radical form of domination. Adorno and Horkheimer thus suggest that the entire Western Enlightenment is based on an instrumental concept of reason as domination over nature. As such, Enlightenment risks resulting in the opposite of reason, that is, myth and barbarism. The critique of reason remained a crucial theme of Horkheimer's writings, which are devoted to the development of a general critique of modern Western civilization and its logic of domination.

The last twenty years of Horkheimer's life were characterized by the recognition of his intellectual prestige (he was rector of the University of Frankfurt and lectured at the University of Chicago) and by an increasing metaphysical pessimism. In the prosperous West Germany of the postwar period, Horkheimer felt the decline of the revolutionary possibilities he had identified during the 1930s and the years of his exile.

Horn of Africa

The Horn of Africa (alternatively northeast Africa, and sometimes Somali peninsula) is a peninsula of East Africa that extends for hundreds of miles into the Arabian Sea and lies along the southern side of the geostrategically important waterway of the Gulf of Aden. It is the easternmost projection of the African continent. The term also refers to the greater region containing the countries of Djibouti, Ethiopia, Eritrea, and Somalia. As such, it covers approximately 1,242,742 square miles (2,000,000 square kilometers) and is inhabited by about 86.5 million people. In the 2000s, the term *Horn of Africa* has often been extended to cover the member countries of the region's Intergovernmental Authority on Development (IGAD), namely Ethiopia, Eritrea, Djibouti, Kenya, Somalia, Sudan, and Uganda (this more expansive definition is disputed by some scholars). Regularly hit by both natural disasters (floods in Somalia, droughts in Ethiopia and Eritrea) and violent conflicts, the Horn remains among the world's poorest regions.

HISTORY OF THE REGION
Many countries in the region have proud historical roots, reaching back as far as four thousand years in the case of Ethiopia (whose emperors claimed lineal descent from King Solomon of the House of David). Partly colonized by Italy (Somalia and Ethiopia) and France (Djibouti), the countries of the Horn regained their independence between 1941 (Ethiopia) and 1993 (Eritrea). During the cold war era, ever-changing alliances between the countries of the region and the two superpowers, as well as frequent conflicts, characterized the region. Far from increasing stability, the end of the cold war and the subsequent diversion of superpower attention away from Africa's proxy battlegrounds further fueled the region's many conflicts.

In 1991, the expulsion of Somalia's long-reigning dictator Siad Barre led to Somalia's descent into a civil war. A United Nations (UN) intervention (UNISOM) between 1991 and 1995 failed to reconstitute the state. While the situation in southern Somalia has since further deteriorated, the northwest of the country (Somaliland), which had declared its de facto independence in May 1991, seems to have managed a transition to democracy, reaching a climax with parliamentary elections in September 2005.

In Ethiopia, the civil war between the Communist regime of Mengistu Haile Mariam (which had toppled the monarchy in 1974) and the Tigray People's Liberation Front (TPLF) led by Meles Zenawi and Issais Afewerki's Eritrean People's Liberation Front (EPLF) finally came to an end in 1991. Two years later, Eritrea officially seceded from Ethiopia. Both countries have since fought several times about disputed territories, most recently in a war between 1998 and 2000 that cost approximately seventy thousand lives.

In Sudan, a coup d'état brought General Omar al-Bashir and his National Islamic Front (NIF) to power in 1989. As a result, the long-running civil war between the Arabic and Islamic north of the country and the African and Christian south escalated and fighting between government forces and the Sudan People's Liberation Army (SPLA) intensified. Following substantial international pressure and the dispatch of a UN mission (UNMIS), a comprehensive peace agreement was signed in 2005.

PREVALENCE OF CONFLICTS IN THE REGION

Despite certain positive developments such as the peace accord between North and South Sudan, the situation in the region has further deteriorated in the first decade of the twenty-first century. Somalia, for example, entered a new conflict phase in June 2006 when fighters of the Islamic Courts Union (ICU) seized power in Mogadishu, causing Ethiopia to intervene in December 2006. Since March 2007, an African Union (AU) peacekeeping force (AMISOM) has been deployed to Somalia but, as of mid-2009, has failed to create stability in Mogadishu.

Concurrently, the conflict between Ethiopia and Eritrea over the border enclave of Badme remains unresolved. The ruling of an international arbitrary commission, the Ethiopia-Eritrea Boundary Commission (EEBC), has not been implemented. In July 2008, the mandate of the UN observer mission (UNMEE), in place since 2000 to keep the fragile peace between the two countries, was terminated.

The Sudan continues to be the theatre of several conflicts, of which at least one, in the western province of Darfur, is intensifying. Despite the presence of a twenty-seven thousand-strong joint United Nations–African Union peacekeeping mission (UNAMID) and substantial international attention, the fighting between local movements and government-supported Arab militias known as Janjaweed has already cost up to five hundred thousand lives.

INTRAREGIONAL DYNAMICS

These conflicts all led to seriously strained interstate relations in the region. In order to improve these relations and provide an anchor of stability, in 1996, the countries of the Horn decided to transform the region's Intergovernmental Authority on Drought and Desertification (IGADD) into a broader cooperative venture addressing issues of peace, security, and development. Renamed Intergovernmental Authority on Development (IGAD), the organization has since made great strides in bringing the region's states together in common projects, such as the creation of a regional multinational brigade as part of the African Union's planned African Standby Force (ASF) and a regional conflict early warning system.

INTERNATIONAL INTERESTS IN THE REGION

Given the prevalence of conflict in the region as well as its geostrategic location, it is not surprising that the Horn of Africa continues to be the subject of considerable external interests (both African and non-African). Fearing the Talibanization of Somalia (as a safe haven and training ground), the United States, for example, has substantially increased its engagement in the region. The United States maintains particularly close relations with Ethiopia, which may eventually even serve as the location of the U.S. strategic Africa command (AFRICOM) currently being established in Stuttgart, Germany. Several other countries, such as China, India, and Malaysia, have increased their presence in the region to satisfy their growing needs for natural resources. In order to curb the increasing piracy in the region and safeguard the Bab-el Mandab, an important chokepoint for international trade located between Yemen and Somalia, the international community has launched two maritime missions (NATO's Operation Enduring Freedom and the EU's Operation Atalanta) to monitor the waterways.

THE STATE OF THE REGION

Since the 1990s, the Horn of Africa has become a synonym for despair. Ranging from serious interstate conflicts, civil wars, piracy, and terrorism to regular natural catastrophes, the problems of the region appear virtually insurmountable. The most pressing challenges confronting the region at the end of 2009 included the deteriorating situation in Somalia, the radicalization of Eritrea, and the various potential hotspots in Sudan, ranging from Darfur and the indictment of President Omar al-Bashir by the International Criminal Court to an upcoming referendum between the north and the south of the country. Without significantly increased support from the international community, a lasting solution to any of the Horn of Africa's manifold problems will remain out of reach for the region and its member states.

Horvat, Branko

Branko Horvat (1928–2003) was a Croatian economist and one of the most active public intellectuals of former socialist Yugoslavia. He is best known for his work on Marxist economic theory in general and the theory of the labor-managed firm in particular. His approach is sometimes referred to as *Marxism-Horvatism*. Horvat was director of the Institute of Economic Sciences in Belgrade, Serbia; a long-time editor of the well-respected journal *Economic Analysis and Workers' Self-Management;* and an adviser to the Yugoslav government and several other countries in the world.

Horvat is recognized for his criticism of existing political and economic systems, both in the West and in the East. He promoted a third system that would avoid both the pitfalls of capitalism in Europe and Northern America and *etatism*, as he called the state socialist systems of Eastern Europe and the Soviet Union. Horvat believed both were inefficient in their developmental results as well as unjust in their distribution of property and power. He hoped that a third model, that of socialism, could be developed to overcome these shortcomings. Yugoslavia had the opportunity to produce this vision of a better socioeconomic system, but Horvat was nevertheless critical of what he saw as various problems of Yugoslav reality. He advocated a mixture of self-management, the market, and planning to overcome the economic crisis which gripped the country in the 1970s and 1980s. Horvat placed great hope in economics as a scientific enterprise comparable to the hard sciences, and he was very confident about the type of knowledge economists could produce. His confidence in economic analysis garnered him a high standing in global leftist circles. He was even in the running for a Nobel Prize in Economics after the publication of his *Political Economy of Socialism* in 1982. In his own country, however, he was often out of sync with current politics.

Horvat was one of several intellectuals who founded the Yugoslav Democratic Initiative at the end of the 1980s. The initiative attempted to establish its base in all the republics and to simultaneously avoid ethnic conflict while promoting democracy. After the initiative failed and Yugoslavia broke apart, Horvat's political outlook only grew dimmer as he clashed with the economic policy of the newly independent Croatian government. He organized a small Social Democratic Party, which never recorded significant electoral results. Despite his scientific credentials, Horvat was forced to retire from his position at the University of Zagreb. He remains notable for his advocacy of market socialism, self-management, and participation as a way of more efficiently and democratically organizing the economy and society as well as his constant efforts in developing a rigorous scientific analysis to support these arguments.

Human Development Index

The Human Development Index (HDI) measures socioeconomic development and serves as an alternative to the Gross Domestic Product (GDP) per capita as an indicator of material advancement. The HDI incorporates three dimensions of human progress: a long and healthy life, knowledge and education, and a decent standard of living. The HDI for nearly all countries has been reported annually since 1990 in the United Nations Development Programme's *Human Development Report* (HDR).

The HDI emerged out of economists' frustration with the use of a single indicator—GDP per capita—as a proxy to measure economic development and thereby rank countries comparatively and assess their progress over time. GDP per capita essentially measures annual real income per capita. Advocates of using GDP per capita to judge development favored it as an indicator, as it is frequently and consistently measured and reported. However, critics, including future Nobel Laureate in Economics Amartya Sen, pointed to many drawbacks of using GDP per capita for comparing development cross-nationally.

Sen, regarded as the intellectual father of the HDI, argued that the goal of development should not be simply to encourage the growth of national income, but rather to promote human capabilities and freedom. Mahbub ul Haq, the Pakistani economist who founded the HDR for the UNDP in 1990, stated that the real goal of development must be to "enlarge people's choices" in all areas of human life: economic, political, and cultural. Haq, with consultation from Sen and Meghnad Desai (and, later, several other noted development economists), created and edited the HDI for the first HDR.

Three component indices—life expectancy, education, and GDP—form the HDI. The indices are generated by comparing a country's actual performance to minimum and maximum goalposts on a particular indicator. For example, the life expectancy index intends to capture the development goal of a long and happy life. For an individual country, it is calculated by the following ratio:

$$\frac{\text{Life expectancy at birth}-25 \text{ years}}{85 \text{ years}-25 \text{ years}}$$

where 25 and 85 years are the minimum and maximum goalposts.

The education index serves to measure the development goal of knowledge. It is computed by this formula:

$$2/3(\text{adult literacy rate}) + 1/3(\text{gross enrollment rate}).$$

Zero and 1.0 serve as goalposts for the education indicators.

The GDP index serves as a proxy for the decent standard-of-living goal. For an individual country, it is determined by this method:

$$\frac{\log (\text{GDP per capita})-\log(\$100)}{\log(\$40,000)-\log(\$100).}$$

The GDP per capita measure used is at purchasing power parity (PPP).

The HDI is then calculated as the mean of those three indices (i.e., it is the sum of the component indices each multiplied by one third).

When the UNDP ranks United Nations member countries by HDI, those societies that have effectively promoted health care and universal education tend to rank higher on the HDI than on a GDP per capita ranking. Other countries with high per capita incomes but poor social services provision—such as many petroleum exporters—rank lower on the HDI than if the list were ordered by GDP per capita. The United States tends to rank lower on the HDI than on a GDP per capita standing, while the European welfare states usually achieve higher positions.

Some critics of the HDI have argued that since it highly correlates with GDP per capita, the HDI offers little new information about societies' comparative economic progress. Other critics, including its principal architects, lament the HDI's inability to capture other important human capabilities, including political freedom or differences in living standards for men and women. Still others criticize the equal weighting of the life expectancy, education, and income components of the HDI, offering various suggestions for improvement. In contrast, Sen has lauded Haq for putting together an index that is easy to understand and can be computed easily with data that are available for most nations. Indeed, the UNDP has produced time series for the HDI that extend back to 1975. Responding to critics, the UNDP has created and now publishes a human poverty index, a gender-related development index, and a gender empowerment measure.

Humanitarian Intervention

By the end of the twentieth century, humanitarian intervention had become one of the most controversial issues in the debate on international relations and foreign policy. It entails forced intervention in the territory of another state in the name of humanitarian aid or humanity. In the first decade of the twenty-first century, a shift in paradigm occurred from the *right to intervene* to the *duty to protect*. The U.S. intervention in Iraq in 2002 illustrates this shift to "duty to protect" as part of U.S. efforts in the global war on terrorism to prevent further threats and attacks such as those against the United States on September 11, 2001, which killed nearly three thousand people.

One example that exemplifies both the right to intervene and the duty to protect is Kosovo. The North Atlantic Treaty Organization (NATO) mounted a military intervention against Yugoslavia in 1999 in response to the Yugoslav government's violent actions against ethnic Albanian citizens in Kosovo, a region where many residents desired independence from the central government. Thousands fled as a result of the central government's crackdown. NATO justified its involvement on behalf of Kosovars on humanitarian grounds, and in 2001 a United Nations–supervised Supreme Court in Kosovo's capital of Pristina confirmed that war crimes and crimes against humanity had occurred, including systematic campaigns of murder and rape. NATO's military action was the first of its kind against a sovereign state, and still remains controversial. Some countries, such as Russia, India, and China, claim that NATO's involvement violated both Yugoslavia's sovereignty and the United Nations Charter, while others have noted that such interventions are based more on national interests than actual humanitarian grounds.

Questions concerning humanitarian intervention include: How can a democratic country legally attack another country or invade a sovereign state? Is humanitarian intervention a right or a duty? What is the credibility of the United Nations (UN) if a group of countries are able to usurp the power to intervene in the name of humanitarianism? How humanitarian is humanitarian intervention? What are the politics, economics, and ethics behind humanitarianism?

In post–cold war politics, Western Europe and the United States have engaged in humanitarian interventions in Somalia (1992–1995), Haiti (1994), Rwanda (1994), Bosnia (1995), and Iraq (2002-). Such interventions have been multilateral and based on cooperation among various governments on the basis of short- and long-term goals. Humanitarian interventions, however, have never been purely humanitarian and can be explained both in terms of idealism and realism. In the debate over humanitarian intervention, moral questions cannot be divorced from political, strategic, and prudential questions.

The normative perspective usually found in contemporary literature on humanitarian intervention is based on international law and rights, but many political and ethical issues are automatically involved in any discussions on humanitarian interventions or human rights. For instance, the UN policies

in Bosnia from 1992 to 1995 were criticized for being too slow to act militarily and failing to prevent the 1995 massacre in Srebrenica, where over seven thousand males were killed despite the town being in a declared UN safe area and the nearby presence of UN peacekeepers. In this case, the United Nations waited too long to take sides in the conflict, yet by taking sides with one of the aggrieved parties, the issue of humanitarian intervention is likely to become politicized. In the absence of coherent international legal order, law cannot provide the sole basis for humanitarian intervention. It must instead be found in ethics, which can be highly subjective.

No intervention can be considered "just" or "humanitarian" unless it is supplemented with the *right authority*, *just cause*, and *right intention*. Moreover, it should be used only as the last resort. The question of right authority is crucial to the debate on humanitarian intervention because the very decision to intervene contravenes a state's claim to sovereignty. It may be justified only in those cases in which the government agrees to accept the UN peacekeeping forces or in those cases in which the states might have "failed." However, it is not easy to legitimize humanitarian intervention in all such cases. For instance, the Israeli interventions in Lebanon in 2006 cannot be legitimized under the failed state dictum.

All sovereign states have the right to decide matters within their own territorial jurisdiction. Both the formal notion of sovereignty and the correlative norm of noninterference have been accorded legal expression under the international law. Article 2, section 4 of the UN Charter prohibits the threat or use of force between the states and Article 2, section 7 prohibits the UN from intervening into matters falling within the jurisdiction of a sovereign state. Exceptions arise only if the state's actions become threatening and actually breach peace.

The problem occurs when it becomes imperative to overwrite a state's sovereignty to protect the human rights of its citizens. In contemporary international relations, there exist three different models of sovereignty that vary considerably over the importance of state rights versus human rights, authority of the state to protect human rights, and the need to conceive an international system to protect human rights. The models correspond to the three most generally accepted traditions of international theory—the Machiavellian tradition, the international tradition, and the cosmopolitan tradition.

HUMANITARIAN INTERVENTION AND SOVEREIGNTY

Under the Machiavellian tradition, human rights are considered the prime responsibility of the sovereign state with no scope for humanitarian intervention for the other states. Under this tradition, statism remains the most appropriate model of world politics and stronger states may coerce the weaker states. Under this tradition, intervention occurs only to enhance one's power and not to protect human rights per se. The basis for intervention lies in the ability to intervene and not in the right to do so.

Those who empathize with the victims of war or the victims of human rights abuse on a massive scale reject the traditional approach to humanitarian intervention. Proponents of this second model insist on adopting the tradition of internationalism to regulate interstate relations and allow humanitarian intervention in rare cases. For instance, the 1951 UN Genocide Convention establishes a right to forcible humanitarian intervention with the UN's authorization on the grounds that repression and cruelty on a large scale can pose threats to international peace and security.

Under the third model, sovereignty of the state is seen in cosmopolitan tradition. It amounts to *sovereignty of the people* rather than the *sovereignty of the sovereign*. According to this model, the sovereignty of the state can be violated not only by outside forces but also by the indigenous use of force. For instance, Chinese sovereignty of the people was violated by the 1989 Tiananmen Square massacre, in which the central government engaged in a violent crackdown against peaceful student protestors. In such cases, sovereignty can be restored both by international and national powers. Such a viewpoint provides justification for humanitarian action against pariah states such as apartheid South Africa, targeted by many nations for social and economic boycotts.

Although the international and cosmopolitan traditions provide legitimacy to humanitarian intervention, they are unable to authorize agents for such an intervention. The agents could be the United Nations, the European Union (EU), NATO, or any state in its single capacity. Nevertheless, larger states cannot be allowed to resort to humanitarian intervention to serve their own self-interests. Their "moral anger" also cannot provide just cause for military intervention. For intervention to be just, the intention must also be just.

The notion of just cause excludes, among other things, motives based on self-interest—profit, power, or glory. For instance, the French intervention in Rwanda in 1994 met with widespread dissatisfaction, primarily because it was perceived as motivated more by the continued desire to play the greatpower game in central Africa than by humanitarian concerns. It can be quite difficult, if not impossible, to draw a neat line between humanitarian and political concerns or between rhetoric and actions. As such, humanitarianism cannot and should not be allowed to be used to justify "unacceptable" or "self-interest based" interventions.

Inconsistent and arbitrary judgments about humanitarian interventions further complicate the matter. Inconsistency and selectivity with regard to the practice of humanitarian intervention makes motives highly questionable. Since the UN, EU, or NATO cannot intervene in every case, it becomes important to establish criteria for when to intervene and when not to intervene. This poses a significant challenge. If humanitarian concerns are to be measured in terms of number of deaths and genocidal campaigns, then Sudan, Liberia, and East Timor have a better claim for humanitarian intervention than Bosnia.

In fact, it is very difficult to arrive at some consensus on acceptable motives focused on preventive diplomacy, peacekeeping, or peace enforcement as far as humanitarian intervention is concerned. While many scholars have criticized

the UN intervention in Bosnia, there is no dearth of scholars who have opined that the UN should have intervened earlier to save lives and avert catastrophe. Despite some support for earlier intervention in crises, it is important to remember that misguided decisions and calculations can also prove costly in terms of both politics and economics. The costs of failure of a humanitarian intervention may prove too high in the long run. It is better to adopt the criteria of proportionality, and reasonable hope of success, to serve as adequate warnings against indiscriminate use of military intervention in the name of humanitarianism.

MILITARY INTERVENTION OR HUMANITARIAN INTERVENTION

U.S. president George W. Bush's intervention in Iraq, allegedly to prevent the nation from using weapons of mass destruction and to liberate its citizens from a dictator—thus bringing about democracy—discredited humanitarian intervention around the globe. The humanitarian arguments for invading Iraq met with severe criticism when the weapons of mass destruction the United States insisted were present—and had built a coalition of allies to assist in containing the threat—were never found. In many cases, humanitarian interventions have not resulted in humanitarian outcomes. British philosopher John Stuart Mill ably summarized in *On Liberty* (1859):

> The disputed question is that of interfering in the regulation of another country's concerns; the question whether a nation is justified in taking part, on either side, in the civil wars or party contests of another: and chiefly, whether it may justifiably aid the people of another country in struggling for liberty; or may impose on a country any particular government or institutions, either as being best for the country itself, or as necessary for the security of its neighbours.

Mill did not support intervention by those governments that tried to oppress an uprising of their own citizens. To Mill, "A government which needs foreign support to enforce obedience from its own citizens is one which ought not to exist." He further added that intervention could be recommended provided it gave people freedom, but he also asserted that freedom bestowed on people from others cannot be real and permanent. People have to be their own vanguard.

In contemporary times, the question arises: is humanitarian intervention morally imperative? This debate took a sharp turn when a cyclone hit Myanmar in May 2008, killing tens of thousands of people. The junta in Myanmar could not provide immediate relief to its own people, yet refused international aid as a threat to its sovereignty. Whereas France was of the opinion that the United Nations should invoke the Responsibility to Protect (R2P) doctrine in the case of Myanmar's natural disaster, allowing for intervention, Russia, China, and South Africa disagreed. The latter opined that it was the responsibility of the states concerned to protect their populations in the event of a natural disaster.

While the 2001 R2P report included "overwhelming natural or environmental catastrophes, where the state concerned is either unwilling or unable to cope, or call for assistance, and significant loss of life is occurring or threatened," there are many scholars who believe that natural disasters should not be politicized and that they should be excluded from R2P. Allowing intervention in such circumstances would arouse the suspicion of weaker states about the true motives of powerful states and their tactics. Weaker nations are usually afraid that dominant states might intend to bring about regime change without taking responsibility toward their nation's reconstruction.

Despite sovereignty concerns, many countries in Asia, Africa, and Latin America are opening up to the idea of humanitarian intervention. For instance, in 2004, Indonesia's Aceh province was worst hit by a tsunami and the Indonesian government allowed international aid in the province, placed under martial law. Aceh was previously not accessible to most human rights groups, international reporters, or aid givers. Similarly, in 2005, the Pakistan government allowed access to international relief agencies in an earthquake-rocked area of the disputed region Kashmir, which divides India and Pakistan.

China too accepted international aid from the United States after an earthquake in Sichuan province in May 2008, despite a history of reluctance to accept such aid. Not all nations welcome humanitarian aid, such as India, which refused aid from other states after a 2004 tsunami and 2005 earthquake in Kashmir. While China's earlier refusals of foreign aid were motivated by its desire to retain complete control over its population, India's refusal was intended to illustrate its strength as an emerging economy and a world power that could effectively manage its own affairs.

In practice, humanitarian intervention, carried out by a coalition of nations, can prove too divisive. Despite the generous notions underlying humanitarian interventions—promotion of democracy; protection of human rights; provision of aid in the case of natural disasters; and the maintenance of peace, law, and order—accepting such aid may be seen as jeopardizing national sovereignty. Article 2.7 of the UN Charter forbids interference in "matters, which are essentially within the domestic jurisdiction of any state." Despite these concerns, humanitarian interventions continue over the years, such as in Congo (1964), the Dominican Republic (1965), East Pakistan (1971), Cambodia (1978), Tanzania (1979), Iraq (1991 and 2002), Somalia (1992), Haiti (1994), and Kosovo (1999).

It is impossible to separate humanitarian motives from the political ones or for those who provide aid to claim a neutral stance. Humanitarian intervention is often directed by some omnipotent states in the north toward weaker states in the south. It is difficult to think of a weaker state in a similar role. For instance, the United Kingdom associated itself with the global war on terrorism in Iraq in support of the United States and their mutual interests as hegemonic countries. However, the United Kingdom perhaps would not have taken such a similar step in the case of India, Pakistan, or Bangladesh. Humanitarian intervention in the developed world may be perceived as mere propaganda on the part of the interveners.

Humanitarian interventions often create a problem of moral hazard. Since the causes of most conflicts and disasters are deep rooted and complex, it is hard to blame anyone in particular. If there is intervention from outside, chances are that it will be followed by retaliations from within. As such, humanitarian interventions may, in fact, increase conflictual situations instead of peacefully resolving them, though that is not to say they cannot help avoid mass atrocities or prevent further upheaval.

While international law and the United Nations provide some structure for humanitarian intervention, the surrounding debate continues. Contemporary concerns include: Can the U.S.–led intervention in Iraq be justified as humanitarian? What exactly is humanitarian intervention? When is intervention legitimate? What form should humanitarian intervention take? Should humanitarian intervention continue as it has been practiced since the end of the twentieth century? What is the relationship between social justice and individual rights in the era of globalization, privatization, and multiculturalism? No consensus exists as yet on any of these issues.

Military or "forced intervention" may or may not be part of humanitarian intervention. It definitely involves boldness and risk-taking behavior on the part of intruders, in addition to a deep sense of commitment. When considering whether intervention should occur, a nation or organization may grapple with the possibility of guilt as a crime of *omission* rather than that of *commission*. This possibility contributes to the international community's sense of reluctance to intervene in the affairs of other countries. It is easier to resort to humanitarian aid in the case of natural disasters than to engage in military interventions in the case of genocide or ethnic cleansing.

Humanitarian aid focuses on the victims desperately in need of aid, whereas military interventions are guided by many other geopolitical factors, such as the relevance of the country in question to the rest of the world, regional stability, and the attitude of the major players. It is never an objective, unbiased, neutral, apolitical, or acultural step. There seems to be better acceptance of humanitarian interventions for crimes against humanity than those for natural disasters, since many other forms of interventions are possible for natural disasters beyond forcefully delivering humanitarian aid. Another position, however, maintains that there is no such thing as humanitarian intervention.

A true internationalist believes in equal rights for all. Under these ideals, the people of Zimbabwe should be rescued from Robert Mugabe and the citizens of Iraq should be rescued from Shia militias. Humanitarian intervention, for the true internationalist, would be both easy and noncontroversial. Humanitarian intervention can also be seen as a response to the Genovese syndrome, the phenomenon implying individual apathy, societal resilience, and governmental inability to deal with big emergencies.

Human Nature and Politics

The topic of human nature encompasses a very large body of philosophical and psychological literature. For the most part, observers discussing human nature refer to those endogenous aspects of genetic, biological, and psychological functioning that rest inside the individual and appear immutable. For example, a person's physical appearance might be considered part of human nature, including the color of an individual's eyes or hair. Similarly, aspects of individual character or temperament can be seen to reflect a person's basic nature; some people seem more anxious, depressed, or energetic than others from birth, regardless of the situations they confront.

This phenomenon is most often contrasted with that of nurture, which concerns those features of socialization and environmental stimuli assumed to control, constrain, or potentiate particular aspects of human behavior. This traditional view presents a false dichotomy between human nature and nurture. Since the late twentieth century, advances in behavior genetics and neuroscience, working within a theoretically evolutionary paradigm, demonstrate the truly coconstitutive relationship between human genes, brain development, environmental interactions, and subsequent political and social behavior.

HUMAN NATURE AS DICHOTOMIZED VARIABLE

Political science, in general, has had difficulty clarifying the concept of human nature. Human nature has often been ignored, conceptualized in narrow and unrealistic terms, or as neorealists argue, assumed irrelevant in the face of institutional constraint. This partly results from the fact that the discipline remains invested in its ability to intervene and change outcomes. If a structure or institution appears responsible for undesirable outcomes, such as poverty, child abuse, or violence, then changing that system can mitigate the problem. However, if the cause lies inside human instinctual responses, change becomes harder to achieve.

Implicit models of human nature exist in many political science theories, although they often remain unexamined. For example, classical realists such as Hans Morganthau assume a fearful, power hungry, and rational human nature. Moreover, human nature is assumed to be endogenous, fixed, and given. Once endowed, it remains unchanging regardless of specific environmental contingencies. For structural realists like Kenneth Waltz, a static conception of human nature renders its worth meaningless, because universal and constant features cannot

explain variation in outcome. In both the classical and structural realist approach, there exists an implicit claim that human nature manifests universal tendencies, with little individual variation.

Other political science models tend to ignore the importance of human nature, arguing that explanations for important behavior reside solely in environmental factors, subject to intervention and improvement. Many institutional models, as well as prominent theories of voting, rest on implicit notions that while human nature cannot be changed, human behavior remains amenable to modification when properly incentivized or constrained by the external environment. For example, economic models that presume human behavior can be economically incentivized may not be wrong, but remain restricted to certain circumstances. People continue to do things for status, sex, or even a sense of honor that might not provide the best financial outcome.

Environmental models that stress the importance of social processes are not wrong. Rather, they omit an important half of the story, which encompasses the biological, psychological, and physiological nature of humans. For instance, models demonstrating the important effect of socialization on party identification do not encompass recent evidence suggesting that the strength, if not the direction, of partisan affiliation may have a genetic component. Such unnecessarily restrictive constructions of human nature actually serve to bolster the conception that human nature does not reflect the reality of the human body's adaptive, malleable, and individually variable complex system.

WHAT HUMAN NATURE IS NOT

What constitutes a realistic portrait of human nature? Perhaps the first thing to examine is what human nature is not. Human nature is not most of the things that have been attributed to it: it is not distinct from nurture; it is not universal; it is not static; and, importantly, it is not restricted to negative emotions such as fear, greed, and anger.

Nature and nurture do not exist in a vacuum. Rather, they continually cocreate one another, such that environmental contingencies constantly interact with genotype to write and rewrite expression that produces a unique phenotype over time. Even twins with the same genotype do not necessarily evince identical disease traits, even for illnesses with established genetic components. In schizophrenia, for example, identical twins share a probability of being stricken at about 50 percent likelihood, which while much higher than the odds in the general population, do not come close to certainty, at least partly due to different environmental experiences and precipitants. Social experiences and relationships can also influence biological changes, even in other animal species, just as any honeybee can become queen after the reigning bee passes away. Some animals even change sex under the right environmental circumstances.

Importantly, human nature is not universal, and therefore can prove quite useful in explaining unique outcomes. While some aspects of human physiology have proven so effective as to drive out much variation, such as color vision, these universal features do not constitute the main focus of interest and attention in political science. Rather, aspects of human nature

that preoccupy the discipline relate more to seemingly broader aspects of human social and political behavior, such as the conditions under which people cooperate, how aggression manifests, what prompts in-group loyalty and out-group discrimination, how identities are constructed, and so on. These expressions of human character, which again emerge and change in interaction with environmental cues and triggers, demonstrably differ across individuals and across populations.

Human nature is not fixed or static. Rather, human nature develops and changes within the context of constant interaction with other people and the environment. All of these social forces can literally change brain chemistry and development, thus affecting behavior.

Human nature is also not restricted to the negative repertoire of emotions emphasized by political theorists from Thomas Hobbes to Kenneth Waltz. Clearly, fear, greed, and anger represent part of the normal panoply of human emotional responses. But just as clearly, positive emotions ranging from hope to happiness do as well. Importantly, humans are the only animals to evolve into a position of self-reflection, where humans are now capable of rewriting their own genetic structure, not only through medical intervention and environmental manipulation, but also through the ability to reflect and reason about one's self and one's institutions. The political implications of this are clear: the political and social institutions that can work in concert with basic human desires and instincts, even though those may remain variable, are more likely to prove effective and enduring than structures that work in direct opposition to prevailing tendencies.

ALTERNATIVE CONCEPTIONS OF HUMAN NATURE

Scholars such as political scientist Robert Jervis have reflected on more novel conceptions of human nature resting on demonstrated common tendencies in human psychology. For example, in his 2004 article, "The Implications of Prospect Theory for Human Nature and Values," Jervis noted the ways in which prospect theory offers a particular view of human nature; this rests on cognitive foundations that focus on the importance of loss aversion, the centrality of subjective well-being, and the critical role of change in explaining and predicting human behavior. These tendencies indeed hold true across the majority of people, although certainly not all people espouse these proclivities.

An additional empirical basis for locating a foundation for an interactionist view of human nature lies in evolutionary models drawn from biology or psychology. Such models posit a functional, adaptive construction of the human mind, which allows both for individual variability, environmental responsiveness, and positive emotions. Evolutionary psychology supposes a set of content-laden, domain-specific mental programs that developed in response to repeated challenges confronted by human ancestors. Some strategies proved more important for survival than others, and these constitute superordinate psychological mechanisms; when necessary, these mechanisms either potentiate or restrict other actions, thoughts, and behaviors. Emotions likely function in this manner, at least

in part. For example, when confronting a predator, fear instigates a series of actions that include enhanced sight and vision, increased ability to mobilize muscles for running or fighting, subjective diminishing of pain sensitivity, and a transfer of blood away from the periphery to the core of the body. When the evolution of such behaviors led to the successful resolution of repeated challenges, and these responses conferred a comparative reproductive advantage, such structures proliferated. When the behaviors were not successful, they died out. Since different strategies may work differently depending on local ecology, individual genetic variation of complex social and political behaviors inevitably emerge.

FUTURE DIRECTIONS

Traditional images of human nature present a static and fixed set of responses. The problem with such models is that they introduce an unrealistically constrained view of endogenous human processes. Human genetic and biological mechanisms interact with their environments in complex and sophisticated ways to produce political and social behaviors of interest.

More accurate and comprehensive models of human nature would explicitly embody the myriad ways in which human brains interact with the environment to prompt change in both. Such attempts should rest on an integration of behavior genetics and evolutionary theory, which recognizes genotypic variance across individuals and populations, and also seeks to understand and appreciate the functional purpose and potential adaptive advantage of any given behavior. In such a way, it becomes possible to develop a more accurate and coherent understanding of the interplay between genes, brains, environment, and behavior.

Human Rights

Human rights are often defined as those rights that belong to persons simply by virtue of their being human. This definition neatly captures the ethical intuition of human moral equality that is at the core of human rights. The idea of human rights has been a central theme of modern liberal and democratic thought. It has also proven politically explosive, igniting the democratic revolutions that swept the Atlantic region at the end of the eighteenth century, and fanning the flames of democratization in the twentieth century. It is the commitment to human moral equality that gives human rights doctrine its revolutionary spark.

HISTORY AND DEVELOPMENT

The idea that human rights belong to people by virtue of their being human makes human rights sound less controversial than they really are. Philosophically, the idea of human rights evolved out of the natural law or natural rights tradition, which still claims some adherents among contemporary proponents of human rights. Yet contemporary questions about the philosophical foundations of, and justifications for, human rights are highly divisive. Politically, the idea has a more convoluted pedigree, with diverse origins in the transnational campaign to abolish slavery, in the women's rights and labor movements, in humanitarian projects such as the International Committee of the Red Cross and the Geneva Conventions, and in the institutions of the League of Nations.

One thing that is clear is that human rights are, both philosophically and politically, distinctively modern. Although the concept of human dignity is probably as old as human society itself, human rights are a modern invention. The two concepts must not be conflated: many ways of thinking about human dignity, such as in hierarchical clan, class, or caste societies, are antithetical to the moral equality at the core of human rights. This is not to deny the close connection between human rights and human dignity in contemporary theory and practice. The key international human rights instruments (the Universal Declaration of Human Rights, the International Covenant on Civil and Political Rights, and the International Covenant on Economic, Social, and Cultural Rights) emphasize the idea of "equality in dignity" for all human beings, articulating a particular conception of human dignity grounded in the moral equality that human rights express.

The earliest explicit formulation of natural or human rights emerged in the context of the rigid feudal hierarchies of medieval Europe, where dignity was linked to birth and status. The terminology of natural rights was borrowed and adapted from the natural law discourses that dominated European legal, political, and theological thinking in the early modern period. The term *natural rights* essentially meant "rights held by everyone." In the medieval context, this idea of equal natural rights played a significant leveling role. In a society in which rights and duties had been based on birth and status, equal rights undermined traditional forms of authority, helping to topple monarchies and transform social and economic relations. Theorist Thomas Hobbes was perhaps the first to argue that the ideas of

moral freedom and equality could provide an independent and sufficient basis for political authority—though for Hobbes, this radical idea led to a very conservative conclusion: the transfer of all rights to an omnipotent sovereign.

Although Hobbes did not see the transformative implications of his argument, others certainly did, and the revolutionary potential of these ideas has yet to play out. If one begins from the premise that all people possess equal rights and freedom, there remains no valid justification for natural subjection or arbitrary power. In this sense, the idea of human rights is inherently democratic; it ignores social, economic, and political distinctions. While early proponents of natural human rights, such as philosopher John Locke, used them primarily to advance a bourgeois political agenda, once the genie was out of the bottle it was not long before marginalized people— slaves, women, laborers—used human rights to challenge the dominant classes.

The idea of natural human rights enjoyed considerable support among Enlightenment philosophers, although this support was often tempered by the thinkers' various and extensive prejudices. It gained global political prominence during the Age of Revolution: the American Declaration of Independence invoked certain "self-evident" truths, including the equality of all men and the "inalienable" and God-given rights of life, liberty, and the pursuit of happiness; the French Declaration of the Rights of Man and of the Citizen similarly extolled the "natural, unalienable, and sacred rights of man" and cited "the ignorance, neglect, or contempt of the rights of man [as] the sole cause of public calamities and of the corruption of governments." These ideas quickly won wide currency, sparking upheavals throughout Europe and America. It also resonated globally within various religious and cultural communities whose indigenous conceptions of human dignity were founded in the same idea of human moral equality. That the specific terminology and mechanism of human rights emerged in the West is an artifact of history; human rights capture an idea whose origins and appeal are truly global and find expression in many forms.

The excesses of the French Revolution (which were often distorted or exaggerated by its opponents for political advantage) (1789–1799) helped to discredit the idea of natural human rights among elites in the nineteenth century. The idea generated considerable skepticism among conservatives interested in preserving monarchical regimes, socialists troubled

by the "bourgeois" character of human rights, social Darwinists propagating a bastardized theory of social selection, and utilitarians dubious of the very idea that rights could mean anything other than guarantees enshrined in positive law. Still, social activists invoked natural human rights in the key struggles of the day (the term human rights did not enter common parlance until the twentieth century).

HUMAN RIGHTS IN THE TWENTIETH CENTURY

The League of Nations, established at the conclusion of World War I (1914–1918), established numerous protections for rights. While the League did not survive, international protection for rights—especially worker's rights and the rights of minorities—endured. At the outset of World War II (1939–1945), British and American officials declared in the Atlantic Charter that a key war aim for the Allied Powers was the creation of an international system that would protect and promote respect for human rights. At the war's end, widespread horror and outrage at wartime atrocities helped to spur the newly formed United Nations (UN) to affirm, both in its Charter and in its 1948 Universal Declaration of Human Rights, the dignity of the human person and the recognition of equal rights and freedoms for everyone. Subsequent treaties, including the two covenants and treaties on racial discrimination, discrimination against women, children's rights, and torture, form the nucleus of a growing body of international human rights law.

Human rights played a significant role in the two most significant political developments of the postwar era: decolonization and the "third wave" of democratization. Human rights were implicated in the ongoing system of European colonialism and imperialism, often providing a pretext or rhetorical cover for naked political and economic ambition. At the same time, human rights provided a significant theoretical and political resource for colonized peoples seeking to throw off the yoke of foreign rule. Out of this experience emerged calls for new rights, such as the rights to development and self-determination.

Antiauthoritarian movements, especially in Latin America in the 1970s and 1980s and in Eastern Europe in the later 1980s, relied heavily on human rights to generate domestic and international support for their struggles for democracy. Activists utilizing the power of prominent nongovernmental organizations (NGOs) and the international media waged successful campaigns for democratization by highlighting the hypocrisy of their governments' commitments to human rights. Such commitments, whether undertaken by governments in the form of concessions or as part of broader treaty obligations, proved an Achilles heel of regimes that flagrantly violated citizens' rights. The normative (rather than legal) force of human rights was decisive in these struggles; neither the lack of global enforcement nor the absence of a genuine commitment to human rights on the part of the regimes prevented the idea from taking hold in the popular political imagination and stimulating demands for reform. Human rights are still invoked today wherever people seek to defend themselves against brutal governments.

HUMAN RIGHTS IN INTERNATIONAL LAW AND POLITICS

In international law, human rights are established by treaty or by custom. Treaty obligations are binding on all signatory states. Some international lawyers argue that human rights have now achieved the status of customary law as well, making them binding even upon governments that have not ratified the relevant instruments. Traditionally human rights have been conceived as rights that individual citizens hold against (their) governments. Increasingly, however, human rights are invoked against governments of foreign states as well as against multinational corporations, international financial institutions, ethnic or religious groups, and a range of other nonstate actors.

Human rights law plays a major part in regulating international relations. A variety of institutions, including the UN's Human Rights and Security Councils and its Office of the High Commissioner for Human Rights, and regional arrangements like the European Court of Human Rights, the Council of Europe, and the Inter-American Court and Commission of Human Rights, help to monitor and protect human rights around the world. Critics deride the lack of enforcement capacity in the international human rights regime as evidence that it is ineffective or inconsequential. Such criticisms highlight an important problem, but tend to ignore the more diffuse, indirect effects of the regime. These include the status of human rights as the de facto standard of legitimacy for governmental conduct; violators often suffer economically, politically, and diplomatically for their poor performance.

In addition, NGOs, ranging from well-known organizations such as Amnesty International and Human Rights Watch to myriad local, national, and international groups, play a prominent role in monitoring human rights. Often using a "name and shame" strategy, these groups call attention to violations of human rights committed by governments and corporations and use the media to publicize these wrongs and assert pressure for change. They also lobby governments and increasingly take part in various international negotiations and deliberations. In the early twenty-first century, almost all debates in international politics take place at least in part within the human rights framework, including issues such as terrorism, development, the environment, human trafficking, and many others.

KEY CONTROVERSIES

Although human rights have become the predominant normative discourse in global politics, there is little agreement on their philosophical foundation or justification. Numerous justifications for human rights have been advanced over the years, from the natural rights arguments of the seventeenth century to more contemporary arguments based in autonomy, human capabilities, and human interests, among others. Some critics cite the uncertainty reflected in this plurality of justifications as a problem for their legitimacy, arguing that without a single, clear, and uncontroversial justification, human rights lose credibility. Yet it is not obvious why everyone has to agree on what reasons justify human rights in order to find

the idea of human rights itself appealing. Human rights are better understood philosophically as considered judgments about what human moral equality requires, given the collective knowledge about, and experience of, the world.

One persistent challenge to human rights concerns their universality. This term misleadingly collapses several important dimensions of human rights into one concept. As Jack Donnelly has argued in his 2007 article "The Relative Universality of Human Rights," what critics usually mean by universality is ontological universality or anthropological universality. The former refers to the philosophical foundations of human rights; the latter refers to the ubiquity of human rights in the cultural practices of societies around the world. Ontological universality would mean that there exists some single, transhistorical, and transcultural justification or moral foundation for human rights. No such foundation has been or is likely to be found. This fact has not prevented the emergence of human rights as the most important normative discourse of politics in the twenty-first century.

Anthropologically, human rights are not universal; they are not an inherent part of every society's cultural practice. Cultural relativists sometimes seize on this fact in arguing that human rights are alien to many cultures and illegitimate for them. The thrust of this critique is that human rights reflect individualistic values and priorities and a particular conception of human dignity that are distinctly Western and therefore inappropriate for "non-Western" cultures or societies. In its most extreme form, this critique endorses a relativism in which the only standards appropriate for a society are those that reflect its existing values and beliefs. In milder forms, this critique is used to reject certain rights or understandings of rights that conflict with traditional cultural norms. The Asian values debate of the early 1990s exemplified this tension: many Asian elites claimed that Western notions of human rights were not appropriate for their more communally oriented societies. Opponents noted the self-serving nature of these arguments and pointed out that many of the societies in question lacked institutions that would allow people to choose for themselves what rights were or were not desirable. They also argued that the elites improperly treated culture as a static and homogenous entity.

There is room for advocates of human rights to argue for general or global standards while also allowing for and encouraging some variation at the levels of interpretation and implementation. Moreover, it should be emphasized that human rights are not an *inherent* part of *any* society's cultural practice. They represent, in the West as well as elsewhere, a set of prescriptions for the equal treatment of human beings in modern social, political, and economic conditions. That these prescriptions often clash with deeply embedded cultural norms and practices is hardly surprising; it is this clash that ignites the revolutionary spark of human rights when proponents challenge the status quo. Thus, human rights might not be universal in the ontological or anthropological senses, but they are increasingly global, in that they are valued and invoked around the world.

Another long-running controversy regarding human rights concerns their so-called interdependence and indivisibility. Human rights are often divided into two categories: civil and political rights (i.e., the right to vote, the right to a free press) and economic, social, and cultural rights (i.e., the right to subsistence, the right to an education). Civil and political rights are sometimes characterized as "negative" rights, supposedly indicating that governments and individuals need only refrain from violating these rights. Economic, social, and cultural rights are often described as "positive" rights, suggesting that the state must fulfill these rights through positive action. Negative rights are sometimes described as first-generation rights, since they were supposedly conceived before and enshrined in law earlier than positive or second-generation rights and the even newer third-generation rights (such as development and self-determination).

These distinctions are conceptually dubious; many civil and political rights—the right to vote, the right to property, the right to security—require extensive governmental activity for their protection and fulfillment. The distinctions are also historically flawed: social and economic rights emerged alongside civil and political rights in the seventeenth century. That the latter were secured first in law says something about the sources of power in many Western societies but little about human rights. The distinction gained false credence because it was enlisted in the cold war rivalry between capitalism and communism, in which each side portrayed civil and political rights as incompatible with social and economic rights. The distinction was also employed in some developing countries to suggest that progress on second- and third-generation rights might justify (supposedly temporary) abridgements of first-generation rights. This "full belly thesis," that people cared more about having food to eat than about abstract ideals like press freedom or democratic elections, was often used to justify authoritarian political practices.

Most scholars and activists in the early twenty-first century recognize that human rights are global in appeal and interdependent and indivisible in practice. Article 5 of the Vienna Declaration and Programme of Action, adopted at the 1993 World Conference on Human Rights, affirms that "all human rights are universal, indivisible and interdependent and interrelated. The international community must treat human rights globally in a fair and equal manner, on the same footing, and with the same emphasis. While the significance of national and regional particularities and various historical, cultural and religious backgrounds must be borne in mind, it is the duty of States, regardless of their political, economic and cultural systems, to promote and protect all human rights and fundamental freedoms." Interdependence and indivisibility mean that rights cannot be subdivided into classes, categories, or generations; rights cannot be secure unless other rights are secure as well. The right to vote, for instance, is not secure if one lacks the right to security from physical violence and intimidation. The right to an education is meaningless without a right to adequate nutrition that makes learning possible.

A common criticism of human rights has been that they exclude or ignore women and people of color. This criticism

is correct in two important respects. First, many rights have been defined quite narrowly and from a masculine perspective, making the idea of "women's human rights" a necessary corrective to notions like liberty and security as they had traditionally been defined and understood by men. For example, what men typically mean by security—protection from the state and its agents and officers—does not address the primary security needs of women—protection from the violence that occurs in the domestic sphere. Second, it is also unfortunately true that human rights rhetoric has been invoked in rationalizing imperialistic behavior, often in the guise of the white man's burden and *mission civilisatrice* or their contemporary analogs. These criticisms are thus very important parts of the ongoing development of human rights theory and practice. Yet they do not, as critics have sometimes claimed, demonstrate that human rights are inherently sexist or racist. Rather, they show the need to constantly subject human rights standards to internal and external critique as a way of developing and strengthening the commitment to human moral equality that animates them.

HUMAN RIGHTS AND POLITICAL SCIENCE

Within the discipline of political science, human rights have—at least until quite recently—met with deep skepticism: scholars of international relations in the realist tradition regarded them as cheap talk that disguised states' true interests in power; comparativists worried about their relevance in non-Western settings; and normative theorists questioned their universality and their philosophical foundations. Since the 1990s, this skepticism has been giving way to growing interest in human rights both as a dependent and an independent variable in social scientific analyses and as a central normative concept in political life.

In international relations, constructivists and those influenced by constructivism have shown how international norms influence domestic politics (such as through democratization). In transnational politics, human rights play a huge role, providing a common vocabulary and a nexus for networks of activists in a variety of issue areas. Even traditional scholars of international relations are beginning to take seriously the effects of human rights in trade relationships, in humanitarian intervention, and in the politics of international organizations. Scholars in the field of international political economy are, with colleagues in comparative politics, asking questions about how globalization affects human rights in a variety of contexts.

Comparativists have also been developing greater sophistication in their understanding of human rights, showing the (positive) effects of (greater) wealth and (democratic) regime type on respect for human rights. They seek explanations for puzzles regarding the increased violence associated with democratic transitions, the effects of trade and foreign direct investment, and the roles of courts, amnesties, and truth commissions in achieving transitional justice in conflicted societies. Scholars are also paying more attention to social activism and networking around human rights issues.

Among normative theorists, the study of human rights has been given new impetus by concerns about global justice and global democracy. Human rights are increasingly seen both as preconditions and products of deliberative or discursive politics. While the old philosophical debates persist, there is renewed attention to how human rights are used by people experiencing oppression and domination and how human rights articulate with concerns about human welfare and autonomy.

Human Security

The human security discourse dates back to the *Human Development Report 1994*, published by the United Nations Development Programme (UNDP), subtitled *New Dimensions of Human Security.* The catchphrase definition has become "freedom from fear and freedom from want." In 2003, the Commission on Human Security (initiated by the Japanese government, and working closely with the UN) formulated the following main characteristics, published in 2003 by

Sadako Ogata, Amartya Sen, and others as *Human Security Now:*

> Human security complements state security, enhances human rights and strengthens human development. It seeks to protect people against a broad range of threats to individuals and communities and, further, to empower them to act on their own behalf. And it seeks to forge a global alliance to strengthen the institutional policies that link individuals and the state—and the state within a global world. . . . The Commission on Human Security's definition of human security: to protect the vital core of all human lives in ways that enhance human freedoms and human fulfillment. (2–4)

Conceptually, human security breaks with the dominant referent objects of security—the territorial state and the national state. It instead puts the individual and nonstate communities in the spotlight. The main concern is no longer the state (national or state security), nor traditional warfare (military security). Security must be about humanity at every level, on every scale: individuals, (small) groups, and humanity.

Advocates of the concept argue that state-centric analyses of "international" security fall short of understanding contemporary dynamics of existential threats to people. This implies a world-society perspective that entails an analysis of how 6.6 billion individuals organize (or disorganize) their lives. Critics emphasize that even from such a perspective, the distinction between external and internal dimensions of social life resurfaces: as soon as social organization occurs, borders are formed, which imply an inside-outside logic. Hence, the referent object of human security moves back from the individual and humanity to social institutions: How do groups relate to each other and how do individuals relate to groups? Economic globalization and political integration have changed the meaning of sovereignty, but sovereign states continue to play a dominant role among these groups. In practice, the human security literature focuses mainly on (correcting) state behavior and fits in the wider discourse on the Responsibility to Protect (R2P).

In some countries, human security has led to reforms in military training and strategy, particularly in Canada and Norway, and in 2003 the European Union (EU) Study Group on Europe's Security Capabilities presented a report titled *A Human Security Doctrine for Europe,* pleading a similar course for the European Security and Defence Policy (ESDP). In 1999, the Human Security Network was established as "a group of like-minded countries from all regions of the world that, at the level of Foreign Ministers, maintains dialogue on questions pertaining to human security." In June 2008, thirteen states participated in this network.

In the early years of the twenty-first century, the literature on human security mainly focuses on interventions in the developing world. It expresses concerns well-known from the fields of development studies and conflict management, and adds a proactive attitude. Human security is typically applied as a Northern or Western concept highlighting the urge to improve the human rights situation in many developing countries; there is a striking neglect of human security issues within Western states.

Advocates of the concept argue that peacekeeping, peace enforcement, and peace building cannot be successful without a human security perspective. Skeptics argue that contemporary politics overestimate the margins for change, and this brings human security policies into the sphere of either utopianism or disguised traditional power politics.

Human security policies can come top-down, initiated by governments or international organizations, and bottom-up, as local self-help initiatives. In cases of a failing or repressive government, the public sector has lost its protective functions. A retracting government runs the same risk. In the absence of a well-functioning public sector, people have no choice but to create self-help structures to provide a minimum of protection. Bottom-up policies—or human security from below—in these circumstances is about resistance and liberation or about making day-to-day life more bearable. The interaction between top-down and bottom-up human security policies is important because a successful human security policy needs roots in society as well as third-party support. Regardless of how local a conflict or lack of basic needs may be, these issues are always embedded in regional and often global contexts. Outside actors within these structures have a choice to determine their level of direct involvement, but cannot escape their responsibility to at least make up their minds. The human security discourse addresses this responsibility.

Human security is also put forth as a concept to change traditional operational military practices. Combining the traditional military spirit with the mindset of police officers and development workers creates a strong incentive to talk about human security because it highlights the changing nature of coercive power in world politics. The traditional division of labor between military, police, and intelligence is in jeopardy. UN peacekeeping has become police work with military means; globalization has increased perceptions of substate violence; network terrorism works along similar lines as transnational organized crime; with more than 50 percent of the world population living in urbanized areas, many security and development issues are about governing and managing densely populated areas. The shift from state security to human security captures many of the dilemmas involved in the contemporary use of violence. Critics, however, point at the risk of widening the concept of security too much and perhaps encompassing every threat to ordinary life.

Hume, David

David Hume (1711–1776) was born on April 26, 1711, in Edinburgh, Scotland. After studying at the University of Edinburgh and briefly considering a career in law, he embarked on a lifelong career as a moral philosopher, historian, and essayist. He is widely considered the leading intellectual figure in the Scottish Enlightenment, and his writings had a profound influence on moral philosophy and the social sciences.

Hume is usually associated with the philosophical doctrine of empiricism, or the idea that all moral ideas can be traced back to sense impressions. This idea influenced Hume's account of the origins of morality and justice. He is often described as a "common sense" philosopher because he believed that moral principles were best sought in everyday moral and political practices that had evolved over time—rather than in appeals to abstract principles, natural laws, or transcendent reason. Another of Hume's most enduring philosophical claims is his criticism of the *naturalistic fallacy*, or the idea that evaluative claims about what "ought" to be can be deduced from purely factual observations of what "is."

In addition to his major philosophical writings, which include *A Treatise of Human Nature* (1739–1740), *An Enquiry Concerning Human Understanding* (1748), and *An Enquiry Concerning the Principles of Morals* (1751), Hume is renowned for his *Essays: Moral, Political and Literary* (1741–1742). Preferring the affluence and stability of modern commercial societies over the ignorance, poverty, and discord of the classical republics of antiquity, Hume argued for the civilizing role of commerce and criticized mercantilist prejudices holding that the wealth of some nations must come at the expense of others. Hume's economic writings influenced his colleague Adam Smith and are widely credited for contributing to the development of the modern science of economics. Additionally, Hume's essays included classic contributions like "Of Superstition and Enthusiasm," in which he condemned Christianity's sectarian tendency to mix into political affairs. His essays on political parties are credited with influencing the thought of James Madison, particularly *Federalist* No. 10 detailing the problems of factions. More generally, Hume's essays idealized a commercial society and the progress in arts, sciences, manners, sociability, and conversation which he believed accompanied economic prosperity.

Hume was also renowned as the author of the magisterial *History of England* (1745–1762), published in six volumes and widely considered the definitive history of England from the time of Julius Caesar to the Glorious Revolution of 1688.

Hume is often characterized as a political conservative, but he resists this kind of easy categorization. He was a moderate who refused to side with either Whigs or Tories, maintaining there was something partially true about each of their claims. Hume was, however, deeply critical of wholesale attempts to reform long-standing customs in light of reason or ideal blueprints of society, and he counseled people to obey existing governments except in cases of extreme tyranny. Neither liberty nor authority is an absolute good in and of itself, Hume maintained, but the possibility of free government hinges on achieving a proper balance between these two principles.

Humor, Political

Political humor is the term used to describe the use of humor in the domain of politics. Though occasionally used to describe the use of humor by political figures themselves, the term is most often reserved for humorous images, texts, and expressions that mock public officials, people in positions of authority, as well as government, institutions, policies, or practices. According to the taxonomy introduced by David L. Paletz in his 1990 article "Political Humor and Authority: From Support to Subversion," political humor can vary in terms of target (at whom or what is the humor aimed?), focus (what element or characteristic of the target is under scrutiny?), acceptability (how socially or culturally accepted is the joke in question?), and presentation (how, with what style or medium, is the humor communicated to the receiver?). These four criteria then determine where a given piece of political humor falls on a spectrum ranging from *supportive* to *subversive*. Paletz defines supportive political humor as political humor that is loyal to the dominant political order, and supportive of the individuals and institutions in power, such as the innocuous and friendly barbs in the jokes of Bob Hope. At the other end of the spectrum is subversive political humor, which seeks to aggressively—and perhaps unacceptably—criticize not just public officials, but the norms and practices of those highest in authority as well as the very institutions that hold power.

SATIRE, NONSATIRE, PARODY, AND CARTOONS

Another method to categorize political humor involves separating it in terms of satirical and nonsatirical political

humor. According to George Test, author of *Satire, Spirit and Art* (1991), political satire is political humor that is simultaneously aggressive, playful, seeks to induce laughter, and casts judgment. Rachel Paine Caufield suggests in her 2007 article, "The Influence of 'Infoenterpropagainment,'" that these four necessary elements separate political satire as a distinct subcategory of political humor, as satire "is specifically created as a means to attack perceived wrongs or ills within society" (7) and "must judge some aspect of society in a way that lends itself to correction" (8). Herein lies the essence of satirical political humor: the use of humor to ridicule institutions, practices, authorities, or citizens in an attempt to remind the audience that a better alternative is both desirable and achievable. As literary scholar Dustin Griffin argues in his 1994 book *Satire: A Critical Reintroduction,* "The business of the satirist is to insist on the sharp differences between vice and virtue, between good and bad, between what man is, and what he *ought to be."* (36). Hence, returning to Paletz's typology, the distinction between political humor and true political satire stems from the focus of the humor—the element of the target that is under scrutiny. While a nonsatirical political joke might poke fun at a political candidate's physicality or style of speech, political satire would go deeper, mocking that candidate's integrity, competence, or the very political platform that they represent.

A common form of political humor is the subcategory of political parody. Parodies are exaggerated or altered depictions of some original political practice, event, or person. Parodies include impersonations of political leaders, in which the impersonator chooses known elements, traits, or characteristics of the original political figure to exaggerate or distort. Editorial cartoons employ the art of parody to generate recognizable cartoonish versions of public officials. Parodies also include exaggerated or altered reenactments of common political events such as speeches, political advertisements, interviews, debates, or news programs. Whether or not these parodic texts constitute political satire depends again on the focus of the depiction.

One form of parody, the political cartoon, has a long and varied history as a form of political rhetoric. As explained by Stephen Hess and Milton Kaplan in their 1968 book *The Ungentlemanly Art: A History of American Political Cartoons,* American political cartoons date back to Benjamin Franklin's 1747 cartoon, "The Waggoner and Hercules," depicting a farmer stuck in mud praying to Hercules in the sky, with the caption, "God helps those who help themselves." The cartoon, aimed at generating support for the revolution, is credited with mobilizing thousands of troops. With the ability to communicate efficiently through metaphor and symbolism, political cartoons present emotionally charged arguments without saying a word. The potential influence of this form of humor is illustrated by cartoonist Thomas Nast's 1870s caricatures of an obese and aggressive William Tweed, the "boss" of the New York Democratic Party's corrupt Tammany Hall. Nast's cartoons, published in *Harper's Weekly,* have been credited with precipitating Tweed's arrest and subsequent imprisonment.

While satirical cartoons critical of the governing regime or existing power structure are common, political leaders also use cartoons as a form of propaganda, and other groups may use cartoons as a means to criticize other cultural, religious, or ethnic minorities. In the German Weimar Republic (1919–1933), following World War I (1914–1918), for example, various magazines and newspapers used political cartoons and satire to criticize the government, cultural trends, or public policies. As the National Socialist Workers Party (the Nazi Party) rose to power in the early 1930s, political cartoons transformed into a central method of propaganda, caricaturing Germany's foreign enemies and Jewish citizens, and later mobilizing German citizens for war. Satirical cartoons targeting Hitler or political elites did not appear in the government-controlled papers of the Third Reich, however—an unsurprising phenomenon under a totalitarian regime.

POLITICAL HUMOR'S ROLE IN DEMOCRATIC SOCIETIES AND PERSUASION CONTEXTS

Scholars have long observed that the pairing of political humor and democratic governments is both logical and functional. In societies where citizens have a say in choosing their leaders and shaping the direction of legislation, political humor provides a cathartic form of criticism aimed at those in positions of authority. The fact that the right to free speech explicitly protects political humor suggests that democratic founders recognize these Freudian roots of humor as a safe form of authority-challenging expression.

Political humorists—and satirists in particular, from Aristophanes to *The Daily Show*'s Jon Stewart—all capitalize on the privileged role that humor plays as a form of communication. The political humorist knows that criticisms of institutions, leaders, and policies will be less offensive if delivered through humor rather than serious discourse. The most contemporary scholarly examinations of political humor in political science, cognitive psychology, and communication have sought to understand how and why political humor seems to suspend the audience's resistance in this way. It seems that humor's ability to suspend the audience's resistance results from the mode in which the listener processes humor. While the audience actively processes the political humor in the hopes of understanding and appreciating the joke, that same audience generally does not process with the goal of judging the humor's merit, truth value, or fairness. This discounting cue that is activated in the brain when encountering political humor signifies that it is inappropriate and unnecessary to critique the message in a serious way, because after all, it's "just a joke."

Obviously, an audience's willingness to activate a discounting cue in the face of political humor is not guaranteed; political humor can certainly offend. In September 2005, the Danish newspaper *Jyllands-Posten* sparked fury among Muslims around the globe because of its publication of political cartoons that depicted various exaggerated versions of the prophet Muhammad. Muslims objected both to the depictions of the prophet Muhammad, which are prohibited by Islam, as well as to the nature of the portrayals.

If an audience does agree to "play along" in keeping with the humorous mode, then ideas that otherwise might be dismissed out-of-hand are given attention, laughed at, and maybe even contemplated in other contexts. Indeed, research in the mid-2000s suggests that political jokes can bring issues and ideas to the top of audiences' minds, influence audiences' perceptions of political figures and institutions, and foster attention to political news and other traditional political information.

Huntington, Samuel P.

Samuel P. Huntington (1927–2008) was an American political scientist best known for his thesis that, in the post–cold war world, conflicts would stem from the competing cultural identities of "civilizations" rather than the ideological (and state-based) conflicts of the cold war period.

Huntington earned a bachelor's degree from Yale University before serving in the U.S. Army at the end of World War II (1939–1945). He went on to obtain his master's degree from the University of Chicago in 1948 and then completed his doctorate at Harvard University in 1951. Huntington joined

Harvard's faculty in 1950 and remained with the university for most of his career. For three years (1959–1962) he worked at Columbia University as an associate professor in the Department of Government and the deputy director of the Institute for War and Peace Studies.

Huntington advised Hubert Humphrey during Humphrey's 1968 campaign for president and served in the Jimmy Carter administration as the coordinator of security planning for the National Security Council from 1977 to 1978. He served as a member of the National Security Council/Defense Department Commission on Long-Term Integrated Strategy from 1987 to 1988. At Harvard, Huntington chaired the Department of Government (1967–1969 and 1970–1971), was director of the Harvard Center for International Affairs (1978–1989), and chaired the Harvard Academy for International and Area Studies (1996–2004). He founded the John M. Olin Institute for Strategic Studies at Harvard in 1989 and sat as its director until 2000. He also cofounded and was editor of the magazine *Foreign Policy* from 1970 to 1977. From 1986 to 1987, Huntington served as president of the American Political Science Association.

Huntington's often controversial scholarship covered a number of different areas, including civil-military relations, military strategy, political philosophy, American politics, and international development and conflict. In his first significant book, *The Soldier and the State: The Theory and Politics of Civil-Military Relations* (1957), Huntington endorsed civilian control of the military and supports President Harry Truman's dismissal of General Douglas MacArthur during the Korean War (1950–1953).

In 1968 Huntington's *Political Order in Changing Societies* spawned debate because it challenged the "modernization theory" that economic and social progress produces stable democratic regimes in developing nation-states. Huntington argued that economic and social growth produced more complex societies, which required states to develop political institutions capable of managing the stress produced by this modernization. Failure to do so, Huntington warned, could lead to political instability, chaos, and violence. The book also attracted criticism because Huntington labeled the apartheid regime of South Africa as a "satisfied state."

In 1993 Huntington published an article in *Foreign Affairs* entitled "The Clash of Civilizations," which was subsequently expanded into a book, *The Clash of Civilizations and the Remaking of World Order* (1996). Huntington theorized that the end of the cold war meant that future conflicts would be cultural rather than ideological in nature. This view contrasted with "the end of history" thesis presented by American political economist Francis Fukuyama, who had argued that the collapse of communism was a victory of Western ideas and the end to conflict.

Huntington asserted that cultural and religious tensions between the West and other cultures would lead to dangerous instability and future wars. He also predicted that the most likely conflicts would involve the West versus either Islamic or the Sinic (Chinese) cultures. While criticized by many scholars, Huntington's view attracted additional attention following the September 11, 2001, attacks in the United States.

In *Who Are We? The Challenges to America's National Identity* (2004), Huntington warned that America's national identity had been threatened by large-scale Latino immigration, which he wrote could "divide the United States into two peoples, two cultures, and two languages."

Hyneman, Charles S.

American political theorist Charles S. Hyneman (1900–1985) was born on a farm in Gibson County, Indiana, in 1900. He received his undergraduate degree from Indiana University in 1923 and his master's degree in 1925. After spending a short time doing graduate work at the University of Pennsylvania, he transferred to the University of Illinois where he received his PhD in 1929. Hyneman held appointments early in his career at Syracuse University and at the University of Illinois before he became the chair of the Department of Government at Louisiana State University in 1937. While at LSU he was instrumental in organizing the Louisiana Municipal Association and initiating a merit system for the state civil service. While Hyneman was a student of pragmatic politics, this in no way limited his accomplishments as a theorist. Much of his later work focused on the philosophical underpinnings of the American founding and the struggle inherent in developing representative government.

During World War II (1939–1945), Hyneman held three separate government posts. He worked first in the Bureau of the Budget, then in the Office of the Provost Marshal General in the War Department as chief of the training branch. Finally, he worked in the Federal Communications Commission (FCC), first as the director of the Foreign Broadcast Intelligence Service and later as assistant to the chairman and then executive officer of the FCC.

After leaving government service, Hyneman returned to teaching, first at Northwestern University in 1947 and then at Indiana University. While he would have many visiting appointments over the next few decades, he stayed at Indiana University until his death in 1985. While at Indiana he was named as a Distinguished Professor in 1961 and from 1960 to 1961, he was the president of the American Political Science Association. Some of Hyneman's most famous books are *Bureaucracy in a Democracy* (1950), *The Supreme Court on Trial* (1963), *Popular Government in America* (1968), and *American Political Writing During the Founding Era: 1760–1805* (1984), which was coedited with one of his former students, Dr. Donald S. Lutz.

Hyneman was an outstanding scholar and practitioner, but he was equally successful as a teacher, inspiring hundreds of students to partake in their own study of the American regime. His legacy was passed on by his students, including Donald Lutz and Ross Lence, and to those who were fortunate to study under them in turn. Throughout his career, Hyneman was concerned with popular control of government. He sought to understand the American founding experience in order to illuminate how those conditions relate to contemporary political life. His understanding of politics and manner of study was pragmatic and theoretical, principles displayed in his work and his life.

Ibn Taymiyya

Taqi al-Din Ahmed Ibn Taymiyya (1263–1328) was a prominent Muslim scholar and jurist of the thirteenth and fourteenth centuries. He is noted for his contribution to debates about the combination of secular logic and Islamic faith, his attachment to a conservative and totalizing notion of Islam, and his defense of jihad as a primary responsibility of Muslims. Ibn Taymiyya resisted contemporary forms of innovation in religion and castigated Muslim rulers such as the Mongols who did not abide by the customs of Islamic unity, all the while defending Islamic practice as a pillar of state policy. He is therefore often credited as a forerunner of modern Salafist or Islamist movements that condemn both non-Muslim governments and their secular Muslim counterparts. His approach to jihad is widely viewed as a significant development in the tradition of Islamic militancy.

Ibn Taymiyya was born in 1263 in Harran, now located in southeastern Turkey. His birth came at a time of widespread political instability and ferment. The invasion and sack of Baghdad by the Mongols in 1258 brought an end to the Ayyubid Empire and left all of Southwest Asia in danger of raids and violence. When he was about seven years old, Ibn Taymiyya's family left Harran for the more stable confines of Damascus, at that time ruled by the Egyptian Mamluks. Both his father and grandfather were noted Sunni scholars of the Hanbali tradition. His father became a teacher in Damascus, and upon his death in 1284, Ibn Taymiyya took his place.

Ibn Taymiyya taught at a time when Arab Muslim societies were being forced to respond to the political challenges of the Mongols and the Crusaders. In 1291 the last Crusader kingdom of Acre was defeated by the Mamluks, and Ibn Taymiyya joined in the defense of Damascus against invading Mongol armies in 1300. The need to maintain a unified defense against external opponents shaped his attitude to politics and to jihad.

An extensive collection of Ibn Taymiyya's teaching has come down in the form of religious rulings (*fatawa*) and monographs. He worked to renew and reinvigorate traditional scholarship, particularly in opposition to the Ash'ari school, which was premised on the unity of creation that fused Greek philosophic thought with the Islamic tradition. His opposition to the Sufi theologies of *hulul* (God's indwelling of man) and *wahdat al wujud* (unity of creation) set him against standard Sufi practices of seclusion and mantric repetition. On the other hand, he counseled Muslims to support the political mobilization of the citizenry of the Islamic state in jihad from the example of the prophet Muhammad, affirming the offensive jihad as a "collective obligation" (*fard kifaya*) and the defensive jihad as an "individual obligation" (*fard ayn*).

Ibn Taymiyya's strong denunciation of popular religion put him in conflict with the Mamluk authorities, and he was imprisoned in Cairo from 1305 to 1306 on charges of heresy. He was also imprisoned in Damascus for his outspoken conservative views from 1320 to 1321 and in 1328. He died in prison in 1328.

Idealism

Idealism usually refers to views holding that reality is constituted by mind, spirit, or some other nonmaterial entities. It is opposed to materialism, holding that reality, including consciousness, is reducible to matter. Political idealism covers political views based on a nonmaterialist ontology, but the term is also used more loosely to describe any conception committed to shape the world through demanding moral ideals and a strict sense of duty. When used in the latter sense it is contrasted with realism, or Realpolitik.

Plato's political theory is idealist in both senses. It holds that moral guidance for political organization and decision making must be sought at a distance from the imperfect world of appearances known to our senses. For Plato, the visible world, with its finite, constantly changing, and imperfect objects, is like shadows of the true, higher, and eternal nature of things.

Philosophy can help us to gain precision about the ideal, objective nature of justice and thus to identify a universal standard against which political units could be assessed. One of the central features of Plato's elitist ideal was that there is a natural, hierarchical division of labor. Justice is realized when each class sticks to the tasks and virtues for which its members are naturally fitted. In Plato's *The Republic,* the ideal city is ruled by philosopher-kings, motivated by love of truth and the good of the ruled. An important implication of the philosopher's privileged position in relation to knowledge was that democracy, which Plato associated with rhetoric and ignorance rather than reason and truth, had to be rejected.

St. Augustine's political and idealist views renewed many Platonic themes in Christian form. However, in the political theology of Augustine it was clear that the ideal, eternal realm of beauty and perfection belonged to heaven and could not be approximated in our worldly political arrangements. Augustine's political theory is based on the distinction between the earthly city and the city of God. In our worldly existence, the members of both cities live together, but only members of the latter are predestined for salvation and will enjoy eternal happiness in heaven. But the fact that perfection is not to be found in this world, with its inescapable evils, does not mean that we should be indifferent about competing political arrangements. Members of the city of God should cooperate with others to support political authority and tame earthly desires for power and glory to secure people's common interest.

Another idealist tradition that builds on Plato's connection between justice and perfection is utopianism. Named after Thomas More's fictional island Utopia, utopian renaissance authors such as More, and followers such as Campanella, imagined perfect, rationally planned societies in the spirit of Plato's republic in a concrete way. More's Utopia is an egalitarian society without poverty, where property is owned in common and inhabitants share a strong sense of duty. Inspired by journeys to civilizations previously unknown to Europeans, More's work gave birth to a new genre of social criticism, often taking the form of interviews with travelers to or inhabitants of distant societies different from our own. Idealism in this utopian sense is often used negatively to describe naïve worldviews with overly optimistic assumptions about the possibility to improve the world through moral ideals alone.

The later British and German idealist traditions in political theory, particularly strong in the nineteenth century, were idealist in a very different sense and more open to conservative conclusions. G. W. F. Hegel in Germany, and the branch of British idealism he inspired with thinkers such as Bosanquet, Bradley, and Green, shared a belief in the spiritual unity of our existence. The idea that there is one single, all-encompassing, and coherent world often led to the conclusion that seemingly inconsistent or pointless events may reflect a deeper form of rationality and purpose. Defending the interconnectedness of everything and the fundamentally social nature of humans, idealists in this context attacked the atomism of liberal contemporaries and placed the role of the state, community, and spirituality at the center of political thought.

Identity, Politics of

Identity for most people derives from personal history, family relationships and friendships, neighborhood, region, and country. Generally, the sense of self is validated by membership in a group or affiliation with something intangible such as a culture or religion. In this sense, *politics of identity* refers to political attitudes or positions that focus on the concerns of social groups identified mainly on the basis of gender, race, ethnicity, religion, or sexual orientation.

The scope of political movements that may be described as politics of identity ranges from the struggles within Western capitalist democracies to indigenous rights movements worldwide to nationalist projects and demands for self-determination. In general, the politics of identity has developed around the idea of empowering the oppressed to articulate their oppression in terms of their own experience.

In the twentieth century, organizing around a shared identity challenged the conventional organization of politics around beliefs or programs. Politics since then has become as much about identity as about self-interest or policy. Particularly during the second half of the twentieth century, large-scale political movements based on claims about the injustices done to particular social groups, such as feminism, minority civil rights, and gay and lesbian liberation, emerged. In this sense, identity has driven politics, if not always explicitly.

In a 2007 publication C. Heyes contends that feminist identity politics has underlined the task of articulating women's understanding of themselves and of men without reducing femininity to biology. According to feminists the experiences women share do not necessarily result from sexual differences but rather from social injustice. In this sense feminist politics of identity as a social and political movement has been based on the argument that although sex may be biological, gender is socially constructed. On the other hand, liberal–reformist gay and lesbian activists have struggled for the full acceptance of gays and lesbians in the institutions and culture of mainstream society.

S. Aronowitz notes that the politics of identity has been criticized by orthodox and revisionist Marxists and socialists. They have argued that groups based on shared identity, other than class, have diverted attention from more fundamental issues, such as class conflict in capitalist societies. However,

other scholars, including Wallace and MacClancy, have contended that—irrespective of the ideational debates and criticisms—in reality the politics of identity has become part of daily life and politics and become influential in many areas of people's political behavior from shopping to art and voting. Politics of identity is proved to be an important factor in voting behavior as experienced in 2008 presidential elections in the United States.

POLITICS OF IDENTITY AND THE NATION-STATE

National identity is privileged within the context of the so-called Westphalian state system. Therefore, national identity, as a mode of identification with a unique and distinct community, is given institutional recognition and sustained by nation-states as well as by the internationally established legal code that provides the criteria for the formal recognition of states.

In the Westphalian system national identity was structurally privileged. Globalization combined with other factors represents a great challenge to the Westphalian state system. Nationally defined territorial bounds reinforced by the insecurities of states placed obvious constraints on the ability of other modes of identification such as ethnic, religious, cultural, and gender identities to mobilize. Several recent developments have challenged this system. First, as cultures and societies are becoming interconnected, societies have become increasingly multicultural. Minorities who were incorporated into states have become more assertive, demanding compensation or autonomy. This has resulted in tensions within states and in demands for international measures for minority protection, as seen in indigenous peoples' demands for self-government—the way that Quebec ensures self-government for the Québécois—for example, Inuit demands for self-government in the north of Canada and Indian peoples' demands for self-government on reservations in the United States. Furthermore, immigration and asylum have increased the ethnic and cultural diversity of most states. In this context, the politics of identity manifests itself in claims for secession, autonomy, self-government, and federalism by national groups and in claims for ethnic rights for immigrants and refugees.

It is generally assumed that, politically, the nation-state remains the anchor of belonging since a shared language, culture, social and political institutions, and norms are derived from it. For a long time, national identity has appeared as a central issue for politics. Regarding collective identities like national identity, the politics of identity is considered a process of negotiation between interest groups. Being English, Irish, or Danish is a consequence of a political process, and it is that process, not the label, that symbolizes it. Thus, identity is an outcome of a labeling process that reflects a conflict of interests at the political level.

As noted, the politics of identity has resulted in national identities' competing with a wide range of claims for recognition from groups that include women, gays and lesbians, aboriginal peoples, immigrants, and ethnic groups. Contemporary patterns of politics of identity stimulate claims, and claimants pursue gender-based, ethnic, regional, and other modes of identification that compete with national identity.

These developments bring forth a heightened concern with identity and the recognition of uniqueness, equality, and equitable valuation. People from different ethnic and religious backgrounds seek recognition of both their unique and national identities. In the early twenty-first century, many of the concerns that excite public discourse are driven by questions of national identity and politics of identity.

In essence multiculturalism stands in contrast to assimilation, which imposes a single culture on minority groups. Some multicultural states such as Britain and Canada have praised the variety of cultural identities of their residents and wish them to be preserved rather than assimilated, despite the concern that the values of such states may be at odds with the values of those they claim to protect. In these cases, the strong emphasis on national identity has proved difficult to reconcile with the notion of multiculturalism, which claims equality for different cultures and identities.

Conflicts due to different ethnic and cultural identities lead to a sort of politics of identity, in which a marginalized community or its members are involved in the reaffirmation of identity. It is the struggle over definitions of, or claims to, politically and culturally sensitive categories of ethnic and religious identities. In the early twenty-first century, the concept of ethnic minorities is identified exclusively with nonwhite ethnic groups, who are mainly the product of immigration into Western societies during the past half century because of persecution or poverty and poor economic opportunities in their countries of origin. The reason ethnic minorities are significant for the politics of identity is not that they are different but the way they are treated by other ethnic groups, particularly by the white majority. Issues of identity and allegiance can be complicated for ethnic minorities, and many immigrants have continuing positive sentiments toward their countries of origin. The United States, which has had a relatively successful program of education to integrate immigrants into the American way of life, nonetheless contains Irish American, Spanish American, Polish American, and Jewish American communities. Similarly, there exist thriving Polish, Italian, and Ukrainian communities in Britain. Werbner points out that these dual identities show that allegiances are not mutually exclusive and that it is possible to be black or Asian and British or American.

Since the 1990s, religion as a marker of identity has been gaining prominence. Religion has played one of the central roles in the politics of identity. Particularly among Muslims, membership in the *ummah* (Muslim community) brings about the Islamic identity. Recent developments show how Islam or its militant adherents have waged jihad, or holy war, against those seen as enemies. Cases such as the attacks on the United States on September 11, 2001, and suicide attacks elsewhere, including Britain and India, have highlighted the role of religion in instances when believers see the issue of identity as a matter of life and death.

In the case of Muslim identity vis-à-vis the West, religion rather than ethnicity comes to the fore because the Muslim

aspect of the identity is perceived as being under attack. Furthermore, Islam appears as a more useful vehicle for political mobilization. Choudhury points out how this mobilization is also considered a reaction to discrimination and socioeconomic deprivation. The increasing self-identification of second and subsequent generations of immigrants in Western societies as Muslim rather than as certain ethnic labels has developed in reaction to their external rejection by the white majority. The public devaluation and disparagement of Muslims and Islam have led to increased in-group solidarity and identification on the basis of religion.

Diasporic identities have also played a significant role in the politics of identity and the challenge to national identities. A diaspora, a transnational network of dispersed subjects connected by ties of coresponsibilities across the boundaries of empires and political communities, is a deterritorialized, complexly spatialized imagined community. Diaspora communities and identities are viewed with suspicion and are the target of racial and nationalistic imaginings. Generally, they have been identified with ethnic or national identity categories such as Armenians, Greeks, Kurds, and Palestinians. However, the categorization of Muslims as a diaspora is a new phenomenon. For Muslims, instances of transnational mobilization, including the Rushdie Affair (1989), the two Gulf Wars (1991–1991 and 2003–), and the Danish cartoon crisis (2006) have been key moments in the development of a global Muslim consciousness. Such mobilizations have been part of the learning process of becoming a politically effective diaspora.

POLITICS OF IDENTITY AND IDENTITY FORMATION IN INTERNATIONAL RELATIONS

Since the end of the cold war in 1991, the interest in identity has increased considerably in international relations. The rise of constructivism as a challenge to mainstream international relations theories has promoted identity as a factor in shaping international politics. Identity is considered an asset of international actors that generates behavioral dispositions.

The concept of politics of identity in international relations shows differences from the general concept of the politics of identity, which generally refers to the empowering of oppressed identities. The politics of identity in international relations comes to the fore in the formation of collective, postnational identities as opposed to national identities.

Throughout history, nation-building has been marked by struggle, by people's actively seeking recognition for their particular culture, history, language, and identity. Nation-building has always been a struggle for recognition of a particular national identity to ensure that it is recognized by the world around it and by those who see themselves as part of it. Since the end of the cold war, the formation of collective identities at the international level has also become an issue. The question of identity in the European Union, with particular emphasis on the question of the emergence of a European identity, illustrates the issue of the politics of identity at the international level. In the European identity formation case,

tensions between the universalist drive for equal dignity and the particularist drive for difference and uniqueness are embedded at the international, European, and national levels. The politics of identity in the emergence of a European identity brings about reassertion of national identity, a transformation of national identities, and the emergence of a postnational identity. There are numerous examples of claims for recognition of unique identity within Europe. Much of the skepticism to the integration process voiced by, for instance, the Danish populace stems from the felt need to protect a unique Danish ethnic identity, Dutch national identity, and even a British one in Europe. However, there are indications of a major identitive transformation in Europe. National identities are becoming more inclusive, and there are signs of an emerging inclusive conception of European identity particularly among the members of the European Union. The latter is far more akin to a postnational than a national type of identity.

The development of postnational identities, the further strengthening of international civil society, and the nonnationally oriented drive of the politics of identity have contributed to a postnational type of politics of identity, especially with regard to the development of a democratic consciousness and the individual identity of citizens. This move toward a postnational politics of identity in international systems brings the challenge of understanding how identity formation takes place in the contemporary world. Debates remain regarding how much identity matters as opposed to material structures and how far the study of discourse as opposed to that of material factors allows better understanding of international relations.

Constructivists have argued that, theoretically, identities are constructed based on the dividing lines between individuals and others. It is argued that the dividing line is not geographical, like state borders, but cognitive. In this regard, politics of identity in international relations goes beyond the formation of national identities and includes the formation of collective and transnational identities as well. Constructivists view social facts as depending on the attachment of collective knowledge to physical reality by way of collective understanding and discourse, as in the case of the classification of self and other.

Based on the nineteenth- and early twentieth-century arguments of Georg Wilhelm Friedrich Hegel and Karl Marx that relate the question of identity formation to the conceptual pair of self/other, the collective identity formation and respective politics of identity are considered dialectical. Hegel's formulation of identity formation is both dialogical, reflected in the relative to changing culture and the other, and dialectical, the self's reaction to the other and the tension between the self and the other.

Marx incorporated Hegel's idea in his reformulation of Hegelian dialectics and focused more on the dialectical principle. His reformulation of Hegelian dialectic with identity formation has become the most popular version of identity formation. For Hegel and Marx, everything has self-identity, being-in-itself, but nothing is merely self-identical and self-contained except what is abstract, isolated, and static. All real and concrete things are part of the world of interaction,

motion, and change—that means things not merely are self-subsistent but exist essentially in relation to other things.

The logic of contradiction suggested by dialectical thinkers has been significant in terms of identity. Based on the dialectical nature of identity formation, Alexander Wendt introduced the concept of identity and collective identity formation in international relations theory in the late twentieth century. Wendt's model is based on the principle of interaction, which argues that the self/other relation evolves through interaction. This interaction between self and other and the existing international environment puts identity at the heart of the approach. According to Wendt, international politics is the process of states' taking identities in relation to others, casting them into corresponding counteridentities, and playing out the result. Using this model, Wendt built an interactionist model of the social processes, which focuses on how identities and interests are constructed as dependent variables at the unit (state) level and are winnowed at the macro (international) and population level. Within this context, identities and corresponding interests are learned in response to how they are treated by significant others. That means that international actors see themselves as a reflection of how they think others see or appraise them. For example, if the other treats the self as if it were a friend according to the principle of reflected appraisals, the self is able to internalize this belief in its own identity vis-à-vis the other, or vice versa. Based on the representations of self and other, a definition of situation is constructed by both self and other.

To show how identities are produced and reproduced in the social processes, Wendt has developed an evolutionary model of identity formation. Through repeated interaction, self and other identify themselves with each other negatively or positively. The debates occurring in the early twenty-first century on the future of international relations in Northeast Asia clearly illustrate how the politics of identity works in international relations. Memory, national identity, and history play important roles in Northeast Asia's new strategic alignments and emerging international tensions. The history of contemporary Northeast Asian international relations is closely linked to new notions of national identity and legitimacy as well as to the questions of power and cooperation. Rising nationalism in China is a symptom of a nation in need of a new identity in the wake of global communism's collapse. China's search for a postcommunist identity has coincided with the rise of neonationalism in Japan, which advocates returning to a pre-1945 world of statehood. On the other hand, in South Korea there exists a new generation of leaders seeking to heal the wounds of national division inflicted by the Korean War by reconciliation with North Korea. Jager notes that Asia's modern history has left a deep-rooted imprint on these societies' views of the world and each other. Thus, it is normal to assume that the politics of identity continues to play a significant role in shaping the future relations of states in Northeast Asia, where the perceptions of the past and the politics of identity have direct consequences for political action and international relations.

Ideologies, Political

Ideologies are systems of ideas that shape people's thoughts and actions with regard to many things, including nationality, race, the role and function of government, property and class divisions, the relations between men and women, human responsibility for the natural environment, and more. These systems of ideas have proven to be potent, and often lethal, political forces. As the historian Isaiah Berlin observed in his 1992 book *The Crooked Timber of Humanity,* "the great ideological storms" of the twentieth century "have altered the lives of virtually all mankind," producing not only revolutions but "totalitarian tyrannies of both right and left and . . . explosions of nationalism, racism, and, in places, of religious bigotry. . . . These great movements began with ideas in people's heads: ideas about what relations between men have been, are, might be, and should be; and . . . [these ideas were] transformed in the name of a vision of some supreme goal in the minds of the leaders, above all of the prophets with armies at their backs" (p. 1).

Not all ideologies have spawned totalitarian tyrannies—not conservatism, for example, nor the liberalism that Berlin

himself embraced. But there is no doubt that the "armed prophets" to whom he referred—Vladimir Illich Lenin, Joseph Stalin, Adolph Hitler, Benito Mussolini, Mao Zedong, Pol Pot, and many others—left the landscape of the twentieth century littered with millions of corpses. Nor is there any reason to think that the apparent demise of Fascism, Nazism, and Communism in the last century signaled the end of ideologies. On the contrary, the twenty-first century already bears the stamp of new and continuing ideologies: of militant nationalists bent on ethnic cleansing, of radical Islamists dedicated to suicide bombing and other forms of terrorism, and of white racists and black Afrocentrists, gay liberationists and "traditional-values" conservatives, feminists and antifeminists, and many others engaged in culture wars. Political ideologies are potent and persistent, in short, and well worth understanding. Such an understanding begins with the history of the concept.

THE HISTORY OF IDEOLOGY

The word *ideologie* was coined by Antoine Destutt de Tracy (1754–1836), who hoped to found a systematic study of the origins of ideas in the revolutionary decade of the 1790s. Like many other French philosophers of the eighteenth century, de Tracy drew on the ideas of John Locke's *Essay Concerning Human Understanding* (1690). Locke had argued that the mind is like a tabula rasa, or blank slate, in that people are born with no knowledge or ideas; everything we know and every idea we have is thus the result of sense experience. de Tracy took this claim about the nature of knowledge as the starting point for his own science of ideas, or ideologie.

As de Tracy conceived it, however, this science was to serve the revolutionary purpose of remaking society. If ideas are the result of experience, he reasoned, it must be possible to discover their sources and explain how people come to have the ideas that they have—including the false and misleading ideas that stand in the way of freedom and progress. Among these were religious ideas, which he regarded as mere superstitions. With the aid of the new science of ideologie, however, de Tracy thought it would be possible not only to remove these and other misleading ideas from people's minds but to replace them with ideas that would lead to a rational and happy society. From the beginning, then, the concept of ideology has been associated with the attempt to shape how people think to move them to act in certain ways.

Not surprisingly, the Catholic Church, the nobility, and powerful political elites viewed ideologie and the "ideologues," as de Tracy's followers were called, with alarm. With its emphasis on rationality and science, ideologie posed a threat to traditional authority in politics and society as in religion. In conservative circles, the word *ideologie* quickly acquired negative connotations as something false, seductive, and dangerous. But it was Napoleon Bonaparte (1769–1821) who quashed de Tracy's attempt to found a reforming science of ideas. Once a supporter of the ideologues, Napoleon changed positions in the early 1800s when, as self-proclaimed emperor of France, he needed the support of the church and the nobility. Denouncing ideologie as "sinister metaphysics," he declared the new science to be nothing but a mask to cover the subversive plans of his opponents and critics.

This sense of ideology as hiding or masking something is also evident in the way that Karl Marx (1818–1883) used the concept some forty years later. In Marx's hands, however, *ideology* referred to a set or system of ideas that served to justify and legitimize the rule of a dominant social class. As Marx and Friedrich Engels (1820–1895) argued in *The German Ideology,* the task of the revolutionary philosopher is to unmask and expose "the illusion of the epoch"—an illusion shared by rulers and ruled alike but working to the advantage of the rulers at the expense of those they ruled. Once the class or classes at the bottom of society begin to see that the ruling class has no legitimate claim to its dominant position—that is, once the oppressed people see through the ideology that supports their oppressors—then revolution becomes a real possibility.

Marx's conception of ideology was not politically neutral. It was, as he acknowledged, a "weapon" in the "class struggle." But Marx thought it was a particularly powerful weapon because it revealed that the prevailing ways of thinking about social relations throughout history were merely complex and subtle defenses of the power and privileges of the dominant classes. Yet his own theory, he maintained, was not biased or ideological in this way, but "scientific." The theory did promote the interests of the oppressed and exploited, but Marx held that the interests of the exploited class in his day, the proletariat, were the interests of all humanity. To expose "the illusion of the epoch" as mere ideology thus was to speak the truth in a way that opened the possibility of a classless society in which ideology and illusion will disappear.

For Marx, then, as for Napoleon, *ideology* was a pejorative term. But this negative connotation began to shift when Karl Mannheim (1893–1947) and others pointed out that Marx's use of ideology as a weapon against the dominant class could be turned against Marx's theory. For if Marx is right when he says that the ruling ideas of society serve to justify the dominance of the ruling class, is it not also likely that the ideas of other social classes arise out of their interests and aspirations? What people think—not just the ruling class but everyone—may depend on their social positions. In his *Ideology and Utopia* (1929), Mannheim called for a "sociology of knowledge" to trace the social origins of ideas and beliefs.

According to Mannheim, the sociology of knowledge requires us to distinguish between the "particular" and "total" conceptions of ideology. To accuse one's political opponents of being ideological, for example, is to employ the particular conception, as the use of *ideological* implies that their views are biased, distorted, and serve some hidden interest. *Total conception,* by contrast, refers to the characteristic ways of thinking of an entire class, society, or historical period, such as medieval society or modernity. Because these ways of thought are so broad and encompassing, Mannheim doubted that anyone could ever stand outside them, entirely free from the web of social and economic interests, and thus be in a position to unmask the ideological sources of all ideas and beliefs. In this way he raised the disturbing possibility that all our thinking about society

and social relations is ideological. Mannheim did believe that intellectuals may be able to achieve a synthesis of opposing perspectives that comes closer to the whole truth, but even then it would be the truth of a specific historical time and place.

By raising the possibility that all social thought is ideological, Mannheim implied that there is no purely scientific or objective understanding of social arrangements. In doing so, however, he stretched the idea of ideology to mean something like a system of beliefs about the social world, or a Weltanschauung (worldview). He may also have made it harder to determine just what an ideology is. Indeed, some twentieth-century social scientists concluded that the term is too vague and contested to be useful for scholarly analysis. One counted twenty-seven definitional elements of *ideology,* for example, and others urged that a less confusing and loaded term, such as *belief system,* should supplant *ideology.*

As its continuing use attests, *ideology* has proved too important and powerful a word to be abandoned or replaced. Yet it continues to be the source of disagreement. To many, *ideology* remains a pejorative term. In their view, ideologies are bad because they always simplify and distort matters. Worse yet, ideologues use emotion-rousing slogans and simplistic analyses to persuade people that their ideology has a monopoly on the truth. Anyone who disagrees must be an enemy of truth, justice, and progress—an enemy who must be either converted or defeated. As Daniel Bell says in his 1961 book *The End of Ideology* (pp. 399–400), "Ideology makes it unnecessary for people to confront individual issues on their individual merits. One simply turns to the ideological vending machine, and out comes the prepared formulae. And when these beliefs are suffused by apocalyptic fervor, ideas become weapons, and with dreadful results."

In contrast to this negative view, many people now use *ideology* in a neutral fashion. For example, it is not unusual to find a candidate for political office distinguishing his or her ideology from that of an opponent. In such cases, *ideology* means a more or less consistent set of ideas, beliefs, and convictions about how the social world does and should operate. The candidate is likely to claim that his or her ideology is right, good, or somehow superior to the opponent's, but this claim can be made only when people believe that an ideology is not necessarily a bad thing. If it were, it would be foolish to admit that one is acting on the basis of an ideology.

Despite their differences, the negative and the neutral conceptions of ideology have at least two points in common. First, both conceptions depart from de Tracy's original understanding of ideologie as the scientific study of ideas, and second, both join de Tracy in using *ideology* to refer to a set of ideas that tries to link thought to action. That is, in both conceptions ideologies attempt to shape how people think—and therefore how they act.

A PROVISIONAL DEFINITION OF *IDEOLOGY*

These points of agreement suggest a definition of *ideology* that provides a useful basis for identifying, comparing, and contrasting various ideologies. According to this definition, an ideology is a more or less coherent and comprehensive set of ideas that explains and evaluates social conditions, helps people understand their place in society, and provides a program for social and political action. In other words, an ideology performs four functions for people who hold it: the explanatory, evaluative, orientative, and programmatic functions.

Explanation. An ideology explains why social, political, and economic conditions are as they are, particularly in times of crisis. Why are there wars? Why do depressions occur? Why are some people rich and others poor? Why are relations between races so often strained and difficult? To these and many other questions each ideology supplies—or at least hints at—its own answers. A Marxist might explain wars as an outgrowth of capitalists' competition for foreign markets, for instance, while a Fascist is apt to explain them as tests of one nation's will against another's. Their explanations are sometimes quite different, as these examples indicate, but all ideologies offer a way of looking at complex events and conditions that tries to make sense of them. Moreover, those who are firmly committed to a particular ideology—ideologues—typically will offer simple or even simplistic explanations as they try to convert as many people as possible to their side.

Evaluation. The second function of ideologies is to supply standards for evaluating social conditions. Are all wars evils to be avoided, or are some morally justifiable? Are depressions a normal part of the business cycle or a symptom of a sick economic system? Are vast disparities of wealth desirable or undesirable? Are racial tensions inevitable or avoidable? Again, an ideology supplies its followers with the criteria required for answering these and similar questions. Those who adhere to one ideology may evaluate favorably something that the followers of a different one greatly dislike—communists look at class struggle as a necessary step on the way to communism, for example, while Fascists regard it as an outright evil. Whatever the position may be, however, all ideologies provide standards or cues that help people assess, judge, and appraise social policies and conditions.

Orientation. Ideologies also supply their adherents with an orientation and a sense of identity—of who the individual is, the group (race, nation, gender, class, and so on) to which he or she belongs, and how he or she is related to the rest of the world. Like a compass, ideologies help people to locate themselves in a complicated world. Communists stress the importance of social-economic classes, for example, with the working class being the victim of exploitation by its capitalist oppressors; Nazis think that racial identity is all important; and feminists maintain that one's gender is fundamental to personal and political identity in a world marked by sexual oppression and exploitation. Other ideologies lead their adherents to perceive their social situation or position in still other ways, but all perform the function of orientation.

Political program. Finally, an ideology performs a programmatic or prescriptive function by setting out a general program of social and political action. The Russian Marxist Vladimir Illich Lenin (1870–1924) made this point in the title of one of his revolutionary tracts, *What Is To Be Done?* As he saw it, part

of the answer is that the Communist Party must take the lead in seizing state power, overthrowing capitalism, and eventually creating a cooperative, communist society. Other ideologies, of course, advance very different programs: Nazis try to rouse the master race to take action against Jews and other supposedly inferior peoples, libertarians advocate policies that will reduce or eliminate government interference in the free market, and a social or religious conservative will call for the state or government to promote morality or traditional values.

In addition to providing a useful way to compare and contrast ideologies, this functional definition helps to clarify what an ideology is by eliminating possibilities that do not perform all four functions. Thus, it enables us to distinguish political ideologies from some of the other isms, such as terrorism, that are sometimes mistaken for ideologies. Terrorism may offer a program for social and political action, but it does not explain and evaluate conditions or provide people with an orientation. It is a strategy that some ideologues use to try to advance their causes, but terrorism is not itself an ideology.

The functional definition also helps to distinguish democracy from political ideologies. Unlike socialism, conservatism, and the other ideologies, democracy offers no explanation of why things are the way they are, and it is only in a loose sense that we can say that democracy performs the evaluative, orientative, or programmatic functions. Moreover, most political ideologies claim to be democratic—Fascism, Nazism, and radical Islamism are the notable exceptions—and they could hardly make this claim if democracy were an ideology itself. One can easily claim to be a conservative democrat, a liberal democrat, or a social(ist) democrat, for instance, but not so easily claim to be a socialist conservative, say, or a liberal Fascist.

HUMAN NATURE AND POLITICAL IDEOLOGIES

Ideologies also harbor, at least implicitly, some conception of human nature—of basic human drives, motivations, limitations, and possibilities. Some ideologies assume that it is the nature of human beings to compete with one another in hopes of acquiring the greatest possible share of scarce resources; others hold that people are naturally inclined to cooperate with and share what they have with others. So, for example, a classical liberal or contemporary libertarian is likely to believe that humans are naturally competitive and acquisitive. A socialist, however, will hold that competitiveness and acquisitiveness are unnatural vices nurtured by a deformed and deforming capitalist system that warps people whose true nature is to be cooperative and generous.

These and other conceptions of human nature are important to the understanding of political ideologies because they play a large part in determining how each ideology performs the four aforementioned functions. They are especially important because each ideology's view of human nature sets limits on what it considers to be politically possible. This connection is particularly evident in the stance ideologies take toward revolutionary change. The fact that most ideologies have played a revolutionary part in modern politics at one time or another, beginning with liberalism in the French Revolution (1789–1799)—if not sooner—suggests that most ideologies have a fairly optimistic view of what people are capable of accomplishing. After all, people will not undertake anything so radical and uncertain as a revolution unless they believe it possible to bring about a fundamental change for the better in society. Conversely, the connection between ideologies and conceptions of human nature also explains why conservatives tend to be suspicious of or downright hostile toward revolutions, for their estimate of human nature generally leads them to believe that sweeping improvements in society are either impossible or unlikely and certainly dangerous to attempt.

Core assumptions about human nature have led most ideologies, at one time or another, to call for revolution, for slow or rapid reform, for a rigid defense of the status quo, or even (in the case of reactionaries) for a return to the way things used to be. In any case, ideas—especially those systems of ideas called ideologies—clearly have consequences. These consequences, whether intended or not, are sometimes benign and sometimes dire.

Illich, Ivan

Ivan Illich (1926–2002) was a one-time Catholic priest, Austrian philosopher, and anarchist social critic of various forms of professional authority. His foremost critique of modern culture was that bureaucratic institutions tend to act counter to their original, rational purpose, thereby undermining people's confidence in themselves and their ability to solve their own problems.

Born in Vienna, Austria, on September 4, 1926, Illich attended religious school from 1931 to 1941. His father was a

Croatian Catholic, but his mother was a Sephardic Jew, which led to Illich's expulsion from school because of the country's anti-Semitic laws. He then attended the University of Florence in Italy and the Gregorian University in Rome. Eventually he obtained his doctorate in history at the University of Salzburg in Austria.

In 1951 Illich was appointed as an assistant parish priest in the Washington Heights neighborhood of New York City where he served an Irish and Puerto Rican congregation. He left this position in 1956 to take up the post of vice rector of the Catholic University of Ponce in Puerto Rico. A disagreement with the local bishop over the issue of birth control ended Illich's tenure at Ponce in 1960.

Illich accepted a professorship at New York's Fordham University in 1961 and later founded the Centre for Intercultural Documentation (CIDOC) in Cuernavaca, Mexico. Illich became disillusioned with the church and disassociated himself from it in 1968, leaving the priesthood a year later. Illich subsequently traveled extensively, dividing his time between the United States, Mexico, and Germany, where he taught and published as an academic. He died on December 2, 2002, in Bermen, Germany.

Illich's initial criticism of professional authority was directed at the Catholic Church, and specifically at Pope John XXII's call for North American missionaries to "modernize" the Latin American Church. Illich created CIDOC to act as a counterfoil to the Vatican's participation in the modern development of Latin America. At CIDOC missionaries were asked to recognize and appreciate the limitations of their own cultural experiences and were shown how modern economic development was really a war on subsistence. Confronting pressure from the Vatican and concerned about the possible side effects of its own institutionalization, Illich closed CIDOC in 1976.

Illich continued his criticism of professional authority in the fields of education, medicine, work, energy, and gender in the 1970s and early 1980s. He criticized the processes of institutionalization, reliance on experts, and commoditization of activities that he believed served to reinforce an authoritarian worldview of continually rising expectations that could never be realized. To "de-institutionalize" society, Illich called for "convivial alternatives" that were characterized by spontaneous, voluntary, and localized social relations in which advanced technology would support these fluid, informal arrangements. It is not clear how Illich envisioned the transition from established institutions such as schools or hospitals to convivial alternatives. Nonetheless, his critical and theoretical contributions still influence scholars today, especially in the field of pedagogical theory and practice.

Immigration, Effects on Intergroup Relations

Immigration affects not only the ethnic, racial, religious, and linguistic makeup of immigrant-receiving countries but also conceptions of national identity and relations between the multitudes of groups that constitute pluralistic societies. In particular, it affects relations between ethnic groups, or as Max Weber (1996) describes, "those human groups that entertain a subjective belief in their common descent because of similarities of physical type or of customs or both, or because of memories of colonization and migration" (p. 35). Under the best circumstances, immigration adds to and enriches the fabric of society and leads to harmonious relationships between ethnic groups. Under the worst, it causes profound socioeconomic and political change that leads to violent conflict.

For many Europeans, immigrating to the New World meant an escape from poverty, increased economic prospects and political freedoms, and the beginning of a new life infused with great opportunity. Conversely, from the vantage point of the native inhabitants, European immigration was commonly associated with conquest, domination, displacement, disease, genocide, and the destruction of traditional ways of life. For the estimated ten million Africans brought to the Americas between the sixteenth and nineteenth centuries, their forced migration experience was characterized by enslavement and extreme racial prejudice. These patterns of migration and settlement resulted in a hierarchical power structure based on race, with whites holding dominant social, economic, and political positions.

INTEGRATION AND ASSIMILATION

In the modern age of migration, immigration's effect on intergroup relations differs from country to country. In so-called countries of immigration, such as Canada and the United States, where immigration was part of the nation-building process, immigrants are absorbed into society relatively quickly. That is, in countries where the vast majority of the population is descended from immigrants, the inclination is to accept the notion, We are a country of immigrants, and therefore assimilate newcomers of any background—as long as they naturalize, learn the language, and respect the laws of the land. In the United States, for example, the children of immigrants born on American soil are, pursuant to the jus soli (birthright citizenship) principle codified in the Fourteenth Amendment, automatically citizens of the country. When immigrants and their children are quickly naturalized and granted concomitant rights and liberties, feelings of social marginalization and tension between ethnic groups are mitigated.

In European countries, some of which have evolved from countries of emigration to countries of immigration, the integration and assimilation of immigrants has often been slow

and fraught with intergroup conflict. This is because immigration in most European countries was not, at least in the popular imagination, an explicit part of the nation-building process. Despite growing ethnic heterogeneity, many European countries have struggled to incorporate immigrants and embrace multiculturalism. Germany officially maintained that it was not a country of immigration until 1998, at which time nearly 9 percent of the total population was classified as foreign, and only in 2000 implemented a conditional jus soli citizenship policy. Even so, many Germans still have difficulty accepting foreigners, especially non-European immigrants, as German, even if they are born in Germany, acquire citizenship, and speak perfect German.

ETHNIC CONFLICT AND NATIONALISM

Intergroup tensions are common in countries that have experienced high rates of immigration. Race riots have periodically erupted in the United Kingdom, for example, in the Notting Hill area of London in 1958 and in Oldham in 2001. France, which has long prided itself on its civic nationalism, as opposed to ethnic nationalism, has also experienced recurrent urban unrest and violence in its immigrant communities. French youths of African descent argue that there is little real intergroup *fraternité* or *égalité* in a country where the National Front, a party that espouses a "France for the French" ideology, is an enduring presence. In the Netherlands, the much-touted Dutch model of integration, which allowed immigrants to create their own space within a multicultural Dutch society, has come under scrutiny in recent years. Since the assassinations of the filmmaker Theo van Gogh and the politician Pim Fortuyn, both of whom were critical of Muslim immigration, some skeptics have denounced the Dutch model as a failure.

Ultimately, immigration's effect on intergroup relations is context specific and determined by multiple factors. Legal immigrants tend to be more accepted by host populations, enjoy more political rights and protection under the law, and be more readily integrated than illegal immigrants. Country of origin, socioeconomic class, race, language, conditions of exit from the sending country, and conditions of entry in the receiving country also play important roles in the ways immigrants are treated and how they relate to other societal groups. In the United States, for example, white immigrant doctors from the United Kingdom are treated differently than unskilled Mexican laborers; in Germany, an Austrian typically experiences a higher level of social acceptance than a Turk; and in Sweden, Norwegian immigrants tend to acculturate more quickly than Rwandan refugees.

Nativist discourse on immigration, whether in the United States, Germany, or Australia, expresses the real and imagined fears of the demos. Those who oppose immigration often do so because they perceive immigrants as an enemy other, who are seen as overcrowding the country, taking jobs, abusing social services, competing for scarce resources, lowering standards of living, usurping political power, committing crimes, lowering educational standards, introducing new languages and religions, changing the culture and national identity, and

so on. When ethnic groups feel that their power, wealth, or prestige is threatened, xenophobic anxieties can lead to support for nationalist parties, such as the Freedom Party in Austria, Flemish Bloc in Belgium, and Republikaner in Germany.

The poet Max Frisch once wrote of immigration to Switzerland, "Ein kleines Herrenvolk sieht sich in Gefahr: man hat Arbeitskräfte gerufen, und es kommen Menschen" (A small master race feels threatened: workers were invited, and human beings are coming). His point is that there are serious economic as well as ethical dimensions to immigration, namely, that workers are also human beings with needs and wants and who, given the opportunity, will create their own space in society, put down roots, raise families, form political organizations, participate in representative democracy, and become long-term residents and eventually citizens. If this process of integration and assimilation is to happen with as much ease and as little conflict as possible, then it should be encouraged by governments, striven for by immigrants, and facilitated by the diverse groups that must inevitably coexist in contemporary multicultural, pluralist societies.

Immigration, Politics of

The politics of immigration (entry) are distinct from, but closely related to, the politics of emigration (departure), remigration (return), and migration (movement) and can be defined broadly as the struggle for power related to the entry and permanent settlement of people in a nation-state. As such, a complex amalgamation of frequently divisive and

controversial politico-economic and sociocultural issues falls under the vast penumbra of immigration politics, ranging from border control, citizenship, national identity, and national security to labor, language, race, religion, and ethics.

LOW POLITICS

The politics of immigration exist, in one form or another, in many countries but are particularly prominent in so-called classic countries of immigration, such as Australia, Canada, and the United States, where immigration has played a central role in the nation-building process. Immigration in these countries is normally considered low politics, and with the exception of the humanitarian admittance of refugees and asylum seekers, policy is made mostly in terms of what is in the state's best interest. The general consensus among economists is that a solvent welfare state cannot have completely open borders, for it must be able to regulate who has access to its finite resources. Conversely, most countries also cannot live with completely closed borders, for capitalist societies invariably need both cheap and skilled labor. Policy makers thus focus on effectively regulating legal entry so as to meet the demand for workers and mitigate illegal immigration.

Once migrants enter, whether legally or illegally, it is difficult for governments to force them to leave. Large-scale forced deportation is neither practically feasible nor ethically in accordance with twenty-first-century human rights norms. Moreover, remigration may not ultimately be desired as national economies quickly become dependent on low-skilled foreign workers to do the dirty, dangerous, and difficult jobs natives are unable or unwilling to do and on high-skilled workers to fill important niches in the labor market. In industrialized countries such as Japan and Italy, where fertility rates are below replacement levels and populations are rapidly shrinking and aging, there is also a dire need for immigrants to offset growing demographic deficits, pay taxes, and finance the social security of retirees.

GUEST WORKERS TO RESIDENTS TO CITIZENS

The historical record indicates that temporary migrant laborers, or guest workers, commonly turn into permanent residents. The longer foreigners stay in a country, the harder it is for governments to deport them, and the more likely it is they will put down roots, invite family members to join them, and embed themselves inextricably into the fabric of society, thereby completing the transition from migrant to immigrant. However, problems ensue if large numbers of legal and illegal (i.e., undocumented) immigrants either cannot or will not adapt to the social, cultural, and political norms of their new country. When foreigners and their offspring become marginalized second-class members of society, a prospective threat arises to the social cohesion and collective well-being of the nation-state. Government policies thus encourage immigrant integration and assimilation, and knowledge of a country's language, history, and laws are normally required to acquire citizenship.

Naturalizing large numbers of foreigners has significant potential long-term consequences as electoral outcomes and the distribution of political power can change as a result. Some political parties cater to immigrant groups, calculating that when immigrants do eventually vote they will remember which party championed their cause. Left-of-center parties like the Democrats in the United States, Labour in Great Britain, and Social Democrats in Germany tend to court working-class immigrants. By contrast, their conservative Republican, Tory, and Christian Democratic counterparts, respectively, are more inclined to preserve traditional ways of life and conceptions of national identity and therefore favor restrictions on immigration. This pattern does not always hold, however, as immigration politics cuts across ideological lines. In the United States, for example, the probusiness wing of the Republican Party advocates both free markets and a flexible approach to immigration to meet labor needs. Libertarian and green parties are usually tolerant of immigrants and relatively open to immigration, while extreme nationalist parties tend to be explicitly xenophobic.

NATIONAL AND GROUP IDENTITY

Immigration shapes the ethnic, racial, religious, and linguistic characteristics of the nation-state and ultimately affects conceptions of national identity. If immigration levels are high enough, native populations often feel inundated and threatened and, especially in times of economic recession, lend electoral support to nativist candidates and parties. Pat Buchanan in the United States, Jean-Marie Le Pen in France, Jörg Haider in Austria, the late Enoch Powell in Britain, and Pim Fortuyn in the Netherlands are examples of politicians who have campaigned on anti-immigration platforms. In rare cases in which mass immigration leads to an increase in electoral support for neo-Fascist parties, political order and even democracy itself are threatened.

So-called émigré politics are manifested in many ways. Some immigrants mobilize around issues of particular concern to their respective ethnic groups. Others bring the political tensions of their homelands with them and embrace the opportunity to engage in radical politics once they arrive in liberal democracies, where the freedoms of speech and press can be used to achieve political goals in their countries of origin. Kurds in Switzerland, for example, lobby for the creation of an independent Kurdistan in the Middle East; Copts in Australia advocate for the rights of their coethnics in Egypt; and Cubans in the United States agitate for the overthrow of Fidel Castro and regime change in Cuba.

Since the September 11, 2001, terrorist attacks in the United States and subsequent bombings in Spain and Britain, immigration is increasingly seen as a high politics issue of national security. This development has brought immigration politics into a new realm in which receiving countries feel compelled to put greater emphasis on border security and more closely monitor political and religious extremism among immigrants. Ultimately, immigration raises many questions about civic and ethnic nationalism, ethical obligations to refugees and political asylum seekers, the nature of multiethnic societies, membership in the state, minority and noncitizen rights, societal change, state sovereignty, and the limits of representative government.

The political challenge in the twenty-first-century age of globalization will be to minimize the costs while maximizing the benefits associated with immigration.

Immigration Policy

Immigration policy refers to the laws adopted and implemented by nation-states to regulate the entry and permanent settlement of foreigners. Immigration policies encompass ways to control borders, integrate immigrants into society, and meet the labor needs of national economies. There is, however, significant variation in the theoretical and practical application of immigration policies around the world.

The immigration policies of individual countries are shaped by such things as political history, geographic location, party politics, and governmental institutions as well as by powerful, ever-changing, global economic push-and-pull forces that are beyond their control. Few countries have completely open or closed immigration policies, but some are more restrictive than others. In Argentina, Australia, Canada, and the United States, for example, immigration played an important role in the nation-building process, and immigration policies in those countries reflect this history. By contrast, France, Germany, and the United Kingdom have only more recently, and reluctantly, received large-scale immigration. Migration scholars make a further distinction between economically developed countries, which regularly attract large numbers of immigrants, and less economically developed countries, which commonly experience more emigration than immigration.

More than half of the world's estimated two hundred million immigrants—that is, people residing permanently outside their countries of origin—live in Europe and North America. In countries such as the United States (a traditional country of immigration) and Germany (a reluctant country of immigration), where the foreign born constitute more than 12 percent of the total population, immigration is a particularly salient political issue. The fundamental areas of policy concern include immigrant integration, border control, refugees, family unification, and migrant labor.

MIGRANT LABORERS, FAMILIES, AND REFUGEES

Capitalist societies invariably need skilled as well as unskilled workers and, as a result, craft their immigration policies to meet the labor needs of their national economies. Highly educated immigrants with special training and talents, such as medical doctors and engineers, are usually seen as having a net positive impact on the economy. Accordingly, there is considerable global competition to attract the best and brightest immigrants. South African doctors and nurses who immigrate to Canada, for instance, are given preference in Canada's points-based immigration system, and their permanent settlement is encouraged. At the same time, many wealthy countries need unskilled workers to fill low-wage jobs, such as harvesting agricultural produce, which native-born citizens are either unwilling or unable to do. These migrants are frequently recruited through guest worker programs (such as the bracero program that brought Mexican workers to the United States from 1942 to 1964), hired on a temporary basis, and expected to return eventually to their countries of origin.

The historical record indicates, however, that temporary migrants often choose to stay in their host countries rather than return home. Many Turks and Yugoslavians remained in Germany, for example, when its guest worker program ended in 1973. When migrants remain legally, they are classified as lawful permanent residents and may, after a set number of years (normally five in the United States and eight in Germany), acquire citizenship. Immigration policies in many liberal democracies allow the immediate relatives—spouses, children, and parents—of legal immigrants to join them through family unification provisions. In some cases, more distant relatives—adult children and siblings—may immigrate as well. Family unification perennially accounts for almost half of all immigration to France and two-thirds of those gaining lawful residence in the United States.

The admittance of refugees and asylum seekers constitutes a significant, yet relatively small, part of many immigration policies. At least 141 countries have signed the 1951 Geneva Convention Relating to the Status of Refugees and its 1967 protocol, which define a refugee as anyone who is unwilling or unable to return to his or her country of origin because of persecution or a "well-founded fear of being persecuted for reasons of race, religion, nationality, membership of a particular social group or political opinion." Despite the commendable work of the Office of the United Nations High

Commissioner for Refugees, relatively few of the millions of people fleeing wars, persecution, and famine will ever gain refugee status in Europe or North America. In 2007, for instance, the United States admitted 1,608 Iraqi refugees out of an estimated two million living outside Iraq. In global comparative perspective, humanitarian concern for refugees falls largely outside the perceived national interest of the world's most powerful countries.

BORDER CONTROL AND IMMIGRANT INTEGRATION

Border control, law enforcement, and the expulsion of undocumented immigrants are persistently elusive policy goals. Potential immigrants may be denied entry if it is thought they will be a drain on public coffers, a risk to public health, or a threat to national security. However, many people enter legally as tourists, students, or guest workers and then remain illegally after their visas expire. Illegal immigration, whether from Mexico to the United States, from Morocco to Spain, or from Zimbabwe to South Africa, poses enormous challenges to policy makers. The 2,000-mile (3,219-kilometer) border between the United States and Mexico is so vast, and the economic push forces in Africa and pull forces in Europe are so strong, that there is little that even the most sensible, efficient, or draconian public policies can do to stem the tide of human migration.

Once illegal immigrants reside in a country it is difficult for governments to apprehend and remove them. Any serious attempt to deport the estimated twelve million undocumented immigrants living in the United States would likely be expensive, disruptive to the economy, and psychologically traumatic to those involved. Similarly, forcibly returning the estimated three million Zimbabweans living in South Africa would be unfeasible as well as contrary to twenty-first-century human rights norms. The practical, politico-economic, and ethical complexities of such scenarios explain why governments tolerate illegal immigrants year after year and why reforms are made to many restrictive immigration laws. Common solutions include providing a path to legalization and government-sponsored programs to help immigrants integrate into society.

Regulations determining who may enter, for what reasons, and how long they may stay not only vary from country to country and region to region, but also change and evolve over time. The fact that globalization allows ever more people to migrate at a time when it is increasingly difficult to control porous territorial borders suggests that immigration policies are likely to remain the focus of considerable attention for some time to come.

Immobolisme

Immobolisme (immobilism) refers to a period of political instability and inaction in France from the late 1800s through the mid-1950s. During the Third and Fourth Republics the French government was characterized by a weak executive and a strong legislature. Within the National Assembly, the number of political parties precluded majoritarian governments, and instead, the country was governed by a series of fragile coalition governments. These cabinets frequently disintegrated over policy or personality issues and often lasted less than a year. Between 1947 and 1958, the office of prime minister changed twenty-one times. This instability prevented the formulation and implementation of long-term planning and policy implementation, leading governments to be characterized as immobile or static. Immobolisme was especially damaging to France because of the dramatic socioeconomic changes that occurred and the high level of external security threats faced by the country, including the initial period of decolonization. There was a rise in the power of the bureaucracy, which itself began to develop and adopt policies in the absence of formal direction from the executive or the legislature. Although particularly associated with France, the tenets of immobolisme may also be applied to other countries with a history of short-lived governments, including Italy.

Impeachment

Impeachment, often confused with actual removal from office, is the required first step in removing an elected official from office. Impeachment is not the same as removal. Presidents Andrew Johnson and Bill Clinton were both impeached by the House of Representatives, but the trial conducted in the Senate failed to garner enough votes, in either case, to warrant their removal.

The Founders, fearing a tyrannical leader, seriously deliberated how to remove judges or presidents who abused their powers. The Constitution states, "The president, vice president and all civil officers of the United States, shall be removed from office on impeachment for, and conviction of, treason, bribery, or other high crimes and misdemeanors." The infrequency with which impeachment has occurred attests to its significance; clearly, only the most extreme situations warrant impeachment. Throughout the nation's history, only two presidents have been impeached, and only one other had impeachment hearings begin. However, the judiciary has been exposed to quite a few more impeachments, and since 1936 the U.S. House of Representatives witnessed six impeachment investigations, while trials have occurred only twice in the U.S. Senate in the nation's history. The infrequency of its occurrence can also be attributed to the ambiguity that surrounds the process.

The Constitution fails to clarify what constitutes an impeachable offense. It makes clear that treason and bribery are impeachable offenses, but what about "other high crimes and misdemeanors"? What constitutes these offenses? This is a question that still plagues constitutional scholars. Article I, Section 2 of the Constitution provides the House of Representatives with the sole authority over impeachment. It also provides the House with the ability to determine the rules of the proceedings. The official process begins once a complaint of official misconduct is given to the House. Any representative, the president, a grand jury, or a state legislature can make a request for impeachment. Once a complaint is received, there are two alternate routes by which proceedings may be initiated in the House. First, the Judicial Conference can forward the request for impeachment to the House and by doing so recommend impeachment. Second, the passage of the Independent Counsel Act provides the special prosecutor with the discretion to forward a request of consideration for impeachment to the House. Once received by the House, all impeachment requests are forwarded to the Judiciary Committee. Any resolutions seeking an impeachment investigation are then referred to the Rules Committee. After the investigation into the impeachment terminates, a vote is set for the articles of impeachment.

If the impeachment passes, the House determines which representatives will serve as House managers in presenting the articles of impeachment to the Senate. They are usually chosen in an election by a majority of the House, by resolution, or by resolution in which the Speaker of the House nominates the representatives. However, the House Judiciary Committee, with the advice of the House leadership, has also recommended House managers, who directly participate in the prosecution of the official being impeached. The Constitution vests authority of the trial with the Senate. Article I, Section 3 states, "The Senate shall have the sole power to try all impeachments. When the President of the United States is tried, the Chief Justice shall preside; and no person shall be convicted without the concurrence of two thirds of the members present." The only punishment the Senate is authorized to render is removal from office. The Constitution states, "Judgment in cases of impeachment shall not extend further than removal from office, and disqualification to hold and enjoy any office of honor, trust or profit under the United States: but the party convicted shall nevertheless be liable and subject to indictment, trial, judgment and punishment according to the law."

In the past seventy years, the United States has witnessed far fewer impeachment hearings, let alone trials, than at any other time in the nation's history. This may be the result of better-qualified officials' holding office, greater media scrutiny's keeping officials honest, the ease in executing disciplinary measures other than impeachment, and the lack of time the House has to get involved in such time-consuming matters.

Imperialism

In a strict sense, imperialism is the process of creating an empire. An empire is a complex political unit comprising diverse social units, each with distinct cultural identities, hierarchically organized under the domination of one of its parts. An empire is thus distinct from a national state, which is relatively homogeneous in its sociocultural features, and a multinational state based on a free federation of its component parts.

Historically, empires generally developed from the expansion of a relatively compact and homogeneous core state extending the territorial range of its domination. Imperial expansion in its early forms was thus largely geographically contiguous, involving a process of progressive movement outward from an original core territory. Various forms of imperial political administration were established, but all involved a substantial devolution of political authority to local officials or agents, creating a recurring problem of fragmentation as local actors chose to prioritize their own interests over those of the imperial center. This produced a typical cycle of imperial

expansion followed by a phase of decay induced by overexpansion and the emergence of dissident forces in the periphery that threatened imperial power.

Nevertheless, imperial development often took place on top of a parallel process of cultural enlargement of the center that contributed to historical nation-building. Thus, the Roman city-state left a legacy that contributed to the formation of the Italian nation long after its imperial dominion had disintegrated, and the Chinese and Russian empires both contributed to the formation of modern national identities and nation-states.

IMPERIALISM AND THE MODERN WORLD

The emergence of economies and societies with a strong commercial orientation coupled with modern technologies of warfare and transport in western Europe led to a new form of imperialism from the sixteenth century onward, as European powers, starting with the Spanish and Portuguese, sought to establish imperial dominion over geographically distant overseas territories. Their motivations were different from those of ancient imperialism in that they were concerned less

with the construction of enlarged imperial states than with the strengthening of the political–military apparatus of the core states in the European arena.

A combination of ambitions and tensions in the home states fuelled a subsequent development of settler colonies, and in the course of the seventeenth and eighteenth centuries European powers developed colonial plantation economies in South America and the Caribbean, worked by slaves imported from Africa, to grow products for the European market.

These processes gave rise to an internationalization of the European economies and contributed significantly to the transformation of European societies into partially or fully capitalist formations, in which commercial interests and social groups predominated. Overseas expansion now became intimately tied up with the desire to secure both overseas markets and sources of raw material for the expanding capitalist industries of Europe, and the central imperial role shifted to the pioneer of capitalist industrialization, Britain.

British imperialism experienced a major political shock in the 1770s with the secession of the United States, an event that was reminiscent of the revolt of the periphery of ancient imperialism. However, the imperial system was preserved through a combination of more sensitive management of relations with colonial peripheral communities (exemplified by the eventual granting of self-government to settlers) and a more intense focus on the extension of imperial interests through trade and economic ties rather than territorial expansion. The latter has been aptly referred to as the "imperialism of free trade."

IMPERIALISM AND COLONIAL RULE

However, it was never possible to separate economics from politics, as the British experience in India demonstrated. From the seventeenth century onward, the East India Company—an ostensibly commercial structure intended to advance British economic interests while avoiding the responsibilities of formal colonization—was compelled to become more and more involved in the power dynamics of the subcontinent, leading to company rule of the subcontinent. This eventually produced a major reaction by indigenous political forces in 1857, referred to by the British as "the Indian Mutiny" and by Indian historians as "the first war of national liberation." This forced the British state to take direct responsibility for the administration of India and integrate it into the British empire.

Later in the century a combination of factors—rivalry between European states, competition for access to markets, the pressure of special interest groups, and the desire for symbols of imperial glory—led to an intense wave of colonial acquisitions in Africa and Asia. By the beginning of the twentieth century, the bulk of the African continent had been absorbed into one or another European empire, and over 50 percent of the territory of Asia was under European colonial rule.

The colonial experience was a mixed one for the colonized. The colonialism of weaker powers, such as Belgium and Portugal, tended toward the brutal and rapacious. British colonialism, with its long experience and sophisticated methods of indirect rule through local elites, checked to some degree by

democratic public opinion at home, was less harsh and more developmental. Colonialism provided a framework for transfers that could benefit the recipient societies: modern technologies, capital, education, public health, and Western-originated values of nationhood and democracy. But colonial administrations also imposed fiscal burdens on local populations and retarded local economic development when it threatened to conflict with the needs of the metropolis. The balance sheet of colonialism is complex, but at the end of the day it must incorporate the fact that colonial development was undertaken in a way that served the interests of the colonial masters and not local societies. Moreover, the liberal Western cultural values that were transferred with colonization contained within them a powerful critique of the ethos of colonial dependency.

These processes fused with the impact of two global wars, in which colonial resources were mobilized to strengthen the military needs of the European colonial powers. In the aftermath of World War I (1914–1918), indigenous resistance to colonialism began to assume a new form, centered on a nascent anticolonial nationalism. World War II (1939–1945) intensified this process still further, and in its wake modern forms of anticolonial nationalism erupted throughout the colonial world.

This ushered in a long, and often highly conflictual, process of decolonization, especially bitter where nationalist forces had to deal not only with colonial administrations but also with privileged white settler groups, as in Algeria, Kenya, and Rhodesia. The independence of India and Pakistan in 1947 marked the commencement of this process, which unfolded throughout the 1950s and 1960s.

IMPERIALISM AND NEOCOLONIALISM

The ending of colonialism, however, did not end the dependent condition of many former colonies. The term *neocolonialism* was coined to characterize the continuing dependence of former colonial societies on Western capitalist states, either their former colonial masters or the new dominant force in the world order, the United States.

Several features of these postcolonial states served to perpetuate their subordinate status within the international system. Their economies continued to rely on foreign investment centered on agricultural monocultures and natural resource extraction; they remained subject to trade regimes and international economic agencies controlled by the developed countries, such as the International Monetary Fund and the World Bank; and their states were often weak and deeply penetrated as a result of the dependence of local elites on ties with political, military, and business interests in the developed countries (often the former imperial power). Even those countries that at a later stage emerged as newly industrializing economies often did so on the back of heavy indebtedness to international financial institutions.

Neocolonialism conceived in this way could be extended to include countries that had never been formally colonized, such as the Central and South American states that were highly dependent on the United States, and it seems conceptually logical to extend the term *imperialism* to include this form of informal domination, whose economic, political, military, and cultural dimensions continue to penetrate many parts of the third world just as deeply as European colonialism did in its era.

THE THEORY OF IMPERIALISM: MARXISM

The contemporary usage of the term *imperialism* is strongly influenced by the role it assumed in Marxist discourse—both Marxist theory and Marxist polemic in the era of the cold war. Marxism has provided the most developed and influential theorization of the phenomenon of imperialism, although the term assumes a more specific meaning within Marxist discourse.

Marx himself dealt with imperialism in a relatively limited way; however, several elements of his work provided a basis for the later development of the Marxist theory of imperialism: the observation that capitalism developed in close association with the world market, his notion of capitalism as a distinct mode of production, his view that capitalism was a system driven toward continual expansion in its search for profit, his idea that the dynamics of the capitalist system led to the progressive concentration of capital in large enterprises, and his concept of the state as a social instrument that serves the interests of the ruling class.

Subsequent Marxist thinkers—in particular Rudolf Hilferding, Rosa Luxemburg, Nikolai Bukharin, and Vladimir I. Lenin—developed a theory of imperialism that saw capitalism progressively extending the world market and displacing precapitalist forms of production in favor of capitalist ones. The increasing domination of national capitalist economies by large firms intertwined with banks (finance capital), the heightened competition between national capitalist interests, and the influence of capitalist forces over state policy were seen as the root causes of the late-nineteenth-century colonial scramble and the international tensions that culminated in World War I.

LENIN AND FINANCE CAPITAL

The most influential analysis was that developed by Lenin in *Imperialism: The Highest Stage of Capitalism,* written in 1916. This work was not so much a theoretical exposition as a political polemic seeking to characterize World War I as a conflict between rival imperialisms, although it later acquired iconic status as a summary of the Marxist theory of imperialism.

Lenin argued that the dominance of finance capital in the leading capitalist economies resulted in an overaccumulation of capital that could not be absorbed in the national economy. Capitalist groups sought to protect their home markets, leading to international economic conflict, but they were also driven to seek new outlets for investment through the export of capital, especially to less-developed regions. However, overseas investments required political security, which could be effectively provided only by extending the territorial authority of the national state through colonial acquisitions.

These interrelated processes constituted a new stage of capitalism in which the export of goods increasingly took

second place to the export of capital. It produced intensified competition between national blocs of capital that moved from the economic to the international political plane. One manifestation of this was the scramble for colonial possessions; another—crucial for Lenin's political argument—was the outbreak of World War I, which he viewed as a conflict driven by rival imperialist ambitions.

Particular elements of Lenin's analysis have been subject to telling criticism, in particular the implication that nineteenth-century colonial expansion was driven by the export of capital, when in fact more capital flowed into countries not subject to colonial rule (either developed countries or those in Latin America) and finance capital was least developed in the most important colonial power, Britain. However, the general sweep of his argument—the identification of a distinct, highly internationalized phase of capitalism based on the export of capital—appears quite prescient. His unidimensional reduction of international relations to interimperialist competition looks oversimplified, failing to give sufficient weight to an autonomous dynamic of state power seeking, but he appears to be right in calling attention to the importance of economic objectives in foreign policy and to the close connection between state power and control of economic resources.

Later Marxist writers have largely followed Lenin's model of imperialism and his linkage between economic objectives and interstate conflict. However, with the establishment of new noncapitalist societies, first in the Soviet Union and then in eastern Europe and China, it was argued that interimperialist rivalry was overshadowed by the conflict between the two opposed social systems and that the imperialist countries became united under the leadership of their most powerful member—the United States—in efforts to prevent the socialist model from spreading to other countries. Later Marxist writings therefore shifted their attention to the structure of the postwar international system and to the relationship between the leading capitalist countries and that section of the world that was seen as being subject to the most intense exploitation: the third world.

THE THEORY OF IMPERIALISM: HOBSON AND SCHUMPETER

The influence of non-Marxist interpreters of imperialism has not been as durable but was of considerable significance in their time. The most important was the liberal economist J. A. Hobson, who produced the pioneering work *Imperialism: A Study* in 1902, used extensively by Lenin. Hobson also located the "tap root" of imperialism in the concentration of capital and an increased volume of capital-demanding outlets for profitable investment, and he saw aggressive international behavior by capitalist states as the political counterpart to this economic drive. He did not assign as great an importance as Lenin to capital exports, seeing the search for foreign export markets as of parallel importance, and did not see imperialism as a distinct structural form of capitalism. For Hobson, imperialism was a particular form of policy, advanced by particular business interest groups. The insufficiency of the home

market was a consequence of monopoly regulation of prices and wages, which squeezed consumer incomes; an alternative to imperialism therefore existed in social reform—policies designed to enhance workers' wages and strengthen domestic demand.

Another non-Marxist approach to imperialism was developed by the economist Joseph Schumpeter. In an article published in 1918 ("The Sociology of Imperialism"), Schumpeter argued that imperialism—which he defined rather restrictively as "the object-less disposition of a state to expansion by force"—was not a product of capitalist development but of the continued influence of precapitalist aristocratic and military elites in modern societies, due to the tendency of some capitalist groups to forge alliances with such social strata. For Schumpeter, imperialist policies would eventually disappear as capitalism became more firmly established and capitalist classes acquired the self-confidence to abandon such social alliances. In this argument, Schumpeter can be seen as a forerunner of the idea of democratic peace, which has acquired influence in contemporary international relations theory.

IMPERIALISM, EMPIRE, AND THE CONTEMPORARY INTERNATIONAL SYSTEM

One important issue for analysts of imperialism in the post–World War II era is the extent to which the term can be applied to the United States, which emerged as the dominant capitalist power economically, militarily, and politically. The United States was never a major colonial power; indeed its self-image is that of an anticolonial force, based on its own history of rebellion against British rule, its espousal of an open-door policy toward China from the late nineteenth century onward, and its support for the independence of colonial states in the postwar period.

However, it can be argued that such policies are the way a late-developing but economically dynamic state in competition with European colonial powers could best facilitate its access to overseas markets. Furthermore, the United States developed a systematic pattern of informal influence in other countries, beginning with its own periphery in Latin America and taking on global dimensions in the postwar world. This led radical critics of American foreign policy during the cold war, such as William Appleman Williams, to talk about an "American empire" in their analysis of postwar American foreign policy.

More recently, in the wake of the collapse of the Soviet Union in the early 1990s, a more far-ranging account has developed that seeks to conceptualize the whole contemporary world order as constructed around an American empire. With the United States's being the dominant power in a unipolar international system and the later formulation of an aggressive foreign policy under the George W. Bush presidency, this concept found favor among both critics and supporters of U.S. global military action.

A major debate among international relations analysts has ensued as to whether the U.S. position in the post-1989

international system is more accurately captured by the concept of empire or by alternative concepts such as hegemony, which suggest a more distinctive and fluid pattern of relations. The use of *empire* in this context has a rather metaphorical character and is based less on the structure of the U.S.-dominated international system than on a characterization of one style of U.S. foreign policy as imperial—that is, relying on the unilateral global projection of U.S. power, especially military power.

Parallel to this discussion is a debate as to whether the global role of the United States is subject to the cycle of expansion and collapse typical of historical empires—imperial overstretch. While this is a complex and multidimensional issue, the experience of intervention in Iraq and Afghanistan would seem to suggest that U.S. global strategic power is subject to more severe limitations than many policy makers and analysts envisaged.

Contemporary social scientists working within the Marxist tradition draw systematically on the concept of imperialism to analyze the contemporary international system. Several issues concern them with respect to contemporary developments: in particular, the extent to which the widely recognized phenomenon of globalization represents a further phase of capitalism, with different implications from those of the classical Leninist model. Some analysts suggest that capital has become genuinely globalized (i.e., has transcended particular national identities and links to specific national states) and that there is now a major transnational component of the capitalist class that underpins efforts to forge a corresponding transnational state apparatus to manage the international system. Others suggest that capital, regardless of the increased complexity of economic composition, remains wedded to the national state and its relations are inherently conflictual, thus preserving the broad validity of the classical model.

In studying the phenomenon of imperialism, it is important to be clear what the object of analysis is. The term has been used to refer to the structure of the world economy and to the structure of global political and military relations. While these may be interrelated, they may also each be subject to different dynamics and causal processes. It may therefore be fruitful to distinguish the economic and political dimensions of imperialism and to recognize that each has, at least, a partial autonomy from the other. An understanding of the distinctive dynamics of each of these dimensions may be a necessary prerequisite to a full appreciation of the functioning of the system as a whole.

Impossibility Theorem

Society has a constant need to aggregate preferences. On a personal level, when making decisions, an individual has to make a rational choice based on several criteria. Taking a presidential election as an example, when deciding which candidate to vote for, the constituent has to take into consideration the candidate's previous history, political party, and program, among other factors. On a group level, voting systems are built with the purpose of extracting the decision from different voters' preferences. In this case, legislatures are the most common example. Legislatures have their own voting rules that are used to translate individual preferences into a group preference.

CONDITIONS OF THE IMPOSSIBILITY THEOREM

The impossibility theorem states that it is impossible to create a voting system that will guarantee a constant set of preferences for a group corresponding to the preferences of the individuals making up that group and offer more than two reasonable choices to the individual. Kenneth Arrow proposes in *Social Choice and Individual Values* (1951) that no system could be both rational and egalitarian, and that even in a simple voting system the paradox of voting will arise. The theorem demonstrates that no voting system based on ranked preferences can possibly meet a certain set of reasonable criteria when there are three or more options from which to choose. The criteria or conditions that Arrow mentions include the following:

Rationality assumption. Social (or group) preferences should be (1) "complete" in that given a choice between alternatives

A and B, individuals from this group should say whether A is preferred to B or B is preferred to A or that there is a social indifference between A and B and (2) "transitive"; that is, individuals have to be coherent about their preferences—if A is preferred to B and B is preferred to C, then A is also preferred to C.

Universal admissibility assumption. Each individual of a group may adopt any strong or weak complete and transitive preference ordering over the alternatives of a given set of alternatives.

Pareto optimality or unanimity condition. If every individual in the group prefers A to B, then socially A should be preferred to B; in other words, the group preference must reflect that A is preferred to B.

Independence from irrelevant alternatives assumption. If members of the group have their own preferences about alternatives A and B, and these preferences do not change, neither should change the group preference about alternatives A and B. This is true even if individual preferences over other (irrelevant) alternatives in the set of alternatives change. Also, social preferences should be independent of irrelevant alternatives; that is, the social preference of A compared with B should be independent of preferences for other alternatives.

Nondictatorship condition. Social or group preferences should not depend only on or be dictated by the preferences of one individual (i.e., the dictator).

For Arrow, any scheme for producing a group choice that satisfies the first four assumptions described above is either dictatorial or incoherent. In other words, there is a person who drives the group decision, or one—or more—of the group members has intransitive preferences. Shepsle and Bonchek (1997) state that Arrow's impossibility theorem implies a great trade-off: there is, in social life, a trade-off between social rationality and the concentration of power. Social organizations that concentrate power are more coherent about their decisions; meanwhile, those organizations wherein power is more dispersed are less likely to make coherent decisions.

USING THE IMPOSSIBILITY THEOREM TO PREDICT VOTING RESULTS

Suppose that there are three representatives (X, Y, and Z) in Congress who have to vote for a legislative bill that allocates funds for a social program. The rankings of the three bills (B1, B2, and B3) for each of the representatives are given below. For example, Representative X rates bill 1 (B1) as the number one choice, bill 2 (B2) as the second choice, and bill 3 (B3) as the third choice.

TABLE 1

REPRESENTATIVE	B1	B2	B3
X	1	2	3
Y	2	3	1
Z	3	1	2

Another common way to represent the representative's preferences would be the following:

Representative X: B1 > B2 > B3

Representative Y: B3 > B1 > B2

Representative Z: B2 > B3 > B1

Now let us consider how the vote would go among the three possible pairs of bills. In a vote between two bills, it is assumed that our representatives would vote for the one of the two that is highest in their preferences even though their number one choice may be different from the two being considered.

In a choice between B1 and B2, the X representative would vote for B1 (remember **B1** > **B2** > B3), the Y representative would also vote for B1 (B3 > **B1** > **B2**), and the Z representative would vote for B2 (**B2** > B3 > **B1**; taking into consideration the transitivity assumption, B2 is preferred to B1). So B1 would win two-thirds of the votes, and we could say that the budget allocation set in B1 is socially preferred to B2.

In a choice between B2 and B3, the X representative would vote for B2 (B1 > **B2** > **B3**), the Y representative would vote for B3 (**B3** > B1 > **B2**), and the Z representative would vote for B2 (**B2** > **B3** > B1). As a result, B2 would win. So B2 is socially preferred to B3. Rationally, as B1 is preferred to B2 (B1 > B2) and B2 is preferred to B3 (B2 > B3), we would expect that this would imply that B1 would be preferred to B3 (B1 > B3).

However, let us consider a social choice by majority voting between B1 and B3. The X representative would vote for B1 (**B1** > B2 > **B3**), the Y representative would vote for B3 (**B3** > **B1** > B2), and the Z representative would also vote for B3 (B2 > **B3** > **B1**). So B3 is socially preferred to B1. Thus, we have the irrational result that socially, B1 is preferred to B2 and B2 is preferred to B3, but on the contrary, B3 is preferred to B1.

What Arrow was able to prove mathematically is that there is no method for constructing social preferences from arbitrary individual preferences. In other words, there is no rule, majority voting or otherwise, for establishing social preferences from arbitrary individual preferences.

Impoundment

Impoundment was a historic power used by presidents of the United States to not spend funds appropriated by Congress. Successive chief executives used the authority to avoid expenditures that they disagreed with or believed were unnecessary. In 1801 Thomas Jefferson initiated impoundment when he delayed spending $50,000 that Congress had voted to fund the construction of fifteen naval gunboats to patrol the Mississippi River. Jefferson believed there was no immediate security threat on the river and that efforts to control the national debt precluded increased defense expenditures. He deferred funding the gunboats for a year. Franklin Roosevelt was also notable for his use of impoundment. Presidents argued that impoundment was one of the inherent powers of the office. In 1974, in response to the repeated use of impoundment by Richard M. Nixon in an effort to reduce public spending, Congress enacted the Budget and Impoundment Control Act, which ended the practice. Henceforth, presidents were allowed only to recommend the recession of a specific expenditure, which then had to be approved by both the House and the Senate. The loss of impoundment was one of the motivators behind efforts to enact a line-item veto power for the president.

Incrementalism

Incrementalism is a theory of decision based on the premise that actors face broad organizational and cognitive limitations in real-life situations and must deal with a complex, uncertain world, the interpretation of which is often a matter of disagreement among them. While democratic interaction is, according to Charles Lindblom and Edward Woodhouse (1993), the most efficient way to decide, an intelligent approach to analysis that aims at simplifying rather than overcoming these limitations is invaluable. Incrementalism offers a multifaceted, flexible approach to this analysis.

Although Robert Dahl and Charles Lindblom's book *Politics, Economics and Welfare* (1953) introduced incrementalism as an analytical aid to decision making and it was expanded on in Lindblom (1959), its final version was tabled only in Lindblom's (1979) article, "Still Muddling, Not Yet Through."

Here Lindblom clarifies the multifaceted reality of incremental analysis by distinguishing among simple incremental analysis (limited to policies incrementally different from the status quo), disjointed incrementalism (a complex simplifying strategy limiting the analysis to familiar options, for which only limited consequences are explored; intertwining values and empirical elements, involving a remedial approach based on a trial-and-error strategy; and fragmenting the analytical work among many participants), and strategic analysis (encompassing the strategically thought and chosen stratagems that allow simplification of complex problems). The concept underwent a progressive refinement and was finally synthesized by Andrew Weiss and Edward Woodhouse (1992) as processes that (1) aid decision making by limiting analysis to familiar policies and to only some of the possible consequences they may carry, (2) employ trial-and-error methods, and (3) are more interested in remedying problems than in seeking positive goals. Incrementalism also tends to conflate values and policy goals with the empirical side of the problem (rather than order them sequentially) and to fragment the analysis among various partisan actors, each working on part of the issue.

There have been five main critiques against incrementalism. The first critique is that it is insufficiently goal oriented, but even a cursory glance to the literature will reveal that this is a baseless argument. Second is the charge that it carries an inherent conservative, proelite bias. One can refute this, however, by noting that bias depends on power distribution rather than on the model: the elites follow a pattern of decisions that favors them; incrementalism does not create this pattern. Third, incrementalism is said to be narrowly applicable, fitting only stable, noncrisis situations. Here it is worthwhile asking why nonincremental models would be better in unstable situations; crisis decision making is inherently difficult, regardless of the model chosen. Fourth, incrementalism is also charged with being vulnerable to threshold effects. Small marginal changes, which the model assumes can be easily reversed, cannot be altered if the threshold is surpassed, but this problem is common to all models of decision making. The final critique is that it is difficult to pinpoint the meaning of incrementalism, which has been applied to fields as diverse as budgeting, foreign policy, and city planning. This is a real problem; the wide array of meanings attributed to incrementalism depended both on Lindblom's delay in specifying the concept and on the liberality with which other scholars applied it. In the 1990s, neoincrementalism attempted successfully to tackle these criticisms by distilling broadly accepted definitions, bringing more precision to the discussion, and distinguishing among incrementalism as an analytical tool, as disjointed incremental strategy, and as a small-step process that involves small sequential moves.

Incumbency

Incumbent refers to the current holder of a political office. The term is used mostly in reference to elections as candidates are often defined by their status as an incumbent or a nonincumbent because incumbency instills benefits that are elusive for nonincumbents. One of the most difficult aspects of campaigning for elected office is generating name recognition among voters, which requires money and visibility. Incumbency affords this type of advantage. To be politically viable, one needs to raise money—and in many cases, do so better than one's competition. Incumbency supplies candidates with the ability not only to call on past supporters but also to seek out new donors more easily. Contributors are more willing to donate to an incumbent because that person has already been elected once and thus has a better chance of being elected again. Last, incumbents can utilize the benefits of being in office to their advantage. They can capitalize on the esteem of their office, advertise their accomplishments and experience, and benefit from a cadre of willing supporters and staffers to assist in their election. In many respects, incumbency allows them to rely on an existing campaign structure.

Indian Ocean Region

The Indian Ocean region (IOR) comprises the forty-seven countries in Africa, South Asia, Southeast Asia, and Australasia that share the coastal waters of the Indian Ocean. The Indian Ocean is the third largest world ocean, covering about 20 percent of the earth's water surface.

HISTORY

The region has the oldest heritage of international exchange in the world. The earliest urban civilizations—in the Middle East, the Persian Gulf littoral, and South Asia—were linked by seaborne commerce. In fact, early civilizations in Mesopotamia (Sumer), ancient Egypt, and the Indus Valley have developed around the Indian Ocean. For some four thousand years, the IOR was the scene of a thriving network of trade and people-to-people links. However, with the arrival of the European powers in the late fifteenth century—first

Portuguese and later Dutch, French, and British—this largely self-sustained and tightly interwoven economic, political, and cultural region was disrupted. Indian Ocean native economies were reshuffled to meet extraregional imperatives, often as suppliers of raw materials for the industrialized areas of the Northern Hemisphere. The Portuguese established a chain of fortified coastal settlements backed by regular naval patrols, which allowed them to gradually eliminate many rivals and enforce a semimonopoly in the spice trade in the region. Quickly, the Dutch, through the Dutch East India Company (1602–1798), and then the English, through the English East India Company (1600–1874), attempted to replace the monopoly of the Portuguese with a monopoly of their own.

Later, during World War I (1914–1918), World War II (1939–1945), and the cold war, the IOR was again an arena where great powers competed over resources and interests. This, coupled with South Africa's isolation during apartheid, India's inward-looking policies, and Australia's prioritization of links with East Asia and across the Pacific, created conditions that made trade investment and economic cooperation links in the region remain thin and sporadic.

Since the mid-1990s, countries belonging to the IOR have been mustering the confidence to invert their fragmented past. The attainment of this objective has been facilitated by the end of the cold war, the national economic reforms of some leading countries such as India, and the reengagement of South Africa as an important democratic state and a key regional player. This has led some countries belonging to the IOR to create trade linkages through the establishment of regional trade agreements. Besides establishing memberships in more local regional arrangements such as the Association of Southeast Asian Nations, the South Asian Association for Regional Cooperation, and the Southern African Development Community, IOR countries have attempted to establish trade arrangements that partially cross the Indian Ocean, including the Indian Ocean Rim Association for Regional Cooperation (IOR-ARC) and the Bay of Bengal Initiative for Multisectoral Technical and Economic Cooperation (BIMSTEC).

IOR-ARC

IOR-ARC was launched in Mauritius in 1997. The association comprises eighteen member states: Australia, Bangladesh, India, Indonesia, Iran, Kenya, Madagascar, Malaysia, Mauritius, Mozambique, Oman, Singapore, South Africa, Sri Lanka, Tanzania, Thailand, United Arab Emirates, and Yemen. Egypt, Japan, China, France, and the United Kingdom are dialogue partners. Seychelles withdrew its IOR-ARC membership on July 1, 2003. The association aims to broaden cooperation among member countries in investment, tourism, construction, trade, training, environment protection, renewable energy, and agriculture. In 2009, member countries decided to establish the International Renewable Energy Agency in the United Arab Emirates. The association also includes bodies known as the Indian Ocean Rim Business Forum and the Indian Ocean Rim Academic Group. Although the charter of the organization does not provide it with an explicit mandate to engage with security issues, over the years member states
Forty-seven nations in Africa, South Asia, Southeast Asia, and Australasia share the coastal waters of the Indian Ocean.

have aimed to achieve regional security and greater welfare through bilateral and multilateral relations and by strengthening the regional alliances within the framework of South-South cooperation, that is, between the developing countries of the global South.

BIMSTEC

The idea of the BIMSTEC regional cooperation project was first brought up by Bangladesh, India, Sri Lanka, and Thailand at a meeting in Bangkok in June 1997. The aims of BIMSTEC are to create an enabling environment for rapid economic development, accelerate social progress in the subregion, and promote active collaboration and mutual assistance on matters of common interest. In January 2004, member countries agreed on a framework to implement a free trade agreement in trade in goods. Currently, the members of the organization are Bangladesh, India, Myanmar, Sri Lanka, Thailand, Bhutan, and Nepal. The regional group attempts to serve as a bridge between the five South Asian Association for Regional Cooperation countries (Bangladesh, India, Sri Lanka, Bhutan, and Nepal) and two Association of Southeast Asian Nations states (Myanmar and Thailand), bringing institutional cohesion to one of the most diverse regions of the world.

The IOR is a region of vast political, cultural, and economic diversity, which has historically been united by processes of cultural interchange. It is the only major portion of the globe where all of the world's great religions are represented. But in modern times the region has been marked by great disparities in economic development and is the location of some of the world's most intractable conflicts and political disputes. However, the growth of regional cooperation and integration, embodied in IOR-ARC and BIMSTEC, might serve as an alternative mode of governance to ensure regional peace and economic development.

Indirect Elections

In an indirect election, the voters do not choose a candidate directly for office but instead choose electors who then decide whom to elect for the constituency. Indirect elections are relatively common, with perhaps the most well-known example of an indirect election involving the U.S. electoral college, which selects the president and the vice president. Other countries that elect officials via indirect elections include Germany, Italy, Greece, France, Hungary, Estonia,

Latvia, Ireland, and the Czech Republic. Some Eastern societies such as India and Pakistan select legislative officials or presidents through an indirect procedure as well. Indirect elections may have implications for democratic representation that are magnified depending on the post that is being elected.

In Europe, presidents, who typically function as heads of state, are often indirectly elected. For example, the president of the Italian Republic (*Presidente della Repubblica Italiana*) is elected by the joint vote of its lower and upper legislative bodies: the Chamber of Deputies (*Camera dei Deputati*) and the senate of the republic (*Senato della Repubblica*). The members of the German parliament (*Bundestag*) and an equal number of representatives from the federal states form the Federal Convention (*Bundesversammlung*) to elect the German president (*Bundespräsident*). Greece, Hungary, Estonia, Latvia, and the Czech Republic also elect their heads of state indirectly but use only the elected parliamentary body to do so. In France, one chamber of Parliament (*Sénat*) is elected by an electoral college for a five-year term. The majority of the senators are selected by state- (*Département-*) elected representatives, and a small proportion by the elected assembly of the French living abroad who form the *Assemblée des Français de l'étranger*. Finally, the Republic of Ireland's senate (*Éireann Seanad*) is indirectly selected by various electoral bodies.

One of the most notable examples of an indirect election occurs in the United States, where the electoral college is used to elect the president. The Framers of the American Constitution wanted to ensure that the federal states would have an equal influence over the election result and simultaneously guarantee that the elected president would be chosen by sophisticated delegates and not the uninformed masses. With the electoral college, each state selects delegates equal to the number of members serving in the House of Representatives and the Senate for that particular state. The party affiliation of these delegates is determined by the winner of the popular vote in every state separately. Although, in theory, these delegates can cast their votes for the presidential candidate of their choosing, the precedent is that they vote for the candidate they have pledged to their constituents to vote for. The electoral college has been the focus of several criticisms, the first being that the presidential campaigns tend to focus on people voting in battleground or swing states. Another is that not all votes cast have an equal influence over the result. A final criticism is that the president can be elected without winning the popular vote, as evident in the 2000 election between George W. Bush and Al Gore (similar to the results in 1824, 1876, and 1888). Debate about the potential reform of the U.S. electoral college has been evident in the past, yet all reform proposals have been denied by the U.S. Congress.

Obviously, not all indirect elections are designed to serve the same cause. The majority of indirectly elected officials do not exercise substantive powers. With the noticeable exception of the American president, the post of head of state has typical and often ceremonial jurisdictions. The same holds for indirectly elected parliamentary chambers such as those in France or Ireland, as their roles are supposedly advisory and lack

significant judicial or executive authority. National govern-ments in Europe that do exercise significant power are being held accountable through direct elections.

Individual and Society

The interdependent relationship between the individual and society has been explored by classical philosophers and modern researchers, beginning with Aristotle's description of humans as social animals about twenty-five hundred years ago. At the heart of this exploration is the puzzling question of how society enters into each individual and how individuals enter into society. A central theme in Greek discussions was the balanced organization of society, so that each individual could find his or her proper role, for example, as reflected in Plato's *The Republic,* in which individuals receive training appropriate for the social position they are to occupy in an imagined ideal society. In 1516, Sir Thomas More (1478–1535) discussed another imaginary, perfect society, Utopia, in which wealth, work, and responsibilities are distributed equally and there is no private property, social classes, or even currency. Of course, utopias or perfect societies require citizens who can sustain them, and the question of how to teach people to live in and support better societies continues to be a central theme in contemporary research.

SOCIAL CONTRACTS

The interdependence of the individual and society was high-lighted in particular in the seventeenth and eighteenth cen-turies through discussions of the social contract by Thomas Hobbes (1588–1679), John Locke (1632–1704), David Hume (1711–1776), and Jean-Jacques Rousseau (1712–1778). It is to Rousseau that we owe the origin of the term *social contract,* or *du contrat social.* These authors were writing at a time of great industrial, economic, political, and social change and faced the challenge of justifying obedience of individuals to societal authorities. According to the logical social contract, it was assumed that sometime in the historical past, an actual contract had been agreed on between individual members of society and their rulers. This must have been the case because humans are fairly equal in their physical and mental abilities, and only through consent could leaders have obtained the cooperation of the majority to live under their authority in organized societies.

But why should individuals consent to enter into a social contract with a central authority? To this question, Hobbes (2008) provided the most direct and forceful answer: because individuals are born selfish and aggressive, and in a state of nature in which there is no central authority, life is "nasty, brutish, and short." Each individual must give up certain rights to a strong central authority so that the central authority can provide protection and prevent a war of "all against all." The Hobbesian tradition of assuming corruption and war to stem from inborn flaws in the individual is very much alive in psychologist Sigmund Freud's (1856–1939) writings, depict-ing human personality to be initially dominated by the id, which is selfish, aggressive, and governed by the pleasure prin-ciple. According to this tradition, which is very much alive in modern research, we should look to inborn characteris-tics to explain not only individual behavior but also the state of society. For example, from Francis Galton (1822–1911) in the nineteenth century to Richard Herrnstein and others in the twenty-first century, one set of researchers has argued that intelligence is basically inborn and social and economic inequalities reflect inherited ability differences. According to this logic, people at the top are there because they were born more intelligent than others.

CORRUPT SOCIETY

Rousseau set a very different tradition to explaining the relationship between the individual and society. People are born free, yet everywhere they are in chains; individuals are born good, yet there is corruption and greed everywhere. The reason, Rousseau argues, is because of the corrupt state of societies. It is corrupt institutions and cultures that cre-ate corrupt individuals. Later, Karl Marx (1818–1883) would argue this corrupt state of affairs is upheld by an ideology and false consciousness, the inability of individuals to cor-rectly perceive their own class membership and interests, and that the role of the central authority is to protect the interests of the ruling class.

This emphasis on the power of the environment to shape human behavior is endorsed by the Lockian tradition of view-ing the newborn mind as a blank slate, a tabula rasa. In the twentieth century, B. F. Skinner (1904–1990) and other behav-iorists attempted to establish a science based on the laws of learning and to demonstrate empirically how the blank slate takes shape through environmental stimuli.

INDIVIDUAL BEHAVIOR AND ENGAGEMENT IN SOCIETY

The decline of behaviorism and the rise of cognitive science and cultural studies have meant that the relationship between the individual and society is now studied with two major questions in mind. First, what are the universal brain charac-teristics that enable individuals to become active and engaged members of society? Second, what aspects of the environment enable society to enter into the individual and to regulate behavior? The first question has led to the study of possible

prewiring in the brain, which enables human language acquisition, moral thinking, and the like. This line of research is particularly influenced by the ideas of Noam Chomsky and by the availability of new brain-imaging technologies. Research on stem cells, robotics, and biotechnology raises the possibility that in the future, researchers will be able to make more direct and effective interventions in cases of brain abnormalities.

Although individuals do arrive in the world with their brains in some ways prewired, research also highlights brain plasticity and the foundational role of society in shaping individual behavior. In addition to the focus on biological characteristics of individuals, then, there is also research on the second question stated above, namely, those aspects of the environment that enable society to enter into the individual and to regulate behavior. Two examples are the discussions by Richard Dawkins of meme machines, a cultural unit that can be transmitted from one individual to another, and research by Fathali Moghaddam on the means by which values and other aspects of culture are spread. The rise of religious fundamentalism and terrorism has focused particular attention on sacred carriers, such as the Islamic veil and the Christian cross, that individuals believe serve to connect them with holy powers.

Individualism

Individualism is largely understood today as a normative doctrine holding the autonomy of individuals to be the final object of moral and political life. The term was originally descriptive, however, invented in the early nineteenth century to describe the atomization of European society that attended democracy's emergence after the collapse of the *ancien régime.* Scholars attribute the first public use of the word to the French conservative Joseph de Maistre, and the philosophical disciples of Henri di Saint Simon popularized it in the late 1820s and 1830s as a mournful term for the disintegration of the social whole.

The most enduring analysis of individualism as a social pathology is Alexis de Tocqueville's. In *Democracy in America* (1835, 1840), he characterized individualism as a "sentiment that disposes each citizen to cut himself off from the mass of his fellow men and withdraw into the circle of family and friends, so that, having created a little society for his own use, he gladly leaves the larger society to take care of itself" (Tocqueville 2004, 585). Tocqueville's critique of individualism as a phenomenon that dampens public involvement, depletes political virtue, and produces alienation survives into the present—inspiring Robert Bellah and his colleagues' *Habits of the Heart* (1985), one of the most popular contemporary communitarian critiques of individualism.

Individualism's vigor as an affirmative moral, political, and economic doctrine matches the vehemence of its critics. The enduring power of both the Christian ideal of individual dignity and the Enlightenment ideal of personal autonomy partly accounts for this. In the mid-nineteenth century, American philosopher Ralph Waldo Emerson and British philosopher John Stuart Mill made these ideals the centerpiece of their positive normative accounts of individualism. They fortified these ideals, moreover, by positing that the individual's freedom to enact his or her inborn genius produces greater social, intellectual, and artistic goods than could ever be realized through centralized social coordination. Emersonian and Millian individualism yields a democratic political morality: the foremost obligation of individuals is to respect their own and each other's autonomy, and the objective of government is to create the social conditions necessary for citizens to realize their autonomy. The pragmatist John Dewey elaborated Emerson and Mill's conception of democratic individuality in the early twentieth century, and the political theorist George Kateb is its most eloquent spokesperson today.

Neoclassical economists and political libertarians are also counted among the twentieth century's most energetic defenders of individualism. F. A. Hayek, Milton Friedman, and Robert Nozick held that society could best honor individuals by minimizing the state's functions to just protecting private property and maintaining a competitive market economy. Reducing the role of the state to the optimization of free market competition, they argued, produces the widest range of life options and greatest life chances for individuals as well as lessens the dangers of government paternalism and tyranny.

The egalitarian liberal John Rawls responded, however, that a morally individualist theory of justice demands that government intervene in the economy to minimize material inequality. Such inequality among citizens, he claimed, is justifiable only when it is necessary to improve the position of the least well-off member of society. Because the wellspring of Rawls's egalitarianism is his basic commitment to the equal dignity of individuals, Kateb crowns Rawls's moral theory the twentieth century's "greatest statement of individualism" (Kateb 1989, 184).

The final form of individualism central to political science is methodological individualism. Methodological individualism is a doctrine of social explanation that holds that all social phenomena are descriptively reducible to interactions between persons; it denies that there are "social forces, structural features of society, [and] institutional factors" greater than the sum of the decisions and actions of society's members (Lukes 1973, 122). Articulated originally by Max Weber

in response to Hegelianism, Marxism, and Durkheimian sociology, the tenets of methodological individualism were later elaborated by Hayek and Karl Popper. The foundation of neoclassical economics, methodological individualism opposes historical materialism. At the same time, its chief contemporary exponent—Jon Elster—has sought to reconcile Marxist social analysis with methodological individualism.

Industrial Democracy

In its most general form *industrial democracy* refers to employees' right to be involved in the decision-making process at the workplace. In some countries such as Germany and Sweden, so-called codetermination between employers and employees is a matter of law (since 1976 in Germany with the *Mitbestimmungesesetz* and since 1978 in Sweden with the *Medbestämmandelagen*), while in other countries similar arrangements are regulated in collective agreements between employers and workers. Since 1994 a European Union directive has existed that requires larger firms with operations in several European countries to create so-called European Works Councils, mainly to create a platform for consultation.

In its weakest form industrial democracy consists of mere information and consultation practices at the firm level. In its strongest form it means workers' absolute workplace control, most often combined with ownership/control of the means of production. The arguments presented in favor of industrial democracy are that fewer hierarchy and authoritarian structures create less industrial disputes, improve decision-making processes at the workplace and firm levels, increase the employees' commitment to corporate objectives, and increase productivity as well as job satisfaction.

At the same time, industrial democracy is a highly contested concept based on different national traditions and historical conjectures. In central European states, including Germany but also in Scandinavia, it is often equated with codetermination and implies collective rights and obligations. It is either based on law or included in general collective agreements. Moreover, arrangements that give workers a permanent place on company boards and in other governing bodies without opting for ownership—codetermination—are frequent here. Workers' representation in such bodies is chosen either directly by the employees or indirectly by a local or central trade union. In its most radical version, industrial democracy is closely linked with the concept of economic democracy, which implies workers' control in the form of ownership over a firm or industry as a whole. One example of such a scheme was the so-called wage earners fund proposed by Rudolf Meidner in Sweden in 1975, according to which trade unions gradually would take over the ownership of private firms.

In Anglo-Saxon countries such as Great Britain and the United States, industrial democracy most often denotes a situation of workplace control wherein the workers have control over their own immediate working conditions, the work process, working-time arrangements, and implementation of health regulations. Such control is based on local trade unions or on informal workshop arrangements. Hence the concept here is based on individual and local rights and obligations, and as such it has a long pedigree. A historical reference can be drawn to the British nineteenth-century shop steward system. The shop stewards were skilled workers who were able to dominate the work process in a certain workplace. Even though mechanization and scientific management (created by Frederick Winslow Taylor and others) did much to destroy such workplace control by skilled workers after World War I (1914–1918), it has remained a vital ideal, for example, in Britain. Industrial democracy in this version is often referred to as "craft" or "guild" socialism. In the late nineteenth and early twentieth centuries it was also often combined with a wish to establish small-scale cooperative forms of ownership.

In the beginning of the twentieth century industrial democracy was often recognized in relation to a wider anarcho-syndicalist movement that was particularly influential in southern European states such as Spain and Italy but also in the United States. Industrial democracy as interpreted by the syndicalists was close to revolutionary socialism but at the same time highly critical of state socialism in its authoritarian version, especially that which developed in Soviet Russia after 1917. In contrast to the communists, the syndicalists emphasized the role of workplace control and cooperative ownership on the local level. In the United States the syndicalist Industrial Workers of the World

(formed in 1905) sought to organize all workers in one big union that with the help of the general strike, would overthrow capitalism and establish local ownership of the means of production. In Spain during its civil war (1936–1939), experiments in this direction were undertaken but failed in their purpose as a consequence of the defeat of the Spanish republic in 1939.

Gradually, however, almost everywhere such radical interpretations of industrial democracy have declined in importance. Today, most would interpret them as some form of codeterminism aiming to enhance corporate aims such as high productivity and look upon them as a means to achieve aims in which both employers and employees have a common stake.

Inference

Inferential techniques allow researchers to learn something about unknown phenomena from known evidence or data. There are chiefly two types of inference: descriptive inference involves extracting useful explanations from masses of evidence; causal inference pinpoints the explanatory factors, frequently suggested by theory, underlying the available data or evidence. Scientific inference, and prediction thereof, usually deploys causal hypothesis testing in which a set of factors accounts for possible outcomes under particular conditions. The fundamental problem of causal inference describes the uncertainty regarding the underlying explanatory factors' being the real causes of the outcomes described. Both supporters and critics of inferential techniques note the influence of omitted factors or variables, difficulty of measuring what is being measured (problems of validity), and impossibility of ever knowing that the same causal factors caused the outcome over and over given that exact experiments cannot be repeated under real-world conditions (problems of

reliability). Methodologists argue that many of these problems can be dealt with by increasing the set of data observations available to make inferences. In their view, expansive data sets will minimize random variations (noise). Critics of inference, nevertheless, argue that alternative techniques such as use of rich contextual information (as in anthropology, e.g.) and path dependence (as in psychoanalysis) are equally good, if not better, techniques for building theory.

Information Society

Australian economist Colin Clark stressed the dominance of different sectors of an economy at different stages of its development and modernization, thus leading to the recognition of the three basic sectors: agriculture, industry, and service. The dominance of each sector was brought about by revolutions, especially in the agricultural and industrial sectors, thus emphasizing the significance of the agricultural revolution and the industrial revolution.

THREE WAVES OF SOCIETY

In the 1960s American writer and futurist Alvin Toffler focused on the role these sectors played in the so-called waves or revolutions in society in his book titled *The Third Wave*. The three types of societies, based on the concept of waves, each wave pushing the older societies and cultures aside, are (1) the first wave or the agricultural age brought about by the agricultural revolution, (2) the second wave or the industrial age brought about by the industrial revolution, and (3) the third wave or the information or knowledge age brought about by the information or knowledge revolution. The first wave produced an agrarian society, which replaced the first hunter-gatherer cultures. The second wave produced an industrial society, which was based on mass production, mass distribution, mass consumption, mass education, mass media, mass recreation, mass entertainment, and weapons of mass destruction. These characteristics combined with standardization, centralization, concentration, and synchronization and ended up with a style of organization called "bureaucracy," which dominated the industrial age. The third wave produced the current postindustrial society. Toffler's third wave was the product of the two previous waves or revolutions in the way humans have organized their economic affairs (agricultural and industrial). Toffler himself coined many phrases to describe what is taking place: "super-industrial society," "Space Age," "Electronic Era," "Global Village," "scientific-technological revolution," and the concurrent phenomena of "demassification," "diversity," "knowledge-based production," and "acceleration of change."

The current focus of attention is on this third wave that some have described as the dawn of the information society. It is a part of the postindustrial and knowledge society that some have described as the new age, spelling utopia for some (the optimists) and dystopia for others (the skeptics). This information revolution or knowledge revolution is characterized by the dominance of information and communications technology (ICT) and emphasizes the role of digital technologies such as the computer, the cell phone, the Internet, and so forth. It is part of a social revolution that moved the world from a traditional to a modern and now to a hypercomplex society, which in the early 1960s recognized the importance and value of information and knowledge.

THE RISE OF TECHNO-SERVICE INDUSTRIES

The origins of the idea of an information society can be traced to the work of Fritz Machlup, who in 1958 first categorized knowledge and information tasks separately from normal industrial and social activities. During that time period he claimed that 29 percent of America's gross national product came from these knowledge industries.

In the early 1970s Daniel Bell introduced the idea of the rise of the individualized, knowledge-adept social actor as one of the most respected elements of the information age. Manuel Castells in the 1980s proposed that ICTs have produced a new kind of society, the network society, characterized by the world's being brought closer together but also experiencing increasing social fragmentation and dislocation. According to Castells, this rise of a techno-service society has resulted in a social revolution, a new economy, and an information politics where those who control information—the technocrats—control power and replace the rule of wealth, landed estates, military power, and religion that has typified previous societies. The character of democratic accountability and participation in the information age is changing. There are problems of access as well as control of the public space of the Internet. There are also the political problems of privacy and censorship. Others worry about the decline of the state as a result of the distrust of government. New methods of communication brought about by changes in information technologies allow individuals to confront the state, which some consider to be outdated and no longer the most efficient way to organize society, if it ever was.

So how does one describe the techno-service economy and its offspring, the information society? The techno-service economy is made up of a diverse group of people who have a wide range of skills and training. The characteristics of the service economy are the following: (1) services are intangible, immaterial, and consumed on the spot; (2) it involves closeness between the giver of the service and the consumer; and (3) the service worker seeks to create rapport between himself and the client. The service economy in the past had the reputation of being composed entirely of low-skilled, poorly paid, dead-end jobs. The advent of technology has changed the nature of service and the characteristics of the people performing them: more skilled, more capital intensive, and more dependent on technology. Among the most educated people in society today are those who work in, operate, and control the information economy.

The size of the information sector has grown rapidly. The concomitant information society would be shaped by the use and deployment of ICTs including computers and other electronic and audiovisual media such as the television, the phone, and the cell phone, which clearly have transformed the way we live and work. At the heart of the information society as mediated by communication is the decentering of communications so that individuals can remake society by remaking their communications network, thus leading to the empowerment of the individual and his or her communicative potential. Lewis Mumford uses the term "democratic technics" to describe the ability of technology to allow for democratic self-government with free communication between equals and unimpeded access to the common store of knowledge. These are emerging because of ICTs' ability to make such flows a reality. The information society conceived as democratic technics allows individuals to express themselves outside mass parties and overcome class identities. Gone is the control of information by the expert.

With the ease and universality of access lies the key to the information technology revolution and the society that is developing around it. In the age of computers with ever-growing storage capacity, interactivity, and processing power, we have a potentially dangerous tool because the revolution is irreversible—like nuclear energy, its power needs to be controlled if it is to work for our benefit. The computer is an empowering tool because of access to information and communication, but it can also be an implement of control, giving unlimited power to those who control the information that it stores. The dilemma is how to resolve that issue.

Toffler talked about a "future shock" from the inability to keep up with the accelerating changes of the information age. It is not unusual to talk about the following types of information: misinformation, disinformation, overinformation, or information overload, which contributes to noise and boredom. Thus, in our information-dependent society those who possess information can derive real power from it, and the loss of empowerment can be caused by its absence. It could therefore be the goal of ICT in politics to enhance the efficiency of delivery methods in terms of voting, political participation, and so forth so that democracy can be maintained and enhanced.

Information Technology and Politics

The information technology revolution is transforming business and the economy, leading to the creation of entirely new markets and the transformation (and sometimes destruction) of old ones. Its consequences for politics are more subtle but equally profound. New technologies—including most particularly the Internet but also advances in telecommunications, in cryptography, in database and data-mining techniques, and other innovations—are not leading to the immediate and radical transformation of politics as some predicted. But they are demonstrably reshaping key areas of political activity, including electoral campaigns, political participation, and interstate relations.

The most important—and controversial—area where information technology and politics intersect is the Internet. The Internet in its early years appeared unlikely to be consequential for politics. Its core user base was restricted to academics and researchers who were comfortable with the often technically demanding tools that were required to access it. However, the advent of the World Wide Web, which was initially based on the simple text formatting language hypertext markup language (HTML) and a set of associated protocols, made it much easier for individuals without technical skills to use the Internet. These individuals could use browsers such as Mosaic (released in 1993) and Netscape Navigator (released in 1994) to access online content easily. The decision of the U.S. government (which still effectively had final say over important aspects of the Internet) to allow commercial use of the Internet further helped to precipitate an explosion in online activity.

Early debates about the political consequences of the Internet focused on whether it would weaken the power of states. Many prominent early adopters of the technology were strongly libertarian and embraced the technology because it seemed to offer a solution to the problems of government censorship and control. Over time, these debates gave way to a rough empirical consensus as it became increasingly clear that governments were both willing and able to regulate new information and communication technologies. Thus, for example, claims about how the Internet rendered censorship nearly impossible were undermined by the ability of states such as China and Saudi Arabia to shape their domestic communications networks in ways that made censorship easier (although far from perfect). Ready access to new forms of cryptography did not empower individuals, although it did help foster e-commerce. Indeed, new information technologies potentially empowered states to do things that they would previously have had difficulty doing. For example, cheap storage and vast increases in computer power allowed states to collect and order vast amounts of data about their citizens and perhaps to mine the data for interesting and otherwise nonobvious relationships.

The resurgence of the state, together with the more ready availability of empirical data, has transformed debates about the impact of new information technologies on politics. Rather than making broad arguments about whether new technologies are likely to result in secular changes to the political system, scholars are beginning to try to identify more specific mechanisms through which these new technologies may have particular consequences for specific areas of politics. Some of these mechanisms are beginning to become apparent but have as yet received little academic attention. For example, the vast increase in the availability of technical information about government and politics is surely affecting the balance of political power, yet we know very little about who is accessing this information and how they are using it. The political consequences will be quite different depending on whether the information is used by ordinary citizens, by specialized actors, or by partisan operatives. Other mechanisms have attracted more attention. Much work has been done on how the Internet affects politicians' electoral strategies, and work is beginning to emerge on its consequences for citizens' political attitudes. Scholars are also beginning to examine broader forms of politics, asking whether the Internet affects nondemocratic countries' prospects for democratization and about the degree of political interdependence between states in a globalized world. The rest of this article will briefly survey how information technology is affecting political polarization and electoral politics in the United States and how it is affecting international interdependence and the politics of democratization. This provides at least the beginnings of an overview of how political scientists are beginning to take account of the impact of information technology on American politics, international relations, and comparative politics.

POLITICAL POLARIZATION

There is consensus among scholars of American politics that the past few decades have seen more polarized politics, although scholars disagree about whether this polarization results from the interactions of parties and politicians or from deeper divisions in the electorate. A significant body of recent work has explored the extent to which greater media choice helps spur polarization.

The basic logic of this argument is laid out in Markus Prior's 2007 book *Post-broadcast Democracy.* Prior uses data from cable television to argue that increased media choice allows individuals with little direct interest in politics, who tend to be moderate in their views, to avoid exposure to political information more easily. This makes them less likely to become mobilized around political issues. In contrast, people with a strong interest in politics, who tend to be more partisan than the average, can consume political information more easily, making them more likely to become mobilized along partisan lines. Thus, politically apathetic moderates are able to escape politics more easily, whereas politically interested partisans have more opportunity to consume political information and hence to engage in political activity.

The Internet provides a much greater profusion of choices than does cable television; thus, we may expect it to have even starker consequences for polarization. As a result, scholars such as Cass Sunstein (2001), in *Republic.com,* have explicitly worried that the Internet is likely to lead to increased balkanization and polarization. Sunstein argues that the Internet leads to less cross-exposure between people with different points of view and hence weaker tendencies toward moderation and mutual tolerance. He uses experimental data from social psychology to underline his claim that people are likely to adopt increasingly extreme positions when they talk only to others who share their points of view.

The empirical data appear to offer at least some support to Prior's and Sunstein's arguments (even if they have little to say about the normative concerns underpinning Sunstein's fears). Lada Adamic and Natalie Glance (2005) have shown using network data about hyperlinks between blogs (the most important online forum for political discussion in the United States) that blogs are clearly polarized. Left-leaning bloggers tend overwhelmingly to link to other left-wingers, while right-wing bloggers link overwhelmingly to other right-wingers. There are similarly sharp differences in the kinds of nonblog content that left-wing and right-wing bloggers tend to link to. Henry Farrell, Eric Lawrence, and John Sides (forthcoming) find that blog readers are demonstrably more polarized on topical political issues than consumers of traditional news media (including viewers of obviously partisan networks such as Fox News).

Even so, Eszter Hargittai and her colleagues (2008) find no evidence that this polarization is increasing over time, and they use qualitative data to point to the existence of real (albeit only occasional) substantive discussion between left-wing and right-wing bloggers. This suggests that blogs are more than mere echo chambers, even if bloggers' arguments are largely conducted along partisan lines. Furthermore, there are also online spaces that are not as directly polarized where people are indeed exposed frequently to differing points of view; Wojcieszak and Mutz (forthcoming) find that hobby discussion forums regularly lead to political discussion and expose people to others with differing points of view.

ELECTORAL CAMPAIGNS

Information technology plays a key role in electoral campaigning, especially in the United States. Data mining, microtargeting on the basis of extensive electronic data, and Internet communication are important components of the political consultant's toolkit. Yet the role of these technologies has changed dramatically over time and can be expected to change further. Bruce Bimber and Richard Davis (2003) studied the role of new technologies in the 2000 election by examining largely static candidates' Web sites. By 2004, Democrats had begun to explore the Internet's potential for electronic fund-raising, while Republicans sought to combine traditional social networks with microtargeting techniques borrowed from advertising. In 2008, both major party presidential candidates tried to build participatory Web sites that would spur activist involvement and to create online systems that would integrate information from volunteers with other forms of data to allow more sophisticated targeting of voters.

Political scientists have had some difficulty in keeping up with this breakneck pace of developments. Nonetheless, they have begun to arrive at some provisional conclusions regarding the consequences of new technologies for elections. First, and most important, there is no evidence to date that the Internet itself plays a major role in mobilizing voters. Experimental research by David Nickerson (2007) finds no evidence that targeted e-mail affects either voter registration or voter turnout. This is not to say that online activity has no consequences whatsoever for participation. Donald Green and Alan Gerber find that MoveOn.org's mobilization efforts in the 2004 elections had a statistically significant and positive effect on voter turnout. MoveOn.org consists of a skeletal organizational structure combined with a massive e-mail list; while it did not use e-mail as a form of voter contact, it certainly used e-mail to organize the volunteers who then made face-to-face contact with potential voters.

There is clearer evidence that information technology is consequential in allowing politicians to gather information about voters from various databases and use it to narrowly target advertising at likely swing voters. Sunshine Hillygus and Todd Shields (2008) argue that new data-mining techniques have helped politicians to find and use "wedge issues" that are aimed at realigning voters who disagree with their party on one or more key issues. By analyzing voters' consumption patterns, media choices, and so on, it may be easier to identify "persuadable" voters and send them specifically targeted messages that are designed to stop their voting from their usual party and, ideally, defect to the other side.

Electoral fund-raising in the United States is being transformed by the Internet. Typically, candidates have had to turn either to major donors (who may want quid pro quos) or to mailing lists of smaller donors, which are expensive and difficult to maintain. In contrast, the Internet allows candidates to raise money from small donors with very little overhead. The evidence suggests that this may have impressive consequences. In the 2008 presidential campaign, the Democratic candidate Barack Obama attracted literally millions of donors to give via the Internet and hence found it to his advantage to forgo public matching funds that would have limited his overall fund-raising. While the Internet has greatly increased the pool of potential donors, there is little empirical evidence available as to what these donors (especially small donors) look like, as compared with previous generations of donors. However, on the basis of raw numbers, it is likely that large donors and individuals able to bundle large numbers of donations together are likely to be less influential than in the past and that insurgent primary candidates with little support in the party machine will find it easier than before to raise sufficient money to put together a serious challenge.

GLOBAL INTERDEPENDENCE

One of the most important themes of international relations scholarship over the past thirty years has been the increase in interdependence between different countries. States

increasingly find that their policy choices are intertwined with the choices made by other states, creating incentives to manage unwanted side effects through a variety of bilateral and multilateral arrangements. As Suzanne Berger (2000) has argued, this has led to increasing controversy as international relationships have come to impinge on sensitive domestic issues. New information technologies have considerably exacerbated these tensions, potentially undermining previously existing national bargains regarding pornography, gambling, intellectual property, and controversial political content. States that seek to limit their citizens' access to these goods may find it difficult to prevent citizens from accessing this content via overseas Web sites. This is particularly likely to be a problem for democracies (such as the United States) that have ruled out the kinds of far-reaching controls over Internet communications that authoritarian regimes frequently impose. Such states may seek to defend their values, and indeed spread them, by pressing private actors that are present in multiple jurisdictions into service on their behalf. Such private actors may extend the effective reach of states beyond their own jurisdictions. However, by the same token, they may impose adjustment costs on other states, presenting the problem of interdependence again in a new form.

The U.S. domestic gambling regime is an excellent example of how the Internet exacerbates problems of interdependence. While many states within the United States allow gambling, federal laws that restrict gambling across state lines have been interpreted as banning Internet gambling. This prompted gambling operators to open operations overseas in jurisdictions such as Antigua, the United Kingdom, and Gibraltar that were accessible to (and marketed to) U.S. citizens but that were beyond the effective reach of U.S. authorities. These operations proved highly successful, presenting U.S. authorities with a clear challenge to their authority.

The U.S. response was to use private actor intermediaries to seek to reimpose controls on U.S. citizens' online gambling. U.S. authorities forced financial intermediaries (such as credit card companies) and carriers of advertising (such as cable television and U.S.-based Web sites) to stop cooperating with offshore gambling operations targeted at the United States. In late 2006, the U.S. Congress passed legislation that cemented this regime, making it unambiguously clear that financial institutions that cooperated with illegal Internet gambling sites were breaking the law.

These measures have had only limited success. While they have certainly made it more difficult for U.S. citizens to gamble online, they have not stopped them. While hard data are difficult to come by, there is strong circumstantial evidence that illegal Internet gambling is thriving in the United States. Not only is it difficult for financial intermediaries properly to monitor the relevant transactions, but financial institutions have incentive to do only the bare minimum that the law requires of them. However, they have clearly imposed substantial adjustment costs on third-party jurisdictions. Antigua, which had been home to many offshore gambling companies, saw its local gambling industry collapse as a result of U.S.

sanctions and sought remedy at the World Trade Organization, with some success. The United Kingdom saw billions of dollars wiped off the value of UK-listed companies and significant burdens placed on UK-based financial services firms that had little choice but to comply with the U.S. regime if they wished to retain significant contacts in the United States.

In summary, the U.S. response illustrates how states may respond to problems of interdependence in ways that exacerbate these problems for other states. As the Internet and other forms of global communication place continued pressure on sensitive domestic bargains concerning social values, we may expect to see more tensions like this emerge.

DEMOCRATIZATION AND INFORMATION TECHNOLOGY

There has been much discussion among media and policy elites about the possibility that the Internet, cell phones, and text messaging will further the spread of democracy. Most famously, former U.S. president Bill Clinton claimed that liberty would spread in this century "by cell phone and cable modem" and that trying to control the Internet was like trying to "nail Jello to the wall." However, although there is some evidence that information technology has been used by democracy activists, there is remarkably scant evidence that this technology has played a decisive role. While journalists describe, for example, the 2009 political unrest in Iran as the "Twitter revolution," the preliminary evidence suggests that Twitter (an online communication tool) did little to help organize protests on the ground. Cell-phone text messaging did play a significant role in coordinating action in prodemocratic revolutions in the Philippines, the Ukraine, and elsewhere, but there is no way of showing that these revolutions would not have taken place, or would not have been successful, in the absence of these technologies. In a detailed examination of eight cases of authoritarian regimes, Shanthi Kalathil and Taylor Boas (2003) find that the Internet and related technologies are not necessarily a threat to authoritarian regimes. More recent work by Ronald Deibert, John Palfrey, Rafal Rohozinski, Jonathan Zittrain, and their colleagues (2008) finds that the Internet has become increasingly balkanized, as governments in both authoritarian and nonauthoritarian regimes have succeeded in filtering Internet access for their citizens. Thus, early optimistic suggestions that the Internet was sliced freedom have turned out to be badly wrong.

Indeed, the aggregate evidence suggests strongly that the causal arrow runs in the opposite direction. Helen Milner (2006) finds strong evidence that differences in regime type explain many of the lags in Internet diffusion. Authoritarian governments are less likely to allow the Internet to be easily diffused within their borders both because authoritarian leaders fear the consequences of open communication and because powerful domestic actors (such as telecommunications monopolies) are in a better position to impede developments that might hurt their profits.

However, there is some reason to believe that the Internet, along with other communications technologies, may foster

increased democratization over the longer term. Marc Lynch (2007) suggests that the Internet is less important because it empowers democracy activists to foment revolution than because it allows new "public spheres" of citizen debate and discourse, which are not under state control, to emerge. Historically, such public spheres have been linked to increases in government accountability and, perhaps, the eventual adoption of democracy. Rebecca MacKinnon's (2008) work on the Internet in China provides some support for Lynch's arguments; she finds that Western efforts to protect Chinese dissidence on the Internet may be counterproductive and suggests that benign neglect, which would allow less overtly political forms of debate to flourish, may be the better approach.

CONCLUSION

Measuring the impact of new information technologies such as the Internet on politics is still a work in progress. However, over the past ten years, there have been significant advances in our understanding of the consequences of these technologies. A set of initial debates that concerned very broad questions of the state and politics has largely been replaced by a set of more specific debates surrounding more particular consequences of the Internet for specific aspects of politics.

This is genuine progress. While early arguments helped set the tone for later discussions, they were for the most part conducted without the benefit of good data and information. By focusing on narrower mechanisms of change—and bringing good empirical information to bear on these mechanisms—we are finally making some genuine advances in our understanding of how information technology affects politics. This is not to say that scholars should refrain from tackling the large, secular questions of how these technologies are coming to reshape politics, but they will be doing so on much firmer ground if they build up from micro- and meso-level mechanisms and data. That the study of the Internet and politics is becoming more prosaic is by no means necessarily a bad thing.

Initiative and Referendum

The initiative, a type of direct democracy, allows voters by petition to place one or more constitutional and statutory propositions on the referendum ballot. Propositions also may be placed on the referendum ballot automatically by a constitution (illustrated by the question of convening a constitutional convention placed on the New York State ballot every twenty years) and by legislative bodies.

The initiative dates to 1715 when the Massachusetts General Court authorized voters by petition to require the town selectmen to include specific articles in the warrant (fixed agenda) calling a town meeting. Several post-1830 Swiss cantonal constitutions granted voters authority to place constitutional questions on the ballot by the "imperative petition" of voters. The new federal constitution of Switzerland in 1848 required all cantons to adopt the device that also could be used to place proposed amendments to the national constitution on the referendum ballot. The Vaud cantonal constitution in 1845 authorized placement of proposed statutes on the ballot by petition.

The 1883 California State Legislature enacted a law on incorporation of municipal corporations to implement the home rule article in the 1879 constitution. The law provided

for the placement of the question of incorporating a city on the referendum ballot by a petition signed by one hundred voters. Agrarian discontent in the post–civil war period gave birth to the National People's Party (Populist), which at its first convention in 1892 adopted a platform calling for adoption of the initiative and protest (petition) referendum on recently enacted laws. In 1898, South Dakota voters approved an initiative-protest referendum constitutional amendment, and San Francisco freeholders adopted a new city-county charter providing for both devices. Currently in the United States, twenty-three state constitutions and the Utah Code authorize state voters to use the device, and a statute or local charter authorizes voters in many local governments to use the device. The direct initiative may be used to place a proposed amendment proposition on the referendum ballot in sixteen states and to enact statutes in seven states provided the required number and distribution of signatures are certified. The indirect initiative, employed in nine states, requires voters to collect a specified number of certified signatures before the proposition is referred to the legislature. Its failure to enact the proposition during a stipulated time period results in the proposition's being placed on the referendum ballot. Additional signatures must be collected to place a state proposition on the ballot in Massachusetts, Ohio, and Utah if the legislature fails to enact the proposition. Massachusetts and Mississippi are the only states with constitutions authorizing the indirect constitutional initiative. The constitutions of Maine, Massachusetts, Michigan, Nevada, and Washington authorize the legislature to place a substitute proposition on the ballot.

Proponents argue that the initiative empowers voters to enact provisions in the face of an unresponsive legislative body beholden to special interests, thereby making it more representative, and that it is a voter civic education device. Opponents contend the initiative authorizes a minority of the voters to make binding decisions, overburdens voters with propositions, and allows special interest groups to achieve their goals.

The referendum, a type of direct democracy allowing voters to make policy decisions, originated in the fifteenth century in the *Landsgemeinde* in several Swiss communes that formed leagues and authorized voters by referendum to accept or reject league policy decisions. The Massachusetts Bay Colony held a referendum in 1640, and voters ratified the first Massachusetts constitution in a referendum in 1780. By 1860, the constitutional referendum and the statutory referendum in most states relative to the issuance of full faith and credit bonds had become established. The term *plebiscite* is used to describe primarily a nation's voters deciding a question of great public importance.

The UK parliament is premised on the leadership-feedback theory positing voters elect leaders to make all laws after receiving citizen feedback on proposed laws. In consequence, a nationwide referendum was not held until 1975 when voters approved joining the European Community (now European Union). Other parliamentary nations with written constitutions, such as Ireland and Italy, hold periodic referenda on proposed amendments and on questions such as the enlargement of the union. Parliament is free to place propositions on the ballot at any time.

A constitution or charter may require a periodic mandatory referendum on a specified question and mandatory voter approval prior to initiation of action on certain matters, or it may be permissive on most other subjects. A local option referendum allows local government voters to decide whether they wish to adopt a specific state law. The petition or protest referendum originated in Switzerland, was promoted by Populists and Progressives in the United States, and is enshrined in the constitutions of twenty-three states and the Utah Code in the United States and numerous local governments. The device allows voters by petition during a sixty- to ninety-day period to suspend implementation of a newly enacted statute or ordinance until a referendum is held to determine whether the law should be repealed. The device is not used often to repeal state laws, but its use is more common in local governments. It should be noted that the initiative may be used to repeal a state law by referendum.

Inner Cities

Inner city refers to the decaying central area of a major city, urban metropolis, or conurbation, comprising the most deprived neighborhoods around the central business district. It is different from the rest of the city in a number of its characteristics: it is an area affected by long-term urban infrastructure decay, poor housing conditions, and lack of basic modern social amenities; it is inhabited by a low-income population,

usually ethnic minorities; and it has high unemployment rates, low school standards, and high crime rates. However, not all cities' areas around the central business district have these physical and social characteristics. On the contrary, in some major cities the ring around the business center is the area where the upper social classes live, and the periphery of the city is where the low-income people reside. In this article, *inner city* means the physical, economic, and socially deprived areas around the city center, containing all or some of those characteristics mentioned above and having been the target of special public policies. These inner-city policies include diverse types of policy measures, applied differently in each city, with different urbanistic discourses adopted over the years, ranging from modern urbanism to new urbanism. For that reason, any generalization must be considered with caution, given the diversity of inner-city areas, the variety of inner-city policies around the world, and the strong overlap of influences and practices from one policy period or generation to the next.

The first generation of inner-city policies, implemented from the 1960s until the 1980s, defined inner-city problems essentially in social terms, in the sense that the inner city's problems should be addressed mainly through social programs carried out by local and central government departments. The aim of these policy measures was to improve these dispossessed neighborhoods through public investments in infrastructures, social welfare services, professional training, and crime prevention, among other social measures, including also the reduction of physical rehabilitation costs through the removal of buildings in brownfield sites, for example. These urban renewal projects were inspired by modern urbanism, with its principles of functional specialization, and led to the demolition of derelict housing and its replacement by tower blocks. It was an urban model easy to implement, a model that provided housing with modern amenities and open spaces where they did not previously exist but that, in some cases, was also responsible for a lower sense of community, for a decrease in the intensity of social life compared with what existed before, and for gentrification due to rises in rents and prices of homes. Economic development policy was based on public subsidies, tax incentives to encourage private investment, and other forms of support in favor of inner-city investors. The overall evaluation of the first generation of inner-city programs suggests that in numerous places in Europe (e.g., in the United Kingdom: London, Birmingham, Sheffield), in North America (e.g., Baltimore), and in other countries, besides physical improvements (e.g., reduction of preexisting densities, improved housing conditions and public space standards), they failed to eradicate part of the social and economic problems they were supposed to solve.

The second generation of inner-city policies, from the 1980s onward, looked at the inner city essentially as an economic problem, contrary to the first approach that saw it primarily as a social issue. The new vision emerged in the context of wider political and ideological shifts on both sides of the Atlantic, epitomized by the Reagan administration in the United States and the Thatcher government in the United Kingdom. Conceived mainly as a problem of economic competitiveness, the regeneration of inner cities was seen as requiring policy instruments different from those used before to create dynamic economies in and around the inner-city area, based on economic sectors in which the inner city had real competitive advantage. It included initiatives such as enterprise zones and empowerment zones, among other similar instruments. There are many examples of this approach all over the world, involving in some cases the creation of private or public-private entities to run the development process (e.g., London Docklands and its Urban Development Corporation, Hong Kong and its Land Development Corporation and Urban Renewal Authority). For the proponents of this new vision, the competitive advantage of inner cities resulted from factors such as their locations, especially their access and proximity to transportation and to the central business district, the size and characteristics of their own consumer markets, and the availability and diversification of their workforces, among other factors. On the other hand, the new approach argued that the regeneration process, contrary to what happened before, should be conducted by private corporations and through special programs for the promotion of homeownership seen as the best answer to gentrification.

Since the 1990s, a third generation of inner-city policies is replacing the previous one as part of a more general shift in the mainstream discourse on urbanism. Cultural urbanism is now seen as the key driver for urban regeneration in the inner city and in other parts of the city as well (e.g., in Barcelona, Buenos Aires, Canberra, and Shanghai, to mention just a few cases). This includes the promotion of iconic architecture, the hosting of large-scale events as place promotion, and the creation of a new image for the inner city, its brand image, as part of a larger project for the cultural city.

Inspector General

Inspectors general are found throughout bureaucratic and military apparatuses around the world. The main purpose of an inspector general is to ensure efficiency and compliance with standards of mission statements for bureaucracies or standards of military service. Inspectors general are often recognized for their expertise within their field and in many countries are high-ranking, well-educated bureaucrats. As the head of inspections and audits for the bureaucratic departments, inspectors general investigate fraud and misappropriations of funds, time, and equipment. They also work to protect whistle-blowers, government workers who bring attention to a serious problem within their agencies. In addition, offices of inspectors general evaluate and audit programs provided by the bureaucratic departments and provide recommendations to heads of state and other interested parties, such as legislatures.

Much of an inspector general's work is in the capacity of finding wrongdoing rather than identifying good practices and making positive recommendations. Inspectors general perform many types of audits, including internal, external, financial, and performance audits. Internal audits focus on a bureaucracy or military agency, where inspectors examine the agency from within, while external audits are performed on contractors the agency has hired to perform a specific task. Financial audits focus on where the money has gone and whether the money allocated to certain projects has been properly spent, and performance audits look at the mission statement of an agency and evaluate whether the agency and its employees are performing up to standards. Although they work within agencies, inspectors attempt to remain impartial; however, objectivity sometimes comes into question when the motives of investigations and audits seem political. Opposing factions within government may request agency audits to search for wrongdoing that will allow them to reduce allocations to that agency.

Older conceptualizations of the inspector general were deeply rooted in the need for organization, efficiency, and compliance in police and military affairs. From these themes modern bureaucracies have taken these initiatives to create better government. More recently, a growing number of private agencies have begun offering inspection services to government and industry to ensure compliance with national and international laws.

Institutionalism

See *Institutionalism, Comparative; New Institutionalism.*

Institutionalism, Comparative

In comparative politics, like in other subfields of political science, the starting point of the contemporary institutionalist scholarship is the idea of "bringing the state back in," which became a rallying cry in the 1980s. Reacting to intellectual trends such as Marxism and system theory, this type of scholarship emphasized state autonomy and the structuring role of state institutions (i.e., formal and informal norms and rules) in political life. This push for a more systematic analysis of the state was grounded in the assumption that state actors and institutions do more than simply reflect material interests. In fact, a major institutionalist belief is that institutions mediate the concrete political impact of such interests. That is not to say that institutions are the only influential factor in politics but rather that institutions should become a focal point of comparative political analysis. Interestingly, even when institutionalist scholars work on only one country, they typically need to refer to other polities to identify and stress what is specific about that country's institutions. Therefore, institutionalist theory naturally leads to comparative perspectives on politics.

VARIANTS: SOCIOLOGICAL AND RATIONAL CHOICE INSTITUTIONALISM

Institutionalism research in comparative politics takes different forms that largely point to the broader distinction between sociological institutionalism, rational choice institutionalism, and historical institutionalism. Because sociological institutionalism is not primarily centered on political institutions, it is not discussed here. As for research in comparative rational choice institutionalism, it has engaged a number of prominent political scientists such as Robert Bates, Barbara Geddes, Margaret Levi, Elinor Ostrom, George Tsebelis, and Barry Weingast. A recent example of comparative rational choice institutionalism in political science is Daniel N. Posner's (2005) *Institutions and Ethnic Politics in Africa,* which shows how political institutions "help to determine which ethnic cleavage becomes politically salient" in multiethnic polities (p. 3). Drawing on the idea put forward by Robert Bates that ethnic groups are rent-seeking coalitions involved in rational calculations, Posner explores "the question of why individuals choose to emphasize the particular ethnic identities they do" (p. 3). From this perspective, the study of ethnic groups is highly relevant for rational choice institutionalists because it allows them to stress the rational aspects of seemingly irrational processes such as nationalism and ethnic conflicts.

Another important contribution to rational choice institutionalism is the work of George Tsebelis on "veto players," which stresses the impact of the institutional rules of the game on the behavior of (rational) political actors. As suggested below, the concept of veto player has been widely used in comparative political analysis, including analyses by scholars who do not belong to rational choice institutionalism. This remark should not obscure the fact that in comparative politics and beyond, rational choice institutionalists commonly embrace a specific vision of institutions that stems from their focus on individuals and their strategies. As Margaret Levi puts it in her classic *Of Rule and Revenue* (1988), "The rational choice approach recognizes that institutions and structures are the consequences of human actions. . . . Individuals create institutions—although, of course, institutions, structures, and other macro-states also influence individual preferences and behaviors" (p. 8).

According to Craig Parsons, however, some of the comparative scholarship known as "rational choice institutionalism" puts more causal weight on structural-economic factors than on the weight of political institutions. Important to note, Parsons cautions that in comparative politics as elsewhere, the term *institutionalism* should be used so that it refers only to perspectives truly focusing on the structuring role of institutions in political life. Stretching the meaning of the term *institutionalism* to include approaches in which institutions are not a primary form of political causality is potentially misleading; for this reason, Parsons claims that historical institutionalism is the most purely "institutionalist" perspective in comparative politics.

HISTORICAL INSTITUTIONALISM

A key assumption of historical institutionalist perspectives in comparative politics is that institutionally embedded rules of the game strongly affect political behavior as well as policy development. From this perspective, political institutions create obstacles and opportunities for actors, and it has been argued that the number of institutional veto players/points present in a polity will structure the political. In her comparative book on health politics, for instance, Ellen Immergut has shown how national political institutions shape the mobilization of interest groups such as doctors. From this angle, "political institutions shape (but do not determine) political conflict by providing interest groups with varying opportunities to veto policy" (Kay 1999, 406). In consequence, although we cannot assume that institutions alone explain political outcomes, from a comparative and institutionalist standpoint, it is crucial to pay close attention to the structuring role of institutions in explaining political and policy differences between countries. This remark points to the fact that as far as the idea of rules of the game is concerned, historical institutionalism and the work of rational choice scholars such as Tsebelis intersect.

In addition to studying political institutions and the rules of the game they create, many comparative institutionalist scholars have taken a historical perspective on the development of institutional and policy legacies and their effects over time. Here, the objective is to explore how temporal institutional processes create constraints and opportunities that can either facilitate or impede change. One influential perspective in the historical institutionalist literature concerns the analysis of path dependence (i.e., how past developments typically constrain future change through factors such as increasing returns that make it harder for political actors to alter an existing institutional path). In comparative research, analyzing the historical paths of institutional development is critical to contemporary institutionalist research in comparative politics. A prime example is the work of Paul Pierson on the politics of welfare state reform during the Reagan and the Thatcher years. According to him, the expansion of social programs during the post–World War II era created powerful vested interests that made policy privatization and retrenchment harder to achieve during the 1980s than what conservatives and academic commentators alike had predicted. From this angle, policies and institutions are embedded in historical logics that accumulate over time to constrain or facilitate change at a later date. As Pierson (2004) states in a more recent book, the idea here is not simply that "history matters" but that the timing and sequence of institutional development is a potential causal factor that deserves close attention in comparative political analysis. In this book, Pierson, who is a historical institutionalist, draws extensively on the work of rational choice theorist Douglass North, who is widely known for his research on path dependence.

RECENT TRENDS

In recent years, reacting to the above scholarship on path dependence, historical institutionalist scholars have stressed the need for more comparative research on the sources of path-departing institutional change. Beyond outside shocks and rare critical junctures, scholars such as Kathleen Thelen argue that over time, incremental processes and political strategies can lead to path-departing changes. In her work, Thelen explores the role of forms of incremental yet path-departing change such as conversion (i.e., the transformation of existing institutions without any radical change in their formal boundaries) and layering (i.e., the creation of new institutional layers alongside existing institutions).

A growing number of institutionalist scholars such as John L. Campbell have also argued that to fully explain institutional change, scholars needed to turn to the role of ideas in institutional development. Because ideas help actors assess existing institutional legacies and forge new institutions when existing ones are seen as flawed, it has been argued that they are a key component of institutional politics. Although Craig Parsons reminds us that ideational analysis belongs to a different type of explanation than institutional analysis, he also shows that it is possible to effectively combine these two types of causal argument. It is hard to predict in which direction contemporary institutional analysis is heading as far as comparative politics is concerned but it is likely that the analysis of change will remain on the scholarly agenda for years to come.

Insurgency

Insurgency is a form of intrasocietal conflict within a state, in which a nonruling group attempts to destroy, reform, or degrade the legitimacy and popular support of the state's ruling group to effect political change. Insurgencies are primarily political movements rather than conventional military conflicts, as insurgent groups attempt to defeat a stronger military power with political activism, subversion, propaganda, and intimidation through terror and assassination tactics. An underlying feature linking many insurgencies—historic and current—is the gross disproportion between the grand political aims of an insurgency and the insurgency's meager military capability to achieve such political aims.

Insurgencies often attempt to redress their military weaknesses by exploiting their personal knowledge and understanding of their local environments. Past insurgencies have originated in trackless deserts, dense jungles, or urban settings, typically less familiar to opposing state or international forces and providing a strategic advantage to local insurgent elements. Third, and most important, insurgencies rely on their popular support to leverage the local population for the additional recruits, funding, shelter, sustenance, and intelligence needed to prevail. In his classic work *On War,* military philosopher Carl Von Clausewitz described "people's war" as "a kind of nebulous vapory essence, nowhere condense into a solid body." This, combined with support of the people for a passionate cause, is the most basic precept of insurgency.

HISTORY OF INSURGENCY

Most insurgencies are labeled "failed revolutions," "rebellions," or "crimes" by history, in large part due to their inability to effectively combat a state or international superior military force or sustain resources to participate in prolonged battles. Consequently, insurgents have been known to lose local support should the population blame the insurgency for increasing civilian casualties or infrastructure damages. These insurgencies are eventually suppressed or often forced to negotiate ceasefires while they regroup and refurbish.

That said, there have been several successful insurgencies in the twentieth century. These include the Chinese Civil War (1927–1949), which some scholars refer to as the "archetype of modern insurgency." Other notable successful insurgencies were the Cuban Revolution (1953–1959), which concluded by placing communist rebel Fidel Castro in power for fifty-one years, as well as the anticolonial wars against the French in Vietnam from 1946 to 1954 and Algeria from 1954 to 1962, in which French forces were expelled by nationalist movements. In addition, North Vietnamese guerilla forces eventually defeated the United States and Allied nations during the Vietnam War (1959–1975); inflicting large numbers of casualties on both sides and concluding with the communist guerillas' unifying North and South Vietnam under a Communist takeover.

Due to the many insurgencies preoccupying the western European powers during the post–World War II era of decolonization, the concept of insurgency did not emerge in the modern military lexicon until this time period. The aforementioned failed French campaigns in Algeria and Vietnam significantly contributed to the emerging theories and discussion of insurgency and counterinsurgency, along with the myriad of British campaigns marking the eventual British withdrawal from Asia, Africa, and the Middle East from 1945 to the 1990s. However, despite insurgencies' accounting for the most prevalent forms of armed conflict since 1945, the study of counterinsurgency is still evolving as most regular armed forces have historically regarded the study as a niche area. Two historical and influential theorists of insurgency, British army officer T. E. Lawrence (commonly known as Lawrence of Arabia) and Chinese communist revolutionary and leader Mao Zedong, both wrote of the nature of insurgency during the first half of the twentieth century. Lawrence's characterization stated, "Armies were like plants, immobile as a whole, firm-rooted, and nourished through long stems to the head. We might be a vapor, blowing where they listed." He also described insurgency as a moral contest, not a physical one, and recognized that insurgent strength derived from strategy.

MAOIST INFLUENCE ON INSURGENCY

The same logic often credited to Mao Zedong underpins insurgency as 80 percent political and 20 percent military. Of note, Mao established and led the People's Republic of China from 1949 until his death in 1976. When analysts speak of classical insurgency, generally they are referring to the Maoist insurgency as "propaganda for guns, subversion for air power, men for machines, space for mechanization, political for industrial mobilization." Mao's goal was to convince the peasantry that his Red Army's soldiers were different, not just the enforcers of the latest warlord, but an end to the cycle of depredation and impoverishment that had plagued Chinese peasants for so long. By doing so, Mao could harness an

immense source of potential energy and resources to sustain his insurgent efforts.

Essentially, Maoist insurgency emphasized the critical relationship between the guerilla forces and the people to achieve a political goal. Since according to studies, there are three strategic phases—the defensive, stalemate, and offensive—between the insurgent and government, who will ultimately meet in conventional battle, the insurgent leaders must be guaranteed of the support of the population prior to engaging in conventional operations, to secure their victory. In an insurgency, the consent of the population as to how they seek to be governed is the underlying debate. The insurgent aims to detach the population's loyalty from the state and to demonstrate a greater capacity for governance. This is accomplished by the establishment of parallel governance structures and intimidation.

CLASSICAL INSURGENCIES VERSUS EMERGING GLOBAL INSURGENCIES

Most recent scholarship on insurgency, in particular that of J. Mackinlay, detects an evolution of classical insurgency to a new, even more virulent, post-Maoist form often referred to as "global insurgency" (Mackinlay, *An Insurgent Archipelago,* 2009). At the moment there is a strong association between global insurgency and the global Islamist movement dominated by the transnational terrorist organization al-Qaida, headed by Saudi Arabian Osama bin Laden. Most experts believe the techniques of post-Maoism may be adopted by any global movement and are not specific to Muslims. Radical Islamic movements have gained considerable popularity, media attention, and widespread psychological fear in the twenty-first century through the use of their mass-casualty civilian attacks and tech-savvy Internet propaganda. Therefore, while radical Islamic terror groups have gained the most international attention, this alone does not qualify such terror groups as the only version of a post-Maoist/global insurgency.

Whereas Maoist insurgent objectives were national, post-Maoist objectives are global, transcending national geographic boundaries and identities. The population involved in the Maoist/classical insurgency is confined to a single state (and possibly that of an intervening state), which is described as manageable. However, the populations involved in post-Maoist/global insurgencies are varied and dispersed, interconnected via mass communications and the Internet and often considered unmanageable. Unlike the center of gravity in a classical insurgency, which is the hearts and minds of the local or national population, global insurgencies attempt to unify their cause by appealing to global communities under the banner of ethnicity, religion, shared oppression, or shared economic status. For some global insurgents, requiring a great degree of local support is less relevant because insurgents operate in anonymity and have external sources of funding, sponsorship, and recruitment from their theater of operations.

Another difference between the evolved global insurgency and the classical version is that the all-important subversion process in Maoist insurgency was top down, whereas in post-Maoist insurgency, it is bottom up, characterized increasingly by propaganda of the terror operations that is conceived, planned, and executed by individuals and small groups without major central direction. National, classic insurgent organizations are vertical and structured, whereas in a global form, they exist as unstructured networks, often taking direction from regional leaders rather than a single entity.

Notably, many modern insurgencies taking place in countries such as Sudan, Iraq, and Afghanistan fall under the classic category of a Maoist national insurgency movement, with indigenous rebel groups seeking to overthrow the current government and expelling any intervening international force. However, what makes these insurgencies unique and reflects a common emerging twenty-first-century trend is that global insurgencies, such as the transnational terrorist organization al-Qaida, manipulate these national insurgencies as venues to proliferate their own ideologies and elicit recruits. Many of these countries become safe operating havens for transnational terrorist networks. Al-Qaida operatives reach out to insurgents, playing on their mutual anti–Western objectives and objective to expel international forces. Although al-Qaida networks may not seek the same nationalist goals as the indigenous insurgents, they provide the insurgents with another source of funding, arms, and training needed to combat the state and international intervention and therefore build partnerships of convenience.

Insurgencies have become one of the most hotly debated and intensely studied aspects of contemporary war studies. With the post-9/11 wars in Afghanistan and Iraq, which have drawn in international forces to quell the national insurgencies in both countries, major world powers have grown increasingly interested in learning to adapt their military structures and doctrines to meet the challenge. More generally, however, the study of insurgency and counterinsurgency has been thrust into the limelight because the once norm of regular conflict now looks decidedly irregular, a trend likely to continue as human society adapts to a radically more interconnected future and war along with it.

Insurrection and Insurgency

Insurrection is an armed uprising; insurgency is armed resistance by an organized political movement against an established government. While uprisings were common during the colonial era, they differed from insurgencies in that they were generally revolts led by elites in defense of traditional rights and obligations. Such was the case of the Indian Mutiny of 1857 and the Rif War in Morocco (1920–1925).

Insurgencies, by contrast, have tended to be mass movements that have their origins in the rise of nationalist sentiment at the end of the nineteenth and beginning of the twentieth centuries. Although insurgencies tend to be the result of local conditions, in particular where there are weak states, social inequalities, and foreign occupation, they are often related to broader trends in global ideas, usually through complex networks of learning and cooperation. The first of these was the rise of insurrectionary anarchism of the nineteenth century, a primarily European phenomenon. A second wave consisted of mainly rural and developing world movements, coinciding roughly with the process of decolonization in the developing world. A third wave, whose intensity has been peaked by uprisings in Afghanistan (1974–2009), Kashmir (1989–2009), Bosnia (1992–1995), Algeria (1992–2005), and Iraq (2003–2009), is the rise of insurgencies associated with militant Islam. These will be discussed in turn.

INSURRECTIONARY ANARCHISM

Insurrectionary anarchism consists of informally organized groups conducting direct and spontaneous violence against political authorities on behalf of oppressed segments of the population. This anarchical approach to revolutionary war eschews the political organization typical of mainstream revolutionary movements. Although it has never succeeded politically, it was noted for many assassinations against the Tsarists in Russia, the brief seizure of government in Berlin in 1919 under Rosa Luxemburg and the Sparticists, and the first car bomb—detonated by Mario Buda against Wall Street in New York in 1920.

MAOISM

Leftist insurgency has its origins in nineteenth-century Marxist predictions of class revolution in industrializing states. An early variant, Leninism, emphasized the use of a vanguard party to guide the masses, which it did with success in Russia in 1917 but failed to do in Hungary in 1919. During the cold war, applications of communist revolutionary theory produced two contradictory doctrines: the Maoist and the focoist. Both are applications of insurgency to conditions particular to China and Latin America, respectively. Through state sponsorship by the Soviet Union, Communist China, Cuba, and East Germany, these were exported widely to Africa, the Middle East, and Southeast Asia.

In Mao Zedong's conception of peasant revolution, insurgencies proceed through three successive phases. The first is the incipient phase, during which existing forces remain dormant while cadres of the political movement are organized. This was the case of the Chinese Communist Party, which organized itself underground from 1920 until the Nanchang Uprising of 1927. The second, or guerrilla, phase consists of terrorist attacks designed to pin down the government and thereby win the initiative. This was pursued intermittently in China between 1927 and 1945. In the third phase, field armies built up during the second stage defeat the government. This coincided with China's Communist Revolution (1947–1950).

Maoism is widely read and associated with rural forms of revolutionary warfare because of the insurgents' special knowledge of social conditions, as in the cases of the Malayan Emergency (1948–1960), the early phase of the Vietnam War (1960–1967), the Zimbabwe Chimurenga (1966–1980), Sendero Luminoso in Peru (1980–1992), the (Maoist) Naxalites of India (1967–2009), and the New People's Army of the Philippines (1969–2009).

FOCOISM

An alternative approach to revolutionary warfare, espoused by Fidel Castro and Che Guevera, is known as focoism. In this approach, demonstrative acts of violence, rather than political indoctrination, are used as catalysts to mobilize the population into an uprising. Revolutionary success without political mobilization was achieved in Cuba in 1959 due mainly to the widespread alienation caused by the inequitable policies of the Batista regime. Subsequent failures of focoism in, among other countries, Colombia in 1961, Guatemala and Ecuador in 1962, Peru in 1963, and Bolivia in 1967 were the result of a failure of political preparation. Focoism is usually associated with urban insurgencies. Focoist insurgency, although not termed as such, was also commonly used by noncommunist states. The United States sponsored the Khampa rebellion in Tibet (1959–1960) and the contras against the Sandinista government in Nicaragua (1979–1988). The Republic of South Africa sponsored União Nacional para a Independência Total de Angola in Angola (1975–1989) and Renamo in Mozambique (1975–1992).

ISLAMIST INSURGENCY

Islamist insurgency is inspired by the Islamic revivalist movement, which draws its legitimacy from the goal of arresting the relative decline of Islam vis-à-vis Europe (since the fall of Andalusia in 1492) and the erosion of Mughal power in India. Islamist thinkers, such as Jamal ad-din al-Afghani (1837–1997), Mohammad Abduh of al Azhar University (1849–1905), and Sayyid Qutb (1906–1966), are generally in agreement that Islam has been distorted, and thereby weakened, by successive

injections of Sufi and modernist thought. Abduh proposes a return to the early uncorrupted practice of Islam, termed "Salafism." Qutb argues that current Islamic governments have regressed to their pre-Islamic states (*jahiliyah*), justifying their removal. Building on obligations in the Sunna to defend Islam through jihad, some extremist movements practice *takfir,* which is the act of designating the *kafir,* or unbelievers. All of these ideas have come to justify the use of unlimited violence, in particular suicide bombings and attacks on noncombatants.

For example, the Peshawar-based mujahideen resistance of Afghanistan (1974–2001) was inspired by Qutb and the Salafism of the Egyptian Muslim brotherhood. Al-Qaida is a Wahhabi movement from Arabia, which seeks to reestablish an Arab caliphate. The Taliban (1995–2009) is a Deobandi variant of Hanafi revivalism popular among the Pashtun tribes. Islamist movements also benefit from a variety of state sponsorships (Saudi Arabia and Pakistan for the Deoband and Iran for the militant Shia) as well as diaspora funding through traditional banking (*hawala*) and narco-traffic. However, Islamist insurgency has won only a handful of militant converts among non-Muslims, underlining its limited appeal. In contrast, leftist insurgents were well represented among the Palestinians, Kurds, Pashtun, Iranians, and even Iraqi Baath.

Intellectual Property Rights

Intellectual property refers to patents, copyright, trademarks, and trade secrets. Intellectual property poses interesting problems because, unlike physical property, knowledge goods and information are not necessarily rivalrous. Simultaneous usage of such goods rarely detracts from their social utility. As they are not physical property, knowledge and information are not formally scarce. Intellectual property constructs scarcity by treating it as an exclusively owned commodity. Persons granted intellectual property rights have the power to withhold their intellectual property and to prevent others from using it. Many regard intellectual property as providing incentives to innovate and disseminate creative work; with intellectual property rights, individuals and companies reap rewards from their innovations, whereas without them, they would not profit from their time and investment.

Historically, governments employed intellectual property policies to promote development goals. Initially granted as exceptions to rules against monopoly, over time and especially beginning in the mid-twentieth century, intellectual property owners have come to regard them as rights. Property rights are quintessentially political, and given the increasing importance of intellectual property in the global economy, political scientists have begun to address the politics of intellectual property.

Early political science scholarship on the politics of intellectual property focused on multilateral negotiations over revisions to the Paris Convention for the Protection of Industrial Property that the World Intellectual Property Organization administers. In the 1970s and early 1980s, developing countries pressed for the New International Economic Order; they sought a weakening of laws governing intellectual property protection so that they could acquire greater access to knowledge goods. States abandoned these negotiations in the face of the 1980s debt crisis. A second wave of political science scholarship traced the incorporation of intellectual property into the multilateral trading regime (first the General Agreement on Trade and Tariffs and now the World Trade Organization). Member states incorporated the Agreement on Trade-Related Aspects of Intellectual Property Rights (TRIPs) into the World Trade Organization at the end of the Uruguay Round of multilateral trade negotiations in 1994. All member states are required to comply with TRIPs or face the prospect of trade sanctions.

Scholars increasingly focused on the politics of intellectual property in the face of the HIV/AIDS pandemic in sub-Saharan Africa and Asia. Some scholars focused on intellectual property and its impact on access to lifesaving medicines. In 2001 World Trade Organization member states passed the Doha Declaration on Public Health and Access to Medicines, affirming that nothing in TRIPs should prevent countries from providing lifesaving medicines to their citizens. Other scholars focused on the nexus between intellectual property, HIV/AIDS, and the implications for national security. The politics of intellectual property has been featured in literatures on nongovernmental organizations (especially concerning access to patented medicines and educational materials), grassroots activist campaigns, international regime complexes, forum shifting, bargaining, and the role of private power in the global economy.

Many international relations treatments of intellectual property rights have focused on norm setting across diverse multilateral institutions such as the World Trade Organization, the World Health Organization, the Convention on Biological Diversity, the Food and Agriculture Organization, and the World Intellectual Property Organization. Scholarship has also examined vertical forum shifting between multilateral, plurilateral, regional, and bilateral arenas for agenda setting, norm setting, surveillance, and enforcement. Analyses have evolved from the initial macro-level international relations treatments

of norm setting and rule making in the trade regime to in-depth comparative and domestic politics treatments. Recent scholarship highlights aspects such as technical assistance, capacity building, and policy implementation.

Further work examines the intellectual property enforcement agenda, locating it in the literature on global business regulation. Heightened interest in a development agenda has renewed scholarly attention to intellectual property policy as a means to an end rather than as an end in itself. For example, intellectual property policy can be tailored to meet diverse development goals such as technology transfer (particularly salient in climate change deliberations), national innovation strategies, and access to educational materials and digital media. The World Intellectual Property Organization is engaged in discussions with member states about a Development Agenda that includes considerations such as the status of so-called traditional knowledge, folklore, and wild cultivars. At the same time, a number of Organization for Economic Cooperation and Development countries are negotiating an Anti-Counterfeiting Trade Agreement in an effort to put an end to software piracy and trademark counterfeiting. The politics of intellectual property has proven to be a fruitful and dynamic area of political science research.

Intelligence Failure

Intelligence failure is a term used to describe situations when intelligence organizations, military commands, foreign ministries, or even law enforcement agencies fall short in providing accurate and timely warning to officials of nascent dangers or opportunities. The term is used to describe failures to predict specific events rather than failures to produce accurate risk assessments, which are more general estimates of the nature, severity, and likelihood of threats. Intelligence failures are often linked to strategic surprise, a type of event that can change the course of history by creating international or domestic crises or by initiating war. Examples of intelligence failures that contributed to strategic surprise include the 1941 Japanese attack on Pearl Harbor, Hawaii, and the 1968 Tet Offensive during the Vietnam War (1959–1975).

TYPE I AND TYPE II ERRORS

Intelligence failures can involve Type I (false positive) and Type II (false negative) errors. The September 11, 2001, al-Qaida attacks on the World Trade Center and the Pentagon involved a Type II error because the U.S. intelligence community failed to recognize or respond effectively to signals of an impending attack. Intelligence and law enforcement officials recognized that al-Qaida was operating within the United States and was even plotting to hijack airliners, but they failed to piece together information within intelligence channels that might have derailed the plotters. The U.S. government's inability to assess accurately the state of Iraqi president Saddam Hussein's efforts to restart his chemical, biological, and nuclear weapons program reflects a Type I error that contributed to the decision of U.S. president George W. Bush and his administration to invade Iraq in 2003. A combination of international sanctions, U.S. surveillance overflights and airstrikes, United Nations inspections, and diplomatic pressure made it impossible for Iraq to continue significant efforts to build nuclear weapons.

Intelligence failure can occur at any or all points in the so-called intelligence cycle: setting requirements for data collection and analysis, collecting information, fusing and analyzing information, and deciding to respond by selecting and disseminating warnings to organizations and individuals. In addition, effective response plans must be available to field commanders, diplomats, or law enforcement officials, and warning has to be received in time to defeat the opponent's plans. Officials sometimes have a good appreciation of what is about to transpire in the final hours before disaster, but they no longer have the means to communicate to field units or a realistic way to prevent what is inevitable.

SOURCES OF FAILURE

Sources of failure have been linked to several levels of analysis: factors that are inherent in the production of finished intelligence and warning, human cognition, organizational behavior, and relations between the intelligence community and officials. The cry wolf syndrome is an example of a problem inherent in analysis and warning. It occurs when analysts repeatedly sound false alarms that cause recipients to dismiss what eventually turns out to be a legitimate alert. Scholars also have identified several common cognitive biases that can impede both the analysis of information and the response to warning. For instance, mirror imaging—the tendency to interpret another actor's behavior using one's beliefs, experiences, values, or standard operating procedures—can cause fatal errors in analysis and response.

Organizational behavior has offered insights into the sources of intelligence failure as well. Compartmentalizaton, for example, is endemic in intelligence production because the need-to-know principle governs individual analysts' access to information. But organizations are jealous guardians of information, and bureaucratic rivalry or differences in standard operating procedures can slow the flow of information within organizations or across the intelligence community. For instance, the inability to move information across the legal and cultural boundaries between intelligence and law enforcement agencies contributed to the intelligence failure associated with the September 11, 2001, attacks. A variety of problems also can emerge to bedevil relations between the intelligence and policy-making communities. Politicization emerges when policy makers place overt or subtle pressure on intelligence analysts and managers to produce estimates to support political preferences or policies. Adaptation failure—the inability of organizations, personnel, or procedures to adjust to a shifting threat environment—is another cause of intelligence failure.

Research indicates that intelligence failures rarely occur as a result of an absence of signals within the intelligence pipeline. Accurate information is often available; what is missing is an analytical framework that can place existing information in an appropriately alarming context. This explains why data and indicators that once seemed innocuous take on a clear and compelling significance in hindsight. Imagination also is generally not lacking among victims of intelligence failure. In the 1930s, the U.S. Navy repeatedly war-gamed a Japanese attack on Pearl Harbor; senior navy officers knew and told policy makers that the U.S. Pacific fleet was in an exposed position.

FUTURE OF INTELLIGENCE FAILURES

Although intelligence failures can create crises or exacerbate enduring conflicts leading to war, it is unlikely that they can be prevented in the future. Intelligence failure might be a manifestation of the structure of conflict itself. The victims of intelligence failure rarely share the same worldviews, perceptions of risk, or incentives as those seeking to surprise their competitors with a fait accompli, creating a cognitive divide that is difficult to bridge beforehand. Even when detected by analysts and reported to officials, signals of impending threats tend to be dismissed as unrealistic or even harebrained because they are deemed to be simply too risky or ultimately counterproductive to be contemplated by even somewhat irrational individuals. Reforms adopted in the wake of intelligence failure also cannot guarantee future success because of the difficulties in making changes in organizations and procedures to anticipate threats that are impossible to discern in their entirety and detail. An additional frustration is that even effective reforms can create a false sense of security, setting the stage for new misperceptions, biases, or organizational pathologies that sow the seeds of future failure.

For instance, security at the World Trade Center was vastly improved following the 1993 detonation of a bomb in a parking garage. Thus, one might wonder why intelligence analysts failed to recognize that the center might be subjected to renewed attack by Islamic fundamentalists, but experts would have considered the site to be relatively well defended against attack. Following security upgrades, traffic was directed away from the buildings, trucks were no longer allowed to drive underground, and surveillance systems were improved. There was every reason to believe that there were easier targets to attack. But in the absence of an accurate perceptual lens, expertise alone cannot prevent failures of intelligence.

Intelligence Services

Intelligence services undertake counterintelligence operations, monitor internal security, make and break codes, or conduct covert operations. Some specialize in gathering information from open sources, espionage, or domestic surveillance activities to produce secret intelligence reports for government officials, members of the armed forces, or the intelligence service itself. During the past half century, technical collection systems involving imagery captured by satellites in low-earth orbit and reconnaissance aircraft, signals intelligence (intercepted communications), and measurement and signatures intelligence, which characterizes and identifies various electronic and industrial systems, have come to play a dominant role in the creation of intelligence estimates and reporting. The rise of transnational criminal-terrorist networks, however, has placed a premium on human intelligence, especially information gathered by metropolitan police forces.

Intelligence services have existed in one form or another throughout history. Today, the best-known intelligence services are maintained by national governments, although state, local, and even corporate intelligence agencies are becoming increasingly prevalent and important. The information revolution has created opportunities for subnational and private organizations to produce tailored intelligence reporting and improved situational awareness by fusing and then analyzing data from a variety of sources. The New York City Police Department, for instance, maintains liaison officers with foreign municipalities and publishes the *NYPD Shield,* an intelligence bulletin for the law enforcement community. Corporate

intelligence organizations provide risk assessments related to a firm's assets or interests while identifying immediate threats to ongoing operations or corporate personnel. Commercial enterprises also offer risk analysis and clipping services to help their clients identify business opportunities and gauge investment risks.

The U.S. intelligence services are nominally under the control of the director of national intelligence (DNI). Created in the aftermath of the September 11, 2001, attacks on the Pentagon and the World Trade Center, the DNI's primary purpose is to coordinate the activities of the organizations that constitute the U.S. intelligence community. The National Intelligence Council and the National Counterterrorism Center are part of the Office of the Director of National Intelligence. The Central Intelligence Agency continues as an independent organization, although the community-wide role once played by the director of central intelligence has now been taken over by the DNI. The Coast Guard, the Federal Bureau of Investigation, the Drug Enforcement Agency, and the Departments of Justice, State, Energy, and Homeland Security all maintain specialized intelligence services. Most of this intelligence community, however, is actually lodged within the Department of Defense. The National Geospatial Intelligence Agency, the National Reconnaissance Office, the National Security Agency, the Defense Intelligence Agency, and the U.S. Army, Navy, Air Force, and Marine Corp intelligence agencies are all part of the Department of Defense.

Oversight of intelligence services and the concentration of police and political power in intelligence agencies vary widely. The division of labor between organizations that gather foreign intelligence and domestic police authorities often was used as a metric of democratic freedoms enjoyed within states. Authoritarian and totalitarian regimes often use their intelligence and law enforcement agencies as an instrument of state terror, helping to keep a ruling party, clique, or dictator in power. No distinction is made between foreign and domestic threats; both are often subject to scrutiny by the same organization. Under these circumstances, intelligence services and government oversight become indistinct, creating a counterintelligence state. The United States, by contrast, has utilized both congressional and judicial oversight of the intelligence community, an arm of the executive branch of the federal government. Domestic intelligence activities also are regulated by the Foreign Intelligence Surveillance Act, which requires a showing of cause either *ex ante* or *ex post* for surveillance actions undertaken against individuals and careful record keeping to facilitate oversight and accountability. In addition, the United States traditionally maintains boundaries between the activities of foreign intelligence organizations (e.g., the Central Intelligence Agency) and domestic counterintelligence and law enforcement agencies (e.g., the Federal Bureau of Investigation). These boundaries between foreign-domestic and intelligence–law enforcement activities were actually exploited by al-Qaida in the months leading up to the September 11 attacks. The U.S. government agencies found it difficult to coordinate the flow of information and analysis across bureaucratic boundaries, especially when the opponent seemed to move across international borders with ease. The fact that terrorists found it easy to hide in plain sight, blending into local populations while they planned and trained for their operation, highlighted the need to better fuse and disseminate information gathered from foreign intelligence services and local, state, and federal law enforcement agencies.

Intelligence reforms in the aftermath of the September 11 attacks have exacerbated the tensions created by the existence of secret organizations within democracy. Indeed, one of the chief externalities of globalization has been the blurring of the distinction between foreign intelligence operations and domestic law enforcement activities. The ability of transnational actors to operate across international boundaries has forced domestic law enforcement agencies and foreign intelligence services to share information. In the United States, this collaboration, however, is constrained by the limited ability of law enforcement agencies to maintain dossiers on individuals or groups in the absence of probable cause, a limit that does not affect the actions of U.S. foreign intelligence services that have only a limited interest in the future legal prosecution of their foreign intelligence targets. Proponents and opponents of increased government domestic surveillance also struggle to strike a balance between the need to increase domestic surveillance and the need to protect citizens' rights to privacy. For example, it is difficult to reconcile monitoring domestic communications or data mining in an open-ended search for anomalies that might indicate nefarious activity with individuals' right to privacy. It is impossible to show cause against individuals living in the United States who might be communicating with al-Qaida if their identities are unknown and evidence of the communication has to be uncovered by sifting through the phone calls of everyone in the United States. Resolving these sorts of issues promises to fuel future debate about the proper role of intelligence services.

Interdependence

Interdependence refers to independent social actors who are structurally affected by one another's behavior. The actors are involved in each other's affairs (functional or integrative

interdependence), or they are part of the same system (systemic interdependence) (see Figure 1). Interdependence can be operationalized into a three-dimensional concept, which expresses how given actors are mutually affected by one another's behavior (see Figure 2). The first dimension concerns the degree of mutual involvement (the existential value of the relationship for the actors). The second dimension concerns the character of mutual involvement: confrontational versus constructional. The third dimension concerns the (a)symmetry of mutual involvement: the distribution of costs and benefits.

The debate about global economic and political interdependence dates back to the late nineteenth century. It reemerged (without awareness of the earlier discourse) in the 1970s, when environmental interdependence was also emphasized, and again in the 1990s. This last round fits the wider context of the present globalization discourse. Much of the debate is about the functional need to adapt global governance to existing (systemic) levels of economic and environmental interdependence: a plea to increase constructive political interdependence in the face of global needs and a critique on the ability of sovereign states to rule effectively. Consequences for conflict management are at the heart of the debate: interdependence is a major source of conflict, but it also sets structural limits on rational choice–based unilateral strategies to win or settle conflicts. The debate reflects the wider chicken-or-egg question: does politics shape the necessary conditions for economics or vice versa?

Interest Aggregation and Articulation

Citizens hold various values or preferences that they wish to promote in public policy, such as protecting the environment or encouraging steel production, and these amount to their interests in government and politics. Citizens with similar political interests often organize into interest groups, and the related concepts of interest articulation and interest aggregation, which were popularized by Almond and Coleman (1960), describe different ways that interests are input into the political system.

To articulate an interest means to express it clearly. According to Almond and Coleman, interests are usually articulated by organizations, or interest groups, that present specific desires before relevant political actors, such as legislatures, executives, bureaucracies, voters, and courts. For example, an environmental group may back legislation to reduce greenhouse gas emissions. Interest groups typically—but not exclusively—engage in interest articulation.

To aggregate interests means to collect and balance different, often competing, interests. Suppose that an industry group backs legislation to subsidize domestic steel production. The legislation could increase greenhouse gases, so an environmental group lobbies against it. In this scenario, the legislature would decide between competing proposals or strike a compromise between the two interest groups. In either case, it assumes the task of interest aggregation.

FIGURE 1. THREE TYPES OF STRUCTURAL INTERDEPENDENCE. FROM DE WILDE, JAAP H. (1991), *SAVED FROM OBLIVION: INTERDEPENDENCE THEORY IN THE FIRST HALF OF THE 20TH CENTURY*, ALDERSHOT: DARTMOUTH, PP. 17–27.

However, Almond and Coleman note that interest aggregation is often performed by another type of political organization, political parties. Contrary to interest groups that are usually formed by those sharing similar and narrow interests, political parties are composed of broad coalitions of citizens with vastly different interests. In assembling that coalition and appealing for electoral support, political parties need to aggregate different interests.

As Almond and Coleman (1960) admit, "The distinction between interest articulation and aggregation is a fluid one" (p. 39). Moreover, the functional allocation of interest articulation to interest groups and interest aggregation to political parties can break down. Some interest groups—often called "peak associations"—are broader than others. They speak for whole classes of society, such as labor or business, and must aggregate their members' conflicting interests. Conversely, some political parties, such as environmental or religious parties, are more articulative than other parties. The extent to which interest groups and political parties vary in being articulative or aggregative becomes a matter for theory and research.

Unfortunately, most existing theory and research neglects the aggregative function of interest groups and the articulative function of political parties. Research often cites aggregation and articulation as functions of political parties but then discusses only how parties aggregate interests, neglecting to describe how they can also articulate interests. Indeed, parties that aggregate interests are usually praised for governmental contributions, while parties that articulate interests, especially ethnic parties, are deemed politically dysfunctional. However, the consociational model of democracy sees democratic potential in ethnic parties too.

Interest Groups and Lobbies

The study of interest groups lies at the intersection of many fields of political science, although it is commonly associated with democratic systems. American political science often associates interest group studies with the study of political participation, linking to the study of electoral politics, campaigns, and elections. Interest groups in the United States are commonly conceptualized as organizations outside government working to influence its policies. On the other hand, interest group studies linked to Europe or Japan become a form of political economy exploring linkages between state and society. Interest groups are generally assumed to be founded on or advocates for an economic interest, particularly in the neocorporatist tradition, which favors centralized unions and opposes liberal capitalism. In this view, interest groups act as partners in governance with the state and are likely to be involved in policy implementation as in policy formulation.

Although the meaning of *interest groups* remains ambiguous—whether it is preferable or inferior to be considered a pressure group, organized interest, state, or society—a large number of impressive studies offer contrasting insights into interest groups and their status among and influence on politics and government. The study of interest groups has inspired large bodies of literature in formal theory, especially on collective action, and in normative political theory, including most famously pluralism, the belief that power is and ought to be widely dispersed among numerous groups, all with a capacity to influence public policy. Since pluralism underscores the guiding principles for most democratic states, the presence and popularity of interest groups in a state tend to be most active within democratic models.

INTEREST GROUPS AND POLITICAL PARTICIPATION

For many, the phrase *interest group* still conjures up an image of an organization composed of individual citizens focused on advocating a particular subject or area of politics, such as the energy sector, the environment, abortion, or animal rights. When studying such interest groups, questions still arise as to the reasons why people join specific interest groups and the consequences of these groups on the political system.

INTEREST GROUP FORMATION AND MAINTENANCE

For nearly two hundred years, the reasons motivating people to join or not join interest groups has been the object of investigation. Nineteenth-century French political thinker and historian Alexis de Tocqueville famously argued Americans were unusually likely to join voluntary associations. In recent years, Robert D. Putnam, in his works *Making Democracy Work: Civic Traditions in Modern Italy* (1993) and "Tuning In, Tuning Out: The Strange Disappearance of Social Capital in America" (1995), expressed worry that Americans were losing this characteristic and as a result, social capital was declining. Theda Skocpol in contrast argued in his 1996 book *Boomerang: Clinton's Health Security Effort and the Turn against Government in U.S. Politics* that voluntary organizations were related to current developments in the nature of the American state rather than a natural enthusiasm of Americans to join. James A. Curtis and colleagues linked high levels of participation in civic life in America to religiosity; in a fifteen-country study, they found Americans' level of participation to be roughly equal to or less than the levels of citizens in other advanced industrial nations when religious memberships were removed.

Some of the most famous literature on interest groups seeks to explain the apparent lack of logical reasoning among members deciding to join such groups. Mancur Olson argued joining interest groups is irrational if an individual can enjoy the benefits they pursue whether or not the individual is a member. According to Olson in his 1965 work *The Logic of Collective*

Demonstrators gather to protest against excessive government spending and financial bailouts. Interest groups may lobby governments formally through organizations designed to influence legislation or they may organize public displays to make their views known.

Action, interest groups must supply selective incentives limited to members to elicit and sustain membership. The most important application of Olson's theory was the difficulty of forming interest groups that pursued widely dispersed, nonexcludable benefits, such as clean air or water, generally termed "public goods." In consequence, pluralism seemed to be an unlikely platform to provide for the common good of a population and instead appeared to favor more concentrated, narrower interests that had a better chance of overcoming collective action problems. Essentially, individuals would be more incentivized to work collectively to promote their private interests rather than joining forces together to promote a widespread, ambiguous greater good. However, after Olson's theories were published in 1965, there was a surge in the strength of public interest groups in the United States and globally, which exists to this day. Scholars such as Jack Walker and his students have suggested explanations for the surge in public interest group strength, which still fall in line with the essence of Olson's argument. Walker argued against underestimating the weight of importance for

an individual to perceive support from a foundation(s) or the individualized benefit of simply belonging to an organization, which can provide satisfaction to the individual apart from the actual stated goals and objectives of the organization.

A focus on why individuals do or do not join interest groups may be misplaced. In many countries, interest group politics is dominated by organizations representing business and labor groups, which are recognized, legitimized, and encouraged by the state to serve as its partners in governance. As Robert Salisbury noted many years ago, "institutions" dominate interest group activities, and he was reinforced by other scholars stating interest group lobbying is carried out primarily by economic organizations.

INTEREST GROUP STRATEGIES: PARTICIPATION IN ELECTIONS

In the United States, interest groups have a long history of working in election campaigns to support candidates, favoring or sponsoring their causes. Labor unions have been particularly prominent in this regard, along with conservative interest groups such as the antiabortion group Right to Life and the gun owners' group National Rifle Association, which have also been vigorous, highly visible national campaigners. There have been repeated U.S. governmental attempts to regulate interest groups' campaigning involvement. As such, interest groups are prohibited from giving U.S. political candidates running for federal office money from their general funds, but they can raise earmarked funds through a separate political action committee (PAC) to distribute in limited amounts to candidates, amounting to US\$5,000 per election. PAC spending is regulated by a federal agency to ensure appropriate candidate spending and prevent direct corporate, interest group, or lobby contributions to candidates. Research studies as to whether PAC financial contributions have changed votes in Congress have yielded mixed results, although they generally conclude PAC contributions do not determine voting outcomes in Congress. However, while political scientists are skeptical that monetary contributions buy votes in Congress, most believe they do facilitate access to policy makers.

Despite federal oversight, interest groups have found alternative means to funnel money to politicians, such as bundling together individual contributions such that they can readily exceed PAC limits, referred to as "soft money." Campaign reforms in the United States in the past ten years—exemplified by the Bipartisan Campaign Reform Act of 2002 (McCain-Feingold Act)—have attempted to further regulate private campaign donations and corporate sponsorship of campaign advertisements. However, in 2010 the U.S. Supreme Court overturned campaign-financing laws related to corporations, nongovernmental organizations, and unions, allowing these entities to finance independent broadcasts for political candidates under the U.S. Constitution's First Amendment.

Similarly, interest group backing of campaign financing occurs in other countries. Labor unions have long been the primary source of finance for the British Labour Party, Britain's democrat socialist political party, whereas businesses

from certain industries were the traditional source of money for Britain's Conservative Party. However, the limited scope for paid television commercials and availability of free television time to the parties have somewhat reduced the need for British political parties and candidates to raise money from external sources. Notably, with the rise of capital-intensive campaign costs, meaning opinion polling, focus groups, and so forth, political candidates could begin to seek additional funds.

LOBBYING

As demonstrated by their engagement in political campaigns, most interest groups focus their energies in ways that maximize their chances of influencing policy in their states. Accordingly, when institutions gain power, they attract greater attention from interest groups. As such, the decision making of the European Union's taking precedence over domestic member state policies has led to a dramatic growth in the amount of interest groups lobbying the European Union.

In states ruled by parliamentary systems—including Australia, Canada, India, Israel, Japan, South Africa, Turkey, and the United Kingdom—the overriding dominance of the executive body inevitably makes the executive the primary focus of interest groups, according to pioneering political scientists Samuel Beer and S. E. Finer. In contrast, the UK government under Prime Minister Margaret Thatcher (1979–1990) explicitly committed itself to reducing the role of interest groups in policy making, trying to limit the administration's contact frequency and closeness with the Trade Union Congress and the employers' organization Confederation of British Industry. The Labour government led by Prime Minister Tony Blair (1997–2007) took care not to reverse this change so as to continue trying to limit union influence in the government. Similarly in Japan, the relationship between the Ministry of International Trade and Industry and the general employers' organization, known as the Keidanren, and trade associations was extremely close during the period of state economic growth from the 1950s to 1990. Thereafter, as this model of economic development faltered, the relationship faltered, and the Ministry of International Trade and Industry was reorganized.

The focus of U.S. interest groups on the U.S. Congress is so well known that some are still surprised that interest groups seek to influence other institutions as well. Since congressional committees generally comprise legislators whose constituencies are affected by the policies the committee adopts, then these legislators are often the targets of interest groups seeking to impose changes within constituencies. The combination of the power of congressional committees over agencies and the influence of interest groups on the legislators on the committees is often described as creating subgovernments or iron triangles, three-sided relationships between legislators, agencies, and interest groups that lead public policy to be directed toward satisfying the interest group, not the public interest. In recent decades, the iron-triangle approach has diminished as interest groups use broader policy networks to veil their strategies and activities.

Separately, U.S. interest groups are not limited to lobbying only congressional committees and legislators, but as Joel Aberbach and Bert A. Rockman depict in their studies, interest groups are in regular and frequent contact with bureaucrats and political appointees within the U.S. executive branch, including the Office of the President or cabinet members. Interest groups have also been highly visible actors in some of the tumultuous legislative and executive confirmation fights over justice nominations to the Supreme Court. Gregory Caldeira and Jon Wright have shown that the filing of a large number of amicus curiae briefs makes it more likely that the Supreme Court will hear the case. In addition, interest groups often appeal through the court system, contesting regulations issued by agencies such as the Occupational Safety and Health Administration or the Environmental Protection Agency.

DETERMINANTS OF GROUP STRATEGIES

With few exceptions, political scientists have been slow to analyze the determinants of interest group strategies. Kenneth Goldstein (1999) proposed analyzing the relevant differences between some interest groups in the United States that give large amounts to political campaigns and others that concentrate on grassroots efforts. Similarly, Wyn Grant (2000) pointed out that theorists should explain the different strategies employed by interest groups in the United Kingdom; some choose an insider strategy, developing strong relationships with government departments, while others prefer an outsider approach more likely to include protests. One explanation for these differences is that institutions shape specific interest groups—as well as being influenced by them. Interest groups in many countries—including democratic governments—have been sponsored and promoted by the government. Political funding/backing of an interest group will most likely determine the methods and degree of accessibility an interest group possesses and most likely predict the group's popular support as interest groups are inevitably shaped by the character of the political institutions supporting them.

INTEREST GROUPS, GOOD OR BAD?

Most American studies on interest groups have been related to the political and scholarly debate about the U.S. implementation of pluralism, questioning whether power is widely dispersed among the competing interests that encompass and characterize American society. In this debate, arguments have pointed out the lack of specific important interests not being represented by the interest group system or conversely demonstrating particular interest groups—usually business associated—enjoy privileged status or power within the interest group system. Thus, these questions tend to reconcile the compatibility of the interest group system and democratic values.

Aside from the impact of interest groups on policy, impact on members is also examined. Tocqueville famously argued that groups could be training grounds for citizens, providing experience at a direct, more limited level of practices vital to democracy. Such groups have been credited with the capacity to counteract the lawlessness or anomie of mass society as well as moderate society's dependence on the state. The

development of groups providing a civil society that stands between the individual citizen and the state has been seen as a key part of a transition from totalitarian or authoritarian dictatorships to truly democratic societies. This aspect of theorizing about transitions draws in part on the Tocquevillian view that involvement in groups promotes social capital and the willingness of citizens to work with and trust each other.

There has been much discussion about whether the associational life of Western democracies has been declining as citizens watch more television and engage less with each other as referenced by Putnam. Less attention and oversight are paid to the nature and activities of the groups, therefore diminishing their capacity to provide the benefits social theorists hoped they would. Skocpol notes that most interest groups in the United States today are far from social reform–minded participatory organizations Tocqueville and others celebrated.

Intergovernmental Relations

Intergovernmental relations describes how different levels of government interact with one another within the same political system. The official organizational structure of governmental units determines the basic parameters of this process. However, funding mechanisms and specific policy issues also have significant impacts on how various levels of government interact with one another.

STRUCTURAL INFLUENCES

In a federal system, political authority and responsibility are divided between one central government and a series of regional governments. The regional governments are often broken down even further into smaller governmental entities, such as counties, townships, cities, parishes, and villages. Although there are differences across federal systems, they do share some common characteristics. In most federal political systems, the central government handles those issues that affect the entire country, whereas regional units focus their efforts on matters that are particularly relevant within their own jurisdictions. Only about twenty nations have federal political systems, but they include some of the largest, most populous countries—the United States, Canada, Germany, Mexico, Argentina, Brazil, Venezuela, India, and Nigeria.

Similar to their federal counterparts, unitary systems divide responsibilities between a central government and lower governmental units. But in a unitary system, the central government retains the ability to determine the breakdown of policy responsibilities and power across various levels of government. The vast majority of nations around the world have some form of unitary structure for political representation and governmental activity. Unitary systems include Great Britain, Italy, France, Japan, Sweden, Uruguay, South Korea, and Kenya.

Intergovernmental relationships are affected by the division of power that exists within a given political system. In unitary systems, the roles of the central government vis-à-vis subnational units are more clearly defined, allowing various levels of government to work more effectively with one another. However, in federal systems, the division of responsibilities between governmental units may not be as clear-cut. This, in turn, can contribute to greater intergovernmental confusion, tension, and conflict.

However, intergovernmental relationships are not solely determined by the organizational structure of a political system. There are countless ways for governmental units to interact with one another in both unitary and federal political systems, and there are a number of factors that affect these intergovernmental relationships.

FINANCIAL INFLUENCES

Many intergovernmental relationships involve an exchange of financial resources targeted to deliver public goods. Various methods are used to determine the amount of intergovernmental transfers, including equal sharing arrangements among municipalities, block grants for individual programs, and formulas that include economic and demographic variables. The disbursal of funds from one unit to another typically involves stipulations for administrative oversight and performance standards. In some instances, lawmakers at the national level enact mandates requiring services be provided by regional, state, or local governments but do not provide sufficient resources to implement them. This behavior is common to education and entitlement programs, wherein performance standards are often dictated by a central government but lower units are responsible for financing the cost of meeting those benchmarks.

In many federal political systems, resources flow from central to regional governments and then to localities, but the amount of money distributed and the level of autonomy that each level of government possesses vary across different federal systems. The central government in Spain, for example, distributes conditional and unconditional grants and a share of income tax revenue to municipalities and provinces, which raise additional income through local taxes, which deliver public services. Likewise, states/provinces and localities in the United States and Canada receive a share of federal tax revenue through various means—direct revenue sharing, grants, and program subsidies—but raise additional resources through income, use, and property taxes. These funds are used to finance programs mandated at both the federal and the state level.

In other cases financial arrangements are more decentralized. Swiss municipalities enjoy a fair amount of financial sovereignty from their central government. While some federal resources do trickle down to municipalities through cantons, a large majority of municipal revenue is derived from locally levied personal and corporate income taxes. Australian localities enjoy a similar level of independence from their federal government, raising a majority of their budgets through property taxes, with most federal and state grants earmarked to provide public goods including housing and infrastructure.

The transfer of funds from central to regional and/or from regional to local governments for the purpose of providing social services can lead to conflict with municipal leaders, who often find that actual program costs exceed what they have been delegated. Such intergovernmental tension is quite common. School districts in the United States, together with many state departments of education, have made light of the issue that federal funding is insufficient to comply with and meet federal education standards. Similarly, costs associated with the transfer of French high schools to regional governments have far outstripped the size of federal grants.

Global economic and demographic changes have had an impact on local, regional, and federal budgets. Technology has played a role, as goods formerly subject to taxes are increasingly delivered through hard-to-tax digital channels, creating downward pressure on state and local budgets that depend on such revenues and, with rare exception, must be balanced each year. At the same time, federal budgets worldwide have been strained by increased expenditures on health care and programs for the elderly, a by-product of a gradually aging population. In the United States, the federal government has shifted an increasing amount of responsibility for infrastructure construction and maintenance to states and municipalities. This, in turn, has created additional pressures on state governments to meet their own obligations.

POLICY INFLUENCES

Constitutional frameworks, political structures, and the needs of native populations contribute to differences in how policy relationships play out between levels of government. Areas that do not require significant dependence on subnational units for implementation, such as defense, foreign affairs, and macroeconomic policy, are directed by central governments. If

necessary, subnational constituents make their views regarding these issues known through institutional channels or by lobbying elected representatives or special interest organizations. But in several other areas, some of which are discussed below, input is required from multiple levels of government. There is often a tension in policy making between the benefits of centralization at the national level, particularly economies of scale on one hand and the need to deliver services that meet the needs of diverse constituencies on the other. Questions about accountability, funding, and oversight further complicate this balancing act, which occurs in multiple areas of policy.

EDUCATION

Given the social and economic benefits attached to a well-educated population, it is not surprising that all levels of government place education at the top of their policy agendas. Elementary, secondary, and postsecondary schools are often locally operated, with regulatory and financial support coming from a combination of local, regional, and national sources. The structure of intergovernmental associations as they relate to education differs among developed nations. Many countries operate national ministries of education, although the actual responsibility for operating the schools often lies at the local or regional level.

In some contexts, such as the United States, Canada, South Africa, and Australia, states and provinces assume a great deal of responsibility for instruction. Funding procedures differ, but in general, primary and secondary education is financed through local taxes with some schools overseen by locally elected officials. Curricula are implemented in accordance with standards developed at the local and/or state level. While states and provinces also contribute funding to community colleges and public universities, the amount is not equalized, leaving some institutions to rely more on tuition, research grants, and private support.

Many national governments do not provide sufficient financial support for schools, but this does not preclude their influence on education policy, especially in terms of establishing standards and being responsible for program accountability. An expanded federal role in the United States can be traced to the 1965 Elementary and Secondary Education Act, the creation of the Department of Education in 1980, and the passage of the No Child Left Behind Act in 2002. These policies had several goals, although most centered on increasing accountability and standards in public schools and ensuring equal opportunity and access to traditionally underserved populations. State and local officials often complain that the funding provided by the federal government is insufficient to implement such policies and that federal mandates have not improved the quality of public schools. A comparable dynamic can be seen in Great Britain between local authorities and the central government. Conflict persists because educational services are delivered at the local level but funded through national taxation and regulated by a national agency, the Department for Children, Schools and Families, although some mandates have been relaxed.

Intergovernmental disputes over education policy do not appear to be as prominent in many other centralized systems. In smaller nations, such as Norway, Ireland, and Denmark, all schools (including universities) are supported almost entirely by the national government. This eliminates some of the conflict between regional and central policy makers. A similar approach is followed in China and South Korea. While education in larger European nations such as Germany and France is financed at both the national and the state level, subnational units retain some policy control. This basic model is also present in Russia, where education is mostly regulated by the central government with some input from regional authorities.

EMERGENCY PREPAREDNESS AND RESPONSE

Emergency preparedness policy is typically established at the national level, with national, regional, and local governments sharing responsibility for program implementation. This includes the development of policies aimed at preventing the occurrence of emergencies as well as policies designed to help citizens recover from them. Coordination among governments and their supporting agencies is a complex undertaking; indeed, the delineation of responsibilities and jurisdictions is still largely a work in progress. The experience of the United States is instructive. In 2002, a new federal agency—the Department of Homeland Security—was created to improve the government's response to emergency situations. But the department has gone through subsequent structural changes, and some of its policy responsibilities have been shifted to other federal agencies and to state and local offices. While the phrase *homeland security* is largely an American term, other countries have pursued similar strategies in this policy area. For example, Canada made strides at coordinating various security and emergency response efforts by forming Public Safety Canada in 2003.

Changes at the national level have increased pressure on regional and local governments, which are often charged with carrying out actual preparedness efforts. Those responsibilities are far-reaching, from day-to-day operations to equipment procurement and disaster response planning, all of which require significant human and financial resources. Localities look to federal agencies for assistance, but national-level feedback, in terms of establishing clear security priorities with sufficient funding, is often fragmented and redundant. One conflict that both national and regional governments have grappled with is "risk versus spread"—whether funds should be concentrated to units with a higher likelihood of experiencing a terrorist attack (urban centers) or natural disaster (coastal areas), split evenly among units, or some combination thereof. Funding issues are likely to stress future emergency preparedness discussions, a policy area challenging enough given the inherent unpredictability of most disasters.

SOCIAL WELFARE AND PUBLIC HEALTH

Governments worldwide have confronted the need for social programs, including public welfare and health insurance, since the late nineteenth century, with a combination of policies directed from the national and subnational level.

Public pensions and health care are often centralized, with the national governments determining eligibility requirements and providing the majority of program financing. This basic arrangement is common throughout Europe and also in Japan, Israel, and Australia. Canada and India mandate national health insurance but leave provinces and states responsible for implementation.

The evolution of American social welfare policy has followed a different trajectory. The role of the federal government increased during the economic turmoil of the 1930s and again during the war on poverty era of the 1960s. But this gave way to a decentralized approach in the wake of the 1990s welfare reform movement. As the number of programs and providers has increased, so has the ambiguity over who bears responsibility for funding and implementation. For example, Temporary Assistance for Needy Families and Medicaid are funded through a combination of federal block grants and additional state spending, but states have a great deal of discretion over program design and delivery. As the costs of these safety net programs have increased, state governments have looked to the federal government—and its wider revenue base—for more and more relief.

The United States is not alone in taking a decentralized approach to social policy. Brazil's national health system, Serviço Único de Saúde, allows municipalities to set their own priorities, providing they concur with federal guidelines. Federal resources are transferred to states and municipalities, which have assumed an increasingly larger role in service delivery. A small number of municipalities have assumed full control of providing health care, but only those that have met established federal requirements.

Yet the United States does stand apart among industrialized nations in not offering a nationalized health care system to all citizens. While federally sponsored programs such as Medicare, Medicaid, and the State Children's Health Insurance Program provide coverage to their respective constituencies, a majority of the population is insured by employer-provided plans, which are regulated at both the federal and the state level. Some states have made strides toward universal coverage by using a mix of public and private plans, but they have seen their successes in increased coverage tempered by cost overruns. The current health care reform debate in the United States centers on precisely this tension: how to expand access while keeping costs under control.

ENVIRONMENT AND CLIMATE CHANGE

Climate change has received substantial attention in recent years, with many developed nations ratifying and enacting measures to reduce pollution in fulfillment of the Kyoto Protocol. These policies require careful attention to placate dueling concerns for a clean environment and continued economic growth. Most often the approach is centralized to and coordinated between national governments, which have adopted policies aimed at encouraging environmentally friendly behavior among consumers and institutions, although the United Nations has also played a role in setting global environmental policy goals. These policies typically include a mix of consumption-based taxes and subsidies. Action on climate change has been strongest in the European Union, where several member states formed the Greenhouse Gas Emission Trading Scheme to coordinate emissions across the continent.

The failure of the United States to ratify Kyoto, in conjunction with the failure of the national government under the George W. Bush administration to enact other comprehensive environmental protection measures, has led to significant policy innovation at the state level. Specifically, interstate cooperation has grown as multiple governments in specific regions have increasingly formed partnerships to advance an ecological agenda, such as the states surrounding the Great Lakes, a trend referred to as "bioregionalism." In addition, regional collaboration has been evident in climate change policy. The establishment of renewable portfolio standards is typically an intrastate political process but has led to interstate coordination, such as when renewable energy produced in one state is traded to another. Regional climate partnerships are not limited to the American border; some states have worked with Canadian provinces on climate policy. Looking forward, sustained involvement and cooperation from all parties may be a challenge, especially if climate and political dynamics change—even more so if the U.S. federal government exerts a larger role in environmental policy.

TRANSPORTATION

Governments have confronted increasing demands for infrastructure development with a mix of public and private financing for road, rail, and air transportation. In most countries construction and maintenance are funded through the imposition of gasoline taxes and/or passenger fees. Project management is usually handled by central governments in Europe and South America, while the United States takes a more decentralized approach. States raise their own revenue through taxes but also receive revenue sharing from the federal government. This arrangement is the subject of some contention among state policy makers. Because federal transportation funds are not redistributed proportionally to states, some donor states receive a smaller share of federal gas tax revenue than they originally remitted.

THE EVOLVING NATURE OF INTERGOVERNMENTAL RELATIONS

It is difficult to generalize about the evolution of intergovernmental relations in countries around the world. Each political system has experienced its own set of intergovernmental issues and problems, some of which are unique to a particular nation. However, it is clear that intergovernmental relationships and arrangements have become increasingly complex in all political systems. This is particularly evident across the last century. Major political initiatives and increasing citizen demands have prompted changes in intergovernmental relations.

In some instances these changes are the product of policies that are not specifically designed to change the intergovernmental process. This trend is visible in the United States, where

several federal policies that did not affect the basic structure of governance nevertheless led to changes in intergovernmental relations. Ratification of the Sixteenth Amendment (giving Congress the power to tax income) and passage of the Revenue Act of 1913 enhanced the federal government's ability to raise revenue and distribute grants, bringing an end to the relative separation between national and state governments. New Deal programs in the 1930s further enlarged federal power relative to the states, while 1960s Great Society initiatives created new areas of shared responsibility between national and state governments. Federal budget cuts during the Reagan administration partially severed some of those associations, leading states to take charge of various programs, effectively increasing their power relative to municipalities. More recent national reforms to social welfare programs, education standards, and homeland security initiatives have added new layers of complexity to the relationship between federal, state, and local governments.

In England and France, the national government has taken a more direct role in shaping governmental relations. Modern British intergovernmental relations were influenced initially by the 1972 Local Government Act, which replaced existing localities with a two-tiered system of counties and districts. While this legislation explicitly divided functions between different levels of government and increased the size of localities, it did little to change their autonomy relative to the central government. Certain provisions eroded during the Thatcher era as local governments mounted greater challenges to national policies. Governmental relationships evolved further as a result of the 1992 Local Government Commission for England, which abolished a number of counties and created new local authorities in urban areas.

Despite its historical nature as a highly centralized state, France represents an interesting case wherein increasing decentralization has been the trend. Laws enacted in 1982 and 1983 assigned specific functions to central, regional, and local governments. A subsequent effort aimed at increasing cooperation between municipalities, the 1992 Chevement Acts, was less successful, perhaps because it failed to provide any financial incentives. But the constitutional reforms of 2003 and 2004 did succeed in clarifying and strengthening the role of local governments.

Decentralization or devolution is a common trend in contemporary intergovernmental relationships. Decentralization or devolution is said to occur when a central government transfers power or responsibility to a regional, state, or local governmental jurisdiction. Although the particular practices vary widely, decentralization has occurred in both unitary and federal systems, including Italy, the United Kingdom, Australia, Canada, and the United States. Although the transfer of resources or authority from national to subnational governments is usually financial in nature, it may also involve the distribution of political power and authority. For example, during the late 1990s a series of votes led to the creation of the Scottish parliament and a transfer of power to that body from the British parliament. In the same vein, the National Assembly for Wales was created in 1998 and given powers previously held by the British government.

A significant body of literature has also emerged about the consequences of decentralization on democratic policy making and governmental performance. Most scholars agree that decentralization is beneficial for democratic societies: it provides more points of access for citizen input and expands the opportunities for political representation. In addition, subnational governments are said to be more responsive to citizens' needs and more attuned to their problems. Hence, shifting responsibilities to lower levels of government can contribute to more effective and efficient governmental policy making. This, in turn, improves governmental performance.

CHALLENGES OF INTERGOVERNMENTAL RELATIONS

Perhaps the most persistent challenge of intergovernmental relations involves how to manage the ever-changing interactions and operations of various governmental jurisdictions. No matter the organizational structure, different levels of government develop their own perspectives about which policies should be pursued and how these policies should be implemented. In some cases, these perspectives may not match those of others. This can produce intense political debates about which level of government should take the lead in establishing policy directions. It can also lead to confusion and breakdowns in the delivery of critical public services. All political systems have encountered these problems of intergovernmental relations. As the intergovernmental system continues to evolve, the management of these complicated, ever-changing systems will become even more pressing.

Internal Colonialism

Internal colonialism is a relationship between urban/majority populations and rural/minority populations. This asymmetric system of power parallels the dependency theory of international relations but directs this relationship to describe domestic development. Like other formulations of the core-periphery relationship in dependency theory, strong actors in the capital-rich center have power over the impoverished majority whom it oppresses at the political, economic, and often geographic fringes of the state. These urban/metropolitan centers develop industry, become centers of capital, and dominate peasant farmers and miners through the economy. Urban elites control farmers and other preindustrial workers through the capitalist–free market system. Rural populations within the state provide raw materials and foodstuffs to support these cities and are economically repressed by the urban center.

Like other types of colonialism, internal colonialism benefits some population at the expense of another. Because capitalist centers produce and sell secondary- and tertiary-sector goods, and because there are many more impoverished farmers and miners than wealthy industrialists, the rural populations remain permanently poor. Capitalist accumulation at the metropole increases at the expense of economies at the periphery. Peripheral populations receive low capital investments and continue agricultural economies and other primary-sector enterprises to feed the industrial center. Such a drain from these local communities has lasting economic and environmental effects. The colonial economy destroys existing trade relationships and depletes local capital but also may destroy local natural resources.

While the idea of internal colonialism is used to describe capitalist accumulation in international relations theory, other disciplines discuss race relations using the internal colonialism model. Famous examples of city centers' expanding and prospering from the work of the periphery are the British at the expense of the Scots and the white urban elite of many former colonies at the expense of indigenous populations in North America, South America, and Africa. Sociologists also point to the U.S. white–African American relationship as an example of internal colonialism. In this sociological literature, elites exploit workers either by maintaining an established system of exploitation or by structuring social arrangements to strategically impoverish or exclude groups of people. Excluded groups may be defined by religion, ethnicity, or language.

However defined, elites prevent the minority group from gaining powerful or prestigious positions and enforce exploitative socioeconomic systems.

Groups in the metropole/socioeconomic center are asymmetrically stronger and have more influence on cultural, religious, and language state policies. Populations with a greater access to the state may pursue policies to homogenize the rest of the population, either deliberately or accidentally. Social policies, such as education and language training, may institutionalize the preferences of one ethnic, linguistic, or religious group and suppress those of others. Peripheral groups may be dismissed as uncivilized or antiquated. The marginalized population is disadvantaged because the social system is built to make them disadvantaged but also because the cultural roots of the system are alien to them and they are forced to adapt. Such social structures may be intuitive to the groups that create them but completely foreign to some of the communities on whom the system is applied. Internal colonialism is said to create mentalities of fatalism and resignation, similar to those dependency theory creates in its periphery. In this way, internal colonialists control the periphery both materially and psychologically.

There are several problems with internal colonialism as an explanation of social systems. First, the internal colonialism model may describe economic patterns but is less potent as a method of explanation. Internal colonialism is unable to specify particular actors and their specific motives. While it is clear that people at the center benefit from this system of trade, it is unclear what defines a state's center, how a population becomes the center, and by what method the center unites as a coherent actor against the peripheral population. Also, the model is unable to describe differences between regions: if there are only center and peripheral areas, why do some peripheral areas experience the same benefits as urban areas? Furthermore, the history of advanced industrial and postindustrial states shows that there is (1) intensive capital investment in the hinterland to efficiently produce goods and (2) a steady flow of migrants to urban centers. Shifting economies and populations complicate the model of internal colonialism. Last, the argument of internal colonialism is laden with normative commitments.

International Administration

International administration refers to the exercise of executive and administrative powers in a given territory by an external actor, endorsed by or part of an international organization or multilateral agreement. International administration is associated with conflict resolution and postconflict reconstruction but is a separate category of policy. Compared with peacekeeping operations and other such kinds of intervention, the external actors are dominant in the political and decision-making process and commit to rebuilding and running the administrative infrastructure of the territory. Even though this involves a lack of nominal and/or effective sovereignty, international administration is different from trusteeship and protectorate given the level of multilateral engagement and the significant extent of involvement it entails.

HISTORY OF INTERNATIONAL ADMINISTRATION

International administration was pioneered at the beginning of the twentieth century when the League of Nations allowed certain territories to be partially governed by its own appointed administration or by countries acting on its behalf. The League of Nations administered directly the Free City of Danzig (1919–1939) and the Saar Basin (1922–1935). These experiments were seen as overall successes and provided a specific inspiration for international administration practices in the past two decades. Under the mandate system, the league also granted to the victors of wars the responsibility to assist certain territories in achieving progressively their independence.

While it resembled a colonial arrangement, international administration also enshrined the idea of accountability for action in the mandated territories. Both policies continued in parallel with the creation of the United Nations. The mandate system transformed into the trusteeship system, a more elaborate and clear policy toward independence of territories, while a limited direct administration (supervision) was used in West New Guinea–West Irian (1962–1963) and Cambodia (1992–1993). While the trusteeship system ended with the independence of Palau (1994), the direct international administration in its different forms gained momentum after the end of the cold war and was used in Eastern Slavonia (1996–1998), Bosnia and Herzegovina (1995–), Kosovo (1999–), and East Timor (1999–2002).

CASES OF INTERNATIONAL ADMINISTRATION

International administration is a policy designed as a response to diverse challenges and used in different contexts, both of which ultimately determine its nature, the strategies behind it, and to some extent, its success. In Bosnia and Herzegovina, the international administration had to create a viable state entity from three territorial formations (Bosnian, Croat, and Serb) whose inhabitants were engaged in a violent ethnic war. The main challenge was to organize and facilitate an integrated political process for the multilevel federal entity and to strengthen the central administration to support it and prevent the entities from separating. The Office of the High Representative for Bosnia, endorsed by a large multilateral body (Peace Implementation Council), had extensive executive and administrative powers, including the banning of political leaders obstructive to the peace process.

In Kosovo, the need for international administration was prompted by its abandonment by Serb military and authorities following North Atlantic Treaty Organization strikes in 1999. The territory was left virtually without any infrastructure, and the lack of authority and security that ensued could have easily degenerated into widespread ethnic and societal violence. The international administration in Kosovo achieved a reasonable level of stability, but its mandate and effectiveness are limited by the uncertain future of the province. Kosovo's declaration of independence in 2008 opens the way for building a full-fledged national administrative system.

East Timor was in a similar situation when Indonesia withdrew its troops from the territory in 1999, following a referendum with a proindependence outcome after three decades of authoritarian rule and sustained repression. The territory was left with no infrastructure, while the society was organized for resisting oppressive rule only and had no tradition of supporting an autonomous and open political process. The international administration was designed as an instrument to prevent civil war and humanitarian disaster.

The success of international administration is also influenced by other factors such as size of the state, level of infrastructural development, and local support. East Timor and Kosovo are relatively small entities and thus are examples of international involvement's being extensive. A similar degree of involvement is almost impossible in Afghanistan, a large country that has historical antecedents in failing to integrate and function. The success of international administration depends on the support of local elites and citizens. If in East Timor the international assistance was seen as a positive factor to facilitate independence and stability in Bosnia and Herzegovina, all the major groups look with suspicion on the extensive powers of the high representative.

THE ROLE OF INTERNATIONAL ADMINISTRATION

The range of activities constituting international administration differs from country to country. In the majority of cases the structure of the political process had to be reorganized, such as organizing elections and drafting key legislation regarding the activity of political parties and mass media. The institutional engineering could include the promotion in the political life of certain ethnic and disadvantaged groups, such as women. In other cases it has had to redesign the administrative structure, empowering regional governments or local authorities. In the case of Bosnia-Herzegovina, for example, the international administration had to implement the constitutional provisions from the Dayton Accord, signed in 1995, which ensured the representation of the three ethnic groups. The protection of human rights and freedoms was doubled by

a specific institutional design, including collective presidency and bicameralism.

Yet still the most extensive and complicated activity of international administration is in the sphere of security and infrastructural reconstruction. The international administrations have had to reform or create effective police forces and assist the judicial institutions to perform their functions. They have had to create the basic environments for economic activity and to ensure systems of taxation that enable the sustainability of the government. A daunting activity is that of restoring the functioning of public utilities and the provision of key social services and public goods such as health, welfare, and education. These activities are very difficult to carry out as the resources to do so are usually scarce and officials are forced to act in foreign and uncertain environments. International administration is assisted by a multitude of state agencies and nongovernmental agencies, each promoting its own agenda. The range of the tasks and the number of distinct actors acting in these territories create the problem of effective coordination.

The impact of international administration on the stability and development of the countries where it has operated is highly debated and controversial. It is believed to have a fundamental role in ensuring that peace arrangements are observed and institutional prerequisites for a normal political process are in place. At the same time, it is criticized for the same reasons. International administration, which can be equally ineffective, removes the responsibility from local political actors in engaging in normalization and reconstruction.

International administrations are still in operation. Some have been concluded with greater or lesser degrees of success, such as that in East Timor, which is a sovereign country but still heavily dependent on foreign support. After almost two decades of intense trial, international administration emerges as an established policy, yet its practical effects and success continue to be inhibited by the enormous resources it demands as well as the operational complications it faces at the local level.

International Bill of Rights

In the United States, the term *Bill of Rights* is usually assumed to reference the first ten amendments to the Constitution, which list certain fundamental rights that are the foundation of American society. However, internationally, there are many more documents that, collectively, provide even greater rights than the U.S. Bill of Rights. One such collection is known as the International Bill of Rights or the International Bill of Human Rights. This is not a formally adopted name, but one that has developed through general usage and application over time.

The International Bill of Human Rights consists of three documents: the Universal Declaration of Human Rights; the International Covenant on Economic, Social and Cultural Rights; and the International Covenant on Civil and Political Rights. It also contains two optional protocols included under the umbrella of the International Covenant on Civil and Political Rights: the Optional Protocol to the International Covenant on Civil and Political Rights and the Second Optional Protocol to the International Covenant on Civil and Political Rights.

The Universal Declaration of Human Rights, adopted in 1948 by the United Nations General Assembly in Paris, France, is not a binding treaty. Rather, it is a statement of goals or intentions acknowledging many of the fundamental rights recognized in the world. These rights include equal rights and freedoms without regard to race, color, sex, language, religion, nationality, social origin, property, birth, or political opinion.

The International Covenant on Economic, Social and Cultural Rights, enacted in 1966 and taking force in 1976, provides for all people, without regard to their status, the right to freely pursue their economic, social, and cultural development. This includes the right to choose the type of work one does, remuneration for that work, fair wages, equal pay for all without regard to sex, safe and healthy working conditions, and reasonable rest and leisure time. The right to unionize is also acknowledged, as are protections for the family. All people are recognized to have the right to adequate food, shelter, and clothing and the right to physical and mental health. The right to education is mandated to include free primary education and higher education equally accessible to all people.

The International Covenant on Civil and Political Rights, enacted in 1966 and taking force in 1976, recognizes many of the rights listed in the U.S. Bill of Rights. These rights include liberty, security of the person, right to a prompt trial, right to an appeal, protection from torture, freedom of movement, due process of law, equal protection of law, right to marry, freedom of religion, freedom of association, freedom of expression, right to vote and participate in government, and freedom from discrimination on the bases recognized in the Universal Declaration of Human Rights.

The Optional Protocol to the International Covenant on Civil and Political Rights provides the authority for the Human Rights Committee of the United Nations to receive communications from individuals concerning the violation of

the International Covenant on Civil and Political Rights. The Second Optional Protocol to the International Covenant on Civil and Political Rights concerns the death penalty. It prohibits any signatory to the Second Optional Protocol from executing any person.

Although admirable in the breadth and scope of the rights that are guaranteed under them, the documents that are part of the International Bill of Human Rights are extremely difficult to enforce. Some nations, such as the United States, adopt certain reservations that severely restrict their enforcement domestically. And even for those nations that have adopted them, enforcement is difficult, as the United Nations lacks any executive enforcement organs such as an international police force or standing military. However, this does not mean that the bill is not without value. It provides nations with goals they can achieve to attain the benchmark of human rights contained in the documents.

International Cooperation

International cooperation refers to the collaborative interactions among different actors across international borders to address common issues or problems. Such cooperation involves both governmental organizations and nongovernmental organizations (NGOs) and may take an array of forms. Among governments, international cooperation may be bilateral, such as between the United States and Canada, or multilateral, such as among Japan, China, and Russia. Countries may also pursue collaborative actions within intergovernmental organizations (IGOs; e.g., within a global IGO such as the United Nations or within a regional IGO such as the North Atlantic Treaty Organization [NATO]), or nations may take shared actions within a particular supranational organization such as within the European Union. At the nongovernmental level, individuals and groups across nations may engage in international cooperation. NGOs are numerous and deal with social, economic, and political cooperation among individuals. Many are humanitarian or social groups, such as the International Red Cross or Amnesty International; others are economic units,

often multinational or transnational businesses such as Exxon or Unilever; and still others are political organizations such as the Socialist International or the Committee on Disarmament. The important characteristic of these groups is that they are outside the control of any particular government or even groups of governments.

GOALS

Just as there are numerous forms of international collaboration among governments, groups, and individuals, these different actors pursue a variety of goals through cooperative activities. One important aim focuses on pursuing greater security or resolving conflicts among states or groups. Some nations enhance their security by forming alliances. In the post–World War II years, the United States joined a number of multilateral regional organizations, such as NATO in Western Europe, the Rio Pact in Latin America, and the Southeast Asia Treaty Organization in Southeast Asia, and formed bilateral alliances with Japan, the Republic of China, and South Korea to protect the members from the threat of international communism.

Other times, alliances are expanded to enhance the degree of security. NATO has been enlarged from its original membership of sixteen nations in the early 1990s to twenty-eight today as a way to provide greater security in central Europe for the nations that emerged from the collapse of the Soviet Union and its empire. In Asia, the Shanghai Cooperation Organization was founded in 2001 among China, Russia, Kazakhstan, Kyrgyzstan, Tajikistan, and Uzbekistan to enhance security, trade, and cooperation among these member states. Other nations form temporary cooperative arrangements, something less than a formal alliance, to address a particular security issue, to mediate an issue, or to address an emerging problem. During the past decade, the six-party talks among China, Russia, Japan, the United States, South Korea, and North Korea represent a cooperative effort among these parties to persuade North Korea to abandon its development of nuclear weapons. Similarly, Britain, France, Germany, and the European Union joined together to try to dissuade Iran from pursuing nuclear weapons. IGOs may elicit cooperative actions among states to promote international security. The members of the United Nations may impose international sanctions or invoke collective actions against aggressor states, such as Saddam Hussein's Iraq, or against regions or countries in turmoil, such as the Darfur region in Sudan. Nongovernmental actors may also be asked to assist in seeking to facilitate cooperation among states in disputes. For example, the Vatican served as an intermediary between Argentina and Chile to resolve a boundary dispute.

IGOS AND TRADE

International cooperation may also focus on economic and environmental activities among states, IGOs, and NGOs. Bilateral and regional free-trade agreements are now prominent features of the international system. These agreements seek to reduce or eliminate tariffs among states or regions as a way to promote greater prosperity for the signatory countries. The creation and expansion of the European Union is the premier

example of this degree of cooperation and integration among states, and that supranational organization has grown over the decades from 6 original members to more than 2 dozen today. The areas of cooperation within the European Union have expanded into numerous sectors and now into a single market. Other regions have followed this example and have created such organizations as the Association of Southeast Asian Nations, the North American Free Trade Agreement, and the Asia–Pacific Economic Cooperation forum. The World Trade Organization, the principal IGO to promote greater global trade, now has more than 150 member nations. Sometimes selected groups of nations hold periodic meetings to foster economic cooperation. The 7 leading industrial democracies—the G7, and later the G8 with Russia added—have held yearly meetings since the mid-1970s in an effort to coordinate policy on political, economic, and environmental issues. Since 1999, the G20, composed of the finance ministers and central bankers from 19 developed and developing nations and the European Union, meet periodically to evaluate the stability of the international financial system. Finally, the United Nations may hold periodic international meetings to address a pressing issue. In December 2009, 193 nations gathered in Copenhagen, Denmark, to seek a cooperative agreement to combat global climate change. All of these kinds of cooperative efforts also serve as important venues for fostering technological innovation and collaboration.

NGOS AND FOREIGN AID

The number of both nations and IGOs has increased dramatically during the past several decades, but these actors have been surpassed by the meteoric rise in the number and activities of NGOs. By some estimates, the number of NGOs totaled only four hundred a century ago, but recent totals range from about six thousand to twenty-five thousand and to even more than one hundred thousand such organizations. These NGOs provide a vast network of interdependencies among the people of the world and often serve to knit the global community together. Such organizations include the traditional political, economic, and social organizations that are often immediately identified, but the array also includes educational, religious, media, fraternal, environmental, and humanitarian ones, among others.

Important to note, these NGOs play an integral role in facilitating international cooperation in many policy areas. Much of the world's foreign assistance is actually distributed by NGOs or private voluntary organizations. Catholic Relief Services, Church World Service, Oxfam, Bread for the World, the International Red Cross, and CARE routinely address the issue of global poverty, foster international development, and respond to natural disasters such as the 2010 earthquake in Haiti. The new modes of communication have only accelerated the rise of more and more NGOs. The growth of satellite and cable television, the cell phone, and the Internet serve as the principal means for enhancing international information exchange across all areas of the world and foster instantaneous sharing of information.

RESEARCH

Important remaining questions are why international cooperation occurs among these state and nonstate actors and how these international institutions facilitate or support such cooperation. Scholars such as Robert Axelrod, Robert Keohane, Stephen Krasner, and Arthur Stein began to unravel these two puzzles in the 1980s, and their insights remain useful to this day. Moral and ethical imperatives and common interests may motivate some participants to cooperate and use these international organizations. Such arguments, however, appear less persuasive in explaining cooperation among states. After all, states have long been characterized as rational actors operating in an anarchic international system in which they are primarily driven by power and interest considerations. Yet as some of these scholars note, states still may cooperate with one another if their rational, self-interested choices yield less than Pareto-optimal outcomes. Consider the security dilemma faced by states, often represented by the Prisoner's Dilemma game, as illustrative of when mutual cooperation would aid states. In a stylized game of an arms race between two nations, the rational and dominant strategy for the two participants is for each to continue to increase its armaments rather than to show any constraint and trust the other state to restrain its arms spending. Yet such a strategy is both economically costly for a state and potentially dangerous for peace and security in the international system. In a situation of a "dilemma of common interests," as Arthur Stein (1982) calls it, there is an imperative for states to abandon independent decision making and collaborate with one another to achieve a better outcome for both parties. The resulting regime may consist of an arms control agreement between the two that specifies the rules, norms, and procedures that each must follow regarding this issue. The Strategic Arms Reduction Treaty between the United States and the Soviet Union is one tangible illustration of this kind of international cooperation. The dilemma of common interests, of course, applies to a variety of security, economic, and social issues for states in international relations and thus, in part, accounts for the emergence of numerous international organizations such as the Nuclear Non-proliferation Treaty and the World Trade Organization. Moreover, the existence of these international institutions has the effect of perpetuating and perhaps even expanding the degree of international cooperation.

International Court of Justice (ICJ)

Established in 1921, the Permanent Court of International Justice (PCIJ) was sponsored by the League of Nations and housed in the Peace Palace in The Hague, the Netherlands. The PCIJ was the first court available to all states on a constant basis for interstate dispute resolution. Although connected to the League of Nations, the PCIJ was not officially part of the organization, and both league members and nonmembers, once ratifying its statute, could use the court. Like the League of Nations, the PCIJ did not survive the conflict of World War II (1939–1945) and officially dissolved in 1940. During its tenure it heard twenty-nine cases and rendered twenty-seven advisory opinions requested by the league.

Following the war, the victorious global leaders sought to build a new international organization and world court for the development of stable and judicial resolutions to interstate conflict. Somewhat more skeptical about the utopian promise of international organizations and international law, the Allies sought to remedy some of the weakness of the league and the PCIJ. To gain distance from the criticism of the PCIJ, the second world court would be an entirely new body, directly integrated into the United Nations (UN) as its official judicial arm. Accordingly, the statute of the International Court of Justice (ICJ) was annexed to that of the UN, and all members of the UN are automatically party to the ICJ, although a UN member state can refuse ICJ jurisdiction. The ICJ, however, took residency at the Peace Palace in The Hague, as had its predecessor, and is now the only one of the six principal UN organs that is not located in New York City.

STATUTE AND JURISDICTION

Similar to the PCIJ, the ICJ has dual jurisdiction to decide legal cases brought by states (contentious cases) as well as to give opinions on questions of international law requested by organs of the UN (advisory opinions). Only states, no subnational entities, other collectivities, or persons, are entitled to initiate proceedings with the court. Furthermore, the court has jurisdiction only over states that have consented to its jurisdiction. The United States withdrew from the court's jurisdiction in 1986.

ICJ judges act independently and do not represent their governments. They are elected by the UN General Assembly and Security Council to nine-year terms and can be reelected. Judges can be dismissed only by a vote of the court itself. There are fifteen judges to the court, with elections for five every three years. It is customary (and a result of the election process, which requires Security Council approval), although not mandated, that each state holding a veto on the Security Council be represented on the court.

According to article 28 the court relies on five sources of international law: (1) treaties, (2) customary state practice, (3) general principles of law applied by civilized nations, (4) national or other international court decisions, and (5) scholarly writings of experts in international law.

The first contentious case was submitted to the ICJ in 1948 (Cornfu Channel, *United Kingdom v. Albania*). The United Kingdom sued Albania when war ships hit mines in Albanian waters. The court decided in favor of the United Kingdom, and the conflict dissipated. From this first case to March 2010, 146 cases (contentious and advisory) were submitted to the court. In a recent contentious case, the first brought before the court in 2009 (*Belgium v. Senegal*), there was a dispute between Belgium and Senegal regarding Senegal's responsibility, as a signatory to the Convention against Torture, to prosecute or extradite for prosecution the former president of Chad, Hissene Habre.

The ICJ statute officially bars any individual decision from directly affecting subsequent cases. A particular court decision is legally binding for only those parties to that immediate case. Nevertheless, ICJ cases do lend to the development of international law and may be considered in future cases regarding similar disputes.

ENFORCEMENT

If parties do not comply with decisions made by the court, enforcement may be taken up by the Security Council. However, when a party to the case, or an ally to such a party, holds veto power on the Security Council, this is not a practical enforcement mechanism. When the Security Council is unwilling to enforce an ICJ decision, there is no formal recourse for the plaintiff. Nevertheless, the court has been broadly successful, and in most cases the court's decisions have been implemented. This has been particularly true of border disputes, such as the two-centuries-long conflict between El

Salvador and Honduras that was resolved by ICJ adjudication in 1992.

International Criminal Court (ICC)

During a five-week period in the summer of 1998, the world's nation-states, along with a large contingent of nongovernmental organizations, came together in Rome to deliberate over the establishment of a permanent International Criminal Court (ICC). At the final plenary session of the conference, the state delegates voted on the proposed Rome Statute of the International Criminal Court. After the United States called for one final unrecorded vote on the proposed Rome Statute, as a means to measure which nation-states would support it in its opposition to the statute, the official vote occurred. The final vote was 120 in favor, 7 against (including the United States), and 21 abstentions. The Rome Conference had achieved its ultimate goal, and on the following morning, the Rome Statute of the International Criminal Court was open for signatures.

On April 11, 2002, the statute received its 60th ratification, thus allowing the ICC to enter into force on July 1, 2002. Currently the Rome Statute has 139 signatories and 110 ratifications. One of the major exceptions to the list of ratifying countries is the United States, which initially signed the statute under President Clinton but then withdrew from any obligation to the court after the election of President Bush. The Obama administration does not appear to be moving in a radically different direction. Although the Obama administration seems more accepting of the ICC and its mandate, it still appears doubtful that this cordial relationship will ever result in ratification of the Rome Statute. The United States's primary objection concerns the sanctity of the state sovereignty rule and the ICC's ability to prosecute individuals from nonmember states. Despite this opposition, the ICC continues to receive widespread support and is currently investigating four cases: the Central African Republic, the Darfur region of Sudan, the Democratic Republic of Congo, and Uganda.

JURISDICTION

Part 2 of the Rome Statute discusses the jurisdiction of the ICC. As stated in article 5, the ICC has jurisdiction over the following four crimes: the crime of genocide, crimes against humanity, war crimes, and the crime of aggression. The court has jurisdiction over these crimes from the time the statute enters into force; therefore, the ICC is temporally bound to the point of its ratification. No crimes committed before that date are within the court's jurisdiction.

Scholars often refer to the crimes themselves as the "core crimes" of international humanitarian law. Definitions of the crime of genocide, crimes against humanity, and war crimes are all predicated on established international law. The foundations for defining these crimes include the Genocide Convention, the Hague Conventions, the Geneva Conventions, the post–World War II military tribunals, and the ad hoc tribunals of the former Yugoslavia and Rwanda.

The crime of aggression is included in the list of crimes within the jurisdiction of the court, but its definition has yet to be determined. Even after this crime is defined, the definition must then pass through the procedures of an amendment to the statute, as laid down in articles 121 and 123. In September 2002, the Assembly of States Parties to the ICC established the Special Working Group on the Crime of Aggression. This group is currently working on a draft text concerning the definition of *crimes of aggression*. Upon completion, the text will be forwarded to the assembly for review, and in a subsequent review conference the parties to the ICC will decide whether to adopt this text.

TRIGGER MECHANISMS

The court may initiate an investigation if a state party, the United Nations Security Council, or the prosecutor refers a situation to the court. If any of these actors determines that any of the crimes defined in article 5 have been committed, they may refer the case to the prosecutor for further investigation. The case is then in the hands of the prosecutor, who must decide whether there is sufficient evidence to proceed.

Although this appears to be an approval of universal jurisdiction, it is not. Certain preconditions must exist before the court can exercise its jurisdiction. These preconditions establish the territorial jurisdiction of the court and limit the application of its power. In other words, article 13 does not give the court universal jurisdiction; it provides certain spatial considerations that determine where and when the court may exercise its power.

According to article 12, the court has jurisdiction within the territory of a state that is party to the statute. Therefore, if one or more of the crimes defined in article 5 were committed on a state's territory that is party to the statute, then the ICC has jurisdiction. The ICC also has jurisdiction if the crime was committed on board a vessel or aircraft that is registered by a state that is party to the statute. The ICC's jurisdiction also extends to a situation in which the perpetrator of the crime is a national of a state that is party to the statute. Finally, the ICC has jurisdiction over a nonparty state if that state voluntarily accepts the court's jurisdiction.

The only exceptions to these trigger mechanisms are if a nonparty state consents to the investigation and subsequent prosecution and if the Security Council referred the case to the court. If the latter, then and only then does the court have universal jurisdiction.

Along with the aforementioned trigger mechanisms, the court must also adhere to the principle of complementarity when considering whether it has legal jurisdiction. The principle of complementarity concerns the relationship that the ICC has with the national authorities and domestic courts of an accused perpetrator. In short, the relationship of the ICC with national judicial systems is a complementary one, meaning that the domestic judicial system of the accused has the right of first prosecution. The ICC can act if, and only if, the domestic judicial system cannot properly investigate or prosecute the alleged crime. Such a situation would most likely occur because of a lack of national infrastructure or a collapse of the state's domestic judicial system. The ICC may also act if the state is unwilling to prosecute. Unwillingness to investigate or prosecute is not as easy to identify but is ultimately determined by a panel of ICC judges.

FUTURE OF THE ICC

As stated earlier, the ICC is currently engaged in four cases. Three of these cases—the Central African Republic, the Democratic Republic of Congo, and Uganda—were referred by state parties. The fourth case, Sudan, was referred by the Security Council. The primary obstacle that the ICC has to overcome is enforcement of its rulings, indictments, and arrest warrants. Because the ICC lacks any centralized form of enforcement, it must rely on member states to enforce its rulings. This is particularly problematic in the case of arrest warrants where the home state of the accused is typically less than cooperative in executing these rulings. However, proponents of the ICC point to the increased support given to the court and the decline in U.S. hostility toward the ICC (as exemplified in its abstention on the Security Council vote concerning Sudan) as reasons to be hopeful for a successful and permanent form of international justice.

International Criminal Tribunals

International criminal tribunals are criminal courts designed to investigate, prosecute, and punish the perpetrators of gross human abuses. Unlike the International Criminal Court, which is a permanent standing court, and the military tribunals of Nuremberg and Tokyo (1946), which the Allied powers created to prosecute war crimes and crimes against humanity committed during World War II (1939–1945), international criminal tribunals are mandated or temporary courts established under chapter VII of the United Nations Charter. In 1993, for instance, in creating the International Criminal Tribunal for the former Yugoslavia (ICTY), the United Nations Security Council declared that the unlawful detentions and mass killings in Bosnia-Herzegovina constituted a breach in international peace and security (the same rationale would later be invoked, under different circumstances, to create the International Criminal Tribunal for Rwanda). As such, the ICTY represented a novel mechanism for promoting peace and security. Although some would argue that it provided an excuse or a weak alternative to the more stringent demand for military intervention to stop the war, it eventually received strong financial backing and international support. More important, the ICTY seemed to overcome the problem of victor's justice, in which criminal justice served the political interests of only a few of the most powerful states (the Allied Powers). It did so by providing a prosecutorial mechanism that operated independent of the UN Security Council and establishing the basis of concurrent jurisdiction whereby the prosecutor and national judiciary would work together to investigate and prosecute the perpetrators of gross human rights abuses.

Accordingly, the ICTY statute empowers the prosecutor to investigate the core crimes of genocide, crimes against humanity, and war crimes and targets the guilt of individual perpetrators. It is believed that by individualizing guilt and establishing a historical record, international criminal tribunals will help to promote national reconciliation. What is more, international criminal tribunals provide an arguably independent venue for investigating and prosecuting the above crimes. Aside from this intangible benefit, two problems should be noted. First, international criminal tribunals require substantial economic resources to investigate, prosecute, and punish the perpetrators of the above crimes. This is one main reason why they need to operate efficiently within

given budgetary constraints. Second, because international criminal courts are a political solution to conflict (as opposed to political tools of Western states), they often tend to expose the politicization of international law, or complications of enforcement, as was the case with Louis Arbor's decision to indict Yugoslav President Slobodan Milosevic at the height of the U.S.-led North Atlantic Treaty Organization war.

The looming issue, then, is whether international criminal tribunals, such as the recently established International Criminal Tribunal for East Timor, will be able to effectively complement commissions by furnishing a more credible historical record. Equally important is the issue of whether poorly funded national courts, which lack the funds and legitimacy to hold impartial and effective prosecutorial proceedings, would benefit from the legal assistance of international criminal tribunals. In Sierra Leone, for instance, where a truth commission and national court (funded by the United Nations) have been established (hybrid court), it is quite possible that an international criminal tribunal would serve a positive, complementary role. In short, these prospects should call attention to the important role that international criminal tribunals have played in promoting accountability.

International Labor Organization (ILO)

The International Labor Organization (ILO) has been a specialized agency of the United Nations since 1946. It was originally created in 1919 as part of the Treaty of Versailles negotiations in the aftermath of World War I (1914–1918). Since its inception one of the key activities of the ILO has been the formulation of international labor standards. It is unique among other institutions of global governance in that it has a tripartite system that includes representatives from employers, labor, and government. Under Director-General Juan Somavía, who was elected to his first term in 1998, the ILO began to engage with other international institutions in attempting to develop a social side to globalization. The ILO conducts research and produces publications on an increasingly diverse series of issues that relate to the changing nature of work and employment.

International discussion of labor standards was developed at the beginning of the twentieth century, partly in response to fear among many European states of the revolutionary potential of workers. It was also driven by a concern that low labor standards would give some countries a competitive advantage in their trading relations with other, more progressive nations. The ILO sought to address these issues and advanced a model of decision making that gave both employers and workers an independent voice. Each member state sends two government representatives, one employer, and one labor representative to the ILO's annual International Labour Conference. The membership of the Governing Body is organized along similar lines.

The ILO has been successful in making labor protection part of the wider discourse on human rights. The annual conference adopts conventions that then become binding at the national level, subject to their ratification by member states. Two important examples of these conventions are number 87, the Freedom of Association and Protection of the Right to Organize Convention (1948) and number 98, the Right to Organize and Collective Bargaining Convention (1949). (Interestingly, as of 2009 both of these conventions had still not been ratified by either the United States or China.) More recently the ILO has broadened its remit. For example, in 1992 it created the International Programme on the Elimination of Child Labour, and in 2001 it launched both the Special Action Programme to Combat Forced Labour and the Code of Practice on HIV/AIDS and the World of Work.

During the cold war the ILO, like many international institutions, became paralyzed by the geopolitical circumstances of the period. During the 1990s the relevance of the organization was questioned due to changes in the global economy that resulted in organized labor's becoming more politically marginalized in many countries. However, the ILO has worked hard in recent years to reassert its importance. When the World Trade Organization announced in 1996 that it would not consider linking labor standards to trade rules, the ILO saw an opportunity to find its voice again in the multilateral system. In 1999 Somavía introduced the decent work agenda, which, among other objectives, seeks to extend the focus of the ILO to include the informal labor sector, which has grown sharply in recent years. The ILO has also begun to work with other institutions of global governance, such as the World Bank and the International Monetary Fund, to develop social policies within their new Poverty Reduction Strategy Papers. Supporters of the ILO suggest that its continued use of a tripartite approach offers hope for multilateralism at a time when the legitimacy of other international institutions is being questioned.

International Labor Standards

International labor standards have risen in prominence alongside the dramatic increase in trade in the post–World War II era. While there is no universally agreed-on definition of *international labor standards,* most widely cited are the core labor standards defined by the International Labor Organization (ILO) in its 1998 Declaration on Fundamental Principles and Rights at Work. These standards are (1) freedom of association and the effective recognition of the right to collective bargaining, (2) elimination of all forms of forced or compulsory labor, (3) effective abolition of child labor, and (4) elimination of discrimination with respect to employment and occupation. These standards emanate from a number of ILO conventions. While these core labor standards have evolved over time, they are essentially a floor of labor rights that states and firms are encouraged to rise above but should not go below.

The ILO is the intergovernmental organization charged with promoting international labor standards and promoting the well-being of workers. The ILO works in a tripartite fashion by convening meetings with representatives of governments, firms, and workers. The ILO develops conventions and recommendations that, once ratified by member states, are considered to be binding for signatories. However, the ILO does not have the power to enforce agreements or sanction states that violate agreements.

The increased prominence of international labor standards is directly connected to debates about globalization and trade. As trade agreements and the general liberalization of trade under the auspices of the General Agreement on Tariffs and Trade, later the World Trade Organization (WTO), have reduced trade friction, it has become much easier for firms to locate production in low-wage and low–labor standard countries. While this may be efficient for firms in reducing unit costs, it also could discourage a country from enforcing international labor standards as doing so may lead to a loss of advantage in the highly competitive market for production, particularly for low-wage production.

Arguments in support of international labor standards cluster around two distinct logics: a normative argument based on moral claims and an economic argument based on charges of unfair competition. The normative argument for international labor standards claims that the rights of workers to collectively bargain, to be free from discrimination in the workplace, and so on are akin to human rights. Thus, international labor standards should be enforced in all places and at all times because workers have these rights by virtue of their standing as workers and cannot give these up by entering into a labor contract any more than a human being can give up other basic human rights.

An economic argument is made when it is claimed that a lack of enforcement of international labor standards leads to unfair competition wherein workers who are protected by such standards will likely be more expensive in terms of labor costs relative to those who do not enjoy such protection. Less-developed countries frequently argue that such demands for international labor standards are actually a kind of Trojan horse for protectionism. That is, industries in developed countries are not competitive with production costs in less-developed countries, so they use the language of international labor standards to protect themselves from competition.

Proponents of international labor standards must always confront the difficulty of sanctioning states that do not enforce them and gain a competitive advantage by doing so. As discussed above, the ILO does not have any mechanism to sanction states that violate international labor standards, even if those states are signatories to conventions. Some firms, under pressure from labor advocacy organizations, nongovernmental organizations, and consumer groups, have committed themselves to corporate codes of conduct that preclude utilizing suppliers that violate labor standards. George DeMartino (2000) has suggested a carefully targeted "social tariff" that would discourage states from gaining an advantage through "social dumping" (denying collective bargaining rights, the use of prison/child labor, etc.). Labor activists and unions have suggested that the WTO would be a logical organization to enforce sanctions against states that violate labor standards. Trade economists have generally argued that the WTO should continue the challenging work of promoting the liberalization of trade and leave international labor standards to the ILO lest the WTO become a site of protectionist schemes masquerading as normative commitments to labor standards. Given the continuing debates around policy responses to globalization, it is likely that international labor standards will remain a vexing issue for some time to come.

International Law

The term *international law* has replaced the older terminology *law of nations* in English and Romance languages, reflecting the diversification of the law and its subjects. Nevertheless, the general public international law covered by the old denomination still constitutes the core of the international normative order, serving as the rules of the game for international politics. These rules are based on international custom, as evidence of a general practice accepted as law; international conventions and treaties, binding the consenting parties; and a set of general principles of law. The system emerged in the period from the Peace of Westphalia (1648) until the end of World War I (1914–1918) and has since been adapted and enhanced by modern international law, such as the prohibition of the threat of or use of force and the growing body of human rights law. Originally a European legal order, international law became globalized through the process of decolonization. The acceptance of its rules is today a constitutive element of statehood. Compared to national legal orders, international law lacks a system of obligatory jurisdiction and a sovereign power to enforce its nevertheless binding provisions. Even if international law is at times violated, "most states are careful to observe most obligations of international law most of the time" (Malanczuk 1999, 6).

International Monetary Fund

The International Monetary Fund (IMF) is an international organization that is dedicated to stabilizing international exchange rates and encouraging development: its official mission statement is "to foster global monetary cooperation, secure financial stability, facilitate international trade, promote high employment and sustainable economic growth, and reduce poverty." As part of this mission, it offers loans to less-developed countries, often with stipulations aimed at ensuring the loans effectively encourage development.

The IMF was proposed in July 1944 at the Bretton Woods Conference. There were originally forty-five member nation-states, with goals to stabilize exchange rates and rebuild the world's international payment system. Countries would contribute to a pool that could be borrowed from, on a temporary basis, by countries with payment imbalances. The IMF was formally established on December 27, 1945, when twenty-nine countries signed its Articles of Agreement. The IMF began its financial operations on March 1, 1947.

The IMF's early years focused on stabilizing the economic system; it retains influence through its work to improve the economies of its member countries. However, some of its policies have been controversial. It has been criticized for protecting the interests of the major economic powers, especially the United States; for requiring borrower nations to sell off assets to multinational corporations and implement austerity programs, which often increased taxes while reducing government spending (often leading to further decline in the standard of living of the borrower nation's citizens); and for providing loans to dictatorships while often ignoring the needs of democratic regimes. With the World Bank, the IMF has been a major target of the antiglobalization movement.

As of 2010, 186 countries are members of the IMF. Any country may apply for membership to the IMF. If the Board of Governors adopts the membership resolution proposed by the IMF's Executive Board, the applicant state must take the legal steps required under its own law to join the organization. Member states can withdraw from the IMF, although that is rare.

Member states are represented on a twenty-four-member Executive Board (five executive directors are appointed by the five members with the largest quotas, and nineteen executive directors are elected by the remaining members) that oversees the day-to-day operations of the IMF. All members appoint a governor to the IMF's Board of Governors. Major decisions require an 85 percent supermajority. The United States, with 16.77 percent of the votes, has always been the only country able to block a supermajority on its own.

The Executive Board selects the managing director, who is appointed for a renewable five-year term. The managing director reports to the board, serves as its chair and the chief of the IMF's staff, is responsible for ordinary business subject to the direction of the board, and is assisted by a first deputy managing director and two other deputy managing directors. Historically, the IMF's managing director has been European. The first deputy managing director of the IMF has traditionally been an American. The managing director as of January 2010 was Dominique Strauss-Kahn, a French academic and politician, who succeeded Rodrigo de Rato, who retired on October 31, 2007.

In July 2009, a report proposing reforms in the governance of the IMF was released. Based on that report and others, a reform plan was being drafted in 2010.

The IMF is headquartered in Washington, D.C., with additional offices in New York; Paris; Tokyo; Warsaw; Dar es Salaam, Tanzania; Libreville, Gabon; Bamako, Mali; and Beirut.

International Norms

International norms provide a measure of continuity and stability to relations between states and transnational actors as they constitute authoritatively endorsed, articulated ideas and beliefs concerning some aspect of political life beyond that of domestic systems of governance. But since the boundaries between national and international phenomena have been significantly relaxed in recent years, norms that evolve and are disseminated across countries at the same time seem increasingly important to the inner life of most contemporary societies. Regardless of the level of governance, norms can be described as the microfoundations of political institutions.

This article examines international norms in five areas. After a brief introduction to the legacy of the term, three phases of the life cycle of an international norm are discussed, namely, its origins, its modes of operation, and its repercussions. The article ends by evaluating the added value of this term and its related field of research to political science overall.

LEGACY

In legal science, *norm* is used to denote a written or unwritten rule that forms part of a system of law in that it has normative power or authority. The term was later borrowed by sociologists, among them Émile Durkheim, to describe intersubjectively shared understandings and expectations of behavior within a particular community of individuals. Both the legal and the sociological concepts of norm, but especially the latter, had profound effects on political research in the twentieth century.

In the 1980s and 1990s, a theoretical current in the social sciences, constructivism, emerged to confront the perceived hegemony of rationalistic theories of politics and political processes. In a series of theoretical debates raging in the study of political organization, public policy formation, and international relations, a rationalist logic of consequences associated with preference-ordering actors was juxtaposed to a constructivist logic of appropriateness, in turn associated with an idea of social acceptance. Much empirical research was conducted

with a view of gleaning which of the two types of explanations would hold sway in a particular political and social context.

The term *international norms* predates the rationalist-constructivist debate but has thrived in the latter. In part by rendering problematic certain Realpolitik assumptions related to the centrality of material power resources and nation-state autonomy, it has served as a common denominator for a wide range of scholarship along the domestic-foreign frontier. Some of this research was charged with vast questions concerning the key characteristics of the international system or sovereignty. Other studies, more modest in scope but often equally illuminating, were devoted to the post-1945 human rights regime, United Nations sanctions instruments, and spread of prescriptive ideas concerning environmental standards or women's rights.

ORIGINS

Studies on the creation and early diffusion of international norms have gained momentum in recent years, as scholars have begun to question the outcomes of predominantly rationalistic approaches oriented toward interest-based conflict analysis or bargaining processes. In 1996, Martha Finnemore made an especially significant contribution in this respect in that she theorized the relationship between norms and institutional development but also provided three short historical case studies devoted to the rise of the United Nations Education and Science Committee, the evolution of the International Red Cross, and the transfer of the war on poverty from U.S. President Johnson's administration to the World Bank by former Secretary of States (and incumbent World Bank President) McNamara. Scholars subsequently explored other examples of governments being prepared, under certain (historical) circumstances, to commit to some universal, normative purpose and at the same time accept the costs in terms of expenses and partial loss of sovereignty. Illustrating this phenomenon, empirical studies have described instances of norms cascades, during which some set of ideas about a particularly prominent problem or solution (or both) is almost universally accepted as urgently requiring a response by the international community of states.

MODES OF OPERATION

Norms cascades remain relatively unusual and restricted to problems that are considered particularly pressing (e.g., antiterrorism measures following the 9/11 attacks in the United States) or proposed solutions that are universally embraced. International norms are otherwise disseminated by more complex mechanisms, which subsequently affect their respective modes of operation. In fact, the incorporation of international norms at the domestic level may be swift or slow, haphazard or consistent, and met with strong resistance or with overwhelming enthusiasm.

Important factors identified by scholars for explaining such different responses are whether the relevant political decision makers find the norm in question conducive to their own agendas, whether a large enough coalition supports it in society at large, whether it can be conveniently plugged into existing

legislation and institutional arrangements, and whether implementation is costly. The matter of who will be assigned to interpret and administer the application of the norm is also potentially significant, as is the scope of the latter's mandate.

REPERCUSSIONS

The literature on norm repercussions examines the vexed question of direct and indirect consequences and of compliance and the eventual effectiveness of international norms. Whereas this type of research has a long lineage going back to work on the League of Nations, the General Agreement on Tariffs and Trade, and the early United Nations system, recent contributions are typically based on more sophisticated methodologies. Empirical studies have demonstrated that diplomats and government representatives at times are socialized into a set of norms and that transnational advocacy groups often help ensure implementation. Whether such processes as a rule affect the foreign policy behavior of resourceful states on major policy issues remains disputed, although with many scholars' insisting that only legally binding obligations are likely to sway governments or that norm compliance ultimately conforms to underlying power relations.

THE ADDED VALUE FOR
POLITICAL RESEARCH

A shift can be noted away from the rationalist-constructivist debate of the past two decades to a reengagement with the study of law, therefore reinvigorating the legal concept of norms in political research. But while Realpolitik skepticism of the predominantly sociological concept of norms thus indirectly is taken into account, the analytical gains made in recent scholarship will remain. The study of international norms provides a positive illustration of interdisciplinary research involving the disciplines of economics, sociology, and law and an example of how policy issues fruitfully can be approached through a transnational conceptual lens. A third advantage of the field is that the study of international norms is well situated to bridge the otherwise large gap between descriptive and normative theory in political science.

International Organization

International organizations are transnational organizations that are held together by formal agreements and that contain elements of formal institutional structure. International organizations can be divided into two types of organizations: intergovernmental organizations (IGOs) and nongovernmental organizations (NGOs). IGOs are those whose membership is composed of state parties. NGOs are groups with global interests and activities but whose membership is independent of state governments. Examples of the former include the United Nations (UN), the World Trade Organization, the North Atlantic Treaty Organization, the International Seabed Authority, and the International Monetary Fund. Examples of the latter include the International Red Cross, Doctors without Borders, the World Wildlife Fund, and Human Rights Watch. International organizations can be global in their focus, such as the Universal Postal Union or the World Bank, or they can be regional in nature, such as the Organization of American States or the African Union. Currently, it is estimated that there are approximately six thousand IGOs and forty thousand NGOs around the globe, for a total of forty-six thousand international organizations worldwide.

INTERNATIONAL GOVERNMENTAL
ORGANIZATIONS: FUNCTIONS

IGOs have been a part of the international system for over a hundred years, since the establishment in 1865 of the International Telegraphic Union (now the International Telecommunications Union). Since the end of World War II (1939–1945), IGOs have commanded a progressively more prominent place in the international system. While states still maintain pride of place as the primary actors in the international system, IGOs have become increasingly active in a number of areas. IGOs serve as forums for discussion and debate, serve as experts in particular areas of interest, provide humanitarian and other forms of assistance around the world, and facilitate state interactions by providing bodies of rules and methods of enforcement in areas such as trade, weapons proliferation, and environmental protection. Specific examples include the UN High Commissioner for Refugees' providing shelter, aid, and relocation services to refugees around the world and the World Trade Organization's settling trade disputes between its members before they escalate into trade wars.

More specifically, the functions of IGOs can be divided into several categories: informational, forum, normative, rule creating, rule supervisory, and operational. These are each discussed in turn.

IGOs serve an informational function through the gathering, analyzing, and disseminating of data. This is an important function because many IGOs are composed of experts in certain fields who are in the best position to provide information to the IGOs themselves and to member states. An example of this would be the UN Development Programme, which collects, analyzes, and disseminates data on climate change. Often researchers from IGOs have more opportunity to carry out their research all over the world than they would if they were acting on behalf of individual states.

The forum function of IGOs provides for settings in which members can meet to exchange views, work out compromises to difficult problems, and cooperate on issues relevant to the global community. This occurred, for example, when the global community came together to draft the Kyoto Protocol to the UN Framework Convention on Climate Change, working together to create emissions-reduction targets to reduce greenhouse gas levels. The Group of Twenty, or G20, is another example of an IGO whose global influence continues to increase due to the forum function this group provides to member states in discussing and setting global economic issues.

The normative function stems from the fact that IGOs are often responsible today for determining and defining the appropriate standards of behavior for their members in the global system. This can trickle down and have a universal effect on the behavior of states and other organizations in the international system. A primary example of this is the adoption by the UN General Assembly of the Universal Declaration of Human Rights, which has been held as the global standard for human rights aspirations for over sixty years and is referred to not only by states but by other international organizations such as the European Union (EU), the Organization of American States, and Amnesty International.

With regard to the rule-creation function, many IGOs are responsible for drafting legally binding multilateral treaties. The UN, for example, is responsible for the inception of many of the major multilateral treaties in existence today, including the Convention against Torture, the Kyoto Protocol to the UN Framework Convention on Climate Change, the UN Convention on Contracts for the International Sale of Goods, and the Comprehensive Nuclear-Test-Ban Treaty. Because IGOs often have global representation of membership and provide a ready forum for discussion, they are natural forums for the creation of such treaties.

Closely related to the rule-creation function is the rule-supervisory function. Many of the multilateral treaties created by IGOs contain within their provisions the establishment of new organizations responsible for monitoring compliance with the treaties. Responsibilities of these groups may include accepting state reports of compliance and monitoring compliance with the treaty provisions, settling disputes that arise over treaty provisions, and if available, enforcing the treaty provisions and punishing breaches. As described below, there is ongoing debate within the field of political science as to whether IGOs can truly be effective if they do not have enforcement powers.

The final primary function of IGOs is operational. IGOs such as the UN High Commissioner for Refugees collect global resources for housing, clothing, and feeding refugees around the world. The organization is also responsible for the logistics of determining when a situation needs refugee assistance, finding locations for refugee settlements, and distributing resources as appropriate. The fact that this responsibility is delegated to a specific international organization provides a more rapid response than might otherwise be available and can streamline the process from the UN to the refugees in need.

Under modern international law, IGOs have gained a rather significant degree of legal personality, capable of entering into agreements among themselves or with states and responsible for a growing number of tasks on behalf of the community of states. In 1949, the UN sought an advisory opinion from the International Court of Justice on the question of whether the UN could seek damages on behalf of its employees who might be injured or killed while on assignment. In its decision, *Reparations for Injuries Suffered in the Service of the United Nations,* the court held that given the functions, rights, and responsibilities given to the UN by its member states, the UN must be held to have legal personality; otherwise, it could not function as intended. This decision recognized that IGOs have legal personalities of their own and are capable of acting in the international systems as separate entities from the member states that form them.

NGOs: FUNCTIONS

While IGOs remain the dominant form of international organization in the global community because their membership is made up of state representatives, which gives them rule-making authority, the influence of NGOs has risen substantially in the past several decades. NGOs serve a number of key functions in the global system, including providing information about specific issue areas to states and their populations, serving as monitors for state behavior to ensure compliance with international norms, and providing grassroots-level support for populations in a number of areas.

First, due to their tendency to specialize in particular areas, NGOs can often be excellent sources of information and data for states and their populations as well as other international organizations. For example, states and the UN rely on annual human rights reports put out by both Amnesty International and Human Rights Watch to accurately assess the human rights situation in certain countries, and they rely on Doctors without Borders for its expertise in providing medical assistance in crisis situations. Unlike many IGOs, NGOs also provide information directly to specific target populations within a state to encourage grassroots activity. Examples of this include a number of environmental groups that provide information to specific communities about environmental preservation and human rights groups that provide targeted medical information to communities in Africa that practice female circumcision to encourage the cessation of the practice. However, because NGOs have no formal powers, their influence varies widely. Moreover, many NGOs are viewed as

having political agendas, which can also dampen the influence they have on international policies of states and other international organizations.

A second important function of NGOs is that they often serve as monitors of state behavior, and because they are not beholden to state power politics, they are able to report violations of international norms. One of the most important examples of this function is the annual reports published by both Amnesty International and Human Rights Watch on the human rights practices of states throughout the world. States routinely refer to and use these reports in their own policy formation, and states will protest the accuracy of reports if they feel they have been unfairly criticized. The fact that states respond to these reports is indicative of their importance in the international community. Moreover, NGOs often are able to have people on the ground in countries when official state representatives are refused. Doctors without Borders is, for example, almost universally allowed into states to attend to medical issues, when an official team of U.S. or French doctors may not be welcome.

Finally, NGOs are able to provide grassroots-level support to populations that IGOs and individual states are not able to provide. While they often have a political agenda, NGOs are not part of the global power structure and therefore are often viewed as more neutral in terms of the assistance they can provide populations. NGOs have served many functions within states, from planting trees and teaching about sustainable agriculture practices to encouraging political participation to providing basic health care and education services to underserved populations. This ability to work at the grassroots level has the potential to allow NGOs to have an overall more significant impact than IGOs in terms of effecting change.

INTERNATIONAL ORGANIZATIONS AND POLITICAL SCIENCE: THEORETICAL APPROACHES

Within the field of political science, different theoretical approaches have dealt differently with the increase in number, and expansion of influence, of international organizations. Neorealism, which retains focus largely on the state as the primary actor in the international system, considers international organizations important only insofar as they serve to bolster a state's power position or further state interests. According to neorealists, states use international organizations as a tool to achieve their own agendas, participating when it serves their immediate interests and withdrawing when their own agendas differ from those of the organizations. For neorealists, the fact that international organizations have limited enforcement capabilities is a testament to the limited nature of their effectiveness.

Neoliberal institutionalists generally consider international organizations an essential tool for states in the international system. Because neoliberal institutionalists suggest that states may seek cooperation as opposed to conflict to achieve their goals, international organizations can play a pivotal role in achieving this outcome. International organizations provide states with a forum to share information and discuss problems, therefore facilitating cooperation by increasing in information sharing among states and ensuring transparency of action. Moreover, international organizations with internal rules and enforcement mechanisms also provide states with assurances that breaches of the principles of the organization will be dealt with. Finally, membership in international organizations provides states with a community of states to which they belong and with which they interact, enhancing state desires to maintain a good relationship—in other words, maintain a good reputation—so that they may continue to reap the benefits of global cooperation.

Given the constructivist consideration of the way ideas and identities within a state may shape state behavior at the international-system level, international organizations are considered for the role that they play in this process. For example, an international organization may function as a norm entrepreneur, creating and advocating new global norms to guide state action. For constructivists, international organizations are also a function of those states that create them and may reflect the ideas, culture, values, and identities of their members. For example, the EU is largely a reflection of the history, values, and ideas of those western European states that created it. Originating in the aftermath of World War II, the focus of the EU on cooperation, human rights, and democracy is largely a reflection of the sentiments of the member state countries at the time of its inception. This relationship between international organizations and the states that create them produces a bond that makes international organizations important actors in the international system.

CURRENT DEBATES CONCERNING INTERNATIONAL ORGANIZATIONS

While international organizations are now widely recognized as part of the international system, a number of issues remain open for debate concerning these transnational actors. The foremost of these is the relationship between state sovereignty and IGOs. Since the Peace of Westphalia in 1648, state sovereignty has been the cornerstone of the global system. IGOs have increasingly challenged the notion of state sovereignty, usurping more and more responsibility from states. Currently there is a spectrum of IGOs in terms of their relationship to state sovereignty. On one end are organizations such as the UN, in which each individual state retains its sovereignty most of the time. In fact, only through voluntary agreement to relinquish a certain amount of sovereignty or through a UN Security Council resolution, which all member states are required to respect, do states lose any significant portion of their sovereignty at the UN. The UN Charter specifically protects the concept of sovereignty, stating in article 2(1), "The Organization is based on the principle of the sovereign equality of all its Members."

On the other end of the spectrum are IGOs such as the EU, in which states must relinquish a portion of their sovereignty to become members, agreeing to have certain matters legislated at the regional level as opposed to the state level.

Certain areas such as the free movement of goods, services, capital, and people in fact have significantly been taken over by the EU bureaucracy, with states mandated to carry out EU policies.

A second issue, one closely related to the question of sovereignty, is that of the enforcement power of IGOs. Despite the rule-creation and rule-supervision functions of international organizations, these do not always readily include the power of rule enforcement. One of the biggest critiques that neorealists and some neoliberal institutionalists make about the efficacy of IGOs is that they do not have sufficient powers to enforce their mandates and that ultimately member states choose to do whatever they wish. The level of enforcement power IGOs have is largely related to the extent to which they take on elements of state sovereignty. In the EU, for example, there are relatively strong enforcement powers through the European Court of Justice and the European Commission's and European Council's ability to sanction member states for failing to carry out their obligations. Many other IGOs, however, to which states do not relinquish such a significant level of sovereignty, have much less effective enforcement mechanisms. For example, the American Court of Human Rights has little authority over states since participation is voluntary. Therefore, its decisions, while technically binding on states, are difficult to enforce. Regardless of the strength of an IGO's enforcement mechanisms, however, the effectiveness of such mechanisms ultimately relies on the state parties' willingness to comply. This leads to another issue currently being studied by international organizations scholars: state willingness to comply with IGO norms, decisions, and policies.

As is evident from the differences between the international relations theoretical approaches to international organizations described above, not all scholars of international organizations agree that they serve a benefit to the international community of states. Given this, one of the ongoing discussions within political science is the question of why states would belong to, listen to, and comply with international organizations, whether the more formal rules emanating from IGOs or the more informational and political advocacy of NGOs. There are a number of theories that have been put forth. First, from the rational-choice perspective, belonging to an international organization facilitates a state's decision-making process on certain issues because it provides the state with a forum for information gathering and discussion, as outlined above. This not only allows the state to gain information that may directly assist it in its decision-making process but provides the state with a mechanism with which to gather information on the intentions and decision-making process of other member states. This makes the decision-making process more transparent and decreases the likelihood of states' acting with incomplete information. Related to this is the fact that international organizations create a common set of standards concerning norms and procedures, providing a common basis from which all member states may act. Thus, even if the states do not adhere to the norms all the time, they at least have a common starting point.

According to current research, one of the primary effects that international organizations have on state behavior, and one of the primary reasons given for why international organizations, particularly IGOs, are ultimately effective, is that joining an international organization automatically puts a state in a peer community. Once in such a community, states face pressure to comply with the norms and procedures of the international organization. A state's reputation rests on its compliance with the organization's directives. If a state consistently goes against the policies and norms created by the international organization or consistently ignores enforcement actions against it by the organization, that state will potentially become an outcast, a position states want to avoid because it can greatly hinder their ability to promote and protect their interests. If a state is viewed as being a violator or a free rider in one organization, this can carry over to other organizations. This can influence the extent to which other states will want to enter into agreements with the violating state, which can affect all manner of transnational activities, from trade to the delimitation of shared resources to migration to security arrangements. States generally do not want to be left out of the international system, so the protection of their reputations is a key reason for them to join and cooperate with international organizations and their policies.

NGOs further contribute to the reputational effect that influences state behavior. Studies have shown that an increase in NGO activity within a state or attention given to a state increases the likelihood of policy change either within a state or at the international-system level. NGOs have a unique opportunity that IGOs do not possess, and that is the ability to work at the grassroots level within a state to encourage citizens to call for a particular state action. Moreover, unlike much IGO activity, which takes place exclusively at the international-system level, far removed from the daily life of most state citizens, NGO activity can be on the ground, tailoring approaches to the individual cultural needs of different states and populations. Examples of successful NGO activities that have effectively changed state behavior out of concern for reputation include the campaign throughout states in Africa to stop the practice of female circumcision as dangerous to the health of women and the dissemination of negative country reports from Amnesty International and Human Rights Watch, which can have a significant influence on a state's reputation at the international-system level.

International Political Economy

International political economy (IPE) is a discipline in the social sciences that is mostly concerned with understanding the dynamic relation between the state and the market. Originally a subfield of international relations, today IPE is an independent and vibrant field that draws on an array of contributions from political scientists, historians, economists, sociologists, and anthropologists. Despite their heterogeneity, IPE theorists all share the notion that political, economic, and social factors cannot be analyzed separately. On the contrary, they stress the intertwined nature of the relationship between the state and the market and advocate a holistic approach to the issue.

Until the 1970s, with a few exceptions (i.e., Charles Kindleberger's study on hegemony and Kenneth Waltz's 1959 book *Man, the State, and War*), mainstream studies in politics and economics treated the state and the market as two independent and separate entities. The state was mostly associated with the pursuit of power, whereas the market was mostly associated with the pursuit of wealth. However, following the 1973 oil crisis and the end of the Bretton Woods monetary system, events led scholars and policy makers to acknowledge the fact that to provide answers to practical and theoretical questions emerging from these two crises, economics and politics should be analyzed together.

The 1973 oil crisis, the decision of the Nixon administration to abandon the Bretton Woods fixed exchange rate, and the disastrous military campaign in Vietnam instilled in the American elite and public the fear that the United States could lose its preponderant economic and military supremacy to other countries. These events inspired the first wave of IPE theorists interested in determining which factors would favor the stability of the international economy. Mostly drawing from the realist tradition in international relation, scholars such as Robert Gilpin and Stephen Krasner reached the conclusion that the answer was in the redistribution of power among states. The hegemonic stability theory, first introduced by Kindleberger, argued that the overwhelming economic and military preponderance of a country was necessary to guarantee a stable and open world economy. Based on the historical experiences of Great Britain (1815–1873) and the United States (1945–1971), IPE theorists such as Helen Milner (1998) reached the conclusion that a hegemon was indispensable "to coordinate and discipline other countries so that each could feel secure enough to open its markets and avoid beggar-thy-neighbor policies. Conversely, the theory asserted that the decline of the hegemon tends to be associated with economic closure, instability, and the creation of competing regional blocs" (pp. 113–114).

Although IPE theorists' most important contribution during the cold war was the formulation of the hegemonic stability theory, IPE research took many other directions, some of which gained even more relevance with the end of the confrontation with the Soviet Union. International trade, international finance, North-South relations, multinational corporations, and globalization are some of the most important topics in IPE. Today, despite their heterogeneity, IPE scholars address mostly two underlying issues. First, economic and technological changes have problematized structures and practices governed by the sovereign nation-state, with the result's being a sense of fatalism and chronic insecurity due to the perceived (real or not) incapacity of national governments and institutions to deal with such a challenge. In this regard, Anthony McGrew (1998) identifies three positions in the literature. First, there are those he calls "hyperglobalists." They believe that the emergence of global markets has ultimately undermined the very foundations of the state. In their view, the relation between market and state is a zero-sum game, in which the expansion of the market has determined the withdrawal of the political influence over every aspect of social action. On the other side of the spectrum, McGrew locates the skeptics. These are scholars who instead share the opinion that international markets have strengthened, rather than weakened, the nation-state. Their conclusion mostly derives from the notion that the international economy is based on a political system of sovereign nation-states, which have instrumentally used the economy to implement their political agendas. Last, scholars such as Anthony Giddens and David Held embody the transformationalists. Transformationalists argue that the nation-state has been sensibly influenced by global markets. However, they do not dismiss completely the role of

the nation-state, as hyperglobalists do. They assert instead that the nation-state is experiencing an overall transformation that is redefining its traditional role.

The second issue that has attracted the attention of many IPE theorists is the relationship between the politics and the institutional framework of social and economic development. As we move deeper into a new century, it is clear that development achievements have come short of meeting global needs. Models of development based on neoliberal economic theories and embraced by global financial institutions, such as the World Bank, the World Trade Organization, and the International Monetary Fund, have become the object of severe scrutiny by scholars and policy makers. Neoliberal economic principles, such as market liberalization, privatization, economic stabilization, and deregulation, have been challenged, and this has sparked a new interest in understanding the interaction between the national and international contexts to set constraints on development and determine possible avenues of growth. As a result, the IPE has expanded its research interests to areas traditionally neglected or only marginally studied, such as democratization, governance, poverty, human rights, gender, environmental issues, and armed conflict, legitimizing once more the interdisciplinary nature of IPE.

In the past three decades, IPE has been able to grow into a true interdisciplinary field of study. Its strong empirical foundation and capacity to draw from different academic traditions have allowed IPE to flourish and provide a vital insightful contribution to the never-ending issue of the relationship between the state and the market.

International Relations

The field of international relations (IR), narrowly defined, analyzes the interactions between nation-states. Yet actors other than nation-states are analyzed by scholars of IR: international organizations, terrorist organizations, multinational corporations, and transnational movements are all explored within the field.

The study of IR has a long history—a history often revolving around human conflict. The exploration of Sun Tzu, the ancient Chinese military strategist, of the art of war was motivated by the Warring States period in Chinese history from 600 to 400 BCE; the writings of ancient Greek historian Thucydides trace the competitive interactions of the Greek city-states; and the writings of Italian political scientist Niccolò Machiavelli outline his governance principles for a prince in the context of the wars of Italian unification in the sixteenth century.

While the study of conflict has been central to the field of IR, a multitude of topics are also discussed within the field. Traditionally, IR is divided into four subfields: international security, international organization, foreign policy analysis, and international political economy. This article will briefly review the major topics discussed within each of these subfields, beginning with a discussion of IR theory, a set of ideas guiding investigations into the world of international politics.

IR THEORY

Historically, the field of IR investigates the interactions or lack thereof between nation-states, commonly defined as politically sovereign territories. There are notable exceptions to this that have grown over time to include international organizations, multinational corporations, ethnic movements, and transnational actors such as nongovernmental organizations and terrorist groups. Still, a key component to all IR research is the nation-state, whether as a dependent or an independent variable.

For several decades, the core of IR scholarship has revolved around a set of paradigmatic theories or approaches, which contain sets of assumptions about the state of the world. These assumptions are then used to deduce predictions to be tested against events in the world. For many years, realism has been the ascendant body of theory holding sway in the field.

Realism dates back to the ancient (BCE) era. Realist theories emphasize power and the drive by states or statespersons to gain it. Writings from ancient China and Greece emphasize that the drive for power often resulted in war or could be harnessed to augment state power. There are numerous variants of realism. Classical realism emphasizes the innate human drive for power. Neorealism emphasizes the global distribution of power in a world that lacks a sovereign arbiter at the global level, described as anarchy, and creates conditions permissive for war when power becomes imbalance. Neoclassical realism focuses on the domestic politics within states driving them to augment their capabilities, often leading to war. Offensive realism points to a world where an innate drive for power combined with anarchy creates powerful incentives for states to constantly expand, leading to incessant conflicts. Again, while all of these variants differ regarding the mechanism by which power translates to war, all predict a usually violent world filled

with power struggles that cannot be easily remedied or controlled by norms, ideas, or international institutions.

For decades, the main competitors to realism were grouped under the rubric of liberalism. Early liberal thinkers departed from the realist assumption that there is an innate human drive for power, rather advocating the traditional liberal argument that humans are inherently peaceful. During the twentieth century, liberalism was overshadowed by World War I (1914–1918) and World War II (1939–1945). While wars appear endemic in the international system, periods of peace have historically lasted far longer than periods of war, suggesting there are human or political limits on the drive for power or the effects of anarchy. Today, two liberal approaches garner the most attention in the study of IR, liberal institutionalism and liberal internationalism. Institutionalists contend international institutions, such as the United Nations and the European Union, serve to enhance cooperation and limit conflict among states, even when those states desire power. Liberal internationalists explain domestic factors, such as public opinion and systems of checks and balance, constrain a state's external behavior. One popular and controversial supporting argument of the latter concept is called "democratic peace," which alleges democracies are less prone to instigate hostile aggression toward one another as no two democracies have fought a major war with another for at least two hundred years.

A third major IR theory is known as constructivism. Constructivists criticize realists and liberals for taking state or individual preferences for granted. According to constructivists, states and/or individuals want their political interactions with other states to be dynamic. One popular constructivist approach examines how international institutions may socialize states into new modes of behavior. Related studies examine how national identities and changes in those identities shift state thinking away from materialist/consequentialist calculations ("I should or should not based on expected outcome") to appropriateness calculations ("I should or should not based on extant norms"). Still other constructivist-oriented scholars examine how institutions diffuse norms, define sets of actors (e.g., refugees), and frame international problems (e.g., climate change).

In addition, IR theorists have studied gender-based approaches to examine numerous topics in IR including the causes of war, the gendered nature of economic development, and the gendered nature of state sovereignty. Last, Marxist-oriented approaches, designed by German philosophers Karl Marx and Friedrich Engels in the mid-nineteenth century, continue to receive attention as well, especially in studies of world systems theory and development policy.

These examples have merely touched the surface of the theoretical debates in the field. Indeed, IR is at times criticized for being overly theoretical, yet at its core, IR is a practical discipline. Scholarly IR trends have often been dictated by real-world events. For example, World War II brought to the fore realist-oriented arguments concerning the importance of power. The Vietnam War (1959–1975) and the collapse of the Bretton Woods monetary management system in 1971,

affecting the world's major industrial players, incited significant scholarship on hegemonic decline, the potential implications for international institutions, and new scholarship on liberal theories of international politics. The end of the cold war in 1991 brought criticism of realist and liberal-based IR ideas, forcing scholars to pursue more identity-based explanations in world politics typically associated with constructivist approaches. Thus, real-world events have historically driven inquiry in IR and continue to do so in each of IR's four subfields. We begin with a discussion of the oldest field within IR, international security.

INTERNATIONAL SECURITY

As previously mentioned, issues surrounding war and peace, involving international security, have been a central feature of IR research for centuries and continue to remain dominant among IR scholarship today. One of the most well-known ideas throughout all of political science is the balance of power: the concept that states will join forces to stop any one state from becoming too powerful in the international system. The theory has been offered to explain both world wars of the twentieth century, the Gulf War (1990–1991), and even the refusal of many states to support the U.S. invasion of Iraq in 2003. While considerable controversy exists as to exactly how well the idea of balance of power explains state behavior, its endurance as a core concept in international security is unquestionable.

Any discussion of the balance of power begs the question of how power is defined and measured. Tremendous scholarship in IR has wrestled with the question of defining the concept of power. If key IR theories, such as realism, gain key insights into the world by examining power, scholars should be interested in discovering the type of power sought by state leaders and whether those definitions relate to historical context.

Similarly crucial to discussions of international security is the notion of state alliances. Extensive studies have inquired as to whether alliances forestall or hasten the onset of war, what types of states are chosen as allies, and the nature of burden sharing within those alliances. Given that alliances, such as the North Atlantic Treaty Organization, remain important in the geopolitical realm even today, research on bilateral or multilateral alliances continues apace.

While early security scholarship focused almost exclusively on the great powers and their wars and alliances, significant scholarship influenced by global current events has risen in IR to explain the wars taking place beyond the great powers' realm. Increasing attention has turned to issues such as third-party intervention in wars, the effectiveness of peace-keeping operations, and ethnic, religious, and civil conflicts. As the threat of great-power war subsided in the late twentieth century—after the cold war—and into the twenty-first century, IR inquiries and research have turned away from the study of great powers and their wars. Major-world-power confrontations have become less relevant and frequent in comparison to the global armed conflicts occurring in modern times. No longer does IR rely solely on the billiard ball model of war, in

which states are assumed to be unitary rational actors achieving strategic goals. Rather, as substate and nonstate actors increasingly play roles in international conflicts, theories about why and how conflicts arise must change accordingly.

In particular, growing research on asymmetric warfare, including terrorism, has become increasingly common in the field, paralleling the twentieth-century evolution of transnational terrorism's capabilities and activities. There are similarities between the debates about balance-of-power politics in seventeenth- and eighteenth-century Europe and the investigation of the origins and effects of terrorist activities. As earlier scholars sought to understand why some nation-states were engaged in internal and external conflicts at different periods, terrorism analysts seek to identify the operational patterns and political agendas, at either the societal or the individual level, that can trigger or predict terror operations. Thus, although the actors are different, the underlying questions are often similar.

Finally, in the past two decades, scholars have begun to question the state-centric view of security. Due in part to increasing interest among policy makers in human security and failed states, some IR scholars now suggest that issues such as development, human rights, and genocide have eclipsed state-level conflict dynamics as the most important line of study in the field. While this scholarly push toward human security has had only limited influence to date, the emphasis on human security issues suggests that the move away from great-power politics as the center of the security field will continue well into the future.

INTERNATIONAL ORGANIZATIONS

Studies of international organizations have exhibited a cyclical nature. Initial studies focused on behavior within organizations and voting patterns of member states. These early studies questioned the politics within the organizations and analyses of the functional programs within them. A major theory surrounding the utility of international organizations was that of functionalism: the idea that through technical cooperation, international institutions would lead to broader political cooperation, as was the case in the European Communities established as the precursor to today's European Union.

Studies of the European Union and its predecessors as well as the United Nations proceeded apace, but by the 1980s, a liberal theory, neoliberal institutionalism, began treating international organizations more theoretically. According to neoliberal institutionalism research, international organizations could tame the ambitions of states by providing information, reducing transaction costs, and lengthening the shadow of the future, all of which would lead states to choose to engage in cooperation rather than conflict to achieve their policy goals. A heated debate ensued between these liberal scholars and realists about the general question of the efficacy of such international institutions.

Today, more detailed studies of international organizations not only investigate whether institutions help states cooperate but also examine when and under what circumstances these institutions are efficacious. A key controversy is the question of compliance: do institutions change state behavior or simply codify existing state behavior? The question has driven scholars to conduct more careful measurements of outcomes in areas such as human rights, the environment, trade, and international finance to determine pre and post behavior with regard to international institutions. For example, is international peacekeeping successful because it creates strong incentives for warring parties to stop fighting or because it is authorized only in cases where it is likely to succeed?

Two other areas of inquiry within the international organization subfield have recently emerged. The first examines the determinants of institutional design: why do institutions look like they do? It is no accident that the United Nations Security Council's permanent veto players are the victors of World War II, nor is it an accident that the largest economies have disproportionate influence in voting at the International Monetary Fund. Similar decisions about institutional rules, voting procedures, and organizational structure are made for every institution, and those decisions are fundamentally political. This new research attempts to shed light on this design process.

The second inquiry treats organizations less as agents of states but rather as independent entities that, like their state members, have independent preferences over outcomes in world politics. When organizations (international or nongovernmental) are placed on a par with states in terms of their ability to act autonomously, IR scholars must deal with a new set of actors that can influence international events such as human rights standards, environmental policy, and even arms control. This forces us to reconsider our state-centric theories of IR but also adds a level of richness to our explanations of world politics.

FOREIGN POLICY ANALYSIS

Although foreign policy is the smallest field within IR, scholars have long studied its process and politics in either case-oriented or comparative fashion. The bulk of this literature highlights the process by which decisions are made at the state level. For example, studies in the field examine how particular procedures guide state behavior in potentially suboptimal ways or whether bureaucratic politics serve as an intervening variable between leader preferences and policy outcomes.

In foreign policy, the processes between institutions are analyzed to determine how internal institution debates shape foreign policy outcomes, often relying on the U.S. model in this context. Specifically, scholars have examined how executive-legislative politics influence the decision to use military force, whether courts can effectively limit executive autonomy in foreign policy, and how public opinion influences foreign policy choices in areas ranging from isolationism to military force to economic sanctions.

A significant literature ties research in cognitive and social psychology to individual-level decisions in the realm of foreign policy. Political psychologists have attempted to decipher individual leaders' operational codes (rules by which decisions are made), how group decisions during international crises are made, and the effect of stress or other psychological phenomena in decision making.

The area of comparative foreign policy also continues to experience a slow but steady accretion of knowledge. The field experienced a renaissance in the 1980s as scholars examined theories such as the diversionary theory of war, the rally around the flag effect, and the dynamics of public opinion and war in comparative political perspective. Although data difficulties can limit work in this area, as information on micro-level political processes around the globe become more visible via the Internet, this field is likely to experience growth.

While research in the area of foreign policy analysis remains vibrant, it has dwindled in importance during the past two decades. Research using economic policy as a dependent variable tends to be folded into international political economy, while studies examining military aspects of foreign policy are largely subsumed by the security literature. Work continues in the area of political psychology in the field, and increasing numbers of scholars now draw on institutional theories developed in American politics (e.g., principal-agent models) to understand foreign policy issues.

INTERNATIONAL POLITICAL ECONOMY

For much of the early twentieth century, questions involving trade and international finance were largely the purview of economists. Yet, after World War II, scholars and practitioners alike recognized that political choices can undermine even the most carefully constructed economic arrangements. Early work in the field of international political economy examined to what extent the post–World War II financial international institutions established by Bretton Woods were dependent on the presence of a great power—in this case the United States—willing to underwrite the global economic framework. The topic became particularly salient as the United States struggled to support the gold standard and eventually moved to a floating exchange rate in the early 1970s. Scholars debated the political options available to supplant or alter U.S. global economic leadership.

An equally prominent topic in the international political economy field during the 1970s involved economic interdependence. Scholars questioned whether interdependence in the areas of trade and finance was a source of cooperation or conflict among states. Further work investigated the political determinants of the expanding flow of international trade. For example, scholars noted that pairs of states engaged in a military alliance as well as pairs of states with democratic regimes are statistically more likely to have higher trade with one another. Work on trade has continued to expand to include the origins and effects of the international organizations that shape trade patterns: the World Trade Organization and a myriad of regional trade arrangements that now dot the globe.

In the past two decades, research on international monetary and financial relations has expanded dramatically. International political economy scholars note choices about exchange rate regimes (fixed vs. floating) are determined by domestic political factors as much as by macroeconomic conditions. Similarly, state choices concerning the money supply, taxation, and the provision of public goods have all been explored by IR scholars, who find variables ranging from political partisanship to political institutions influence such economic choices.

A large literature within international political economy has focused on development. Again, although there is a high degree of overlap with economics in this field, IR scholars have long noted the political nature of development: world systems theorists highlight the dependencies in North-South trade flows, some scholars examine how trade flows to the developing world are influenced by global organizations, and other scholars assess the influence of conditionality policy by the International Monetary Fund on economic growth rates. Still other scholars examine topics including the effects of remittances, foreign direct investment, and immigration flows on development in the global South. The research on development topics within international political economy is vast and varied and is growing quickly as scholars of many fields attempt to ascertain why economic growth in the developing world has lagged for so long and continues to do so.

CONCLUSION

The field of IR is extremely broad. In some ways, it is easier to suggest which topics are excluded from study rather than which ones are included. Indeed, the borders within and around IR are increasingly porous. Trade research and studies of human security increasingly focus on organizations that operate in those areas. Alliances are relevant to security and trade policy yet are also treated as organizations. In an era of globalization, economic and security factors are increasingly intertwined in foreign policy decision making. Examples of the intermingling of the fields are endless.

Increasingly, the boundaries between IR and other subfields also are becoming porous. On one hand, these blurry boundaries make the generation and testing of theory more difficult: no longer can IR scholars ignore important advancements in comparative politics, American politics, or political economy. On the other hand, the ability of IR scholars to explain or predict events in an increasingly complex world requires increasingly complex theory and research. While such complexity may make IR theories and research less parsimonious, it carries the promise of not only making the field more relevant to understanding today's global crises, armed conflicts, and endemic socioeconomic and political problems but beginning to develop and implement the solutions.

International Relations Doctrines of Power

Among the most important foreign policy doctrines since the nineteenth century are balance of power, self-defense, appeasement, containment, détente, and interventionism, doctrines that unfolded in the wake of four wars: the Napoleonic Wars (1799–1815), World War I (1914–1918), World War II (1939–1945), and the cold war.

NINETEENTH- AND TWENTIETH-CENTURY EUROPEAN DOCTRINES OF POWER

The doctrines of self-defense and balance of power originated in past millennia but found creative practitioners in nineteenth-century Europe. Self-defense entails two principles: (1) states may use force to defend themselves and their allies, and (2) self-defense may involve other doctrines listed above (and more, including preventive measures to avoid war, coercive threat, collective security, counterterrorism, tribute, economic sanctioning, and deterrence based on threats of nuclear retaliation). The balance of power idea was a means for weaker states to defend themselves from hegemonic states by forming alliances to counterbalance expansionist states. Balancing power would serve to maintain independence of major states and regional and international stability.

A failure by European governments to balance Germany led to World War I and World War II. Appeasement, designed by British idealists (and Woodrow Wilson) to persuade hegemonic states to abandon aggression by offering unilateral compromises, conciliations, and economic incentives, failed to prevent World War II. These failures led American cold warriors to seek more effective defense doctrines.

THE COLD WAR AND CONTAINMENT

Suspecting that the Soviets sought territorial and ideological expansion after World War II, the Truman administration launched containment to deter aggression. George Kennan, an official at the U.S. State Department, argued in his 1946 "Long Telegram" that the paranoid, militaristic, and dangerous Soviet Union was "committed fanatically to the belief that with the U.S. there can be no permanent *modus Vivendi.*" According to Kennan's "Long Telegram," selective shows of force and economic counterbalancing would create "situations which will compel the Soviets to recognize . . . the necessity of behaving in accordance with precepts of international conduct."

Containment led to the United States's subsidizing the Western European economies, engaging in limited military actions, leading alliances that committed the United States to intervention, assisting states facing communist insurgencies, and mobilizing global public opinion. All U.S. administrations during the cold war deemed this effort necessary to prevent Soviet global dominance. The ever-growing commitments and interventions, however, aroused questions about American purpose and credibility. All administrations agreed that containment suffered a debilitating blow in Vietnam.

Richard Nixon sought to alleviate this blow through détente. Henry Kissinger defined *détente* as "the pursuit of relaxation of tensions" with the Soviet Union based on four principles: the United States must (1) resist Soviet aggression but respond to moderate behavior, (2) maintain a strong defense but not expect political power to flow from military strength, (3) accept its limited ability to produce internal change in other countries, and (4) recognize that both superpowers should receive advantages in any constructive relationship. Nixon and Kissinger described the hope that "the Soviet Union would acquire a stake in a wide spectrum of negotiations and would become convinced that its interests . . . would be best served in mutual restraint" (in Nomination Hearings for Henry A. Kissinger, Part 1, 1973).

After a decade of détente failed to fulfill these hopes, Ronald Reagan reinstituted containment. He argued that only Western willingness to resist challenges encouraged Soviet restraint. Reagan's containment entailed several assumptions:

the Soviets posed strategic and political threats to the United States and the world, détente facilitated Soviet activism, and military strength was the most effective tool to deny Soviet exploitation of international crises, convince them to negotiate seriously, and enable the United States to sustain international commitments. Containment, based on American economic and military superiority, would keep regional conflicts from spreading, convince the Soviets that expansionism no longer worked, and reduce the risk of superpower confrontation. According to Reagan in 1986, "Backing away from [Soviet] challenge[s] will not bring peace. It will only mean that others who are hostile to everything we believe in will have a freer hand to work their will in the world" (quoted in Kissinger 1993).

In the post–cold war, debate resurfaced between those for and against American interventionism to deter aggression and establish global security. Noninterventionists such as libertarian Doug Bandow do not believe interventionism is feasible, affordable, or likely to defend America's security, freedom, or prosperity. He assumes that global disorder per se does not threaten the United States, intervention on behalf of dictatorships to promote regional stability yields instability instead, and instability "can be contained by other states, met by more modest steps such as sanctions, or simply ignored" (Bandow 1992/1993, 164–169).

Selective noninterventionists call for an idealist (golden rule) ethic to guide policy. Charles Kegley (1992) argues that the ethic depends on awareness of the strategic as well as humanitarian advantages that come, in an interdependent world, from aiding those in need. This ethic requires multiple subscriber states and institutions. The United States must not go it alone. In Kegley's (2003) view, a unilateral American-imposed democratization policy is an example of unreflective globalism that employs an ends-justifies-the-means interventionism. In the idealist noninterventionist view, the United States may promote democracy by abstaining from excessive intervention and hoping that the example of democracy and freedom will inspire the nations of the world.

Noninterventionists fear that American democratization projects in Russia, Serbia, Somalia, or Iraq patronize them; paying for nation-building jeopardizes American financial equilibrium; and the expansionist impulse inspires impossible (democratization) and neoimperialist goals. This vision for American retrenchment and democracy building by example may reflect a lack of realism about power, conflicting interests, aggression, the might of reason and public opinion, and the prospects of international cooperation. Noninterventionists, while sympathetic to democratic principles and victims of tyrannies, may end up with weak proposals to cheer freedom fighters, boo bad guys, and abstain from liberating interventions.

Multilateral interventionists want to do more than cheerlead. Bill Clinton noted in 1992 that "it is time for America to lead a global alliance for democracy" (p. 421). Multilateral interventionists call for collective security, multilateralism, and intervention on behalf of democracy, human rights, and global

order. This avoids the taint of unilateralism but may lack full appreciation that consensus and effectiveness are hampered in a world of conflicting interests and limited military and economic resources.

Given the difficulties of multilateralism, unilateral interventionists (such as George W. Bush) say the United States must act unilaterally when necessary to ensure global or regional democratization and stability or to fight global terrorism. One must deal with instability on the periphery to prevent conflict escalation and erosion of the credibility (willingness to intervene) of states or organizations committed to peacemaking; in this view, the United States cannot sit on the sidelines. Multilateral interventionists see much risk of overextension in unilateralism. They urge a more prudent (and internationally endorsed) selection of problems to solve and warn that a U.S.-imposed democratic world order is unobtainable.

International Relations Theory

International relations theory is an umbrella term for perspectives used within the field of international relations (IR) for understanding and analyzing political, economic, and social activity on a global scale. These perspectives are prepackaged analytical templates or structures for categorizing, explaining, and understanding IR. Because IR theories adopt different substantive, epistemological, and normative assumptions, collectively these theories constitute competing ways to understand global affairs. Their scope is systemic in that they are meant to have broad applicability to human global activity across both time and space. As such, IR theory constitutes a grand theory within the study of IR, as opposed to middle-range or foreign policy theories that are narrower in focus, scope, and applicability.

IR theories are typically described as if they were competing camps, paradigms, or isms vying for analytical dominance

within the subfield. Examples of IR theories include, but are not limited to, realism, liberalism, constructivism, world system theory, historical materialism, and feminism. The content and parameters of IR theories are usually described in contrast to one another, yet each perspective consists of multiple variants, some of which are in disagreement and competition with one another. There are also cross-cutting substantive and epistemological commitments, so that depending on the specific variant and subject at hand, opposing IR theories may share common assumptions and other characteristics. Still, the juxtaposition of the larger, umbrella categories or isms to one another usefully illustrates the differing commitments made by IR scholars with regard to domains of research, units of analysis, and methodological choices as they attempt to explain world politics and global affairs.

DISCIPLINARY HISTORY

The history of IR theory is typically described within the discipline as a series of "great debates," the first occurring in the interwar years of 1919 to 1939 between realism and idealism. Idealism emphasized the efficacy of international institutions, law, and cooperation. Realism, with its pessimistic emphasis on anarchy, states, security, and balance-of-power politics, is said to have won this debate following World War II (1939–1945). While there was considerable analytical coalescence within the discipline around realism thereafter, interest in international institutions and cooperation remained and led to the development of liberalism as a broad category of theories collectively interested in exploring the role of nonstate actors, international institutions, cooperation, and democracy in international affairs.

Realist and liberal perspectives, and the ongoing analytical disagreements between them, tended to dominate the IR theory subfield for much of the cold war. The cold war period also saw the development of neo-Marxist approaches, such as world system theory, which was influenced by theories of development and imperialism and conceived of global activity in terms of a world capitalist system. Marxist approaches were often described as the third leg of an analytical triad in the discipline (along with realism and liberalism), but since the cold war this position has often been assigned in most disciplinary accounts to constructivism, which focuses on the social construction of norms, identity, and interests.

Two other great debates within the discipline occurred during the cold war, and both involved disagreement over the discipline's preference for examining global phenomena with methods drawn loosely from the hard sciences. Such methods include an emphasis on empirical data collection, testing, and falsification, and they underscore a preference for research subjects that appear to be objectively quantifiable. Disagreement between the behavioralists as proponents of these methods and the traditionalists (or classicists) as critics of them constituted the second debate in the 1960s, with the behavioralists generally seen as the victors. Yet as with the realist-idealist debate, concerns about the scientific method, or positivism, did not entirely disappear. Many traditionalists found refuge in English

school theory, which examines IR as a society of states, thereby combining within the same analytical rubric elements of realism, liberalism, and constructivism and an interest in historical sociology.

POSITIVISM AND POSTPOSITIVISM

Concerns with positivism resurfaced in the late 1980s in the third debate, which sought to reveal how positivism's epistemological and normative foundations excluded and marginalized particular subjects that were relevant to understanding global affairs. A number of postpositivist theories gained prominence at this time and collectively represented an analytical assault on the positivist preferences of established IR theories such as realism, liberalism, and world system theory. Individually, these postpositivist perspectives focused on exploring different aspects of what established theories missed or marginalized.

Postmodernism, for example, concentrates on mapping out the hegemonic discourses of IR and of the discipline itself. Feminism explores how these same discourses reify and subordinate gender difference. Historical materialism draws on the work of Antonio Gramsci to examine the coconstitution of state and society within the capitalist world economy. And contemporary adherents of the Frankfurt school of critical theory rely on the ideas of Jurgen Habermas to argue that dialogue and particular forms of communication can have emancipatory effects in world affairs.

The debate between positivists and postpositivists also opened analytical space for a renewed interest in ethics and normative theory and for exploring topics such as postcolonialism and the effects of U.S. political and economic dominance on IR theorizing itself. Yet postpositivist theories did not displace positivism and the theories that subscribe to it within the discipline. Rather, postpositivist approaches exist alongside established IR theories, in which analytical innovation and variation has continued. As a result, the variations among and within IR grand theories, and the subjects they seek to address or explore, have multiplied considerably since the end of the cold war.

Taken as a whole, IR theory is an analytical domain in which there is considerable disagreement about theoretical fundamentals. IR theorists disagree about what the appropriate unit of analysis is, how to conduct analysis itself, whether particular normative commitments underwrite particular methods, and what or whether there are theoretical and empirical boundaries to appropriate disciplinary theorizing. Even whether IR theory should be described as a series of great debates or in terms of competing camps and isms is a subject of debate. Still, these IR theoretical categories remain a useful heuristic for cutting into and understanding both the disciplinary history of theorizing in IR and the ongoing analytical disagreements that continue to animate the subfield.

International Relations Worldviews and Frameworks

One way to review international relations worldviews related to foreign policy is to probe the positions of key theorists within the influential schools of realism, idealism, behavioralism, and postmodernism.

IDEALISTS AND REALISTS

The twentieth century brought into focus several "great debates" in international relations (IR) theory. The oldest, and still unresolved, is the debate between realism and idealism. *Idealists* claim that human nature is basically good, rational, and law-abiding and seeks peace, well-being, liberty, democracy, justice, and self-determination. Nation-states ought to pursue these goals and will do so given rational and democratic leaders, transnational institutions dedicated to idealist goals, and global education and socialization that instruct citizens about habit-forming benevolence. Idealists from ancient philosophers to Woodrow Wilson, pacifists, and utopians see global harmony of interests and cooperation as realizable goals.

Realists, from ancient philosophers to modern proponents of balance of power like Hans Morgenthau (1948), reject most of these idealist assumptions. With a pessimistic view of human nature and transformative (harmony-producing) transnational institutions, realists see all politics as a struggle for power, national interest, and survival in a dog-eat-dog world. Rational citizens and leaders, schooled in the reality of hostile forces, incomplete understanding, scarce resources, and disagreement on the rules of engagement, must prepare for the worst; doubt

the good intentions of states with competing interests; pursue obtainable (limited, not utopian) goals of national interest; and cooperate with like-minded states (democratic scruples need not intrude) dedicated to resisting hegemonic states that seek to dominate neighbors and upset balances of power. For realists, conflict is inevitable but manageable when leaders understand that anarchy breeds danger and that a balance-of-power strategy, rather than policies based on human goodness, provides the best avenue toward stability and survival.

This debate resurfaced in the 1970s when neorealists and neoliberals delivered upgraded reports on the prospects for peace in the twenty-first century. *Neorealists* argued that states remain the major actors in an anarchical world. While cooperation occurs, states still may fight for self-defense, power expansion, stability, national or ideological interests, and economic or geopolitical necessity. Neorealists, like Kenneth Waltz, want to shore up the rigor of realist theory to enable better explanation for state rivalry. The neorealist emphasizes the persistent influence of the anarchic structure of the world as a constraint on states that still respond to structural/system-induced drives for power, security, and stability.

Neoliberals, like Robert Keohane (2002), reject the pessimism of realists who failed to predict the peaceful end of the cold war. They expect to encounter cooperation, integration, and peace once states abandon dangerous power obsessions. Where neorealists expect stability to be produced by states adjusting to international anarchy and power imbalances, neoliberals assume stability and prosperity will follow in the wake of expanded awareness of the benefits of global economic and technological interdependence and the effectiveness of transnational institutions, such as the United Nations and European Union.

BEHAVIORALISTS AND TRADITIONALISTS

In the midst of this two-part realist/idealist debate, a second great debate emerged between traditionalists, who approached IR theory as intuitive historians, philosophers, and policy analysts, and behavioralists (or empiricists), who intended to discover, by scientific method, laws of human and state behavior.

In this epistemological (ways of knowing) debate, *behavioralists* assert that knowledge depends on a logical positivism: We can only know to be true that which we can observe, measure, test, operationalize, and replicate. Only through observation, quantitative experimentation, and scientific conceptualization can we build empirically valid and cumulative theory. From observing and scientifically unpacking the interacting parts of the political world, IR scholars like J. David Singer claim to discover and describe the objective laws of interstate relations; convert facts into "hard" data, without which one cannot generalize; offer generalizations (empirically derived and sponsored) and heuristic explanations about human action; and predict from discovered trends to high probability futures.

Traditionalists are not persuaded that scientific techniques and hyper-abstractions applied to state behavior will yield accurate data measurement and empirical validity. For traditionalists, behavior is not prepackaged and uniform, but

unique; not subject to scientific predictability, but affected by chance and random human choices; and not quantifiable or subject to controlled experiments, but understood by philosophical reasoning. Traditionalists, therefore, maintain that IR theory remains slippery and impressionistic, difficult to measure, and dependent on historical and speculative analysis or on what Donald Puchala (1990) calls a metaphysical way-of-knowing accomplished through plausible and insightful reasoning and conceptualizing. Theory, in this view, derives from analytic impressions and intuition and then launches empirical follow-through. Thinking, imagining, and theorizing precede empirical testing, data making, and knowledge.

POSTMODERNISTS

Postmodernists (a.k.a. postempiricists, postpositivists, and structuralists) reject all these previous theoretical endeavors as façades because there are no "proven" facts, data, truths, or value-free theories, only perceptions and opinions. In their view, Modernist or Enlightenment metaphysicists, whether creating or asserting knowledge based on reasoning or revelation or on realist or idealist perspectives, are actually imposing their privileged Western opinion about truth as if this opinion were neutral theoretical explanation. Enlightenment behavioralists (empiricists) impose meaning on what they discover, presumably without preconceptions or bias.

Postmodernists do not care for behavioral, realist, Marxist, or natural law models, either in terms of their social scientific or value-free methods or their presumptions about data making or the ability to discover truth. For postmodernists, it is unfounded arrogance to presume that history moves with meaning toward goals like democracy, balances of power, capitalism, socialism, and even human progress toward the "better." The seemingly antitheory-theory of postmodernism questions and deconstructs all notions about truth and embraces conceptual pluralism and relativism. There is no one better idea or explanation, or rather there are many social and political constructions that portray reality according to many (equally valid or equally invalid) points of view.

Postmodernists lament that these points of view masquerade as objective truth presumably proven by rational discourse and exegesis or by the tools of science. In their view, authority figures such as political and cultural elites (usually male) of dominant power centers (usually Western) take control of people (variously poor and oppressed), language, identity, and history to coerce others to accept their power, ideas, and cultures. We are better off rejecting theoretical and ideational imperialists posing as fact-finders and neutral interpreters savant. However, postmodernists themselves reveal an imperialist impulse because they believe their philosophical proclamations are somehow true (one must, apparently, strive for absolute tolerance and yet reject all forms of dominance) and not just opinion constructions. Postmodernists rightly question, but in the grab-bag of contending IR theories, they have made little headway.

International System

Since the 1970s, scholars have largely conceived of international politics occurring within a system or environment defined by a structure and interacting units. Systemic approaches make it possible to understand two recurring features of the international political landscape: unintended consequences and equifinality. How scholars define the international system and characterize its potential for change depends on their theoretical orientation. The two main approaches are realist and idealist. Among idealists, one can further distinguish between evolutionary and revolutionary perspectives.

KENNETH N. WALTZ'S CALL FOR SYSTEMIC THEORIES

In *Man, the State, and War* (1954), Kenneth N. Waltz identifies three images, or levels, of analysis from which international politics are typically studied: the individual level, the state level, and the international level. In the first half of *Theory of International Politics* (1979), Waltz argues that international outcomes are best explained systemically, at the international level of analysis.

According to Waltz, reductionist approaches (those at the individual and state levels of analysis) are inappropriate wherever unintended consequences and equifinality prevail. In the international realm, unintended consequences are evident in that individuals who prefer to avoid war are often drawn into fighting, and states whose policy is to ally with certain types of states often end up allying with others. Equifinality, by contrast, is evident in the fact that all manner of individuals and states participate in war.

Unintended consequences and equifinality demonstrate that individual and state actions are affected by systemic conditions. These conditions must be taken into account when explaining and predicting international outcomes and prescribing foreign policies.

WALTZ'S STRUCTURAL-REALIST THEORY

In the second half of *Theory of International Politics*, Waltz develops the first systemic theory of international relations. Today structural-realist theory remains at the center of scholarly debates about how international relations work and whether they can be changed.

In developing structural-realist theory, Waltz defines the structure of the international system in terms of anarchy (the

absence of world government) and polarity (the distribution of capabilities among units). In addition, he argues that states should be "taken as the units of the system" (Waltz, 1979, p. 93). According to Waltz, a state is an "autonomous political unit," an entity that "decides for itself how it will cope with its internal and external problems" (pp. 95–96). Finally, Waltz assumes that states seek, at least, to survive.

From this theory, Waltz derives several hypotheses about international outcomes. In particular, he expects that strong states have better survival chances and more influence than weak states. He also predicts that balances of power recurrently form to limit the reach of the strong. Above all, Waltz expects that wars continue to occur "because there is nothing to prevent them" (1959, p. 232). Specifically, in the anarchic international system, there is no sovereign to limit the expansion of strong or ambitious states and to help states avoid the "security dilemma," in which relative power is, at once, the best guarantor of security and likely to make one a target.

According to Waltz, it is necessary to distinguish between change *in* the system and change *of* the system. Changes in the distribution of capabilities, for example the rise of a third great power in a bipolar era and the consequent emergence of multipolarity, are simply changes in the system. A change of system would occur only with a change of ordering principle, from anarchy to hierarchy. Like classical realists such as Hans Morgenthau, Waltz and other structural realists doubt that such a change will occur. Unlike classical realists, however, structural realists' pessimism arises not from a dim view of human or state nature but from the structure of the international system. International anarchy gives states both the means and the motive to preserve their sovereignty.

ALTERNATIVE PERSPECTIVES ON THE INTERNATIONAL SYSTEM

Unlike realists, idealists are optimistic about the transformation of the international system from an anarchic realm characterized by conflict to a hierarchic, or at least cooperative, realm. There are two types of idealists: those who argue that system transformation is inevitable and evolutionary, and those who argue that change is possible but will not occur without deliberate, revolutionary action.

Liberalism is the most prominent evolutionary theory. Liberal arguments range from classical claims, about the inevitable and pacifying spread of capitalism and democracy at the state level of analysis, to neoliberal assertions, about the socializing effects of international institutions and economic interdependence at the system level. According to neoliberals Robert O. Keohane and Joseph S. Nye (2001), weak states and nonstate actors are "able to put increasing leverage on [strong] states" (p. 225), thereby creating "*de facto* governance" (p. 261). What unites classical and neoliberal arguments is their view of human nature. According to liberals, all people seek prosperity and justice. In pursuing these interests, individuals transform the world into one that is good for all.

Marxism, dependency theory, and constructivism are often characterized as revolutionary theories. Whether this is apt depends on the argument under consideration. Karl Marx's claim about the role of technology in the rise of capitalism and inevitable emergence of a cooperative socialist order rests on evolutionary logic. By contrast, for dependency theorist Johan Galtung system transformation requires deliberate choices and strategies by center and periphery classes and countries. Constructivist Alexander Wendt's early argument about the possibility of replacing "self-help" with "other-help" norms rested on revolutionary logic. By contrast, his more recent argument that a universal desire for recognition leads inevitably toward world government has strong evolutionary tones.

Feminists, too, differ in their predictions about system change. Liberal and radical feminists take an evolutionary view, asserting that female enfranchisement and participation have made international politics more cooperative than they once were and that progress will continue as more women become involved. By contrast, critical feminists such as Sandra Whitworth argue that the behavior of both men and women reflects gendered norms of competition and dominance constructed by governments and militaries. For a more cooperative and nurturing international system to emerge, these norms must be deliberately reconstructed.

For structural realists such as Waltz, changes in the attributes, interdependence, and norms of states are changes in the international system, not changes of the system. Unless states surrender sovereignty to a world government, the anarchic structure of the international system will persist, and war and conflict will continue to occur, both intentionally and inadvertently, among a wide variety of leaders and states.

Internet and Politics

At no other time in the history of American politics has the Internet been considered such a major factor in the mobilization of the electorate than during the 2008 election. From the grassroots fund-raising efforts of the Obama campaign to the mass mobilization activities to get supporters in many localities to engage in various political participation activities, the Internet was indeed a force in bringing about the success of Barack Obama's presidential campaign. The big question now becomes, Is the Internet going to be a permanent feature of American politics, especially when this generation of candidates and voters will bring such technological knowledge with them?

The Internet is a set of many networks linking together millions of computers to send and receive data. It allows for the facilitation of communication, especially one-to-many communication. The Internet began in the 1960s as a Department of Defense project called the Advanced Research Projects Agency Network, or ARPANET. Although purely a defense project, it found its next greatest use in academia in the 1970s and 1980s with the growth in computing for research. As computers became smaller and faster, the age of personal computing brought the technology into the hands of the ordinary user. People have found use for computers in various business tasks, so the commercialization of the Internet has gained in importance. E-mail is the most common Internet activity, followed by entertainment. Beyond commerce for both employment and consumer activities, the next most common use of the Internet is obtaining political news. Other uses include health-related activities, education, and religious activity.

USES IN POLITICS

The Internet plays a substantial role in politics and government today. In 1993 the White House went online with the introduction of the Web site www.whitehouse.gov. The 1996 and 1998 campaigns were benchmark years for when democracy met the Internet. The dawning of netocracy was hailed because the use of the Internet created active participatory netizens. The Howard Dean presidential campaign is considered a precursor to the Obama campaign in its initial use of the Internet as a method of fund-raising, campaigning, and mobilizing citizens to engage in active participation in the political process beyond the act of voting. By 2004 the Internet would serve as an integral part of any campaign. Part of the success of the Obama campaign can be attributed to a large Web presence that allowed ordinary citizens to participate in the process through small contributions, house parties, bake sales, and so forth. Even after the election was won, the Web continued to be used by Obama supporters to inform people about the direction of the country and as a way to solicit and maintain continued support of Obama policies.

Beyond the White House, the entire executive branch of government has a Web presence. Both houses of Congress have Web portals at www.senate.gov and www.house.gov, where members of Congress can inform their constituents about their voting records, legislation that they have sponsored, their

personal biographies, and much more. The U.S. Supreme Court has a Web presence at www.supremecourtus.gov, and materials on the site include court cases, rulings, and opinions.

The various components and institutions in the political system also have their presence on the Web. Political parties major (Republican and Democratic) and minor (Libertarian and Progressive) inform their supporters as well as would-be detractors about their platforms and goals. Major interest groups such as the National Rifle Association and the American Association of Retired Persons likewise find that having materials on the Internet allows them to make their presence felt. This allows for activism and political engagement to take place at the netroots. This form of direct democracy has been billed as what will connect citizens to mass decision-making processes. Media sources at all levels—newspapers (*New York Times, Washington Post, USA Today, Wall Street Journal*), magazines (*Time, Newsweek, The Economist*), and television (CNN, FOX, ABC)—can also be found on the Web.

Most major countries in the world have found uses for a Web presence: to inform the world of their existence, to lure those who have the money and the curiosity to visit them, or to facilitate communication from government to government or from citizen to citizen through exchanges of e-mails and the sharing of audio and video. Although the state of technological development in a country may provide insight into the usefulness of the Internet to deliver basic needs to its citizens, the digital divide is a constant reminder that gaps between wealth and poverty will prevent billions of people from availing themselves of the advantages of connectivity.

Whereas initial interest in the Internet for government was geared toward providing information to constituents, today it allows for more than that, including greater interaction so political mobilization can take place. Those who favor going electronic in various facets of our lives believe that the Internet will ultimately strengthen democracy through information dissemination and mobilization. As the Net becomes more integrated into our lives it will be an integral method for discussing political issues such as cyberlaw cases, gambling and pornography on the Internet, online voting, and debates at the national and international levels regarding the impact of the so-called digital divide.

POSITIVE AND NEGATIVE ASPECTS

The Internet has challenged the responsiveness of government to the needs of the revitalization of democracy. Although some political scientists contend that political life online is a mere extension of political life offline, it is also another medium through which expressions of political activity can be channeled. Positive political consequences have come about as a result of the popularization of the Internet. It has allowed for greater political access to those otherwise not able to make their thoughts and ideas known. It has been used by various groups to engage in agenda building and agenda setting and is a powerful tool in voting, campaigning, fund-raising, and mobilizing volunteers.

Proponents of the use of the Internet in government say that it makes government more responsive, more efficient, and

less bureaucratic. The greater transparency that Web presence brings could prevent government from withholding or censoring information. However, information delivered can be only as reliable and credible as the producers of the information allow, and therefore misinformation, deception, and manipulation can still take place.

Many see the Internet becoming as available as the telephone and television. Idealists believe the Internet holds promise for narrowing the digital gap and bringing about democracy and world peace. However, it can be just as instrumental in spreading hate and bigotry—just as the Internet can help spread freedom, it can also be used to curtail it. There are things that the Internet cannot do. As an alternative mode of communication and participation, it will not lead to the triumph of direct democracy. It does not automatically give power to the powerless. It has the potential to reinforce existing relationships of elite domination due to the persistence of the digital divide. And with billions of people worldwide still not online, it will not automatically build a global village without borders.

Interregnum

Literally "between reigns," *interregnum* refers to the time when England was kingless after the regicide of Charles I in 1649 and before the restoration of Charles II in 1660. This period is known as the commonwealth period after the English Civil War (1642–1651), when the Puritans sought to establish a godly republic under the leadership of Oliver Cromwell and the force of the New Model Army. Parliament declared the monarchy abolished—there was no king and no House of Lords. The first republican government—the Rump Parliament, a unicameral body—lasted only four years (1649–1653) when Oliver Cromwell established a protectorate (1654–1658) to be succeeded by his son, Richard Cromwell (1658–1659). In 1660, Charles II took the throne and ended the interregnum by restoring the monarchy, House of Lords, and episcopacy to England.

The political theory of the interregnum was English republicanism, a combination of classical republicanism, natural law theory, and ancient constitutionalism. Several political works of English republicanism were published, such as Marchamont Nedham's *The Case of the Commonwealth of England Stated* (1650), Thomas Hobbes's *Leviathan* (1651), John Milton's *A Defence of the People of England* (1651), and James Harrington's *Oceana* (1656). Freedom of worship was granted to Presbyterians, Independents, Quakers, and Baptists. The Church of England lost ecclesiastical control as the principles of liberty of conscience, universal toleration, and egalitarianism, which had been advocated by the Levellers during civil war radicalism, were implemented by the Puritans, both Presbyterians and Independents. Parliamentary sovereignty as representative constitutionalism, civic and moral virtue among the people, and individual natural rights were core principles of English republicanism.

Intersectionality

Intersectionality is an approach to research that emphasizes the significance of intersecting social categories. Race, ethnicity, gender, and class are categories of difference that can serve as identities but are also social structures associated with status hierarchies. Intersectional research focuses on ways that these categories of difference, and their related social structures such as racism or sexism, interact to reproduce social inequalities. *Intersectionality* also refers to a normative theory, claiming that meaningful understandings of social phenomenon require a consideration of the ways that multiple social categories and structures interact with each other.

While gender studies research commonly focuses on sexism to explain social inequality and race studies research typically concentrates on racism, intersectional research is explicitly interdisciplinary, focusing on the ways that social institutions such as racism and sexism interact. Intersectional theory can be used to combat the tendency for researchers to explain social inequality by looking at one factor only, such as race, gender, or class. Explaining what goes on at the interstices of social categories and social institutions such as racism and sexism is a central goal of intersectional research. The concept of intersectionality is central to the work of many interdisciplinary researchers.

Intersectionality is often characterized as a codeword for research on women of color, but intersectionality theorists point out that class, ethnicity, citizenship, religion, age, sexual orientation, marital status, and disability—in addition to gender and race—are all categories of difference that interact with each other in varying and multiple ways. The intersections of these categories of difference have been described as axes of disadvantage or axes of structural inequality.

Philomena Essed's concept of gendered racism is an example of intersectional work. Essed uses the phrase "gendered racism" to explain how women in racial minority groups often experience the interaction of racism and sexism as more than just racism plus sexism. Gendered racism describes the gender-specific ways that racism often manifests itself, creating and reinforcing race- and gender-specific stereotypes. In the United States, the welfare queen stereotype, for example, applies not to African American people in general nor to all women but specifically to African American single mothers. More traditional research that focuses on only race and racism, or sex and sexism, would miss this important interaction.

Intersectionality has been developed primarily by race and gender scholars since the 1980s and early 1990s. Intersectional approaches are more commonly found in gender studies, race studies, and sociological research, but political science researchers are increasingly utilizing intersectionality. Political theorists such as Ange-Marie Hancock and Wendy Smooth have considered the value of, and implications of, an intersectional approach in political science research.

Interstate Compacts

An interstate compact is a binding agreement among two or more states that has the legal status of a contract and a statute. Originally, interstate compacts were used mainly to resolve boundary disputes and apportionment of river water among the states. In the early twentieth century, they began to be used for a greater variety of purposes. As new issues emerged that were no longer regional in nature, states in geographically disperse locations across the country began to form compacts.

The formation of a compact is a step-by-step process. Compacts can be created formally, with states negotiating in a multistate commission, or informally, with state officials formulating compacts at regional conferences. Concerned state legislatures must enact the compact. Political compacts require the consent of Congress to become effective.

Interstate compacts have a long history in the United States. In colonial times they were used to settle boundary disputes among the colonies. Interstate compacts continued to be used for this purpose after the country gained its independence from the United Kingdom. The Framers of the Articles of Confederation and Perpetual Union codified the process forming an interstate compact in the document.

The current power to form these compacts is derived from the compact clause (Article 1, Section 3, Clause 3) of the U.S. Constitution: "no State shall, without the consent of Congress . . . enter into any Agreement or Compact with another State, or with a foreign Power." For a compact to be created, the states must come to a mutual agreement and, depending on the parameters, must obtain congressional approval.

The law of interstate compacts has been developed in several major U.S. Supreme Court cases. The most important is *Virginia v. Tennessee* (1893), a case that dealt with a tract of land that was claimed by both states. The Court ruled the consent of Congress is necessary if a compact encroaches on the powers of the national government. The Court also stated that congressional consent could be given both explicitly and implicitly.

Until the early twentieth century, the use of compacts was limited. Since that time, there has been a growth not only in the number of compacts but also in the subject matter they cover, including compacts dealing with transportation, business, criminal justice, and education. In the 1980s, the use of compacts in disposing of low-level radioactive waste became more common because of an act of Congress encouraging their use. States have also used compacts to regulate and raise revenue through gambling.

Several criticisms have been leveled at interstate compacts. Paul Hardy (1982) discusses four problems associated with them. The first is the length of time it takes from formation to implementation of a compact. The process can be very time consuming because of the different levels of government involved. The second is their inflexibility. It is often difficult to modify compacts once they have been implemented. Third, states relinquish some of their sovereignty when they enter into a compact. Finally, compacts may prove difficult to enforce, as some states may not live up to their end of the bargain.

Political science scholarship on interstate compacts has been relatively limited compared with other areas of American state politics. Most of the research on interstate compacts has been conducted by legal scholars. Two of the most important articles, written by political scientists, were published in *Publius: The Journal of Federalism*. David Nice's (1987) article "State Participation in Interstate Compacts" systematically examines which factors are associated with the use of interstate compacts. He finds that geographical proximity of state capitals as well as state-level socioeconomic and political factors are important determinants in the utilization of compacts but that they are conditional on the subject matter of the compact. Patricia Florestano's (1994) article "Past and Present Utilization of Interstate Compacts in the United States" is more descriptive in

nature and analyzes the changes that have occurred with regard to the subject matter and the states participating in interstate compacts.

Interstate compacts continue to be used by states to resolve political and social issues. The general trend is that their scope will continue to be expanded. Future scholarship should discuss and analyze the efficacy of compacts as well as their potential to address new regional issues.

Interstate Rendition

Fugitives from justice in a federal nation may flee to a sister state or a foreign nation, and a process established by the national constitution or a foreign treaty, respectively, is necessary to ensure their return to the state from which they fled. Members of the New England Confederation, established in 1643, utilized a rendition process subsequently included in the Articles of Confederation and Perpetual Union (Article IV). Currently, the U.S. Constitution (Article IV, Section 2) and a congressional statute (18 U.S.C. §3182) govern the rendition process, and the United States has entered into extradition treaties with many foreign nations.

The governor of the state from which the fugitive fled demands that the governor of the asylum state apprehend and return the fugitive to the demanding state. Whether the offense committed by the fugitive is an offense in the asylum state is immaterial. The U.S. Supreme Court in *Dennison v. Kentucky* (65 U.S. 66) in 1861 ruled the asylum state governor

has only a moral obligation to return a fugitive. The Court in *Puerto Rico v. Branstad* (489 U.S. 227) held in 1987 that the governor of the asylum state has a constitutional mandatory duty to return the fugitive. The fugitive, however, has due process of law rights guaranteed by the Fourteenth Amendment to the U.S. Constitution and may demand a hearing before the governor and an appeal to the judiciary to secure his or her liberty.

All state legislatures have enacted the Agreement on Detainers, an interstate compact establishing a similar process for a state penal institution prisoner to be returned temporarily to another state for a trial on an untried indictment, information, or complaint.

Interview Techniques

An interview is the act of posing questions to a respondent to obtain information. In political science, interview responses are typically recorded and then analyzed for research purposes. Interviews are used to fulfill a variety of methodological needs and may be the most applicable design to gauge a respondent's attitudes about a topic(s), obtain factual information about the individual, or ask respondents to self-report their behaviors or habits. Interviews not only can obtain qualitative data on political phenomena but also help to acquire firsthand, factual, and in-depth knowledge about entities, organizations, and social movements from those associated with the item in question.

Although an interview can assume one of several forms, an interview by its nature is predicated on interaction between the interviewer(s) and the respondent(s)/interviewee(s). As such, an interview is generally conducted in one of two ways: either face to face (either in person or, in some cases, via electronic teleconferencing) or over the telephone. The method chosen for the interview is contingent on the nature of the research, cost, and time frame.

A researcher may opt to conduct face-to-face interviews with respondents, although this method can be costly in terms of both time and money and is thus frequently reserved primarily for smaller sample populations. For larger samples, a researcher may opt to conduct interviews over the telephone or administer a questionnaire. A telephone interview is conducted by an interviewer or a series of interviewers who may or may not include the researcher him- or herself or the principal investigator of the study. A telephone interview is typically less expensive than a face-to-face method and is particularly useful for larger sample populations and when time and cost limitations may preclude the face-to-face method.

Depending on the nature of the interview's response format, an interview can be considered either qualitative or quantitative research. Less-structured interviews are frequently qualitative, particularly when the research objective is exploratory in nature, as they generally provide respondents an opportunity to answer open-ended questions in as much detail as possible and do not constrain responses. However, highly structured interviews in which the interviewer is administering a standardized questionnaire (particularly those with a higher volume of closed-ended responses) are more quantitative, especially when the researcher plans to code and statistically analyze the data obtained. In this sense, the interview technique may be qualitative in nature but useful in quantitative analyses.

INTERVIEW STRUCTURE

There are multiple types of interviews ranging from highly structured formats using predetermined questions and/or questionnaires to relatively spontaneous, unstructured formats that are more conversational in style and fluid in nature. Some research designs may incorporate both structured and unstructured interview formats, and some may employ a semistructured hybrid of the two. The latter is known as a focused interview.

A highly structured interview typically involves the administration of a predetermined, standardized set of questions, a questionnaire. This particular structure can be beneficial when a researcher is dealing with large sample sizes and will be comparing the data either across the sample or across other populations. The standardized approach also maximizes the reliability and validity of the measure but is frequently an impediment to more exploratory research as questionnaires typically constrain responses and do not allow an interviewer to stray from the script to probe for more information or clarify responses. Highly structured interviews may also prove to be impossible for some types of research, particularly if the researcher lacks the knowledge or understanding necessary to construct a viable and comprehensive questionnaire or when the nature of the research necessitates individual interpretation or in-depth exploration of a topic.

Unstructured interviews provide the interviewer with the capacity to control and guide the direction of an interview. They also allow an interviewer to probe responses and accommodate for the intangible elements that may affect responses. These intangibles include the intensity with which a respondent may respond to an opinion question, the respondent's mood during the interview, and response latency, the amount of time it takes a respondent to answer a question, which can be important when analyzing the level of truthfulness in a respondent's answer.

In a semistructured/focused interview, the interviewer may prepare a list of questions or topics that ought to be covered in the interview, and he or she may delineate in what order these items should be addressed. Although a researcher may use this as a guide, a semistructured focused interview affords the researcher significant flexibility in terms of how the interview will be conducted and allows for additional questions to be asked if certain responses require clarification or exploration. This method is particularly useful when interviewing elites.

The chosen structure of the interview is typically contingent on the nature of the research as well as practical limitations (i.e., cost and time frame). Generally speaking, the more exploratory the research, the less structured the interview will be. In other words, when the research goal is exploratory in nature, the researcher will wield less control over the topic and direction of the interview as the research objective is more to gauge the respondent's interpretation and underlying attitudes, which may be lost in a more structured setting.

POTENTIAL METHODOLOGICAL PITFALLS OF INTERVIEWS

Interviews, particularly those that are less structured in design, are fraught with potential methodological pitfalls. The wording of the questions and/or the order in which they are asked, for instance, may affect respondents' answers to those questions. The very presence of an interviewer may inspire a certain type of response, generally one that is more prosocial in nature, particularly in interviews examining more controversial topics. The gender, race/ethnicity, sexuality, and age of the interviewer may affect responses, particularly in face-to-face interviews. The actions of the interviewer may also influence respondents. Indeed, the very analysis and interpretation of the data may be affected by the interviewer's own preexisting biases or knowledge of the topic being researched. In this sense, interview data are frequently not especially useful when reliability and validity of measurement instruments is essential to the research, except when employing highly structured, standardized techniques.

Investiture

Investiture (from the Latin *Investitura* and the German *Gewere*) involves the formal installation of an individual (incumbent) into an office, organization, or rank. The term is generally used in reference to one's installation into a formal office,

such as that of the aristocracy, church, or state. Investiture is preceded by a formal ceremony. For example, British investiture is a unique ceremony: an individual who has been awarded an honor is presented with the official medal from the queen or the prince of Wales. Presidential inauguration is another example of the investment of a head of state. Under the feudal system, the term referred to the ceremony between a suzerain (feudal lord) and a vassal. Having received the homage of the vassal and oath of fealty, the suzerain would invest him with either land (fief) or office by presentation of some symbol according to custom. During the eleventh century, the term designated both the act and the ceremony for abbots and bishops by which princes granted certain property (benefice), political rights, and titles. The investiture controversy of the eleventh and twelfth centuries was an ecclesiastical dispute regarding whether a suzerain or pope should grant the symbols of his authority to an ecclesiastical vassal. The sword and scepter were emblematic of feudal authority, whereas the ring and staff were symbols of spiritual authority. Pope Gregory VII (Hildebrand) sought to abolish lay investiture wherein a suzerain, who was normally a layman, invested ecclesiastical leaders with a clerical office.

Iron Curtain

In a speech in Fulton, Missouri, on March 6, 1946, former British Prime Minister Winston Churchill warned that "From Stettin, in the Baltic, to Trieste, in the Adriatic, an iron curtain has descended across the Continent." Churchill's speech is seen as signaling the onset of what later came to be called the "cold war." The speech came as a shock to Western public opinion, which still saw the Soviet Union as a loyal ally in the recently won war against Fascism.

Churchill felt the need to speak out against Soviet actions in those Eastern European countries that were occupied by the Red Army, especially Poland. Political leaders and parties that were not considered loyal to the Soviet Union were being brutally suppressed. It was clear that Joseph Stalin intended to permanently occupy and control as much territory as he could in central Europe. As of 1946, the borders between East and West were still quite open. It was only later that elaborate border defenses were erected to prevent people from Eastern Europe from fleeing to the West: a more literal iron curtain. (The term *iron curtain* originally referred to a fire-protection device that could be dropped onto a theater stage.)

Irredentism

Irredentism refers to a state's policies aimed at annexing adjacent territory and ethnic kin living in (those) neighboring countries. As a political dynamic it lies at the intersection of domestic and interstate politics, well capturing the blurring of the boundaries between the two in the contemporary world.

The term derives from the Italian *terre irredente* ("unredeemed lands"), indicating the territory inhabited by Italian-speaking communities left out of the state-building process in the second half of the nineteenth century (Trentino, South Tyrol, and Istria, all on Italy's northeastern borders). In this sense irredentism can be seen as a remedial form of state nationalism that seeks to solve the mismatch between ethnic and political boundaries left by the process of modern state formation.

As pure forms of nation-states are more the exception than the rule in the contemporary political system, the potential for irredentist disputes is considerable. However, unlike in the late nineteenth and early twentieth century, when episodes of irredentism were far from infrequent, in postwar Europe and in the post–cold war period, irredentism has turned into a sort of "anomaly," notes Markus Kornprobst (2007, 459), a latent phenomenon that, according to Naomi Chazan (1991), tends to manifest itself particularly at times of political reordering in the international system. Irredentist disputes have not disappeared (e.g., the Republic of Ireland, West Germany's refusal to acknowledge its post–World War II [1939–1945] boundaries and the German Democratic Republic, Serbia's and Croatia's policies toward various portions of Bosnia Herzegovina in the 1990s, interstate disputes in postcolonial Africa, the Kashmir conflict), but empirical evidence has contradicted expectations about their occurrence and frequency. This has led to the opening of a new path of enquiry investigating why some conflicts escalate into irredentist disputes whereas others do not.

Donald Horowitz (1991) has observed that some conflicts, separatist and irredentist in particular, move in and out of categories. Because of the nature of the actors involved, some empirical overlapping is inevitable. At the same time, irredentism has to be kept distinct from separatism (the attempt of a group to separate from the state it finds itself in) and self-determination, namely, from attempts by one group to unify territories belonging to separate states into a new political entity (i.e., the Kurdish case).

There are two discriminating factors distinguishing conflicts that are irredentist from those that are not: (1) the role of the state (as opposed to nonstate actors such as irredentist organizations) and (2) the presence of policies that are explicitly aimed at (re)gaining/retrieving control of territories and peoples that the state claims as its own (as opposed to more vague orientations and sentiments or even claims that may or may not be sanctioned by the state).

As the phenomenon of irredentism is multifaceted, it is not surprising that the focus of scholarship has been extremely diverse. First and foremost, the question of the conditions under which an irredentist dispute arises (or fails to) and the

mechanisms through which disputes are settled have received the largest share of scholarly attention. The possible causes are manifold, and the following is simply a list of some of the factors identified in the literature as triggering irredentism: the size of the community of ethnic kin (to be redeemed), the influence of the alleged homeland, contagion effects across state boundaries, ethnic security dilemmas, international toleration of state behavior, and political reordering in the international system. While identifying the causes of irredentism occupies a central position in the literature, other questions have animated the debate too: the identity of the actor raising the demand (i.e., the government of the irredentist state), the nature of the demand (i.e., boundary adjustments), and the way in which demands are presented (i.e., negotiation, declaration of war). Last but not least is the way irredentist disputes end. Settlement of irredentist disputes occurs in one of the following manners: readjustment of boundaries in accord with irredentist demands, redefinition of group action (switching to separatism), withdrawal of irredentist demands, and dispute settlement, including dejustification of the claim to land and people by the irredentist state.

Overall, the literature on irredentism has encountered three problems. First is the often interchangeable use of the concept with separatism. The two are clearly cognate phenomena but are analytically and empirically distinct, as noted above. The focus of irredentism is on the state willing to redeem lands, not on the peoples to be redeemed who may or may not be engaged in separatism. Second, the principal agent behind irredentism has to be clearly identified. Here authors have divided themselves between those who have acknowledged the centrality of the state and others who instead have pointed to the role of organizations within the home country and even minority groups themselves in the host state. Last is the lack of conceptual clarity, namely, the risk that irredentism encompasses virtually anything, from actual state policies to claims, movements, and even orientations within the very same minority groups that the state aims to retrieve.

Scholarly interest in irredentism is growing, and both large-sample comparative analyses and more qualitative studies have greatly contributed to the advancement of our knowledge about why some conflicts escalate into irredentism whereas others do not.

Islamic Political Thought

The basic assumption of Islamic political thought is that the believers' primary objective is being able to lead a life in accordance with *Ibada* and *Hisba*—that is, adhering to the Quranic injunctions to do service in the name of God and to do good and prohibit evil. The Quranic injunctions are embodied in the Sharia, which is law comprising rulings in the Quran (God's word) and Hadith (narratives of Prophet Muhammad's sayings and doings and, for the Shia, the narratives of their twelve Imams also). In this the Islamic state is pivotal because it assumed and was accorded a moral mission to enforce the application of Sharia with a view to ensuring that believers performed the duties of Ibada and Hisba. This task entailed four responsibilities: safeguarding the community from moral and physical danger from within and without, safeguarding the community against schisms and heresy in accordance with the rulings of the ulema (religious scholars), enforcing the rules of the good moral life as they were set forth in the Quran and Sharia and interpreted by the ulema in accordance with the various schools of law, and being just and ensuring justice.

On the basis mainly of Hisba (doing good and preventing evil), it was considered a command of God that the Muslim community should resist or disobey a government that violated the precepts of the Sharia. Other than morally sanctioned rebellion or civil disobedience, the only means available to the community to protest wrongful acts of a sovereign were the protests and warnings of religious leaders. These generally took two forms: the first one was fatwas, that is, formal rulings by one or more of the ulema based on Sharia. But the ruler could get around a fatwa by having a counterfatwa issued by a mufti (official deliverer of fatwas) under his control or one who simply disagreed with the original fatwa. Theoretically under Islamic notions of government, the state's judiciary and executive powers were limited by the Sharia.

THE MODERN PERIOD

In the modern period beginning with the dominance and influence of the West over Muslim countries in the nineteenth century, Islamic political thinking and practice underwent important changes. Most modernizing states in the Muslim world derived law, at least theoretically, from Western-style legislative processes and institutions, including parliaments, which could ultimately have authority over Sharia. But there is continuity between traditional and modern concerns in this regard: to the older discussions of Ibn Taymiyya (1263–1328) of the place of Sharia in governance were added questions relating to democracy in general and specifically where sovereignty lay in the Islamic polity: in the people or in God's commands?

Demonstrators in Morocco protest a law they believe goes against Sharia, or Islamic law, which comprises rulings in the Quran and Hadith to guide the lives of Muslims.

DIALOGUE WITH WESTERN MODERNITY AND MUSLIM REFORMERS

In many ways modern Islamic political thought has been one of an adjustment to Western political domination. Muslim political thinkers have reacted in different ways to the question of the place of Islam in modern politics: from advocating secularism (separating politics from religion) to re-instating *salafism,* a return to Islam as it was practiced during the time of the prophet and his companions. Among the Islamic political thinkers who more or less rejected incorporation of Western forms of democracy into Islamic political thinking were Hasan Al-Banna (1906–1949) and Sayyid Qutub (1906–1966). Others such as Maulana Maududi (1903–1979), Imam Khomeini (1902–1989), and Muhammad Asad (1900–1992) considered democracy to be compatible with an Islamic polity as long as Sharia remained the supreme source of legislation and lawmaking and the latter did not contradict the former. In varying ways, these authors, among others, saw no incompatibility between representative government and the supremacy of Sharia. This position follows from the concepts of *ijtihad* (independent reasoning—a term used by earlier Muslim scholars to refer to independent legal reasoning on matters about which they were not in agreement), *ijma* (consensus of scholars), and *qiyas* (analogical reasoning), which are applied by jurists in complex ways within Sharia—reasoning that allows for change and innovation to be incorporated into the Islamic polity. Ijtihad is often posed as being opposite to *Taqlid* (the unreflective reproduction of tradition), but this view is problematic in relation to understanding Islamic political thought. The orientalist thesis that the Islamic legal tradition became ossified—that the gates of ijtihad were closed—after the first formative years of Islam, is untenable. Argued change in relation to particular circumstances was always important to the Sharia, and its flexibility was retained through such technical devices as custom (*urf*), public interest (*maslaha*), and necessity (*darura*).

In any case, a tradition passed down in history imperceptibly accumulates something new and is never an exact copy of a previous tradition, including in the political realm. A case in point is the way some modern Muslim scholars (such as Sayyid Qutub) would classify most Islamic countries as being in a state of *jahliyya* (ignorance or barbarism), a situation that Arabia was in before the advent of Islam. Their strategy to end

this situation does not entail exact copying of the methods by which the original jahliyya was ended. It often means putting an end to contemporary jahliyya, using present-day discourses and practices including modern technology, media, and even armed conflict and establishing a state based on Sharia. Another example of change within tradition is that classical Hanafi doctrine forbade torture to extract evidence, but later Hanafi *fiqh* accepted it for reasons of expediency.

The practice of including or rejecting forms of political innovation (*bida*) falls within the parameters of fiqh (Islamic jurisprudence comprising the four schools of the Sunni tradition—Hanafi, Maliki, Hanbali, and Shafi—and that of the Shia including the Jafaria), which grades laws and acts according to the stipulations of the Sharia: mandatory (*wajib*), recommended (*mandub*), permitted (*jaiz*), disapproved (*makruh*), and forbidden (*haram*). Islamic political thought is located within this Sharia-bound matrix of discourses and practices. These concepts, including the historical situations in which they are located, can explain the change and continuity in and the connection between the past and present of Islamic political discourses and practices.

Isolationism

Isolationism refers to a foreign policy in which a nation seeks to limit its contacts and involvements with other nations to achieve and maintain its security and well-being. Although the array of ties among individuals, groups, and nations make the pursuance of isolationism more and more difficult today, this approach has been popular throughout human history and remains an attractive option for some nations.

Historically, Japan adopted a policy of isolation for centuries, lasting until 1902 when it allied with Britain—in an effort to obstruct Russian expansion and control of a China-based, Japanese-controlled port for use by the Russian navy. At the time, Britain was also breaking from a period of political isolationism. China, too, pursued isolationism for varying periods of time throughout its history, most recently during Mao Zedong's Cultural Revolution from 1966 to 1976. Today, North Korea pursues a policy of isolationism in foreign affairs by limiting its contacts with the rest of the world and by severely restricting access to its country. Myanmar has long followed an isolationist policy as a means to preserve its

independence and to protect itself from the influence of other nations.

Although a nation may not want to pursue isolationism, a nation's geography; its limited political, military, or economic capability; and its lack of domestic unity may limit its involvements abroad. Nations fraught with domestic turmoil, such as Afghanistan, Somalia, and Sudan, have limited options in terms of foreign policy as they continuously struggle to maintain internal stability. Thus, many weak and failing states will ultimately pursue a more limited or isolationist foreign policy. The actions of the international community may also force isolationism on some countries. During Saddam Hussein's rule of Iraq, the imposition of international sanctions on Iraq after the Gulf War (1990–1991) limited the country's international engagements. Similarly, Libya under Colonel Muammar al-Gaddafi's rule since 1969 was internationally outcast due to Libyan involvement with and alleged sponsorship of international terrorist activities. In 2003 Libya announced its decision to abandon its nuclear, chemical, and biological weapons program and was able to reintegrate into the international community, particularly improving relations with Europe and the United States.

ISOLATIONISM AS A POLITICAL TOOL: CASE STUDY OF THE U.S. HISTORY OF ISOLATIONISM

More often, though, isolationism is a deliberately chosen foreign policy. By using the United States as a case study, we will examine a country with a long-held tradition of isolationism and explore the philosophical and practical reasons for which the United States employed an isolationist strategy for most of its history. On a philosophical level, the aim of America's Founders was to avoid the entangling conflicts that seemingly enveloped Europe and from which the colonists had recently departed. According to the Founders, isolationism would allow the nation to develop its distinct values and beliefs. On a practical level, isolationism also had an appeal. The thirteen original colonies were hardly unified at the outset of the new nation, and substantial foreign involvements would only be detrimental to achieving unification since a weak and fragmented nation would likely have little impact on politics abroad but severely risk America's becoming dominated by European politics.

Thus, isolationism quickly became embedded in America's foreign policy through the political statements and doctrines of its early presidents. U.S. President George Washington's Proclamation of Neutrality for the United States in 1793 during a war between France and England was perhaps the first declaration of this policy. Washington, in his Farewell Address of 1796 further outlined future U.S. political isolationism, stating, "The great rule of conduct for us in regard to foreign nations is, in extending our commercial relations to have with them as little political connection as possible." President Thomas Jefferson's inaugural address in 1801 echoed this sentiment by declaring the United States should have entangling alliances with none. The Monroe Doctrine of 1823 specified these positions by stating that the United States would stay out

of the affairs of Europe and that Europeans should stay out of the affairs of the Western Hemisphere.

America's foreign relations during the next century and a half largely adhered to the imperatives of political isolationism. Although the United States established numerous commercial and friendship agreements with countries around the world, it formed very few political ties. The few political involvements were largely confined to expanding control over the American continent or enforcing the Monroe Doctrine in the Western Hemisphere. Even when the United States became more globally active at the turn of the century and subsequently gained control over the Philippines and other territories after the Spanish-American War in 1898, domestic voices were quickly raised over these seemingly imperialist and globalist pursuits. The United States became involved in World War I (1914–1918) relatively late in 1917, three years after the war began, primarily because Germany violated the freedom of the seas principle toward neutral passenger ships, killing U.S. and European civilians traveling the Atlantic Ocean. Yet President Woodrow Wilson's call for the creation of a collective international security organization among states, the League of Nations, to stop future international aggression met with stiff opposition in the U.S. Senate. Staunch isolationists, such as Senator Henry Cabot Lodge (R–MA) and Senator William E. Borah (R–ID), led the opposition and defeated American participation in a new international institution. By 1920, the campaign slogan adopted by Warren Harding, the Republican presidential candidate and later president, was a "return to normalcy," a thinly veiled appeal to return to isolationism after the internationalism of the Wilson years.

This isolationist sentiment continued into the next decade and right up to the outbreak of World War II (1939–1945), as the U.S. Congress passed several pieces of legislation, including the Smoot-Hawley Tariff, a highly protectionist measure to seek to insulate the United States from the economic problems in the rest of the world and a series of Neutrality Acts throughout the 1930s in an attempt to keep the United States out of foreign wars and conflicts. Regardless, the events at Pearl Harbor, World War II, and the postwar threat of international communism ultimately compelled the United States to abandon isolationism. Since then, the United States not only has been involved in but has led the development of multilateral agreements and alliances, in addition to sponsoring international organizations. Still, appeals for U.S. isolationism appear from time to time, specifically after the country has engaged in a foreign armed conflict in which significant American losses or expenses are incurred and future threats remain. In the aftermath of the Vietnam War (1959–1975) in the early 1970s and with the formal end of the cold war in the early 1990s, isolationist sentiments emerged among the American public. After the events of September 11, 2001, some calls were made for isolationism as a way to insulate the United States from future terrorist actions. According to periodic foreign policy surveys during recent decades, roughly 20 percent of the American public routinely embraces isolationist views as a foreign policy option.

Italian Political Thought

Italian political thought has charted, and often directed, the journey of Western ideas and practices from Roman times to the medieval Christian period to the modern world. Italians have been artisans of political theory and empirical inquiry. The reflections and experience gained in the art and practice of governance by successive generations of Italians have arguably inspired or played a part in the neo-Roman theory of free citizens and free states in early modern Britain, the creation of an Atlantic republican tradition, the growth of public choice theory in the 1960s, and the conceptualization of liberal socialism in the first part of the twentieth century as well as showing that ordinary people can successfully resolve collective-action dilemmas, or contentious politics, in the management of common property resources over extended periods.

Like the Greeks, the Italians had the advantage of an early start. But unlike the Greeks, the Italians did not, for a variety of reasons, stop contributing. Successive generations of Italian thinkers wrote as comparativists and seldom as parochial thinkers or narrow pan-Italian nationalists. Their contributions meshed with, and continue to be easily understood in terms of, familiar categories of thought in the Anglophone world. Because Italy was less directly involved in the competition of national monarchies and was late to achieve national unification, Italian perspectives tended to be less caught up in momentary conflicts. As Anthony Pagden (1990) notes in *Spanish Imperialism and the Political Imagination,* "For centuries . . . the Italians had been the most sensitive, the most astute observers of the European political scene" (p. 5). In that sense, Italian political thought often possessed the quality of distance modern social scientists seek. While thinkers often wrote in

response to particular political-economic exigencies confronting their community, they each, at the same time, engaged in reinterpreting the past. This way, as John Burrow (2007/2008) put it, "the image of Rome [in the Renaissance] assumed a different form from that current in the Middle Ages, [and] focused not on the imperial city, the *urbs aeterna,* but on the struggling early republic to which the Romans of the first century BC had themselves looked back as a lost era of patriotic republican virtue" (p. 260). By the time of liberation and unification in the middle of the nineteenth century, Italy had accumulated such a rich and variegated patrimony of political-economic ideas that the meaning of the past posed serious dilemmas about how to look to the future.

For all these reasons, the Italian tradition of political thought is not easily reducible to a single linear narrative or simple summary. Yet general trends do emerge. These are an emphasis on microfoundations of political behavior accompanied by a preference for empirically informed ideas and speculations, an approach to institutional order that does not presume unitary or command forms of rule (the state) as the only way to enhance liberty and institutions of self-government and sustain organized existence, a view of political economy as involving reciprocal assistance and the promotion of public happiness, and a repertoire of republican and liberal ideas that cannot be contained within the analytical framework of either liberalism or republicanism.

MICROFOUNDATIONS

The microfoundations of Italian political thought rest on the individual as the basic constituent of the world (who is malleable by others but who can shape himself) and a strong dose of political realism. Thinkers in the Italian tradition have been concerned with not just the role of ideas but how those ideas emerge and give meaning to political action—hence the persistent reference to the importance of artisanship in the crafting of institutions of all sorts. The discourse about microfoundations has proceeded in terms of the unity of mind and body and the relationship between ideas and deeds.

UNITY OF MIND AND BODY

Following the Greek discovery of the mind, there emerged in the Western philosophical tradition a mind-body dualism. This dualism gave rise to an excessively intellectualistic conception of the mind as the primary source of our ideas. One characteristic of Italian political thought is a rejection of this dualism and an insistence on the unity of man. Over time several arguments have been used to justify this position.

Generalizing from an isolated human consciousness was considered misguided because the world was not something that an isolated mind could imagine and construct ex nihilo. Consequently, both philosophical idealism and extreme forms of rationalism were rejected. Immanuel Kant was seen as pushing the Cartesian system of thought to its logical conclusions and identified with what should be avoided: extreme rationalism. A nineteenth-century thinker went as far as to predict, wrongly, that Kant would be relegated to the dustbin of intellectual history. Italian thinkers were more open to British

sensism or empiricism, but they saw problems there too. By locating the search for knowledge and even for truth primarily in the individual's sensory and emotional experience of a world without history (and hence without culture) much of British empiricism was viewed as replacing one source (the mind) of knowledge with another (sense and emotions). As much as many Italian thinkers during and after the Enlightenment admired the empiricism of the English over the rationalism of the French and the idealism of the Germans, they could not accept any of them in toto.

Italians derived from Giambattista Vico and Catholic thought an awareness of the complex historicity and cognitive evolution of humanity, which did not allow them to reduce human thought either to some mere movement of the speech organs, as Hobbes did, or simply to an atomism of the mind, as Locke seemed to do. The emphasis on self-preservation by English authors was generally viewed as a Protestant way to undermine the importance of human sociality and, indirectly, the teachings of the Catholic Church. This helps to explain why, for example, Italian Enlightenment thinkers privileged comparative cultural analysis rather than introspective psychology. For all their declared hostility to medieval thinkers, many Enlightenment and post-Enlightenment figures in Naples as in Lombardy remained within the Catholic tradition when they emphasized the unity of man (and woman).

UNION OF WORDS AND DEEDS

The independence of Italian political thought showed itself in a closely related feature: an emphasis on empirical inquiry and interdisciplinary work. This involved a rejection of the separation of legal, economic, and philosophical issues into categories distinct from each other and the pragmatic use of classical and Catholic writings and examples. The mode of analysis was especially noticeable in the eighteenth century, but it was not unique to that period. An antiabstractionist and interdisciplinary mode is common to the different periods and streams of Italian thought. The main interest was in men, not Man. This interest took many forms.

With Niccolò Machiavelli, we see it in his insistence on considering individuals self-interested beings and on political realism more generally. His attention to what is, as opposed to what ought to be, is nevertheless always accompanied by speculation of what can be done. Some later analysts regard Machiavelli as practicing a form of humanist realism or civic humanism. Some intellectual historians have discovered this humanist realism at work in Renaissance Naples as well. A chief weakness with Machiavelli's realism is that it was primarily concerned with how to achieve and maintain power— not unlike what Richard Neustadt was to do in the United States with his work on presidential power. In the words of American economist Scott Gordon (1999), a chief problem with Machiavelli is that he "does not examine the organization of government as a means for making collective decisions, and despite his republicanism, he does not consider how the liberty of the citizen may be preserved, or how the self-interest of the governors may be directed to the service of the general welfare" (p. 162).

There were other thinkers who, just as Machiavelli, had a realistic view of human nature and insisted on a secular view of the state but went much further in showing how the problems of factional politics and government organization can be met to maintain liberty and achieve a stable social order. A case in point is Gasparo Contarini's *De Magistratibus et Republica Venetorum*. Well before the English translation as *The Commonwealth and Government of Venice,* the book became almost instantly a classic study for understanding why Venice of all the other city republics retained such a long-enduring form of republican independence. Contarini's reflections also became a main source of idealization of the myth of Venice by foreign writers.

From the book alone, one would never know that aside from having served the republic in different important posts abroad, Contarini was a profoundly religious man, a theologian, and a prince of the church. He advanced a temporal and secular view of government: the purpose of civil society is that men "might live happily and commodiously." He recognized that "there have been many commonwealths which have far exceeded Venice as well in empire and in greatness of estate, as in military discipline and glory of the wars; yet have there have not been any, that may be paragoned with this of ours, for institutions and laws prudently decreed to establish unto the inhabitants a happy and prosperous felicity" (1599, 5 ff).

More generally, Contarini anticipated a lesson American patriots were to learn later from *The Federalist:* that human beings are rational creatures, that they can devise means of effective governance to generate good laws without either depending on the altruism of governors or denying the importance of civic virtues and human ability in the selection of men for office, and that it is possible to ensure accountability of rulers through various forms of checks and balances. Rulers could be ruled. Against this backdrop, it becomes easier to understand the high praise heaped on Contarini by Gordon, who tends to gloss over the fact that Venice's form of government was hardly democratic. Still there is something to Gordon's point when he avers that Contarini's book "did for political science what Adam Smith's mode of the marketplace did for economics: it showed how a stable social order can be achieved without a hierarchical structure of authority and demonstrated that personal liberty is harmonious with social order in a pluralist system of countervailing powers" (1999, 162).

Practical realism was also the motivating force behind the ruling elite literature made famous by the works of Gaetano Mosca and Vilfredo Pareto. When he was still a student at the University of Palermo, roughly between 1878 and 1881, the young Mosca boldly swept away the prevailing tendency among historians and political scientists to explain how governments worked largely by the type of regime this way: "among the constant facts and tendencies that are to be found in all political organisms, one is so obvious that it is apparent to the most casual eye. In all societies—from societies that are very meagerly developed and have barely attained the dawning of civilization, down to the most advanced and powerful societies—two classes of people appear—a class that rules and a class that is ruled" (1939, 50). Yet sensitivity to practical details has not been the privilege of political thinkers alone.

In a famous novel set in seventeenth-century Milan, *Column of Infamy,* the nineteenth-century writer Alessandro Manzoni, a chief figure in Italian literature, ably sketched the personal responsibility of public officials to do good even under autocratic political regimes. More recently, students of comparative politics have described the phenomenon with the expression "Rome flattens everything. Fascism without Rome would have been Nazism." The slogan of Italian Communism in the 1970s and 1980, "the Italian Way to Socialism," captures a dimension of the same thought, as did Antonio Gramsci's earlier refashioning of Communism. Some theorists, such as Hannah Arendt, have explained the same thought in grander terms: "the almost automatic general humanity of an old and civilized people" (Arendt 1963, 179).

MULTIFORM NATURE OF POLITICAL RULE

In identifying the multiform nature of political rule as an enduring lineament of Italian political thought, there is no suggestion that the principle of liberty and the conceptual language appropriate to that principle had been worked out in institutional forms from the very beginning—far from it. But there is no doubt that a prevailing view among successive generations of thinkers was to think of liberty and self-government as plants of many roots.

Aquinas accepted the doctrine of natural hierarchy with the king as the best kind of ruler, while arguing for widespread popular participation in the actual conduct of government. He unsuccessfully tried to reconcile both views through a theory of a mixed constitution. Likewise, Dante's (1998) call for an extension of natural hierarchy (the monarchy) to solve the problem of universal peace came alongside his strongly held view that "citizens do not exist for the sake of the consuls nor does the people exist for the king; quite the contrary the consuls exist for the sake of the citizens and the king for the sake of the people" (p. 69).

The great challenge over the course of Italian history was how to suggest solutions to what was a visible reality throughout the entire peninsula and islands: widespread asymmetrical human relationships but also a great commingling of horizontal and vertical legal systems as well as ascending and descending political and economic orders. Men of thought and action knew a lot about local self-rule and good government, but they still did not find a satisfactory solution to how to organize multiple jurisdictions in relation to each other. Lorenzetti's famous painting about good and bad government in the communal hall of Siena generated learned commentaries about which mechanisms were appropriate to translate into practice his vision of good government. For all their brilliance, the people in Lorenzetti's fresco did not have the intellectual resources to think of ways to combine self-rule with shared rule. Thus, while many Italian thinkers rejected Thomas Hobbes's *Leviathan* as an appealing argument but disastrous for

the prospects of self-government, they did not offer persuasive alternatives—and what they suggested has seldom, if ever, reached the international scholarly community.

A leading nineteenth-century federalist and republican thinker from Milan, Carlo Cattaneo, characterized the lack of conceptual resources in the construction of a new cognitive map this way: "the idea of equality of rights in the disparity of force, the idea of federal justice, was a ray of light reserved to illuminate future generations" (Cattaneo 1858/1957, 243) in North America—a point also made by Tocqueville (1835/1969) in the first chapter of *Democracy in America* when he drew attention to the fact that Americans were building society on a new foundation and applying "theories till then unknown or deemed unworkable" (p. 30). It was in fact Cattaneo who, probably for the first time in the history of Italian political thought, showed that it was possible, through a federal commercial republic, to harmonize and foster liberty (the focus of liberal theory), equality (the focus of democratic theory), and heterogeneity (the focus of federalist theory). Characteristically, Cattaneo envisioned a federal commercial republic for Europe as well as Italy.

The unification of Italy in the nineteenth century was a rejection of Cattaneo's vision and an affirmation of the entrenched view of the European state. The Risorgimento differed from earlier European state making in some important respects.

The prospect of a single political regime for the entire Italian peninsula and islands generated considerable debate for more than sixty years on two general topics: whether it was possible to achieve freedom and self-government through peaceful means and avoid the trap of violence, armed revolt, and war and what constitutional design or model of government was best suited to a population that had lived under separate and diverse political regimes for more than thirteen hundred years. Some of the sharpest minds took part in the debate. As described by Raymond Grew (1996), the challenge of constitutional choice had "a particular resonance in Italy where nineteenth-century constitutions were associated with the liberties of medieval communes; the historical and patriotic perspective of [Ludovico Antonio] Muratori; the romantic figure of [Pasquale] Paoli popularised by Rousseau; and the eighteenth-century projects for constitutions in Corsica, Tuscany and Lombardy, which were written by prominent Italians and widely discussed across the peninsula" (p. 221).

The centralized system that emerged in liberal Italy after 1860 was greatly helped by war, but it was also the product of a conscious choice between alternative regimes. At the same time, federalist, nonunitary principles of organization were such a central part of the Italian political tradition that the victory of centralized government and administration failed to eclipse them completely. Nonunitary forms of rule gained renewed support starting in the 1880s, as government performance began to deviate radically from expectations. The establishment of regional government in the 1960s and recent attempts at fiscal federalism attest to the enduring attraction of a theory of governance grounded in a polycentric system of order.

POLITICAL ECONOMY

There is a rich literature available in English on the importance of trade in the history of Italian political thought. The experience of Venice as a transnational commercial republic generated a considerable literature in several languages, and its outpouring continues unabated. Equally important theoretically, although less known, are the treatises in support of commerce, trade, and entrepreneurship penned by two friars in the fourteenth century: San Bernardino of Siena and San Antonino of Firenze. San Bernardino's originality was in promoting economic entrepreneurship, and for this his work has been widely praised by historians of economic thought and of the Austrian school of economics. But it was not until the Enlightenment that the centrality of trade and commerce emerged in full force in Italian political thought, under the rubric of political, public, or civil economy.

Two main Italian groups of political economists of the time from Milan and Naples worked, often independent of one another, to place economic issues at the center of public thought and life. A combination of factors came together, and these include various attempts to update the Aristotelian and Scholastic tradition and the Italian tradition in physics and mechanics; the extension of the emerging scientific methods to the betterment of human society; the renewed importance of the principle of usefulness, especially in the work of the Milanese Pietro Verri, now extended to reform institutions of society, as evident in Beccaria's famous work on crime and punishment; and an attentiveness to political, economic, and intellectual developments taking place in Europe. Italian thinkers were as much influenced by their European counterparts as the latter, Baron de Montesquieu and Adam Smith included, were influenced by the former.

A recent book by John Robertson (2005) advances a powerful restatement of the interconnection of different movements of ideas during the Enlightenment. He focuses on similar facts in dissimilar milieux that conventional wisdom would hardly put together: the Enlightenment in Scotland and Naples, the two "kingdoms governed as provinces" (p. 147). He breaks new ground in showing why the science of human nature and sociability was an essential part of the intellectual life in both kingdoms and how much David Hume and Vico drew, albeit in different ways, on the revival of Epicurean moral philosophy in seventeenth-century France, which in turn served to provide philosophical foundations for political economy. Robertson challenges us to think again about the proposition advanced by standard accounts that have Scottish illuminati resolve "the riddle" of the modern world all by themselves—or that the Enlightenment was a movement dedicated to the overthrow of religion and even clerical power, more generally. The commitment to political economy in Scotland and Naples began when Hume, Ferdinando Galiani, and Antonio Genovesi persuasively argued that commerce might replace war and conquest as the means of human betterment and national aggrandizement. Genovesi wrote about human betterment and the wealth of nations years before Adam Smith did.

The Neapolitan and Lombard thinkers sketched sophisticated blends of institutional interaction between public and private institutions that went beyond the narrow confines of state and market to give meaning to trade as *socialitas* or reciprocal assistance and to convey a strong positive relationship between trade and public trust and happiness. These intellectual developments raise questions of their own that did not have answers at the time: why were the outcomes of the Enlightenment very different in Scotland and Naples? What factors were at work in the two kingdoms that advanced or retarded human betterment? What happened after 1760?

Other generations of scholars answered these questions in the nineteenth century, thereby generating a new body of ideas and empirical inquiry. Interregional variations were accounted for in two ways. First there were the relative bargaining powers, transaction costs, and discount rates of regional rulers vis-à-vis others who counted in society: the Sicilian parliamentary barons were stronger and more united than their Neapolitan and Lombard counterparts vis-à-vis their respective rulers. Second, what were also at work were alternative conceptions of how best to repair failings in agriculture as well as government. The interaction of these factors created a complex matrix of choice and results. Some wanted to make a tabula rasa of the past but could not for the way they pressed the issue; the result was that either nothing was done to repair failings or some reformist policies were introduced. Others succeeded in making a tabula rasa of some institutions. The net result was that for different reasons "liquidating the heredity of the past" (to use the famous words of the Neapolitan French-inspired viceroy of Sicily, marquis Domenico Caracciolo) did not produce the desired results in both Naples (were that it succeeded) and Sicily (where it did not). Where more modest reforms were introduced with local cooperation, such as in Lombardy and Tuscany, they had far more productive consequences than anticipated.

Also by the nineteenth century, with industrial development, new ways to conceptualize the relationship between politics and economics were gaining ground among attentive Italian thinkers and the public. One way was that the form of government best suited to free men in a commercial society was not the enlightened despotism or monarchical sovereignty of the previous century but a constitutional monarchy or a federal republic. Most political and economic thinkers continued to promote free trade, but they differed from their counterparts in the Scottish Enlightenment in their search for mechanisms capable of reconciling economic inequality with adequate provision for those excluded, who possessed no property except their labor.

These developments help to explain why Italian fiscal theory and political economy "have never been plagued with the heritage of utilitarianism which has so influenced the development of fiscal theory in England and America" (James M. Buchanan 1987, 334). It equally helps to explain why many nineteenth-century thinkers such as Cattaneo, Napoleone Colajanni, and Antonio de Viti de Marco found no contradictions in being friends of both free trade and the nascent labor movement and could praise Britain but also criticize its government for the treatment of the working class and the Irish people. The world of equality, they thought, has as much to fear from politics as from economics.

By the twentieth century what had been a broad current of political-economic thought branched out in even broader directions to inspire two seemingly opposed ways of thinking: a liberal formulation of socialism in the 1930s in response to both the Great Depression of 1929 and Fascism and the emergence of public choice theory in the United States in the second half of the twentieth century. It should come as no surprise that some of the early writings of James Buchanan, before public choice gained its name and fame, were published in the Italian journal *Il Politico,* whose editor, Bruno Leoni at the University of Pavia, did much to keep the flame of classical liberalism alive in the immediate postwar period.

A PUBLIC SCIENCE BEYOND LIBERALISM AND REPUBLICANISM

For quite some time it was commonplace in the international intellectual community to maintain a binary, paradigmatic distinction between liberalism and republicanism, nourished by a growing literature. A recent study by Andreas Kalyvas and Ira Katznelson has helped to discredit the binary distinction. The authors draw on the writing of six leading thinkers—Adam Smith, Adam Ferguson, James Madison, Thomas Paine, Germaine de Stael, and Benjamin Constant—to successfully demonstrate that many republican principles and ideas were part of the modern liberal beginnings. Their conclusion, unthinkable in Anglo-American academic circles as late as the 1970s, is unsurprising to careful students of Italian political thought.

Machiavelli aside, there are streams of republican thought in Italian history yet to be tapped. Practically every region of Italy can point to some form of free government or republican democracy in the past. This republican tradition is not to be confused with the French republican tradition that misled Gramsci so much. As Franco Venturi noted, "Jacobin propaganda, monotonous and exalting at the same time, brought into Italy a republican ideal which was ill-suited to a country in which the republican experience was firmly rooted" (1971, 19) A chief merit of Cattaneo in the nineteenth century was to go beyond republicanism and liberalism to fashion a public science aimed at making sense of the progress of civilization (*incivilimento*) and self-government that could not be adequately addressed by either separately. Equally important, Cattaneo's work can be used jointly with more recent studies to suggest ways to remove untenable and false distinctions and dichotomies that have so preoccupied the Anglophone academic world: the distinction between negative and positive liberty and the dichotomy between methodological individualism and community; between individual action, collective action, and institutions; and between self-interest and the public good. In stressing the master role of ideas, Cattaneo argued that people have first to learn the arts of incivilimento before they can practice self-governance. Polycentric federal

republicanism lies at the heart of his science of self-governance. Cattaneo laid the groundwork for a public science that never developed in the nineteenth century but may be developing in the early twenty-first century in the form of civic studies and a science of citizenship, with the Indiana University Workshop in Political Theory and Policy Analysis, founded by Elinor and Vincent Ostrom, as one of its major centers.

CONCLUSION

In spite of the importance of the contributions sketched above, Italian political thought as a whole has not had as much influence as British thought in the development of liberty and institutions of self-government throughout the world. No doubt, it is partly due to the relative position of the two countries in world affairs. But if the study of comparative political thought is more than simply the study of canonical authors and texts, then there is much to be gained from a careful study of the history of Italian political thought. The preceding pages suggest why.

Jabotinsky, Vladimir

Ze'ev Jabotinsky (1880–1940) was a liberal Zionist leader and author. He was born in Odessa, then a part of the Russian Empire. At age eighteen he went to Italy and Switzerland to study law and then served as a correspondent for several Russian newspapers, signing his articles and reports with the pseudonym Alatalena. He earned a law degree from the University of Rome. The pogrom against the Jews of Kishinev in 1903 spurred Jabotinsky to join the Zionist movement. He organized self-defense units and fought for Jewish minority rights in Russia. He was elected a delegate to the Sixth Zionist Congress, which was attended by Theodor Herzl, the founder of political Zionism. During this period, Jabotinsky also worked to promote the use of Hebrew and for the establishment of the Hebrew University of Jerusalem.

Following the outbreak of World War I (1914–1918), Jabotinsky left for the front as a newspaper correspondent. In Alexandria, Egypt, he joined Joseph Trumpeldor in organizing the Jewish Legion, battalions that fought with the British army against the Turks. Jabotinsky opposed the Zionist leadership and asserted the right of the Jews to seize Palestine by force if necessary. He participated in the assault on the Jordan River and the conquest of Esalt. In 1920, after his discharge from the army, he stood at the head of Haganah, a Jewish paramilitary organization, against the Arabs and was condemned by the British to fifteen years of hard labor, a sentence that was later commuted. From 1921 on, Jabotinsky was a member of the Zionist executive and one of the founders of *Keren Hayesod,* a fundraising organization for Israel. Following further disagreement with the Zionist movement, he seceded in 1925 to establish the Union of Zionists-Revisionists (*Hatzohar*), which called for the immediate establishment of the Jewish state. In 1929 he founded the youth movement *Betar* to instill a militant spirit in Israeli youth. Also in 1929 he left Palestine on a lecture tour and was not allowed to reenter.

In 1935 the Zionist Executive rejected Jabotinsky's program calling for the immediate establishment of the Jewish state. He thereupon resigned from the movement and founded the New Zionist Organization (NZO). In 1937 he founded his third organization, the *Irgun Tzvai Leumi*, as the military arm of the NZO. These bodies cooperated in the *Af Al Pi,* the illegal immigration of Jews into Palestine during which forty ships transported Jewish immigrants from Europe. The groups that Jabotinsky founded evolved after the formation of the State of Israel into the Herut Party.

Jabotinsky was an outstanding orator and continued to write poetry, novels, short stories, and political commentaries until his death in 1940. He is ranked among the most noted Hebrew writers, poets, and translators of the modern era. His complete works and speeches were published in fifty volumes in Israel. He was a great promoter of the Hebrew language, which he considered part of the Jewish identity. He demonstrated this affinity by changing his Russian name of Vladimir to Ze'ev, which means wolf.

Jabotinsky wrote a number of books on his struggle on behalf of the Jewish people. They include *Turkey and the War* (1917), *Samson the Nazarite* (1930), *The War and the Jew* (1942), and *The Story of the Jewish Legion* (1945).

As a political Zionist, Jabotinsky was the heir of Herzl, but he added military strength to the Herzl legacy. He was a National Liberal in the great nineteenth-century tradition and a revolutionary in the mold of Italian soldier and patriot Giuseppe Garibaldi.

Jacksonian Democracy

Jacksonian Democracy refers to an ideology and political movement in the second quarter of nineteenth century America characterized by the widespread expansion of suffrage and a pervasive egalitarian sentiment (in terms of opportunity, not outcome). Its primary figure was President Andrew Jackson, while Alexis de Tocqueville's *Democracy in America* (1835 and 1840) offers the most sophisticated contemporaneous appraisal of the time, sympathetic to its promise while critical of its excess.

The Jacksonian era was dominated by a hostile reaction to the alliance between the state and privileged private interests, who were accused of using their influence within government to restrict access to the economic opportunities created by rapid expansion. Jacksonian Democrats sought to reduce the privileges of moneyed interests and restore genuine equality of opportunity to the common people. There was no hostility to wealth, only a fear of exclusion from it. Preserving economic access for the small capitalist would require enhancing the people's political power and using that power to limit the elites' ability to co-opt the state. Though women, Native Americans, and blacks were still excluded, the era saw the culmination of a broad movement to open democratic participation to more Americans. Barriers to participation fell (increasing access to the vote and reducing the power of party elites to determine candidates) while immigrants were welcomed into "The Democracy" to swell vote totals and turn the Democrats into a genuine mass party. Gradually the National Republican/Whig opposition adopted similar strategies, with mixed results.

Jacksonians were united by their commitment to a producerist ideology. Rejecting traditional arguments that only those with property could be invested in the well-being of the nation, Jacksonians (theoretically) extended a political voice to any white male who was willing to work to pacify the continent and add to America's bounty. The act of labor, more than the type, was the source of civic virtue. One need not be a farmer to be a good citizen, as was often the case for Jeffersonians. Individualism was the spirit of the age, but it was an individualism that connected individual prosperity with a larger common good. The generation of private wealth was given a public dimension, becoming an important component of citizenship. One served the republic by serving himself.

The Jacksonians purged themselves of the founders' fear of excessive democracy and ignored de Tocqueville's concern that the uncritical sanctification of majority could lead to a "tyranny of the majority" potentially more destructive of liberty than the tyranny of the monarch. The movement was far more democratic than it was liberal; believed that the will of the people was by definition virtuous and just, rendering restraints on it unnecessary and illegitimate. The national character of the people was somewhat uncertain, however. Given the rapid increase in size and population, the instability caused by the rise of bourgeois capitalism, and the social dynamics of immigration, about the only thing that could unite the Jacksonians as a national coalition was a focus on participation itself (alongside their fear of entrenched elites). However, that participation most prominently manifested itself at the state and local levels, where the illiberal, coercive strains of democratic rule were most likely to manifest, both politically and socially.

The presidency of Andrew Jackson embodied the spirit of Jacksonian democracy. Jackson believed the presidency was the only authentically national office in the country, a direct attack on the authority of the Congress. As president he claimed to be the "tribune of the people," and he used his authority to eliminate some of the checks on executive power that interfered with institutionalizing the popular will. If the president was indeed the voice of the people, then by extension most limits on executive power were antidemocratic. Of particular institutional consequence was Jackson's argument that the president could veto legislation solely on the grounds of his (and by extension the people's) personal opposition to the bill, rather than solely on issues of constitutionality. However, Jackson primarily used his influence to weaken the federal government (e.g., the fight over the National Bank), provided the states accepted the overarching sovereignty of the union (e.g., the nullification crisis).

Jacobinism

Jacobinism was a radical political movement that emerged during the French Revolution (1789–1799). The term later came to be used to describe any extreme left-wing grouping. The Jacobins were initially formed in 1789 in the Brittany region of northwestern France. Their formal title was the Society of the Friends of the Constitution, but their popular name was derived from the Dominican monastery where the group met. The members were moderate republicans who sought to limit the authority of the monarchy. The early Jacobin leader Honoré de Mirabeau advocated a constitutional monarchy modeled on the British system. The Jacobins became more radical under the leadership of Louis de Saint-Just and Maximilien Robespierre, who gained the support of the Paris working class. More moderate Jacobins left the organization and formed the Feuillants, but became increasingly marginalized. The Jacobins helped undermine the Girondists and in 1793 were able to gain power. Under Robespierre, they instituted the Reign of Terror (1793–1794). The excesses and political repression of the Jacobins led to their downfall and both Robespierre and Saint-Just were executed during the counterrevolt of July 1794. In Great Britain, the term *Jacobin* was applied toward radicals, beginning in the 1790s, and later radical groups calling themselves Jacobins emerged in France during the mid to late 1800s.

Jacobson, Harold K.

Harold K. Jacobson (1929–2001) was a prominent scholar in the field of international relations. Although he published works on a variety of topics, he is best remembered as a pioneer in the study of international environmental policy. A native of Michigan, he studied at the University of Michigan and Yale University, from which he received a doctorate in political science in 1955. In 1957 he joined the faculty of the department of political science at the University of Michigan, where he worked until his death. He was known by all simply as "Jake."

Jacobson had wide-ranging interests, and his research and teaching covered such fields as decolonization, international conflict, international law, international negotiations, international organization, and international political economy. He wrote, edited, or coedited twelve books and produced numerous scholarly articles. Among his major works are *Networks of Interdependence* (1979), an optimistic assessment about the prospects for international organizations and a more integrated international system, and the coedited *Double-edged Diplomacy* (1993), which highlighted the role of domestic politics in international negotiations. Arguably his most important work is *Environmental Protection: The International Dimension* (1983, cowritten with David Kay), which was the first book to offer a systematic approach to the study of international environmental policy by examining international environmental agreements. Jacobson's approach emphasized the role of international governmental and nongovernmental organizations in shaping the adoption and implementation of environmental policy, the latter of which he noted was always more of a problem. He was not only a social scientist well-schooled in the methods of behavioralism, but also an advocate, as his works reflect his normative commitment to human rights, environmental protection, and international cooperation.

Due to Jacobson's teaching and research, he assumed many prominent positions and won numerous awards. He served as director of the Center for Political Studies and the Institute for Social Research, both at the University of Michigan; as president of the International Studies Association from 1982 to 1983; and as a fellow of the American Academy of Arts and Sciences. He also held numerous leadership positions in the American Society of International Law. In 1989 he became the founding chair of the (International) Human Dimension of Global Environmental Change, and for his groundbreaking work with that organization he received an Award for International Scientific Cooperation from the American Association for the Advancement of Science in 1995, a rare achievement for a social scientist. From 1994 to 1996 he served as the lead author of the Intergovernmental Panel on Climate Change, working with many international organizations, including the United Nations, on global environment issues. One of his final works, *Engaging Countries: Strengthening Compliance with International Environmental Accords* (1998), emerged out of his advocacy work on this issue.

James, Cyril Lionel Robert

Cyril Lionel Robert James (1901–1989) was a major contributor to socialist and pan-African thought. He wrote on history, literature, philosophy, art, sports, and politics. His best known books include *The Black Jacobins: Toussaint L'Ouverture and the Haitian Revolution* (1938); *Notes on Dialectics* (1948); *American Civilization* (1950); *Mariners, Renegades and Castaways: Herman Melville and the World We Live In* (1953); and *Beyond a Boundary* (1963). Along with the Italian social theorist Antonio Gramsci, James is one of a small number of twentieth-century Marxist intellectuals whose reputation has continued to rise after the collapse of Soviet-style communism.

James was born and raised in Trinidad, which at the time was part of the British Empire. He migrated to England in 1932 in hopes of pursuing a career as a novelist and literary critic, then became active on the far left and turned to political topics. He supported himself through cricket journalism and became a widely known figure on the English left. He also joined the International African Service Bureau, which was a nexus of interwar anticolonial activism. Toward the end of the 1930s, James took part in the founding convention of the Fourth International (FI), a communist organization. It was on behalf of the FI that James relocated to the United States in 1938 to take up a leadership position in the country's fledgling Trotskyist movement. Within a few years, however, he had broken with the FI and developed his own ideas about civil rights, socialist democracy, art and politics, and the distinctive role of small socialist groupings. He developed these ideas with a small number of cothinkers in the so-called Johnson-Forest tendency, whose circle included Raya Dunayevskaya, the founder of Marxist-humanism in the United States; Chinese American theoretician Grace Lee; and American Marxist Martin Glaberman.

James was deported from the United States in the early 1950s as an "undesirable alien." After losing his appeal for citizenship, he reluctantly returned to Britain, where he continued to correspond with his U.S. collaborators but also began writing on cultural questions as well as the modern history of the Caribbean. He spent nearly four years in the West Indies in the late

1950s and early 1960s, where he participated in the movement for national independence. His most important work for the nationalist cause was his role as editor of *The Nation,* a weekly newspaper that was part of the People's National Movement, led by his childhood friend Eric Williams.

Inspired by his experiences in preindependence Trinidad, James returned to pan-African issues and traveled throughout Africa and the Caribbean in the 1960s. He spoke on numerous campuses during this period and became well known for his advocacy of both black protest and his somewhat anarchistic version of democratic socialism. In his final years James settled in London. He was awarded the Trinidad Cross, the country's highest public honor, in 1988. Since his death, a number of biographies and studies have been published on various aspects of his life and work.

James, William

William James (1842–1910) was born to a wealthy family in New York City on January 11, 1842. His father, Henry James Sr., who was educated at Princeton Theological Seminary but rebelled against "Old Princeton" Calvinism, wrote prolifically regarding ethical and religious matters. Influenced by the mystic writings of Emanuel Swedenborg, Henry Sr. sought to develop a humanistic theology that was more personally suitable to his own soul, as expressed in his *Substance and Shadow: Or, Morality and Religion in Their Relation to Life* (1863); *Society the Redeemed Form of Man, and the Earnest of God's Omnipotence in Human Nature* (1879); and other works. The influence of his father's unorthodox theology is evident in James's reconsideration of consciousness and spirituality.

James was reared in both New York and Europe and educated privately. At the age of eighteen he revealed an interest in art and studied with artist William Morris Hunt, but James ended this career pursuit abruptly and entered Harvard University in 1861 to study medicine. James began teaching physiology at Harvard in 1872 and eventually became professor of philosophy. His Harvard lectures were a synthesis of philosophy, physiology, and psychology. James was a considerable influence on Harvard students such as Spanish philosopher and poet George Santayana and American writer Gertrude Stein. In 1878 he married Alice Howe Gibbens, with whom he had five children (one of whom died in infancy) raised in an environment of free thought and tolerance.

James is regarded as both an eminent American philosopher and psychologist. His two-volume treatise *The Principles of Psychology,* published in 1890, was a pioneering work that influenced the development of nearly all the foremost psychological theories of the subsequent seventy years and became a foundational text. Early statements of his ideas of the nature of freedom are evident in noteworthy chapters explaining the "stream of thought," "consciousness of self," "the emotions," and the "will." His 1897 publication of *The Will to Believe* expanded on conceptions of freedom differentiating between "hard" and "soft" determinism. *Talks to Teachers on Psychology: And to Students on Some of Life's Ideals* (1899) contributed to the development of educational psychology.

James accepted an invitation to deliver the Gifford Lectures on Natural Religion at the University of Edinburgh in 1901 and 1902. The publication of his twenty talks appeared as *The Varieties of Religious Experience* (1902), which contributed to the psychology of religion by distinguishing "experience" and "philosophy" (defending the former against the latter) through a humanistic and scientific methodology. These lectures, along with the publication of *Pragmatism* (1907), which articulated James's experimentalism and redefinition of the correspondence theory of truth, helped place his name among the most renowned American philosophers of the period. *A Pluralistic Universe* (1909) was the publication of his Hibbert Lectures at Manchester College on the Present Situation in Philosophy. The relevance of his "philosophic attitude" was published posthumously as *Essays in Radical Empiricism* (1912). James died of heart failure at his family's summer home in Chocorua, New Hampshire, on August 26, 1910.

Jennings, Ivor

Sir Ivor Jennings (1902–1965) was an English constitutional lawyer. He adapted jurist and constitutional theorist Albert Venn Dicey's doctrine of parliamentary sovereignty for an era of executive sovereignty over parliament. Although an acute observer of Dicey's weaknesses, Jennings provided few constructive arguments of his own. Due to this he was overshadowed when constitutional writers reverted to their former hostility to executive domination over the legislature and by the sudden rise of judicial review in the United Kingdom.

Born into a working-class family in Bristol, Jennings was marked as an academic lawyer from an early age. He attended Cambridge University, then went to work as an academic lawyer for his entire career, apart from a spell in Ceylon (Sri Lanka), where he was a university principal. He was much sought after as a constitution writer for newly independent states in the British Commonwealth in the 1950s.

In his 1933 *Law and the Constitution,* which ran into five editions, Jennings merged the constitutional doctrines of Dicey and British economist and journalist Walter Bagehot. From Bagehot he accepted the view that the UK executive and legislature were fused, so that "acts of Parliament" meant "acts by the governing party." The basic feature of the British constitution was, for Jennings, not parliamentary sovereignty, which he dismissed as a "legal fiction," but the fact that the executive derived its authority from popular election and would therefore not deliberately pass any act that made it likely to lose the next general election.

Nevertheless, parliamentary sovereignty did play a role in Jennings' constitutionalism, as it held the courts in check. Like earlier English constitutional writers, Jennings was hostile to judicial review of legislative or executive actions. The government was elected; judges were not. It was for the government, not the judges, to face the people with the consequences of their decisions. He repeated this analysis in his 1936 *Cabinet Government,* which remained influential until the 1970s.

As with Dicey and Bagehot, Jennings' constitutional arguments have been sidelined by the rapid growth of judicial review in the UK since the 1980s and by the first straightforward setting aside of a statute of the UK Parliament. This occurred in 1991, when first the European Court of Justice and then the UK domestic courts ruled that an act discriminating against Spanish fishing companies must be set aside as incompatible with the European Communities Act 1972.

Jeremiad

The jeremiad, a form of social criticism and political rhetoric, takes its name from the Jewish prophetic tradition, in which critics regularly arose to chastise the community for violating God's commands and call it back to its most basic values. More generally, though, such rhetoric has appeared in all times and places, and is not unique to any particular religious tradition. In common usage, the term tends to be used to describe social and political criticism that decries the loss of important social values and longs for a simpler, more virtuous, or ethically superior past. Jeremiads identify a crisis in contemporary society, relate that crisis to a falling-away from fundamental values, trace out a process of decline from earlier virtuous generations (epitomized by founders or godly ancestors), and call for renewal and reform, to recapture the promise of communal life. Thus the jeremiad involves both social critique and historical memory.

The American version of the jeremiad draws heavily on the notion of America (later, the United States) as a "chosen nation," with a special role to play in the unfolding of God's purposes in human history. Early New England clergy employed this rhetorical form to understand how and why a host of social and even natural disasters—factions, dissension, Indian wars, crop failures—had afflicted their settlements. Jeremiads continued throughout the Revolutionary War (1775–1783) period, the Civil War (1861–1865), and even in the wake of the September 11, 2001, attacks.

Jewish Political Theory

The ways in which the Jewish people have thought and written about politics, divine authority and human power, and the dispensing of justice have been shaped by their unique historical experience. Over the course of two and a half thousand years, Jews have lived under a remarkable variety of political forms and practices, including loose tribal federation, monarchy and regional power, imperial client state, diasporic semiautonomous communities, voluntary religious associations, and modern democratic nation-states, and have struggled against as many.

Unlike the classical Western traditions, Jewish political theory is not primarily located in philosophical treatises, nor is it controlled by the fundamental category of the *state* and the question of how to construct the best regime. Jewish political discourse has tended to be occasional and situational, emerging from and attempting to deal with immediate political circumstances, always with reference to the Jewish religion. Because *the political* as such has rarely received systematic or independent theoretical treatment in Judaism, and because the Jews have endured a long period of statelessness and dispersion, some have questioned whether such a Jewish political tradition exists. Nevertheless, a sophisticated and

nuanced intellectual engagement with the practical and theoretical problems of politics can be found in texts throughout Jewish history—embedded in the narratives, poetry, and laws of the Hebrew Bible; the discussions in the Talmud and other rabbinic literature; communal enactments, law codes, and responsa; biblical commentaries; and philosophical writings. In the seventeenth century, Christian political thinkers such as Petrus Cunaeus, James Harrington, and John Selden looked to the Bible and rabbinic writings to reconstruct the political history of the Jews as a model of a godly commonwealth. Recent interest in this tradition has yielded a number of important scholarly projects. There is growing recognition, moreover, of the extent to which these sources have had an impact on the development of political theory in the West, evidenced by recent establishment of the *Hebraic Political Studies* journal.

PEOPLEHOOD, REVELATION, AND LAW

The Jewish political tradition is marked by its national, religious, and legal character, and the concepts that form the conceptual basis of this tradition—Jewish peoplehood, its covenant with God, and the law (Torah)—have remained constant up until the modern age. Jewish political discourse develops with reference to divine revelation, beginning the covenantal relationship with God, based on the acceptance of the sovereignty of God and His Torah. The Jews are therefore bound by special duties and obligations of the Torah, which aim at molding the people into "a kingdom of priests and a holy nation" (Ex. 19:6). The Torah may be seen as a religious-political constitution of the Jewish community. Under the leadership of the rabbinic sages, the dominion of the law came to comprehend all aspects of human life: worship, personal status and family life, agriculture and commerce, civil and criminal matters, and social organization. This *halakhah* served to maintain the semiautonomous Jewish communities through the centuries of exile.

The political questions that these communities faced, practical and theoretical, were deliberated with reference to the divine law. Such discussions revolved around matters of immediate concern, such as the organization of the community, the form and extent of authority, taxation, communal welfare, judicial practice, and resort to coercive power. The issue of the legitimacy of and obligations to "foreign" political authority was dealt with under religious law as well, based on the Talmudic dictum of *dina de-malkhuta dina* ("the law of the kingdom is the law").

Jewish thinkers also engaged in speculative issues, such as the nature of the covenant between God and Israel, the revelation of the Torah, the meaning of exile, the messianic expectations for the restoration of the Jewish state, war, and relations with non-Jewish populations.

MEDIEVAL JEWISH POLITICAL THOUGHT

In the medieval period, due to the growing authority of Islamic philosophy, a more theoretical interest in the political meaning of Judaism emerged, seen in such treatises as Saadia Gaon's *Book of Beliefs and Opinions,* Judah Halevi's *Kuzari,* and Joseph Albo's *Book of Principles.* The most significant political theory was developed by twelfth-century philosopher and legal codifier Moses Maimonides. In *The Guide of the Perplexed,* Maimonides depicted the divine law (Torah) as the constitution of the ideal city and Moses as its prophet-legislator. In *The Book on Kings and Their Wars,* the final treatise of his monumental codification of rabbinic law, *Mishneh Torah,* Maimonides detailed the character of Jewish kingship and the deeds of the messianic king. Even in these works, political concerns are fully integrated into the broader questions of Jewish belief and practice. Because Judaism did not make a distinction between the realm of politics and earthly life and the realm of religion and spiritual life, Jewish political discourse had no need to engage with the theoretical problem of the relationship between the *sacerdotium* and the *regnum* that directs so much Christian political thought in the West.

MODERN JEWISH POLITICAL THOUGHT

Jewish political thought underwent significant modifications in the modern period. The centralization of authority and bureaucratization of political life, and the influence of liberal and Enlightenment political ideas, shifted the social and political situation of the Jewish communities in western and central Europe. The possibility of emancipation—the granting of civil and political rights—made the unity of legal, religious, and the national elements, which had characterized traditional Jewish political theory, difficult to maintain. Already in 1670, Jewish excommunicant Benedict (né Baruch) Spinoza had, in his *Tractatus Theologico-Politicus,* suggested the outlines of the Jewish predicament. Following Maimonides, Spinoza argued that the Jewish law was the constitution of the Israelite state, but he maintained that once this state had ceased to exist, the law itself was rendered obsolete. Spinoza's critique of Judaism as an anachronistic political phenomenon significantly influenced Enlightenment critiques of Judaism as a "political" religion.

The dominant trend of Jewish political thought in the eighteenth and nineteenth centuries could be regarded as liberal. Jews advocating emancipation advanced new understandings of the tradition to defend the suitability of Judaism and facilitate the Jews' entrance and adaptation into the modern world. This motive is clear in the initial attempt at a modern presentation of Judaism: Moses Mendelssohn's *Jerusalem, or, On Religious Power and Judaism* (1783). Mendelssohn formulated a social contract theory that would secure the toleration of different religious societies and developed a conception of Judaism compatible with natural religion and the contractual state, which would permit Jews admittance into the civil society. Though the law had originally served both political and religious functions, after the destruction of the Israelite state, the law became purely religious. Modern Judaism would be reconfigured as a purely voluntary religious association, the performance of the law serving to secure knowledge of

metaphysical religious truths, the community losing its power of coercion.

Subsequent liberal Jewish thinkers took a far more radical stance regarding the enduring authority of the law. Influenced by German idealist philosophy and historical critical research, thinkers such as Hermann Cohen, Abraham Geiger, and Ludwig Philippson rejected the centrality of the law and focused on the prophetic-ethical and universalist elements of the religious tradition. The liberals also denied the national character of Judaism and radically reinterpreted the messianic idea from the hope for the reestablishment of a Jewish state to that of a universal messianic age, in which the ethical teachings of Judaism would be manifest in all the nations. This would be promoted through the mission of Israel, in which the teaching of Judaism would indirectly become embodied in social institutions and in the constitutional state.

By the early twentieth century, this liberal theology increasingly came under assault by a postliberal, "existentialist" brand of religious thought and Zionism, whose proponents reasserted the centrality of the Jewish "nation" and its distinctive political destiny. The theological ferment of the early twentieth century produced diverse theological–political positions, notably the retrieval of a biblical anarchotheocratic tradition by Martin Buber, the apolitical interpretation of Judaism of Franz Rosenzweig's *The Star of Redemption,* and the development of a mystical redemptive Zionism in the work of Rabbi Abraham I. Kook.

With the establishment of the state of Israel in 1948, Jewish political thinkers were faced with a novel situation: a Jewish state that was not principally governed by Jewish law (though family law is an important exception). They have had to engage—and are still engaging—with the fresh problems of state sovereignty, the relationship of religious to secular political authority, the meaning of the enduring diaspora, and the connection of the *halakhah* to the coercive arm of the state.

Jihad

Literally jihad means "effort" and in Islamic tradition it has been interpreted as "striving for God." According to the Quran and *hadiths* (narratives of sayings and doings of Prophet Muhammad), jihad is a duty that may be achieved in four main ways: by the heart, the tongue, the hand, and the sword. The first is known also as the *greater jihad* and describes the inner struggle to control one's bad inclinations against seduction and enticement by earthly pleasures and achieve spirituality; while the *lesser jihad* describes the armed struggle against *unbelievers* and the defense of Islam. Which of these is more meritorious has long been a point of dispute among scholars, though one may, in general, say that this depends on the socioeconomic and political context in which the discourse on, and call for, jihad has taken place.

MEANING AND HISTORY OF JIHAD

Jihad is not one of the five pillars of Islam (which are profession of faith, prayer, fasting, giving of charity, and pilgrimage) and instead constitutes a collective duty to fight under certain circumstances, such as when Muslim lands are occupied by non-Muslims and when Islam is in danger. Jihad is often equated with a "holy war." This is wrong because military action is only one possible manifestation of spiritual effort. In fact the Arabic word for holy, *muqqaddas,* is never applied to war, *harb,* in the classical texts. And because there has never been a cohesive centralized theological authority in the Islamic world, there never was a consensus about the virtue of religious warfare, though there are several references to jihad and warfare in the Quran. For example: "And fight in God's cause against those who wage war against you, but do not commit aggression—for, verily, God does not love aggressors" (2:190).

In premodern times (when Muslim lands had not come under the direct or indirect rule of the European powers), the legal theory of jihad came to be articulated in the context of a distinction between *dar ul-harb* (the domain of war) and *dar ul-Islam* (the domain of peace), making jihad appropriate only to the former. During this period, another juridical category relating to jihad emerged called *dar ul ahd* (the domain of treaties) that allowed for peaceful trade and social interaction between Muslim and non-Muslim territories. In the premodern period, most jurists stipulated that it was permissible according to *sharia* (Islamic religious law) for Muslims to live as subjects under a non-Muslim ruler (generally a Christian) as long as they could practice their faith openly. This of course has resonance with the situation of Muslims living in the contemporary West under non-Islamic laws whereby they can practice their religion.

JIHAD IN THE MODERN PERIOD

In the modern period (the period when most Muslim lands came under direct or indirect European rule, from the eighteenth century onward) the doctrine of jihad was reformulated. Many, though not all, jurists stipulated that Muslims living under non-Muslim governments (and therefore according to *sharia* in *dar ul-harb*) were not to undertake jihad as long as they could practice Islam and maintain its central institutions. Nevertheless, Muslim revolts against colonial rule sometimes invoked jihad, and in recent years militant Islamists have raised jihad to the level of an individual religious duty. But these usages have not had the support of most Muslim jurists, for the legal preconditions of jihad, as argued by many Muslim scholars, must include both the presence of a genuine threat to Islam and the likelihood of success in opposing it.

There are minor differences in the doctrine of jihad in the two major traditions of Islam, the *Sunni* and *Shia,* and in the subbranches of these. According to classical *Shia* scholars, jihad can only be waged under the leadership of the *imam* (religious leader).

Historically, *fatwas* (religiously sanctioned proclamations) for jihad have been issued by state and nonstate actors in differing political and ideological contexts. In the modern period, jihad has been invoked to resist Western colonial domination; among others, by the Faqir of Ipi against the British in the 1930s in what is now the northwest frontier of Pakistan. This jihad took the form of guerrilla warfare and a major war against the British in 1936 and 1937. Earlier in the 1820s, Sayyid Ahmed Barelvi called for a jihad against the British and the other non-Muslim rulers of India. In the 1830s and 1840s, Abd al-Qadir carried out a jihad against the French occupation of Algeria. In Egypt Ahmed Urabi's rebellion against the British in the closing decades of the nineteenth century was proclaimed as a jihad. In the early part of the twentieth century in Libya, the *Sanusi* order of *Sufis* (Muslim religious mystics) proclaimed a jihad against the occupying Italian forces and inflicted a defeat on them in 1915. Probably the most unusual *fatwa* calling for jihad was under the Ottoman Turks. The Sultan of Turkey in November 1914 declared war against Britain, France, and Russia, which was accompanied by a *fatwa,* extolling not only subjects of the Sultan, but all Muslims living under European colonial rule. This *fatwa* was translated into Arabic, Persian, Tataric, and Urdu. In the 1930s, Sheikh Izz al-Din al-Qassam led a jihad against the British and Zionists in Palestine. In the 1980s, Afghan *mujahideen* declared a jihad against the Soviet occupiers of Afghanistan. Other groups such as al-Qaeda and the Taliban, as well as the Iraqi insurgents, have declared jihad against the United States and its allies in Afghanistan, Iraq, and Pakistan.

The doctrine of jihad and the terms related to it, such as *dar ul-harb* and *dar ul-Islam,* are not part of a transhistorical world view. The doctrine belongs to an elaborate political vocabulary in which jurists or *ulema* (men of religious learning) and modernist reformers argued in response to varying circumstances. But what has connected the discourses on and practices of jihad, in spite of differing circumstances in which these have been located, is resistance to perceived dangers to Islam and Muslims.

Jim Crow

Laws pertaining to the separation of races in the American South were referred to as Jim Crow laws. The term *Jim Crow* can be traced to the early nineteenth century. Jim Crow was

the name of a character in a popular minstrel play performed in the United States during the 1820s. The character possessed characteristics supporting stereotypes of blacks held by many whites in America.

Jim Crow laws prohibited interaction among blacks and whites in public and in private. The scope of the laws was broad and detail was great. Separating blacks and whites in public places such as schools, parks, restaurants, buses, theaters, restrooms, and waiting rooms was common. Many cities had segregated sports teams.

Social interaction was prohibited in many aspects of private life as well. Many states prohibited interracial marriage and sexual activity between white and nonwhite people. Some cities would not allow black and white citizens to come together to play cards, dice, or dominoes.

Elimination of these laws was a slow process. After passage of the Civil Rights Act of 1964, Voting Rights Act of 1965, and Housing Act of 1968, nearly every remaining Jim Crow law was repealed.

Journalism, Political

Political journalism reports about domestic politics and institutions. It can include political analysis, opinion, interpretation, and advocacy. From the middle of the first half of the nineteenth century, American newspapers' partisanship and reliance on opinion were the norm. The papers were numerous, slim, and financed by political parties.

During the late nineteenth and early twentieth centuries, the demographic shape of the population changed. Citizens were moving from rural to urban life, as retailing expanded and industry developed. Economic shifts made large numbers of newspapers catering to partisan groups uneconomical. Greater gains came from a strategy of shifting away from party and toward the more inclusive market. As urban newspapers gained wealth, many could detach themselves from party control and back independence among their journalists, who, nonetheless, could be curbed by owners.

With the professionalization of journalists, they specialized on given aspects of politics and society. These assignments would be their *beats.* The *yellow journalism* of the mass press and partisan news of the past declined. Professionals aimed for well researched, politically centrist reporting, and investigative or *accountability* journalism advanced the watchdog role for news.

The advent of electronic media affected political journalism in newspapers. Radio news at first tended to rely on (or even read from) newspaper accounts. When television became the electronic medium of choice, newspapers turned to more second-day or analysis stories and commercial radio tended to reduce news to brief top-of-the-hour headlines. Public radio by the 1980s developed daily programs with extensive political journalism, but popular stations over the next decade advanced a new form of politicized *talk show,* most often an aggressive, name-calling, partisan vehicle of the political journalist "celebrity," known for extreme political views.

To compete with the dynamic narratives of electronic media, newspaper journalists attempted to create more striking storytelling, moving away from the straightforward stance in search of "interesting" stories.

In the political and social upheavals of the 1960s and 1970s, public trust in institutions plummeted. Some political journalism adopted the style and content of identity politics in response to the civil rights movement, the women's movement, and other minorities' claims. Others did investigations of government malfeasance and crime. What had been a comfortable and mutually rewarding relationship between journalist and government sources broke apart in the new climate. Some political journalists began to write in a critical and emotional style. They claimed that the truth of the turbulence at home and an unpopular war abroad could be conveyed only by a "new" journalism of descriptive equivalence. Journalists disagreed about how objective or engaged political journalism should be. But political journalists at elite newspapers maintained the norms of balance and fairness.

The decline of mass circulation magazines and then the entry of cable television fragmented the audience for political reporting. Considerable research into the public as a multitude of niches can isolate dimensions of preference, so that channels now target niches with precision. Cable channels adjust programming for tastes in news as well as entertainment and provide political journalism of every persuasion. The "big three" U.S. broadcast networks still have a commanding but diminishing lead for their classic news programs. The loud and heated opinion journalists on cable channels are increasing their ratings rapidly.

The Internet makes information available faster and in far greater volume. If the definition of journalist includes the millions of bloggers on the Web, then political journalism has grown astoundingly. Bloggers are a disparate group, many or most of whom use unidentified sources and rely on opinions. Some provide on-the-spot pictures and observations if they happen to witness catastrophes, police violence, and mass political events.

Political journalism in elite newspapers and magazines continues, but the companies are in declining economic health. Surveys show that for the television public the line separating news from political comedy satires and entertainment magazine shows has become indistinguishable. The high-voltage extremist political journalists are further blurring the distinction.

Judgment, Political

In philosophical terms, judgment is the intellectual process of subsuming particulars under, or otherwise connecting them to, universals. Thus, this particular thing is a cat, that particular thing is a chair, and so on. Ordinarily, we have widely accepted rules, formulas, or tests for making such judgments reliably. The concept cat includes, or is even constituted by, criteria for determining which particular things in the world are cats and which are not.

JUDGMENTS IN ABSENCE OF CLEAR CRITERIA

Special difficulties arise, however, in cases where there appear to be no such rules, formulas, or tests. Is the flower beautiful? Unlike the concept cat or chair, the concept beauty seems to include or suggest no clear criteria that would govern its application. Political judgments—for example, does this particular public policy best serve the public interest?—are often thought to be of this kind. Like beauty, the concept of the public interest does not seem to come with ready-made rules for determining how it should be applied to particular cases. Of course, we routinely make judgments about what is in the public interest. Such judgments are obviously central to all political life. Thus, the problem is to discover how we make them in a way that allows us reliably to distinguish good judgments from bad.

ANCIENT PHILOSOPHY: ARISTOTLE

The theoretical treatment of the problem is conventionally traced to Book VII of Aristotle's *Nicomachean Ethics.* Plato had argued in *The Republic* that kings should be philosophers and philosophers kings, suggesting thereby that good judgment in politics is simply a matter of applying the methods of rational, scientific analysis to matters of political consequence. Against this, Aristotle proposed a strong distinction between *episteme* (scientific knowledge) and *phronesis* (practical wisdom, prudence, or judgment) and attempted to show how phronesis can produce a kind of objective rational knowledge despite being unscientific. It is far from clear, however, that he succeeded in doing so. In particular, some scholars have doubted that Aristotle provides a convincing or even explicit positive account of how phronesis actually operates.

EARLY MODERN APPROACHES: HOBBES AND MACHIAVELLI

In the early modern period, Thomas Hobbes proposed a similar distinction between *sapience* (a kind of infallible scientific knowledge) and *prudence* (a type of skillful know-how) and offered the still influential claim that prudence or political wisdom is largely a matter of historical knowledge and hands-on experience; the prudent person is the one who has observed or directly experienced what has generally worked well in the past. For some scholars, such an account seems very much to comport with the earlier and personal example of Niccolò Machiavelli, a well-traveled public servant and, at the same time, an historian of note who used both his practical experience and historical knowledge to offer lessons in good judgment to would-be princes.

MODERN PHILOSOPHY: IMMANUEL KANT AND JUDGMENT OF BEAUTY

Much later, toward the end of the eighteenth century, Immanuel Kant produced his so-called third critique, the *Critique of the Faculty of Judgment,* a work that, though not directly concerned with political matters, has had a major impact on all subsequent thinking about political judgment. Kant argued that nonscientific or *reflective* judgment, as opposed to scientific or *determinant* judgment, is not, properly speaking, a matter of knowledge at all. In Kant's terminology, it is *noncognitive.* The logic of reflective judgments is that they claim to be universal—they should be endorsed by everyone—but they are nonetheless subjective (i.e., incapable of being demonstrated).

The case of beauty is, for Kant, paradigmatic and shows how reflective judgment, though not a matter of knowledge, is also different from mere taste. If I claim that spinach is delicious, I am expressing nothing more than a preference. I know full well that I am making a purely subjective claim—spinach is delicious to me—and that I cannot offer any objective proof that spinach really is delicious. On the other hand, if I say that the painting is beautiful, I am implicitly saying that everyone should agree with this—everyone should recognize the beauty of the painting—despite the fact that, as with the spinach, I can offer no objective proof that it is so. In making his argument, Kant adverts importantly to the notion of common sense. Reflective judgments presuppose, without being able to prove, the existence of a kind of aesthetic sensibility that is common to all rational creatures and that makes it intelligible to claim, for example, that the beauty of this or that object is something that we all should acknowledge.

CONTEMPORARY DEBATE

Largely through the work of Hannah Arendt, Kant's approach has set the terms of much contemporary debate. For Arendt, Kant's theory of judgment, with its emphasis on common sense and the alleged implications of this for the possibility of free and open deliberation in the public realm, is in fact the core of Kantian political thought.

Subsequent writers have sorted themselves at least in part according to whether they accept Kant's general approach. Thus, some authors insist on the ineffable, indeterminate, impressionistic, and even aesthetic quality of good judgment in politics. In the words of Michael Oakeshott (1962), political judgment is a "pursuit of intimations" that occurs in a kind of "mental fog." Others, however, insist that good judgment, if it is to be a

meaningful category, must have stronger claims to objectivity. For example, it must be eligible for a kind of rational reconstruction that provides, if only after the fact, objective reasons for preferring one course of action to another.

Judgment and Decision Making

Judgments refer to external evaluations of the world, regarding the probability, likelihood, or frequency of events occurring. Judgments often happen under conditions of uncertainty. Decisions involve internal trade-offs of values and often take place under conditions of risk. Judgments can be systematically and predictably influenced by heuristics, which represent basic rules of thumb, helping to reduce the time and effort required to render good judgments. Most of the psychological research on judgment and decision making has been conducted by Daniel Kahneman and Amos Tversky; their work has proven widely influential in a variety of disciplines, and Kahneman won the Nobel Prize in Economics for this work in 2004.

The three most important judgmental heuristics are representativeness, availability, and anchoring and adjustment. Representativeness refers to the way in which people judge the probability that one object, person, or event belongs to a particular category based on similarity. This tendency leads people to underutilize the base rate, or prior probability. This results in three specific biases. First, the conjunctive fallacy occurs when individuals judge scenarios that encompass specific details to be more likely because they appear more representative. This makes decision makers overestimate certain probabilities, leading to unwarranted optimism in planning. Second, people tend to believe in the law of small numbers, assuming that chance processes correct themselves in short strings, as when one expects tails to follow heads quickly on the toss of a fair coin. Last, people often engage in nonregressive prediction, failing to understand that many outcomes return to the mean regardless of intervention. The representativeness heuristic encourages the sometimes inappropriate use of historical analogies when decision makers use obvious similarities between cases to draw implications and instructions on how to act based on past experience, often without full recognition of the important ways in which the events may differ.

Availability encourages individuals to judge frequency according to associations that are triggered in memory or imagination. The strength of these associations then serve as the basis for judgments of frequency. Problems arise because such associations derive from many factors, such as vividness, salience, and primacy and recency effects, which do not strongly correlate with actual probability. Availability contributes to worst and best case scenario planning, as plausibility and ease determine judgments of likelihood.

Anchoring and adjustment biases predictions toward initial values, or anchors, which are then often insufficiently adjusted to current circumstances. This leads to the disjunctive effect, whereby people underestimate certain probabilities. This can prove important in planning and failure analysis.

Decisions are then made on the basis of these judgments. Prospect theory offers a psychological model of decision making under conditions of risk. It encompasses two phases: editing and evaluation. Editing, or framing effects, constructs options for choice. The order or method of presentation can decisively affect substantive choice. Evaluation includes two functions, value and weighting. The value function evaluates relative change from an individual's reference point, typically represented by the status quo. People tend to be risk averse in a domain of gains and risk-seeking in a domain of loss. Loss aversion establishes that losses hurt more than equal gains please. The weighting function evaluates psychological significance. Certain or impossible events carry more weight. Further, low probability events are overweighted, while moderate and high probability events are underweighted.

Judicial Activism

Judicial activism is too often simply a criticism made against a judge who exercises the power of judicial review to strike down a democratically enacted law on constitutional grounds. If judicial activism is only a way to disagree with a judge's decision, it has little jurisprudential value. Judicial activism means more than just simply invalidating a democratically enacted law, just as judicial restraint means more than simply upholding one. The term implicates a court's role in a constitutional system.

THE COUNTERMAJORITARIAN JUDICIARY

In the United States, judicial activism has been associated with liberal judges since Earl Warren's tenure as chief justice

of the U. S. Supreme Court, during which the court struck down legislation by interpreting the Constitution to expand the scope of individual rights in such areas as privacy and criminal procedure. However, as the political science literature persuasively shows, conservative justices also seek to strike down legislation as unconstitutional. According to Thomas Keck, the court under Chief Justice William Rehnquist was the "most activist in American history" (2004, 203). Political scientists such as Jeffrey Segal and Harold Spaeth (2002) have shown that justices often invalidate laws and policies on the basis of ideological preference.

So, whereas a liberal judge may be more likely to invalidate laws that infringe privacy or expand executive power, the conservative counterpart may be more likely to do so when laws infringe property or benefit racial minorities. Judges invariably invalidate legislation, acting in a countermajoritarian fashion. That is the role of a judge in a constitutional system. Though the empirical literature is instructive in highlighting the way in which all justices—conservative and liberal—seek to strike down laws, it does not capture the normative sting of accusing a judge of judicial activism. Equating activism simply with the frequency or likelihood with which a court strikes down laws is insufficient. After all, there is a connotation of illegitimacy about judicial activism.

Within political science, this connotation of illegitimacy stems in part from what Alexander Bickel famously called the "countermajoritarian problem." Bickel argued that judges should restrain their desires to bring about policy outcomes because their insulation from political accountability subverted the democratic process. While some authors have tried to reverse the stigma on judicial activism (notably Terri Peretti's book *In Defense of a Political Court*), the stigma remains politically important. A normative response to Bickel's thesis is possible, however, that explains the negative connotation of judicial activism while showing the essentially democratic function of judicial review. This response draws on Bruce Ackerman's distinction between higher and lower lawmaking. This distinction defines judicial activism as the perception that a court has engaged in higher lawmaking. This definition has two parts. First, in the U.S. political system (as with most constitutional systems incorporating judicial review), the court's constitutional role preserves "higher" lawmaking moments against "lower" lawmaking ones. Second, this distinction can be connected to the perception that a court has gone beyond merely interpreting a constitution.

HIGHER VERSUS LOWER LAWMAKING

Central to the definition of judicial activism is Ackerman's distinction between higher and lower lawmaking. This distinction posits two levels of democratic lawmaking. The Constitution, including its amendments, represents higher lawmaking. According to Ackerman, these are moments of heightened deliberative democratic debate where the "people" do more than simply pass a law. They engage in *constitutional* decision making, not just *legislative* decision making. Statutes, laws, policies, executive orders, and the like are instances of lower lawmaking. After all, consider that the process for amending

the U.S. Constitution is far more onerous than simply passing a law. Amending, for instance, requires ratification by three-quarters of the states. Higher lawmaking, then, is substantively more democratic than a simple law or statute. The role for the court is to preserve higher lawmaking moments from lower ones by invalidating laws that conflict with the Constitution. (This is a separate issue from whether other branches may perform this preservationist role.)

For instance, if Congress were to pass a law that instituted a national religion, the court's duty would be to strike it down even though a current majority favors it. The law conflicts with the First Amendment's establishment clause. If a state were to pass a law that disenfranchised women, the court's duty would be to invalidate it under the Nineteenth Amendment. These would *not* be instances of judicial activism. Rather, they represent the dualist legal structure of a written constitution in which the court thwarts current majority interests that conflict with the higher democratic interests of the Constitution. The court, in this view, must preserve these hard fought "constitutional moments."

BEYOND CONSTITUTIONAL INTERPRETATION

If Ackerman's argument is correct, then the question of judicial activism (sometimes seen under the rubric of *institutional power*), spills over into the question of judicial interpretation of the constitution. It implies that the court's role is to *interpret* the Constitution by invalidating laws and statutes that are inconsistent with it. Judicial activism is thus the perception that the court has engaged in higher lawmaking; it has gone beyond interpretation. By co-opting the constitutional democratic process, and in particular its amendment procedures, the court goes beyond its role as merely the preserver of higher lawmaking. Rather than seeking to uphold the higher law against its lower counterpart, the court improperly makes higher law. This explains why judicial activism is widely viewed as illegitimate. It does not allow the relevant democratic polity to deliberate, debate, and ultimately decide constitutional issues.

Sanford Levinson proposes a useful typology for appreciating the bounds of interpretation. He posits a sliding scale of constitutional change from interpretation, to amendment, to revision, and to revolution. An interpretation is a judicial decision that "was already immanent within the existing body of legal materials." An amendment, on the other hand, "represents a genuine change not immanent within the preexisting materials." (1995, 20–21). Judicial activism is the perception that the court has genuinely changed the document. Such changes or amendments, he and others argue, must occur through the "people," not the court.

If one accepts this framework, the perception that the court has engaged in higher lawmaking still often hinges on what theory of interpretation an individual adopts. Crudely put, the two opposing theories are static and dynamic ones. The static conception, often associated with originalism, contends that constitutional language must be understood as it was written. Its dynamic counterpart contends that constitutional language

must be interpreted in a way that expands or informs liberty. A judge who deploys a dynamic theory of interpretation may interpret *equal protection* to strike down legislation that limits marriage to opposite sex couples or may interpret constitutional language to expand rights; this can be seen by the static camp as judicial activism. However, by insisting on the original language or meaning of the text to strike down a law relevant to a situation never envisioned by the framers of a constitution or its amendments, originalists can be accused also of judicial activism by the dynamic camp. Thus, the charge of judicial activism goes beyond any particular theory of interpretation: conservative or liberal. It rests on the perception that the court has exceeded its constitutional role by engaging in higher lawmaking rather than simply upholding it.

Judicial Behavior

Judicial behavior is a field of inquiry in political science that seeks to understand and explain actions taken by judges and courts. At the foundation of this scholarly endeavor are systematic efforts to build generalizable theories, empirically tested, that illuminate and clarify the primary factors that drive judicial decision making. As political scientist James Gibson declared trenchantly concerning this subject, "judges' decisions are a function of what they prefer to do, tempered by what they think they ought to do, but constrained by what they perceive is feasible to do" (1983, 9). In this one sentence, Gibson penetratingly distills down the essence of political science insight into the actual world in which judges reside. That is to say, many forces sway, motivate, and direct judges in the fulfillment of their duties that are beyond the narrow confines of the law. This constitutes the central debate among political scientists and legal scholars on judicial behavior: which set of influences—political, legal, personal, or some combination thereof—best explain the actions of judges and why.

LEGAL VERSUS POLITICAL SCIENCE MODELS
One can fruitfully break this debate down into two major camps or schools of thought. The first camp, composed mostly of lawyers and law professors, espouses the classic and traditional view taught in law schools, focusing on the role of the law and legal principles in determining the choices judges make. The second camp, more recent in its origin compared to the legal approach and populated by political scientists, instead prefers to focus on the role of politics. Scholars commonly refer to the first camp's orientation as the legal model, and the second camp, with its emphasis on political consideration, is further divided into the attitudinal model and the strategic model.

LEGAL MODEL
The legal model contends that judicial decisions result from judges' attempts to apply legal principles and engage in varying modes of constitutional interpretation and techniques of statutory interpretation. At the heart of the legal model is the concept of *stare decisis* (Latin for "let the decision stand"), according to which judges draw on the principles and rules laid out in earlier cases and use them to guide their decision in similar cases (a practice drawn from English common law). In addition to precedent, according to the legal model, the other prominent law-based considerations judges entertain consist of the intention of the Framers or legislators and the plain meaning of the words or text in the relevant constitutional provision or statute. Legal model adherents argue that judges are process-oriented as opposed to being result-oriented. That is to say, judges render decisions based on the appropriate legal consideration and wherever the law (precedent, text, intention of the Framers or legislature) takes them, with no palpable effect stemming from the judge's own political or personal wishes in terms of the final disposition of a case. Thus, the legal model de-emphasizes and discounts the

potential impact of a judge's ideological or policy preferences in a case and instead stresses and focuses on the role of purely jurisprudential factors and law-based considerations.

ATTITUDINAL MODEL

This orientation of the legal approach in downplaying the political is exactly what political scientists find flawed and lacking, and these concerns led to the respective development of the attitudinal model and the strategic model, which many scholars believe more accurately capture the dynamics underlying judicial behavior. The attitudinal model, as advanced and developed by Jeffrey Segal and Harold Spaeth, contends that judicial decisions are essentially a function of judges' political ideologies and philosophies. In other words, judges decide cases in terms of their policy wants and preferences. Thus, attitudinal model adherents argue that judges are more result-oriented than process-oriented—they decide cases in light of the result they wish, allowing their ideological attitudes to directly affect their resolution of disputes in front of them. As Segal and Spaeth express it, "Simply put, Rehnquist [William Rehnquist, former chief justice of the U.S. Supreme Court] votes the way he does because he is extremely conservative; Marshall [Thurgood Marshall, former associate justice of the U.S. Supreme Court] voted the way he did because he was extremely liberal" (2002, 86). The attitudinal model is essentially the result of a blending and merging of various perspectives and conceptualizations from legal realists, economists, political scientists, and psychologists. This attitudinal orientation has tended to dominate analysis of judicial behavior of the U.S. Supreme Court and other appellate courts, where the justices and judges have higher levels of discretion and leeway in their decisions compared to trial court judges, who are much more necessarily constrained by procedures and precedents.

STRATEGIC MODEL

The strategic model, also referred to as the rational choice model, takes issue with some of the primary assumptions of the attitudinalists. The debate and dialogue between the strategic and attitudinal models is at the current forefront of judicial politics scholarship in political science (although there is also an increasing call for a greater appreciation of the relevance of the legal model). Proponents of the strategic model accept the attitudinalist proposition that judges are primarily seekers of legal policy, but at the same time point out that judges are not simply ideological automatons who slavishly decide cases liberally or conservatively to advance their political preferences. For strategic model adherents, judges at times will act in a strategic, sophisticated manner (as opposed to sincere behavior) and vote on cases (and take other actions as well on the court) in ways that belie their underlying ideology. In other words, judges will vote divergently from their policy preferences in a case directly in front of them so as to be better able to achieve their policy goals elsewhere or at a later time—judges will sacrifice short-term "loss" for longer-term "gains."

As Lee Epstein and Jack Knight put it, "justices are strategic actors who realize that their ability to achieve their goals depends on a consideration of the preferences of others, of the choices they expect others to make, and of the institutional context in which they act . . . the choices of justices can best be explained as strategic behavior, not solely as responses to either personal ideology [as the attitudinal model posits] or apolitical jurisprudence [as the legal model contends]" (1998, xiii). Thus, the strategic model incorporates insights from both the attitudinal and legal models, along with its own recognition of the strategic quality behind much of judicial behavior. Prime examples of reasons behind such strategic behavior include: maintenance of good and effective working relations with other justices on the court; not wishing to motivate the Congress to react negatively to a court ruling that may lead subsequently to injury to a justice's policy preferences; preservation of public opinion/support in favor of the court so as to maintain its institutional legitimacy and influence for future cases; and sensitivity to a period of crisis in the nation and accompanying deference to the elected branches (especially the president acting as commander-in-chief) until a better time develops to act differently.

Judicial Independence

Judicial independence in modern society and in the classical liberal tradition is considered to be one of the cornerstones of any free and democratic society. But what is meant by *judicial independence*?

Considering the concept of the term *independence,* the first definition that comes to mind usually involves the idea of freedom. When freedom is applied to a principle, a person, or an entity, it usually is used in the context of freedom from some form of restraint or influence. In this matter, the entity under examination is the judiciary, which in most governments is the formal structure of courts to resolve legal disputes.

Courts, when resolving legal disputes, can be subjected to a number of influences. These influences may include other branches of government, the litigants, other judges, special interest groups, and society or public opinion. Each of these

potential influencing entities might have a particular interest in how individual cases are decided by the courts. If any of these entities had a controlling influence over the courts in the adjudication process, then it can be logically concluded that judicial independence was lacking. However, there is another influence over the courts that many people would consider to be a proper and a controlling influence: the law. Generally, the courts are expected to make rulings according to law, under the assumption that the law is designed to accomplish justice.

This leads to the reason why many free and democratic political systems and societies find at least some form of judicial independence desirable and incorporate judicial independence into their legal systems. Free and democratic societies generally, at least in theory if not practice, follow the principles of fairness and justice in the resolution of legal disputes, with decisions being made in accordance with the facts and previously established law, giving all parties notice and the opportunity to be heard. If the courts can be controlled by other influencing factors, such as the ones listed in the previous paragraph, then the decisions of the courts likely will not be based on the facts and the previously ascertained law.

Indeed, history is replete with examples of societies and political systems where the judiciary has little or no judicial independence. In these political systems, resolution of legal disputes might depend on such factors as the whim or caprice of the rulers or on the desires of a wealthy opponent who could cause the decision to be based on factors other than the facts or the law. Even in free and democratic societies, external factors such as public opinion and special interest groups have been known to influence court decisions. Examples of judicial corruption, even in free and democratic societies, are too numerous to be listed here.

In the basic governmental structure of most free and democratic societies, the courts are separate and distinct from the other major branches of government. Usually, such as in the Untied States of America, there are three basic functions or branches of government: the executive, the legislative, and the judicial. This structure was advocated by one of the famous French philosophers of the Enlightenment, Montesquieu, whose writings greatly influenced the Founders when they wrote the U.S. Constitution. This governmental structure was intended to help prevent tyranny, wherein power was concentrated in a single person or group of people. In many tyrannies throughout history, the tyrants could control the adjudication process as a means of social and political control. Judicial independence from the other functions of government helps ensure a fair adjudication on the facts and law before the courts.

As this discussion illustrates, *judicial independence* is not a precise term. One definition of it can mean that the judges are completely independent of all influences, including the law. Of course, such an interpretation is an extreme example that no government follows. Judicial independence, in the context of a free and democratic society with a government of laws, is a concept that allows the courts freedom from controlling influence from other branches of government, special interest groups, or wealthy litigants, but also contemplates limits on the courts to act within the scope of the law and the principles of justice where the law does not address specific situations.

Examples of the application of the concept of judicial independence are found in national governments, such as the U.S. Constitution and its doctrine of the separation of powers, and international treaties, such as Article 14 of the International Covenant on Civil and Political Rights.

Judicial Philosophy and Decision-making

Judicial philosophy is the set of ideas that inform how justices and judges rule in cases. Judicial philosophies can be based on many different elements. They may be based on theories of constitutional interpretation, views about the place of courts in a democratic republic, or notions about the role of precedent and what the words of the Constitution meant at its founding. Some justices advocate a more active role for the court to address social evils or protect "discrete and insular minorities." Others encourage judicial restraint to avoid usurping the democratic process of lawmaking.

Political science scholarship, however, has called into question whether such philosophies are explanatory of judicial decision making. Justices also may alternatively base their decisions on their opinions or attitudes about public policy. For this reason, justices usually are labeled as conservative, liberal, or moderate, the same labels that are applied to other political actors. While all judges and justices espouse judicial philosophies, this entry centers on the place of judicial philosophies

in the decisions made by justices of the Supreme Court of the United States.

CLASSICAL JUDICIAL PHILOSOPHY: INTERPRETIVISM AND ORIGINALISM

The most basic distinction in judicial philosophies for Supreme Court justices is between *interpretivism,* which sees the task of judicial review as a matter of interpreting and applying the Constitutional text, and *noninterpretivism,* which is willing to reject aspects of the text for the sake of contemporary notions of justice. As few if any justices explicitly defend noninterpretativism, judicial philosophies tend to rather be contrasted between "strict" and "loose" constitutional interpretation.

A variation on the classic strict-loose differentiation in judicial philosophy, one that is widely discussed politically in the early twenty-first century, is a difference in viewpoint among justices as to the importance of what the words meant at the time of the framing of the Constitution and its amendments. Justices who subscribe to the judicial philosophy that restricts the scope of the Constitution to its original meaning are commonly known as *originalists.* They argue that the court preserves its proper democratic function by restricting itself to upholding the decisions of the past, and that new applications of those principles should come from the legislature or a constitutional amendment.

Nonoriginalist justices, by contrast, believe that what the words meant when the Constitution was written is only one factor among many to consider when interpreting the Constitution. They argue that in some cases, the words of the text themselves carry a greater meaning than the Founders may have intended. For instance, the Fourteenth Amendment was originally intended to give equal rights to African Americans (especially former slaves), but its prohibition of discrimination is not restricted and should be applied more generally. They also generally place more importance on court decisions since the founding period in light of changing social, economic, and political factors through history. Contemporary originalist justices, such as Justices Antonin Scalia and Clarence Thomas, are usually considered conservatives. In contrast, nonoriginalist justices may be liberal, moderate, or conservative, depending on the many additional grounds upon which justices make constitutional choices.

A POLITICAL SCIENCE MODEL OF JUDICIAL DECISION-MAKING: ATTITUDINALISM

Political scientists have responded to these varied judicial philosophies by empirically investigating how judges actually make decisions. Political scientists widely hold the notion that at the core of judicial decision-making is not an official judicial philosophy, but rather a judge's view of what the policy outcome should be in a particular case. This view asserts that judges base their decisions on the facts of a case juxtaposed against their personal policy choices. Scholars with this view are called *attitudinalists.* Attitudinalists believe that when

conservatives on the Supreme Court are replaced by liberals, as was done in the late 1930s and early 1940s, and again in the 1950s and early to mid-1960s, liberal decisions in policy terms are the result. They would similarly expect that when conservatives are appointed to the court, conservative policy decisions are the result. Attitudinalists claim that preferences alone, usually policy preferences, account for a justice's vote in a particular case.

Thus, attitudinalists say that Supreme Court justices are like elected and appointed government officials who are free to make decisions based on their political preferences or "attitudes" to public policy. In fact, attitudinalists claim that justices are freer to make decisions in terms of their attitudes on policy because they have life tenure, unlike elected officials. Jeffrey Segal, perhaps the foremost attitudinalist of the past two decades, argues that judges vote their ideological preferences. In addition, attitudinalists argue that legal discretion in cases that reach the Supreme Court combines with institutional incentives, like life tenure, to favor court independence so justices are capable of acting like single-mined seekers of legal policy. In other words, "Justices decide cases on the merits in light of the facts in the case vis-à-vis their sincere ideological attitudes and values" (1999, 238). The most pure form of the attitudinal model, one in which jurists have unconstrained choice to make decisions on the basis of judicial philosophy, viewed as policy desires, is the Supreme Court, especially when justices make decisions on the merits of a case. The reasons for this are that "[n]o court can overrule the Supreme Court, the Justices have life tenure with no diminution of pay, and docket weeds out legally unambiguous cases" (1999, 238).

Attitudinalists consider institutional and legal norms (such as the rule of following precedent, the need to be consistent in the development of doctrine, interchanges among justices in the decision-making process itself, and changing political, social, economic, and historical contexts outside courts over time, including those after a given judge joins a court) to play little role in shaping or constraining the Supreme Court, or any courts, in what Howard Gillman has called "the presumptive desire of judges to promote policy preferences" (1999, 66). Among the factors that attitudinalists reject as key to court decision making include legal rules, the *certiorari process,* opinion assignment, accommodations among justices in the decision-making process, precedent, and theories about the role of the courts as compared to legislative and executive institutions.

AN ALTERNATIVE POLITICAL SCIENCE VIEWPOINT: HISTORICAL INSTITUTIONALISM

One group of nonattitudinalist scholars, called historical institutionalists, considers historical accounts of institutional development or interpretive characterizations of the actions of judges and other political actors. They look at preference formation itself and view the process as constitutive.

> Judicial behavior is not merely *structured* by institutions but is also *constituted* by them in the sense that the

goals and values associated with particular political arrangements give energy and direction to political actors. The work is historical because it is assumed that, over time, as institutions interact with the features of the political system and attempt to cope with a changing society they might transform themselves and develop new norms, traditions, and functions. (Gillman and Clayton, 1999, 6–7).

Historical institutionalists also argue "that individual conduct is not just the consequence of particular institutional settings, but the product of much larger social frameworks" (7). Social institutionalists argue that:

> individuals find themselves embedded in cultural and organizational fields or sectors which determine the very concept of self-interest and utility. Thus the conduct of individuals within particular institutions must be understood to be within the contextual web of attachments, obligations, and affective bonds that constitute the essential grounds of conduct. These would include such broad social and cultural structures as class, race, gender, and religion (7).

Thus, social institutionalists explore the larger ideological or cultural contexts within which institutions develop identities.

Scholars of what has been called the historical institutionalist model of court decision making argue that judges are less affected by personal judicial philosophy and attitudes than they are by the institutions in which they are embedded and, most importantly, the social, economic, and political world outside institutions. Thus, it is institutional, legal, and historical factors which explain doctrinal change, not the attitudes of judges toward public policy. Moreover, these factors cause judges to make decisions in support of a public policy or case outcome that they would oppose were they not a justice, but rather an elected official.

Finally, part of the Supreme Court decision-making process may also involve strategic concerns among judges as to the effect of a decision on the Supreme Court as an institution. For example, a justice might consider whether reversing a landmark decision would undermine the legitimacy of the court, when the principles upon which that decision was based not only continue to exist, but have been expanded by subsequent cases, and where citizens have relied on the decision in their everyday lives. This is exactly what the Supreme Court asked and answered when it refused to overturn the 1973 abortion rights case, *Roe v. Wade,* when it decided *Planned Parenthood v. Casey* in 1992. The court did this even though several justices in the majority opposed the policy that gave women the right to abortion choice.

Judicial Restraint

Judicial restraint is too often simply an endorsement of a judge who upholds a democratically enacted law on constitutional grounds. If the term is only a way to agree with a judge's decision, it has little jurisprudential value. After all, the role of a judge in the system of judicial review is to uphold laws that are constitutional and strike down ones that are not. Judicial restraint means more than simply upholding a democratically enacted law just as judicial activism means more than simply invalidating one. The term implicates a court's role in a constitutional system.

HIGHER VERSUS LOWER LAWMAKING

Like judicial activism, much of the debate about judicial restraint is confused with the debate on the "correct" theory of constitutional interpretation. That is, references to judicial restraint often simply turn out to be a proxy for a static, conservative theory of interpretation, one generally associated with originalism. This confusion is belied by empirical work on judicial behavior, which shows that liberal judges may be just as likely to uphold legislation as their conservative counterparts. Whereas a conservative judge may be more likely to uphold laws that infringe sexual freedom or expand executive power, the liberal counterparty may be more likely to do so when laws infringe property or benefit racial minorities.

Other authors avoid this confusion by seeing judicial restraint as simply a prescription that courts should show a large degree of deference to democratically elected or majoritarian institutions. These theories are borne from the larger countermajoritarian problem, articulated most comprehensively by Alexander Bickel, who proposed restraint and the passive virtues as ways of mitigating the antidemocratic tendencies of

judicial review. While this meaning of *judicial restraint* does not collapse it into a theory of interpretation, it seems to equate judicial restraint simply with the frequency or likelihood with which a court upholds laws.

Such an understanding of judicial restraint has been criticized as insufficient, because it fails to capture the normative implication of the term, namely that the court has opted *not* to fulfill its constitutional duty. In contrast with Bickel's characterization of judicial review as antidemocratic, Bruce Ackerman distinguishes between higher and lower lawmaking. The heightened degree of democratic deliberation that enters into drafting and ratifying a constitution or constitutional amendment distinguishes those documents as more genuinely democratic than the typical laws and policies of a government. The highest court of a democracy has a duty, on this view, to invalidate those laws and polices—lower lawmaking—that conflict with the constitution, the higher law. Judicial restraint occurs when the court refuses to perform this role and refuses to strike down a law, even though the judges may very well see the legislation as unconstitutional with their theory of interpretation. This primarily happens (though this is not an exhaustive list) when: (1) a judge decides not to review the case; or (2) a judge decides for political reasons that it is better overall not to strike down a possibly unconstitutional law.

REFUSAL TO REVIEW

First, and this is a more subtle type of judicial restraint, a judge may simply refuse to hear a case. For instance, the U.S. Supreme Court hears only about 2 percent of all cases that come before it. This process of certiorari means that the court will review petitions from thousands of cases, but only select a few to hear and review. Individual justices may have their own reasons for practicing this kind of judicial restraint. Because a justice does not need to publish or justify a decision not to review, these reasons need not be constitutional or even legal in nature.

The court often declines to judge a case if it poses a delicate political question or one that lacks a judicially enforceable rule, even if a constitutional issue is at stake. In *Luther v. Borden* (1849), two factions claimed to represent the legitimate government of Rhode Island. The court refused to decide that issue, reasoning that its disposition was too political because the president had already sided with one of the factions.

REFUSAL TO STRIKE DOWN

Second, and this is the more obvious type of judicial restraint, a judge may refuse to strike down a law because it may provoke some kind of backlash. In this case, even though a judge believes the law may be unconstitutional, that judge declines to invalidate it, reasoning that doing so may cause more harm than good. Though *Brown v. Board of Education* (1954) struck down the doctrine of "separate but equal," the decision failed to integrate schools in the short term, perhaps even fueling racist sentiments in the long run. Political scientist and legal scholar Gerald Rosenberg famously argues that the decision did not have the force that is often attributed to it; rather, *Brown* led to more retrenchment from the South. In reply,

Derrick Bell, a constitutional scholar, contends that if he had been a justice on the court, he would have likely upheld separate but equal, even though he concedes that such segregation is unconstitutional. He argues that practicing such judicial restraint would have been better for racial minorities in the long run precisely because it would not have invited the backlash that *Brown* did.

In another example, the California Supreme Court struck down that state's ban on same-sex marriage in 2008. Californians in turn passed Proposition 8, an amendment to the state constitution overturning the court decision. The amendment enshrines the prohibition on same-sex marriage at the constitutional level. Before the state supreme court decided the case, the prohibition was merely statutory. In this way, judicial intervention may have injured the cause of same-sex marriage. One of the dissenting judges in the California opinion—considering the possibility of such an antigay backlash—suggests that judicial restraint may be a better strategy of furthering the cause of gay and lesbian equality (Judge Carol Corrigan, dissenting opinion, *In re Marriage Cases* at 8). This kind of judicial restraint trades any short-term gain for long-term results. It requires that the judge consider the deleterious effects of invalidating a possibly unconstitutional law.

Judicial Review

Judicial review is the capacity of a court to review and, if necessary, reject the laws or directives of the legislative or executive branch. In administrative law, *judicial review* simply refers to court oversight of government actions, and in this usage, judicial review is a necessary component of the rule of law (the government is restrained by the laws in place). In constitutional law, *judicial review* refers to the power of the courts to strike down the laws in place as violations of the more basic principles enshrined in the Constitution and its history of interpretation.

Judicial review in the constitutional usage is essentially an American contribution to the art of government. Within the constitutional usage, *judicial review* can be used in a narrow or broad sense. In the narrow sense, judicial review is essentially collateral—that is, it does not consider the merits of the impound decisions but examines only its constitutionality or basic legality. In the wider sense, it includes even appeals on the merits of a decision taken either by the executive or the legislature.

ORIGINS AND PURPOSE

The origin of judicial review can be traced to the Cokian dictum of the common law (named after Lord Chief Justice of England Edward Coke), under which there are certain principles, which are considered fundamental and higher, and they cannot be altered even by the parliament. With the provision of a written constitution, a new basis for judicial review was created. Judicial review is not explicitly provided for in the U.S. Constitution. The Supreme Court was established by the Constitution and subsequent Judicial Act in 1789, but this court's power to invalidate laws or other government actions was only declared in *Marbury v. Madison* (1803), in the decision written by Chief Justice John Marshall.

The distinction between a legislative act and the constitution is basic in any type of written Constitution. It is the very source of judicial review, whether expressed explicitly or inferred logically. Judicial review can be seen as an outcome of the supremacy of a constitution over legislative acts. Both the legislature and the judiciary derive their respective authority from the Constitution. Under judicial review, it is the duty of the judges to pronounce upon the constitutionality of the legislative acts. Without judicial review, there would be no court of appeals for citizens who consider a government's action, while currently the law of the land, to be in violation of the principles on which the country is founded.

The generality of some clauses of the Constitution (for instance, "equal protection") allows the judiciary in the United States to invalidate a law passed by the Congress on the basis of inherent goodness or badness of the law. This wider application of judicial review is highly contested in political theory, usually couched in terms of *judicial activism* and *judicial restraint*. In practice, as undoing a high court decision is extremely difficult, much depends on the creative interpretation of the wisdom of the legislative policy expressed through due process of law. Because the U.S. Constitution is very brief with a rigid amendment procedure, many see the judiciary as playing a crucial role in adapting the Constitution to the changing circumstances. A similar phenomenon occurs in India, although the words *due process of law* were replaced with *procedure established by law* (drawn from Japan).

Under the guise of the due process clause, supreme or constitutional courts have succeeded in striking down congressional laws passed by the legislatures as unjust, unreasonable, and violative of the supreme law of the land dedicated to preserving and protecting the ideal of constitutionalism. The role of the judiciary is thus not confined merely to the annulment of legislative discretion but also interpretation and application of legal rules to social facts. Former U.S. Supreme Court justice Benjamin Cardozo argued that the chief worth of judicial review lies in: "Making vocal and audible the ideals that might otherwise be silenced, in giving them continuity of life and of expression, in guiding and directing choice within the limits where choice ranges" (Cardozo, 94). "It is very well said that judicial review affirms as well as negates. It exercises both 'power releasing' and 'power breaking' function. It helps in accelerating and quickening the movement and expediting the realization of social conscience" (Cardozo, quoted in Mason, 1979, 244–245).

FROM JUDICIAL REVIEW TO JUDICIALIZATION

It seems there are times when judges cannot escape the duty to judge, to choose between competing social values or make a choice amounting to indulging into politics. It has led to some problems and controversies. In the late twentieth century, the U.S. Supreme Court played a proactive role as the fallout of the judicialization of politics in general. *Judicialization* implies a process whereby the judiciary engages in administrative supervision. It also implies the proactive role played by the judiciary in social engineering by laying the foundations for desirable behavior on the part of the public institutions and the masses alike.

According to proponents of this trend, the judiciary is in a better position to resolve the contentious issues in pluralistic and modern complex societies as the judges appear to be apolitical, neutral, and fair to the vast majority. Moreover, they can give equal attention to all the aggrieved parties and take a nonpartisan and long-term perspective, a feat that cannot be performed by the legislative or the executive. Under this interpretation, the judges not only adjudicate between the two litigants in whom the "better boxer" wins the game but also take side with the just party. They can do so because they are capable of taking independent decisions and autonomous actions, whereas the executive and the legislative branches are found to be too fragmented to do so. Thus, judicial review can help in providing logical and rational solutions in an atmosphere charged with partisan politics and interest group lobbying.

The appropriateness of the trend of judicialization has been called into question in legal studies at least since Alexander Bickel's 1962 work *The Least Dangerous Branch*, wherein he

coined the term *countermajoritarian difficulty* to describe the removal of important societal judgments from democratic, majoritarian processes. One response from the court itself has been to argue for its role in protecting "discrete and insular minorities" (*United States v. Carolene Products,* 1938, footnote 4) against majority-backed laws that may make sense in themselves but prove onerous for an unfavored group. Moreover, many political scientists since Bickel have argued that, in fact, judicial power is "politically constructed." It is less insulated from popular pressure and reprisals from political actors than previously thought, and therefore represents not a frustration of democratic processes, but a different outlet for them.

CONCLUSION

Whatever the outcome of the current debates in political science, it is clear that the genius of any constitution lies not only in static meaning but also in the adaptability of its great principles in the light of current problems and needs, and judicial review provides the primary means of extending those principles in many countries, especially the United States, in the early twenty-first century.

Judicial Selection and Nomination

Courts play an important role in most Western democracies and varying roles elsewhere in the world. Understanding judicial selection offers a window on how justice is dispensed, which is a reflection of how politics and the political system of a given country work.

At the outset, it must be recognized that an independent judiciary is a hallmark of a free society. In the United States, the Framers of the Constitution, mindful of this and also influenced by French political thinker Montesquieu's work, incorporated the principle of the separation of powers among the branches of government. The judiciary was established as a separate and distinct branch of the federal government. The president was charged with nominating justices, and the U.S. Senate was given the task of deciding whether to confirm the nominee. To guarantee the independence of the federal judiciary, judges were given lifetime tenure, removable only by impeachment by the House of Representatives and conviction after a trial by two-thirds vote of the Senate.

An independent judiciary is impossible and the ability to dispense justice is questionable from a judiciary whose members owe their jobs to an executive who can remove or discipline them at will. However, there is also a serious question of whether there can be a truly independent judiciary if that judiciary is selected or retained by popular election. Indeed, can a judge whose selection and retention is by election be as neutral and objective as a judge with life tenure? Are civil service methods of selection, which are in use in many Western democracies, superior to more political selection methods in producing fair and objective justice?

JUDICIAL SELECTION METHODS

Many judicial selection methods are used in countries worldwide. Legislatures, the chief executive or heads of executive branch departments or agencies, and even members of the judiciary, as, for example, in Sweden, participate to varying degrees in selection processes. In the United States, five methods are in use by the states and one used by the federal government. More than three-quarters of the states elect some or all of their judges at general elections in which individuals run for judicial office as members of a political party (partisan elections) or are required by law to run without a party affiliation (nonpartisan elections). About one-third of the states use the merit plan to fill some or all their judgeships, and this method involves a nominating commission submitting to the governor a list of names to fill a particular judicial position. The governor by law must make the selection from that list. Five states and the federal government select their judges by appointment of the chief executive with the approval of another body, typically the executive council or senate. Three states use the legislature to select some or all their judges, with the governor having no constitutionally mandated role in the process.

In practice, scholars have found that all these methods in use in the United States involve politics of one sort or another. Studies of electoral methods have found that judicial elections, particularly at levels below the highest state court, tend to be ignored by the electorate, with low voter interest and turnout. Furthermore, the majority of judges in electoral systems are initially selected for interim appointments by the governor to fill vacancies on the bench that occur between elections due to resignation, retirement, or death. This means that at the next election such judges run as incumbents and are often uncontested.

Research has found that the party label is the most significant factor in the voter's choice: judges who are Democrats tend to be more liberal than judges who are Republican.

Judicial selection of federal judges in the United States has some similarities with selection in the states. Party-organizational politics, the politics of policy, and bar association politics all come into play. But because federal judges are nominated by the president, the center of selection activity lies in the executive branch. Participants in the negotiations, particularly for lower-court judgeships, include not only Justice Department and White House officials but also U.S. senators and other major leaders of the president's party from the state in which a federal judgeship is to be filled or the state that by tradition expects to be represented on a federal court of appeals.

The professional credentials of judicial candidates are subject to close scrutiny by the Justice Department, but the political reality is that typically 90 percent of judicial appointments go to members of the president's party. Furthermore, the policy or ideological outlook of the candidate is important. If an administration sees the judiciary as affecting its policy agenda, as was notable with the Franklin Roosevelt, Reagan, and two Bush administrations, it will tend to screen judicial nominees to eliminate those antithetical to its policy agenda. The U.S. Senate in more recent decades has played a more active role in the confirmation process, with nominees perceived as being either too far to the political left or political right running into difficulty, but presidents can use their appointment powers to move the judiciary in a more liberal (as was the case with the Carter and Clinton appointees) or more conservative directions (as was the case with the Reagan and the two Bush appointees).

JUDICIAL SELECTION AROUND THE WORLD

For countries other than the United States, relatively little research has been conducted on judicial selection and its impact. The principal judicial selection mode in civil-law countries is that which considers the judiciary a form of civil service and part of the government bureaucracy. Judges work their way up the judicial hierarchy—all outside the political appointment process. Judges are typically seen as defenders of the regime insofar as the regime is responsible for the law that judges must apply.

The bureaucratic route to a career judiciary may be by a competitive entrance examination that enables those who pass to attend a school for judges (the selection method, for example, in France, Portugal, and Spain) or by solely a competitive entrance examination (the method found in Belgium, Brazil, Italy, and Peru). Grades on examinations typically determine first judicial appointments and subsequent promotions usually are based on seniority and the assessments of senior judges or state ministries of justice. An alternative bureaucratic selection method uses a type of an apprenticeship without examinations and schooling (as with Argentina, Chile, Ecuador, and Germany). Bureaucratic selection systems tend to produce a more conservative judiciary.

In England, a common-law country, there are some similarities to the United States in that judgeships are not considered a form of civil service and that there is a tradition historically of political experience and party patronage playing a role in the Lord Chancellor's selection of judges for the appellate courts. Higher court judges are drawn from the legal elite. In general, partisan considerations are much more muted in England than in the United States, although both countries tend to place an emphasis on professional qualifications. The selection process generally favors the appointment of judicial conservatives. More systematic empirical analysis is needed to sketch in the details of judicial selection and its impact around the world.

Judicial Supremacy

Broadly speaking, judicial supremacy is the position that courts have supreme or final power to interpret a nation's constitution or supreme law. A person who subscribes to judicial supremacy supports the rulings of judges even despite any belief that such rulings are based on incorrect or flawed interpretations of the constitution.

Scholars, politicians, judges, and other commentators who reference judicial supremacy are frequently imprecise, linking the concept with a range of different practices and beliefs. Nevertheless, one should distinguish judicial supremacy from judicial exclusivity, the view that courts alone should have the power to engage in constitutional interpretation, as well as judicial review, the specific power of courts to invalidate government action on constitutional grounds. Supporters of judicial supremacy necessarily believe in judicial review, but do not automatically believe in exclusivity. A judicial supremacist might recognize that legislative and executive bodies, state

officials, and even the populace at large could discuss the meaning of a constitution, so long as, at the end of the day, these interpretations were subordinate to courts' views.

ARGUMENTS FOR JUDICIAL SUPREMACY

Defenders of judicial supremacy advance three general arguments in support of this practice. First, giving courts final authority to determine the meaning of a constitution is supposed to be instrumental for enforcing this document as a nation's highest law. Without supremacy, a constitution's limits on government powers and protection of rights might be compromised by the encroachments of other government officials, or by the confusion created by having multiple and perhaps contradictory readings of law. Judicial supremacy recognizes courts—with some supreme tribunal at the apex of the judiciary—as the designated referees for working out constitutional disputes between political institutions and between government and citizens. This arrangement purportedly ensures that a constitution's meaning and application is unambiguous, stable, and somewhat insulated from the electoral and transitory concerns that often motivate political figures such as legislators. Larry Alexander and Fred Schauer have elegantly articulated this argument, concluding that judicial supremacy supports a constitution's capacity "to achieve a degree of settlement and stability, and . . . remove a series of transcendent questions from short-term majoritarian control" (1997, 1380).

A second justification for judicial supremacy contends that it is a necessary arrangement because of the status of constitutional interpretation as a branch of law. Under this understanding, the superior capacity of judges to elucidate constitutional meaning must be recognized and protected due to their specialized training and capacity for dispassionate legal analysis. One version of this argument (famously set out in the U.S. case *Marbury v. Madison*) holds that because a constitution is law, and judges are distinctively associated with interpreting law, it is their privileged duty to give meaning to the constitution.

Finally, some argue that, especially in systems of governance based on the separation of powers, judicial supremacy is necessary to protect the independence of jurists. Without supremacy, courts would be institutionally impotent, possessing insufficient tools to promote their special functions and to check the other branches of government.

A number of other factors account for countries' acceptance of this enormous power in the judiciary. In some cases, nonjudicial officials use courts' status as supreme constitutional interpreters to help enact legal change. If a governing coalition can get the support of judges protected by judicial supremacy, they gain a decisive ally in efforts to chart a new policy path. Keith Whittington (2009) has shown how presidents often will entrench or expand judicial power (including interpretive supremacy) to develop their own policy and partisan goals, or to navigate uncertain political and electoral waters. Judicial supremacy also can be an invaluable tool "both as a means of avoiding political responsibility for making tough decisions

and as a means of pursuing controversial policy goals" that could not otherwise be advanced through normal legislative or electoral politics (Graber, 1993, 37). In sustaining judicial supremacy, legislators and executives can attempt to hand off and escape accountability for some divisive, volatile issues.

CRITICISMS

Judicial supremacy has been challenged as being an inaccurate description of public life and an undesirable political arrangement. As both a matter of prescribed law and effective political practice, courts do not construe the meaning of a constitution in every aspect of public affairs, or on every question. As Walter Murphy puts it, "in no constitutional democracy does any single institution have either a monopoly on constitutional interpretation or a guarantee of interpretive supremacy" (2007, 469). Instead, to varying degrees (and with more and less formal acknowledgement of the arrangement) many nations embrace some version of what is often called *departmentalism* or *coordinate construction*, in which the power to interpret the national constitution is shared among governing institutions. In the American context, for example, the judiciary has been quite reluctant to weigh in on the parameters of constitutional war powers or the impeachment process, leaving these (and many other) subjects to be constructed by nonjudicial officials.

Moreover, a number of scholars and politicians have suggested that judicial supremacy dangerously wrests responsibility for defining and protecting supreme law from the people and their representatives. In a number of nations, including the United States, nonjudicial officials take oaths to support and protect their constitutions, and arguably, this signals an independent and equal commitment by these individuals to understand and articulate constitutional meaning.

Judicial supremacy might also give too much power to judges, who are traditionally removed from the direct control of popular forces and are fallible in their legal judgments and assessments of public policies. Moreover, research suggests that courts are not always effective in actually promoting their supposedly signature functions, such as protecting individual liberties or inducing stability in the overall political system. In view of these objections to judicial supremacy, recognizing the authority of other branches of government, and even the people themselves, to engage in their own, "coordinate" forms of constitutional analysis could perhaps better support the values embedded in a nation's highest law.

Judicial Systems, Comparative

The fundamental purpose for judicial systems or the court systems is to provide an institutional mechanism for the resolution of disputes. While the specific characteristics of judicial institutions vary across countries, they all operate to ensure that a neutral party (i.e., the individual judge or group of judges) exists to resolve conflicts between separate parties. As Martin Shapiro (1981) observes, courts serve as the lynchpin in a triadic system of conflict resolution—where two parties experience a dispute and rely on a neutral third party to resolve the dispute. To better understand how courts fulfill their conflict resolution responsibilities, this entry provides information on the composition and organization of judicial systems around the world. It focuses specifically on the legal structures of courts, the role of judges and attorneys during court proceedings, and the relation of the judiciary to other branches of government.

LEGAL STRUCTURES OF COURTS

When deciding how to organize their judicial systems, countries initially must address two important questions. The first question involves the legal foundation of the judicial system. What types of law will be emphasized or even permitted in judicial proceedings? In civil-law systems, emphasis is placed on statutory laws and specific legal codes that typically codify elements of customary law. Of note, civil-law systems are the most prevalent law system worldwide, found typically in continental Europe and the former colonies of those countries, including all of South America minus Guyana, the Caribbean, most of Africa, and most of Asia and Southeast Asia. Consequently, in civil-law systems, a tremendous amount of legal deference is afforded to legislatures and parliaments, with courts playing a more subservient role in the development of law.

In common-law systems, which are primarily associated with the United Kingdom and the United States, emphasis is placed not just on legislative statutes, but also on judge-made law. Common-law countries allow for rulings from relevant past judicial decisions, called *precedent*, to determine the proper outcome of contemporary disputes. Common-law systems are additionally found in Australia, Canada, India, and parts of Africa including Kenya, Tanzania, Zambia, and Zimbabwe. Arguably, the introduction of judge-made law presents these courts with additional avenues to have a substantial influence on broader policies. Some countries, primarily found in the Middle East, also have adopted a system of law based on sharia, or Islamic law. In these countries, the legal foundations of the judicial system are derived from the Quran (or Koran), and courts apply religious principles to resolve disputes.

The second question to be considered when establishing a judicial system that countries must address is whether their judicial systems involve the jurisdiction of specific courts. The term *jurisdiction* refers to the authority vested in courts to resolve certain disputes. Some countries, such as the United States, provide their courts with general jurisdiction—the authority to hear any and all legal disputes. Other countries, such as France, have a set of courts with general jurisdiction to resolve the majority of disputes, but also rely on a special *constitutional court* derived from the Kelsenian court model to resolve more important conflicts related to constitutional provisions or protections. Essentially, the constitutional courts in this model do not address specific complaints involving the rights of individual citizens, but rather they rule on the constitutionality of the acts of public powers, seeking to protect the constitutional order.

THE ROLE OF JUDGES AND ATTORNEYS

The role of judges and attorneys differs dramatically—especially during trials—depending on whether the country employs an adversarial or inquisitorial system. Countries using the former system pit one litigant directly against the other as adversaries to resolve disputes. In these adversarial systems, the attorneys for each litigant actively argue their clients' positions both in terms of the evidence introduced to the court and the legal arguments developed. Thus, each litigant's attorney tries to prove a particular set of facts, circumstances, and law while simultaneously trying to discredit the opponent's version. Given the active nature of the attorneys, the role of the judge in adversarial systems is somewhat more passive. Judges remain the neutral arbiter, interjecting themselves into the court proceedings only to rule on matters of procedure. In this way, the judge acts as a referee over the attorneys, ensuring they follow the proper rules of litigation.

In countries employing an inquisitorial system, judges possess a more active role and work with attorneys to uncover what actually happened. Rather than rely on attorneys to provide evidence and legal arguments as opponents, inquisitorial systems allow the judges to assume more control over court proceedings. They can call on court-appointed experts to provide neutral testimony, instead of relying on attorneys to call their own experts, who may provide testimony favorable to only the attorney's litigant. Additionally, judges routinely ask questions of attorneys and litigants directly, in order to clarify legal or evidentiary aspects. Consequently, the role of the judge in these countries is more assertive than what is observed in adversarial systems, where the role of the attorney is more active.

THE RELATION OF THE JUDICIARY TO OTHER BRANCHES OF GOVERNMENT

The ability of courts to serve effectively as the lynchpins in the conflict resolution process also depends on their relationship to the other branches of government. In particular, effective judicial systems must possess suitable levels of independence and legitimacy, especially when their decisions affect other governmental institutions and powers. At a fundamental level, judicial independence is necessary to ensure the decision-making process of courts and judges is not influenced or biased by external considerations for a more detailed discussion of judicial independence. Many countries provide specific provisions for judicial independence in their constitutions, while simultaneously giving courts the authority to nullify statutes or actions of governmental institutions by claiming them to be unconstitutional. This latter authority is called judicial review.

For other branches of government to comply with court decisions—especially those decisions that declare governmental actions or statutes unconstitutional—courts must also enjoy suitable levels of legitimacy. This concept refers to the *reservoir of good will* developed by the judiciary among the other branches of government and also among the general populace of the country. Courts with higher levels of legitimacy can expect and receive widespread compliance with their decisions, even rulings that are unpopular. Courts with low levels of legitimacy must tread carefully as they resolve controversial disputes. Further, court systems with the ability to uphold and defend their own interpretation of the law and rulings on constitutionality or judicial review are more commonly associated with democratic regimes and less likely to be as effective in socialist, totalitarian, or theocratic systems.

Judiciary

The judiciary refers to the courts or institutions that administer the law on behalf of the state or the sovereign. It also refers collectively to the judges, magistrates, and other personnel who function in courts and resolve disputes under law or legal principles. The judiciary's role in government and the process by which judges decide disputes vary among countries and over time.

LEGAL SYSTEMS

The role of judges is shaped in part by the legal system in which they operate. Comparative legal scholars have identified several different families or systems of law: the Anglo-American systems of common law; the Roman-inspired French, Germanic, and Scandinavian civil-law systems; socialist legal systems; Chinese or Far Eastern systems of law; and Hindu or Islamic religiously based families of law. Most research in political science examines the role of judges in common-law or civil-law legal systems.

Common-law systems date back as early as eleventh century England and are today found in most nations that trace their legal heritage to Britain. Such systems formally recognize the creative, policy-making role of judges. Judicial decisions are a source of law alongside government regulations, statutes, and constitutional provisions. In cases of government regulations, if a judge finds no authoritative statement of the law, they can "make" law by enunciating a new rule, principle, or legal interpretation that allows them to resolve the dispute at hand but is also applicable to future cases by creating a precedent, the body of which is called *common law.* In common-law systems, precedent binds future decisions under the doctrine of *stare decisis,* a Latin term meaning "standing by things once decided." Precedent has vertical and horizontal dimensions. Vertical precedent holds that decisions of higher courts are binding on lower courts, while horizontal precedent holds that a court's interpretation of the law should be consistently applied by the same court in future cases. Common-law systems thus recognize the creative, lawmaking role of judges while also ensuring uniformity and stability in the law through the doctrine of *stare decisis.*

In civil-law legal systems, judges interpret law but are in theory prohibited from creating law. Courts are not empowered to issue rulings more general than the case being judged, and only legislative enactments (rather than judicial precedents) are legally binding. Civil-law systems have their origin in Roman law and Emperor Justinian's Corpus Juris Civilis issued in the sixth century. In later centuries, continental legal scholars adopted a similar approach and developed extensive legal codes, the most well-known being the Napoleonic Code. Within these systems, it was believed that because the law was written very specifically, there was no need for judicial interpretation. Judges base their decisions on the provisions of codes or statutes from which solutions in particular cases must be derived. Civil-law systems do not recognize the doctrine of *stare decisis* but rather the concept of *jurisprudence constante*

The justices of the International Court of Justice preside over issues that go beyond national boundaries, whereas many national and local judiciaries perform constitutional review independently of the executive.

that requires judges to rule in a predictable and nondiscretionary way. Judges in socialist legal traditions also are expected to strictly apply legislative codes but legal interpretation is explicitly recognized as part of the political process and judges are not considered independent interpreters of the law. In the People's Republic of China, for example, the final authority over the interpretation of the law is the National People's Congress rather than judges.

In practice, civil-law judges are often just as creative as common-law judges. When applying textual provisions of a code, civil-law judges must often look to underlying rationales in the structure or purpose of the code to resolve disputes. The culture and behavior of judges in civil and common-law systems nevertheless differ considerably. Civil-law judges are more constrained in interpreting statutes and more reticent to look to principles beyond legal texts. Judicial opinions in common-law systems also tend to be longer and contain elaborate reasoning, whereas opinions in civil-law countries are short and formal in nature, as judges are apt to cite only legislation but not prior case law.

Legal academic scholarship about judges and the role of the judiciary tends to be prescriptive, focusing on normative theories of jurisprudence and the development of legal doctrines. Although not without a normative component, political science scholarship tends to be empirically inclined, focusing on how judges actually behave and on the social and political impact of judicial decisions. Political science scholarship has covered a broad range of issues and topics but three strands of research are central to the field: judicial independence, judicial policy-making, and judicial decision-making.

JUDICIAL INDEPENDENCE

An independent judiciary is critical to democracy but the degree to which the judiciary is conceptually and functionally independent of other branches of government varies. In parliamentary democracies that fuse different governmental functions in a single institution, the judicial function is often conceptualized as part of the executive. Judges and government ministers both apply laws made by parliament; while ministers apply the law through general policies or

regulations, judges apply it in particular cases between individual litigants. In these countries there is less concern about judicial separation and more emphasis on the idea of judicial impartiality. In Great Britain, for example, the Law Lords is the highest court in the land and a part of Parliament. By contrast, countries that embrace a stricter separation of powers tend to emphasize the idea of separateness as well as judicial impartiality. In these systems judges are usually conceptualized as performing a distinct function of government and are barred from simultaneous service in other branches. In the United States, for example, federal judges are barred from membership or service in the executive or legislative branches; the only exception is the chief justice's role in presiding over presidential impeachment trials in the Senate.

The relationship between the judiciary and other branches of government is also influenced by differences in the legal system. In some common-law countries, the judiciary is expected to balance or check the power of other branches of government. By contrast in many civil-law systems, such as France, the purpose of separating powers was to assign specialized roles to legislation and judging. Formal recognition of the policy-making role of judges also leads many common-law countries to provide some form of direct democratic control over the appointment of judges. Federal judges in the United States are nominated by the president and confirmed by the Senate, and in many American states judges are directly elected. In British Commonwealth countries such as Australia, Canada, and England, judges are often selected by the elected executive (though usually assisted by selection commissions). By contrast, in civil-law systems judicial selection usually is removed from direct political influence. The bench usually is appointed in the same fashion as other parts of the administrative bureaucracy. In France, for example, there is a specialized graduate school for judges; in Japan judges are selected by the court-administered Legal Training Research Institute.

Scholars have adopted various approaches to analyze judicial independence. A large body of research examines the formal institutional structures that tie courts to the elected branches. In addition to differences in the way judges are selected, provisions for judicial tenure also differ. In many civil-law systems, judges are considered professional civil servants and spend their entire careers on the bench, although their tenure on any one court may be limited. In common-law systems, judges are sometimes given life tenure as a means of securing their independence, although in many jurisdictions judges are elected or appointed to fixed terms of office. Studies indicate that the mode of selection and the provisions for tenure have important consequences for the way judges behave and their independence from other branches or elected elites. In a classic 1957 study of the U.S. Supreme Court for example, Robert Dahl found that the political process of appointing justices ensured that the court acted in line with the party coalition that controlled the national government. Similarly, studies of state judiciaries have found that judges who stand for periodic election are more likely to behave in ways that reflect public opinion and popular attitudes than those with

life tenure. Other institutional mechanisms that political scientists have studied as affecting judicial independence include provisions for removal and discipline of judges, control over judicial administration and budgets, and the formal powers granted to courts and judges by the constitution.

Rather than focusing on specific institutional arrangements, some scholars studying judicial independence have analyzed whether judges can act without political manipulation or examined strategic interactions between courts and other branches. This latter approach assumes that political elites foster or thwart judicial independence to advance their political goals. Judicial independence is fluid rather than fixed and waxes or wanes depending on the interests of other political elites. A 2003 study by Tom Ginsburg comparing the judicial role in Asian democracies found that political elites were more likely to foster an independent judiciary in countries with multiparty electoral competition than in countries dominated by a single party because judicial independence provides a form of "insurance" to prospective electoral losers. Other scholars have employed formal theory or game-theoretic approaches to explain why elected elites might foster judicial independence as a way of gaining important informational advantages not otherwise available to them.

JUDICIAL POLICY MAKING

A second major research focus in political science is the scope and impact of judicial policy making. The power of judges to make policy depends on several factors. For example, common-law judges are generally more active policy makers than civil-law judges, and appellate courts are more powerful than trial courts. The most salient feature of a court's ability to make policy is the power of constitutional review: the authority to examine the actions of the legislative or executive arms of the government and determine whether such actions are consistent with the country's constitution.

Elements of constitutional review date back to as early as the Holy Roman Empire in the twelfth century, where judicial-type bodies were empowered to deal with jurisdictional disputes between rulers. Nascent forms of constitutional review later emerged in France in the thirteenth century and in Portugal under Philip's Code in the seventeenth century. The modern concept of judicial review however emerged in the early nineteenth century as a distinctively American institution. Chief Justice John Marshall's famous opinion in *Marbury v. Madison* in 1803 is generally credited with establishing judicial review in the United States (although there is some dispute among contemporary scholars about its importance). Today more than 150 countries around the world have empowered courts to exercise some form of constitutional review.

Judicial constitutional review takes several forms. In some countries such as Canada or the United States, constitutional review can only be exercised in concrete cases or controversies and only *a posteriori* or after the fact. Laws or government actions can be held unconstitutional only when they have already occurred and only when they involve a specific dispute

between separate litigants. By contrast, in other countries, such as France, judicial review takes place in the abstract and only before the law or government action occurs. In principle review is advisory, prospective, and usually abstract or in reference to a general constitutional question rather than particular parties. In countries such as Germany or South Korea, courts can exercise judicial review only after a law has taken effect, though they can do so either in the abstract or in concrete cases.

Systems of judicial review also differ in either concentrating or diffusing the power. Approximately one-third of countries allowing judicial review follow the American model wherein the power is diffused throughout the judicial system and can be exercised by ordinary courts (e.g., Canada, Japan, and the United States). Another third follow the Austrian or continental model, wherein review is handled only by specialized constitutional courts or special chambers of high courts (e.g., France, Germany, and New Zealand). The countries have some form of mixed system that combines elements of concentrated and diffused review, such as allowing only specialized courts to decide claims of unconstitutionality but allowing other courts to decline to apply laws deemed unconstitutional (e.g., Brazil, Portugal, and Taiwan).

Legal academic scholarship has focused largely on what law professor Alexander Bickel called the *countermajoritarian difficulty,* or the normative problem of reconciling judicial review with democratic theory. Political science scholarship has generally focused instead on the empirical conditions that give rise to judicial review and the substantive interests that it advances. For example, a large body of empirical scholarship has demonstrated that far from protecting disempowered minorities, judicial review often serves to entrench or advance the interests of political and economic elites. Other studies have demonstrated that judicial review can effect policy change only when it is supported and implemented by other powerful political actors.

JUDICIAL DECISION MAKING

One of the most sophisticated strands of political science research examines judicial decision making. In contrast to legal academic scholarship, which characterizes judicial decisions as driven by legal doctrines, political science has focused on the political and social forces that influence judicial choice. This body of literature has examined various extralegal influences on judges, including intracourt relations, management of workloads, career advancement, or the role of personal characteristics such as race, sex, and religion. Until recently most research on decision making focused on the U.S. Supreme Court and adopted behavioralist approaches. Indeed C. Herman Pritchett is generally credited with pioneering the field in his seminal 1948 work *The Roosevelt Court.* By examining individual voting patterns, Pritchett demonstrated that justices on the court voted in blocs, with some consistently voting in a liberal direction and others voting in a conservative direction. The systematic voting patterns led him to argue the justices based their decisions on ideological or political policy preferences rather than the law. Later scholars applied

the techniques of dimensional analysis to develop increasingly sophisticated measures of judicial ideology. Political scientists Jeffrey Segal and Harold Spaeth distilled the insights of this line of empirical research in their major 1993 work *The Supreme Court and the Attitudinal Model.* While the attitudinal model is specifically tailored to the unique institutional features of the U.S. Supreme Court (and is not readily transferable to study of other courts such as trial courts bound by appellate decisions or courts that do not permit separate votes or opinions), its key insight of modeling decision making as a function of individual judicial policy preferences has been extended to research of decision making on many other courts and by judges in many other countries.

Rather than focus narrowly on individual attitudes, recent scholarship has examined the role of institutions in structuring judicial choice. One line of this research builds on Walter Murphy's 1964 classic study, *The Elements of Judicial Strategy,* which posits that judges are motivated to maximize individual policy preference but recognizes that they must act strategically with other judges and other political actors to achieve their goals. Often employing formal or game-theoretic modeling, researchers adopting this approach have examined both exogenous institutional constraints on judicial choice, such as the relative power of other branches or the relative dependence of a court on other courts, as well as endogenous constraints on choice, such as the institutional rules, procedures, and norms internal to a court.

A different line of institutionally focused research on decision making adopts historical and interpretive analysis. It seeks to demonstrate how judicial preferences are not only constrained but also constituted by institutional norms and structures. Rather than reflecting policy preferences, judicial decisions are viewed as the product of institutionalized norms and perspectives that are distinctive to courts and the judiciary. Rather than separating legal and political attitudes in the judicial mind, this research connects the two, demonstrating how judicial beliefs about the law are shaped by political and social forces over time. This scholarship shares an affinity with previous political science scholarship that was often labeled *political jurisprudence.* It too sought to analyze judicial decisions in light of how broader political and social changes influenced legal doctrines and institutions. The key distinction is the extent to which the later research adopts a more rigorous and self-conscious methodology grounded in new institutionalist theories of political change.

Other approaches to judicial decision making have included psychological analyses that demonstrate that judges seek approval from audiences such as policy elites, law faculty, the public, and the media, or that judges seek to legitimize their policy choices to implementing populations by appealing to legal norms. Like other areas of judicial behavior research, studies of decision making are methodologically diverse and theoretically rich.

Jurisprudence and Legal Theory

Jurisprudence is the study of law in its broadest forms. Historically, jurisprudence has been concerned with the answer of two questions—one descriptive, one normative: What is law and what is justice (or to what ends should law be put)?

Answers to these questions in different times and different nations have come not only from legislators, judges, and lawyers practicing law but also from scholars who have inquired about the nature of law and observed law in practice. *Jurisprudence* has been invoked in many ways, sometimes focused on what law is, under the rubric of legal science, legal theory, or legal analysis, and sometimes focused on what law should be under the philosophical frameworks of natural law, utilitarianism, law and economics, pragmatism, critical legal scholarship, or race and gender critical studies.

ANCIENT AND CLASSICAL LEGAL SYSTEMS

Archeology and anthropology describe social organizations in prehistoric societies, which had systems like law. Some scholars suggest that any continuous social organization may be called law if it creates norms, and therefore one can think about law as an element of the most essential social organization. Jurisprudence usually examines laws from a broad array of materials, describing the law and its operation in social contexts.

The earliest records of systems of law come from Sumerian records of legal transactions, which were later codified in the Babylonian Code of Hammurabi, probably written around 2050 BCE. The Code of Hammurabi is very detailed, listing a variety of things that people ought to do and ought not to do and a variety of punishments for those who would fail in their duties. The law was pronounced in written rules made public in the name of the king who pronounced laws justified by a special relationship with their god. The rules say that they bind every person, and the rules are very specific in their requirements and their punishments.

Not all ancient legal systems were based on exact rules and punishments. Ancient Egyptians developed a religious law that was followed in life and measured at death, when the gods would balance one's sins against one's virtues. This practice introduced the principle of measurement governing a variety of prohibitions and expectations.

In both the Babylonian and Egyptian examples, certain aspects of the rules and of principles were applied during the life of individuals and as means of religious judgment. In those records we see different approaches, an emphasis in Babylon for rules with specific punishments and an emphasis in Egypt for principles with balanced punishments applied case by case. These approaches correspond with the use in Babylon of written laws to judge conduct that follows the writing and in Egypt with judgment following conduct. Legal systems reflecting by these approaches include the Jewish law apparent in the Tanakh and the Mishnah, in which judgment sometimes follows unrighteous conduct, yet written laws are still very specific. In all of these instances, there is a very strong relationship between the law, the religion, the state, the society, and the expectation of individual conduct within these contexts.

The first sustained effort to understand the nature of law apart from its statements by lawgivers and applications by priests or officials came with the zenith of Greek philosophy,

particularly around the time of Socrates, Plato, and then Aristotle. Plato's writings depict Socrates's arguments and Plato's own views in a sustained description of what the law is as well as what the best systems and rules of law must be. These philosophers considered democracy an unreliable basis for law, believing that democracy would fail and be replaced by the rule of a mob or of a tyrant. Plato thought the law must require people to live the best life according to their talents and stations. This view, with less emphasis on the need for philosopher kings, was developed with great precision by Aristotle.

Aristotle argued that lawmakers should follow the laws themselves and that this was more important than whether the laws are made by a single king, a small group of counselors, or the people as a whole. This principle is now recognizable as the rule of law. Aristotle developed the Socratic idea that the purpose of laws was to encourage each person to live the best possible life. This was to be done through the pursuit by law of the common good as well as pursuit of the individual virtues in each person's life, which in turn should be encouraged by laws. Aristotle's sophisticated analysis of law describes the ideal system of laws and organization of the state according to law, basing his understanding of law on a broader understanding of morality, an approach later taken as the basis for much of natural law.

Greek legal practice was manifest in the laws of Draco, Solon, and later the Athenian assembly, which together yield a considerable commercial and dispute-driven system of legal arbitration, including arbitration between states. In general, law in Ancient Greece relied on a system of principles and rules, such as the requirement of keeping a contract or treaty, which were applied by neutral arbitrators.

ROMAN LAW

Roman law organized the personal, social, commercial, state, and military relationships of the early Roman state and republic, as well as the vast Roman Empire. Manifest in the historical record is the influence of rules and of principles, and in the application of them the organization of the state; of private relationships in contracts; and of private noncontractual duties. Moreover, we see in Roman law the origins of complex institutions for hearing legal disputes and the rise of specialization and the professionalization of roles for those with legal expertise. Over time the Romans developed a complex legal machinery with a variety of judicial offices to hear disputes, as well as separate legal systems of rules to adjudicate questions rising between Roman citizens and between Roman citizens and noncitizens. Later, more sophisticated courts advised on special questions dealing with problems of state and problems of law themselves. Imperial Roman law was created through legislation enacted by the Roman senate, decrees promulgated by the emperors, and the decisions of law judges, particularly the judices, who were especially knowledgeable in the law.

Toward the end of the Roman Empire, some jurists had become especially acknowledged for their knowledge and wisdom, particularly Ulpian, Gaius and Tribonian, whose work in particular was the foundation for the great books organized under Emperor Justinian known still as the Corpus Juris, or the body of law. The summary of the corpus, the Institutes of Justinian, describes the entire imperial legal system and its rules of law for easy legal study. The Institutes organize the law into questions of justice and of law and describe specifically what is meant by *jurisprudentia*, which is the knowledge of both what is just according to the law of nature and what is required according to the specific rules of the civil law. The Romans firmly believed that the civil law reflected the natural law in a manner similar to that of the Greeks. The summary of this law includes not only its nature, which is to say that it is both written and unwritten, but also its fundamental principles—the most important of which are three: to live honestly, to hurt no one, and to give all persons their due.

Our understanding of Roman law and its philosophy is greatly enhanced by the writings of Cicero, the great lawyer of the republic, centuries before the writing of the Institutes. Cicero understood the law to be a tool for the regulation of private affairs and of public affairs, governing the actions of private citizens and of public officials. Particularly in his book on laws, he lays out a comprehensive argument for the importance of law in a manner that echoes Aristotle, in which the laws must be made fairly and applied fairly to both private and public parties. From Cicero and the institutional writers we see Roman law as a series of rules both written and unwritten and based on principles, particularly those that were believed to reflect the natural organization of human beings in society. Those governed by the state should have a more specific series of rules with more specific punishments, and those outside of the state should have access to the law and be treated under the law in a manner that was more principled and less governed by specifics and particulars of rules. There is a professional cadre of lawyers evident from Cicero's time forward, whose influence grows as the empire grows and whose judgments become essential to the creation of legislation and to the application of law in specific cases throughout the empire.

CANON LAW AND THE MEDIEVAL STATE

With the fourth century conversion of Roman Emperor Constantine I to Christianity, the church entered the protection of the later Roman Empire, and the principles and rules governing relationships within the Christian church became a more important source of law to both the states of Europe and to the individuals living there, regardless of their religion. Canon law became organized through the decrees of bishops and the statement of counsels, collected by monks and bishops and their staffs into treatises, or *decretals,* and summaries, or *summae.*

Canon law was organized very much in the light of the Roman legal tradition, moderated by the biblical text and the church fathers. Canon law therefore takes as its source the authority of the church in the revealed gospel, interpreted through ecclesiastical institutions such as the offices of the pope, various councils, and the decrees of church courts.

Canon law was particularly essential to understand relationships tied to church sacraments, and therefore it was especially important in the regulation of families. The greatest expositor of law in the canon tradition was Saint Thomas Aquinas. He grounded the laws of the state in a divine order, from which arises a natural order, within which states create law, and according to which the state-created law binds individuals.

With the fall of the Roman Empire and the development of independent principalities and states, the law within each state grew somewhat independently. Some laws evolved with little participation from state officials, most importantly the private commercial legal customs among international merchants. Still, law was promulgated by the civil officials of each state, increasingly regulating property and private lives and serving as the primary tool of social order.

The Middle Ages saw a considerable movement of ideas among the various states as both church lawyers and increasingly academic lawyers and professionals moved among states, either as a result of private travel or princely conquest and statecraft. Early English lawbooks, for instance, were very much in the French tradition of institutional writing reflecting both canon and civilian texts, the decrees of the kings and counselors, and the decisions of the king's justiciars. The great illustration of this is the thirteenth-century text of Bracton, which is very detailed in describing rules and principles governing private affairs but also treats the origins of laws and the rule of the king, particularly the famous adage that the king is under no man but God and the law.

LAW AND THE MODERN STATE

The rising authority of the kings and the waning influence of the pope gave rise in the fifteenth century to a new understanding of the power of kingship and its relationship to laws. This trend is manifest in the writings of Niccolò Machiavelli, a Florentine legal official whose descriptions of the powers of a prince were relatively unfettered by moral or religious obligation toward any purpose beyond the acquisition and maintenance of power. Even so, Machiavelli expected the prince to use laws as a tool of state and made clear the prince must respect the expectation of the people that those laws must be fair and just, and if the prince would rule them effectively the prince must manage their interests.

This more subtle understanding of a natural relationship between interest of the governed and the governors was a hallmark of the writings of law in Europe for the next several hundred years. Hugo Grotius, a Dutch legal scholar of the next generation, developed the idea of law as tied to the natural order, understood through reason rather than as a dictate of the divine. From this conception came a single powerful model for law based on a view of mankind that was both Aristotelian in its natural reason and very practical in its human observation.

These descriptions of law and state must be understood alongside the views of a growing cadre of professional lawyers, whose own understanding of the law was more technical but still framed as a view of what the law is as well as what it should be. Sir Edward Coke, a seventeenth-century jurist and parliamentarian, created a systematized foundation for law, requiring a careful and reasoned understanding of the rules of law developed by reason and reflected in legal materials, which could only be interpreted by learned counsel and skilled judges. Coke argued that the law could not be applied by the king but must be applied by professionals and could not be arbitrary. Laws had to be reasoned; rational law could not embrace principles or rules that did not reflect a form of underlying logic. Coke also argued strongly for a coherent organization of legal institutions with a common rule of law binding everyone within the kingdom. Though Coke was less concerned than classical thinkers with the promotion of virtues through law and more concerned for the regulation of property and commerce, the institutions of law as Coke described them were very similar to the institutions of law promoted by Aristotle and then by the Romans.

The idea of law evolved with conceptions of the state and its sovereignty, both of which changed with a series of challenges to royal authority, such as the English Civil War of the 1650s, the Peace of Westphalia of 1678, and the Glorious Revolution of 1688. The church had lost its powers over the princes of Europe, but the princes themselves were losing power to parliaments and a new bourgeoisie that displaced the previous feudal social and political order. A debate ensued over the sovereignty of the state, whether the power of the state was ultimately superior or was limited by anything at all.

This argument is illustrated in the tension between the writings of social contract thinkers like Thomas Hobbes and John Locke. Hobbes wrote of a king above the law created by a social compact by which the people alienated their natural-born freedoms in return for the safety of a legal order created by the king. Locke, opposing a similar argument by Robert Filmer, accepted that people had a natural freedom and that an arrangement like a contract existed, but that the rights of the people could never be fully surrendered, and the king could not be above the terms of the contract. Thus Locke argued the king must perform the contract to secure order with the least loss of that liberty required for order. So as Hobbes believed the law served the interests of the king as the king defined them, Locke saw the law as serving the interests of the people and their collective and individual good.

A view of the interests of the governed was emerging as essential to conceptions of the state and the law. Gottfried Leibniz argued that officials have the power of law in order to exercise the charity of the wise to use the law for the benefit of the people bound to it. Scots lawyer David Hume and economist Adam Smith, writing in the eighteenth century, analyzed law in the light of Hume's famous dictum that one must distinguish between what is and what ought to be to argue that the law must be built on a system of exact justice, public works, and public institutions.

These arguments were furthered in the fiery debates preceding and following the birth of the United States of America and the French Republic. Writers such as the Baron de Montesquieu, Jean-Jacques Rousseau, Alexander Hamilton, and James Madison wrote extensively about popular will and the

appropriate reasons for law, as well as the importance of institutions and essential values in making law, seeking an understanding of law justified by the will of the majority of the people as well as to balance that will through certain principles like rights, protected by institutions that divided state power.

UTILITARIANISM

The principle of proportionality in people's private affairs recurs in jurisprudence throughout history since the Babylonian and Hebrew injunction of an eye for an eye. It reached a high point in the writings of criminal law of eighteenth-century Italian Cesar Beccarra and particularly in the analysis of an Englishman living in France early in the 1800s, Jeremy Bentham. Bentham argued that the fundamental purpose of law was utility, or the promotion of the greatest happiness for the greatest number of people. This assessment of the law from a framework that does not depend on divine revelation or an arcane assessment of natural order, but rather on principles of utility that may be assessed by any observer was a profoundly democratizing move. From a utilitarian perspective the individual governed by the law is as competent to assess the law as is the lawmaker or the judge.

This type of redefinition of the potential answer to the question "what should be law" did not arise without also a change in the question of "what is law." It is unsurprising that such a transition would occur at roughly the same time as the principles of John Locke became manifest in the statements of Thomas Jefferson and others in the Declaration of Independence in the United States. Law, indeed, was moving from a source of rules created by the elite and managed by a profession to a source of rules in which the polity as a whole had a great stake.

LEGAL SCIENCE

The growth of professional legal philosophy and the increasingly public role of the judiciary spurred the growth in the nineteenth and twentieth centuries of attempts to study law more scientifically. One of the earliest of these attempts flowed from the notion that law is the command of the sovereign, an idea advanced by John Austin. Austin's analysis of the law gave rise to an understanding of the law as a formal system of rules that are carefully organized and reasonably related so as to achieve fundamental purposes. This perspective became known as the study of legal science (but is now commonly characterized by scholars as the era of legal formalism).

Legal science presumed to have the study of the law echo the study of scientific principles of the natural and practical sciences in the world. Under this approach certain enduring principles of the law were to be isolated and mapped with a taxonomy, rather like the taxonomy given by Linnaeus for biology. This understanding of the law would demonstrate an innerconnectedness of legal rules and principles, one that is illustrated with Sir Frederic Maitland's adage that the law is a seamless web, a pluck in one place disturbing the law throughout. Legal science recognized law as an artificial creation—in the same manner that inventions reflected the underlying physical and chemical nature of the universe. So too would the artificially constructed law reflect the underlying conditions of the natural world.

SOCIAL DARWINISM AND ITS SUCCESSORS

A related nineteenth-century legal movement influenced by science is misleadingly labeled *social Darwinism*. The fundamental idea of social Darwinism's view that people behave according to natural law is that populations of people, and particularly nations and races, compete for survival. This idea owes less to Charles Darwin than to Herbert Spencer, who coined the term *survival of the fittest,* and to their American apostles such as William Sumner, who saw law as a tool for social competition that must allow the strongest to survive unfettered by artificial weakness that would hamper the competition of great nations to reach powerful heights. This was the intellectual basis for the law of empire as well as commerce, environmental exploitation, and—above all—contract without regulation.

One outgrowth of this view was the rejection of institutional understandings of law as well as democratic justification, challenged by continental arguments like those of Rudolf von Jhering and François Geny, who argued that institutional law and natural law must reflect the native customs of the people the law represents. The fascist theories of Giovanni Gentili and Carl Schmitt directly rejected laws as a limit on the state, arguing that people and institutions must yield to a national leader whose decisions would be the law, and whose will would be the justification for law because it would manifest the national interest.

These views of law are important but contested in the United States in the twentieth century. Social Darwinist arguments were challenged by realism and progressivism, leading to the New Deal. And a new interest in the theories of natural law in procedure and in human or natural right followed World War II (1939–1945), once it became known that the German state and its skillful legal institutions had led to the Holocaust.

LEGAL REALISM

Legal realism challenged some of the fundamental propositions of legal science, particularly the notion that law was an inevitable product of certain essential or immutable fundamentals. In both Europe and the United States, an understanding of law as being rooted in the individual action by legal officials began to gain credence. In the United States, this view of the law was presaged by the writings and speeches of Justice Oliver Wendell Holmes Jr., who had once been a legal formalist but whose descriptions of law both as something to be studied and as something to be understood from the perspective of the bad man inspired a generation of legal philosophers that followed. Chief among these were Karl Llewellyn and Roscoe Pound, who along with judges such as Jerome Frank and Benjamin Cardozo developed a rich approach to the law that recognized the law as a system of obligations and rules, yet understood the necessity of seeing these rules as the product of individual choice made by legal

officials. Legal realism thus saw laws that favored the wealthy not as inevitable principles reflecting the natural order but as social choices made by officials from a ruling elite. Legal realism thus provided an intellectual framework that made changes in American law, particularly those of the New Deal of the 1930s, more plausible. Following World War II, legal realism prompted something of a reaction as scholars sought a clearer understanding of law as rules rather than merely the acts of officials, which seemed too arbitrary in its reliance on the preferences of judges in shaping the path of the law.

LEGAL POSITIVISM

The most recognized description of law in the twentieth century was that the law is best understood as a system of rules, both regulating the creation and management of law and regulating the individual actions of daily life. These rules, classified by H. L. A. Hart as secondary and primary rules, describe a mature legal system. According to Hart and other legal positivists, law is whatever is made as a law according to the rules of law. Thus what makes a statute a law is that it is adopted by the appropriate system of rules as ordained in a constitution or, as Hart described the fundamental rule for the origination of law, the fundamental rule of recognition. Positivism has led to a greater appreciation for law as a structure of rules, yet it also has prompted debate over whether rules alone sufficiently describe the law and whether rules can provide an understanding of justice.

MODERN NATURAL LAW

Challenges to positivism arose from normative perspectives on what law should be. Some have argued, such as Lon L. Fuller, that certain conditions are required in law or forbidden from law to be considered a valid law or the product of a valid legal system. Thus a legal system that attempted to enshrine laws that are impossible or laws that destroy the authority of the legal system cannot be considered law. Ronald Dworkin has argued that laws must rely upon moral norms to function; for instance, juries must rely upon moral understanding in order to apply or give meaning to rules. John Finnis has argued that certain continuing understandings of the good must inform our understanding and criticism of law.

LAW AND ECONOMICS

Building on the utilitarian tradition, the study of economics developed in the nineteenth century, initially describing human and economic activity, including the regulation of conduct, and then promoting certain practices on the basis of their ability to develop the wealth of society. In the early twentieth century, lawyers embraced economic models such as those of Nicholas Kaldor and John Hicks in order to measure the balance of harms from various industrial activities, as well as Pigou to determine the most valuable rules of contracts. In the late twentieth century, the pursuit of microeconomic efficiency in the law, particularly influenced by the Chicago school economists led to a riposte that the economic criticism of law had become a defense of wealth and corporate capital from state protections of the individual.

LEGAL PRAGMATISM

Justice Oliver Wendell Holmes Jr. argued for a view of law that was practical rather than theoretical, which reached decisions based on all of the legal sources, all of the facts, and was respectful of the popular will in legislation. This pragmatic view has been revived by Richard Posner, an American judge and legal scholar and earlier in his career a prominent proponent of the law and economics perspective, whose later jurisprudence has revived legal pragmatism as a rejection of the grand theorizing of legal formalism, legal positivism, or even the utilitarian strain of law and economics, in favor of a recognition that judges make legal decisions on the basis of facts and the weighing of consequences rather than interpretive theories or theories of justice. Moreover, jurists make their decisions and individually weigh expected consequences within a context shaped by psychological, career, and institutional factors. These factors may include ideology as it colors the perspective of individual jurists, but Posner argues that ideology is mitigated by a practical respect for the appearance of judicial modesty and an understanding of a decision's social context. Jurisprudence in this formulation is about applying the law to presented facts with recognition of the social context, the likely consequences, and the underlying political tensions within a given polity.

CRITICAL LEGAL STUDIES

Some contemporary legal scholars, inspired by the student radicalism of the 1960s and new means of literary and social criticism that examine the role of discourse in constructing how we perceive reality (made up of various strains of thought loosely referred to as critical theory), challenged the pervading understandings of what law is and should be. Legal scholars like Mark Kelman, Duncan Kennedy, Mark Tushnet, and Roberto Unger argued that the discourse of law and of justice enshrined in principles such as positivism and natural law (and later pragmatism) was so laden with the vices of power and the subjugation of people for social and economic reasons that there could be no legitimate authority in these approaches. Critical legal scholars argued that the law must be assessed through "mapping" its connections to centers of power and criticized through "trashing" by comparing the rhetoric of law (its claims to universality) to its practices and effects in fact (like creating and preserving hierarchies and in reifying social and political inequalities). Pointing to obvious failures of the law to provide security for the poor and dignity to all, critical scholarship declared the law and its institutions unredeemable because they promoted injustice rather than justice. Critical legal studies (CLS) adherents had a normative agenda. They sought to expose hierarchies of power and law's role in creating and preserving them in order to seek a more egalitarian basis for law—that is, a new definition of justice. Most criticism of this approach points out the difficulty of rebuilding a basis for law from an approach that undermines the legitimacy of discursive practices, including its own.

IDENTITY CRITICISM

Feminist legal theorists, critical race theorists, queer legal theorists, and others have argued that the law cannot be understood except from the viewpoint of a group or a member of a group that has been a victim of the law. Thus, critical race scholars argue that American law must be defined by the experience of those whose ancestors were slaves and who suffer continuing discrimination and economic disenfranchisement based on race. Feminists argue that the law cannot be understood unless it is seen as a male enterprise of gendered power that denigrates a feminine understanding of society and social values. Thus, rules making it difficult to prosecute claims of rape and systems of taxation favoring corporations over families would be seen in a different light from the traditional patriarchal or phallocentric perspective. Queer theory and others have argued similarly that the law must be seen from a lens of those who have been particularly villainized by law, such as homosexuals, "illegal" immigrants, or other marginalized groups stigmatized or ignored by the law. Together, these identity-centered approaches share a similarity with CLS in their desire to unmask the positivist and natural law schools' failure to recognize the contradictions in modern liberalism's universal claims for its conceptions of law and justice. Where they depart from CLS is in the emphasis on which inequalities are most reified by legal practices (that is, which contradictions are most glaring), and how legal liberalism's own rhetorical claims can be used to challenge these contradictions.

TWENTY-FIRST CENTURY LEGAL PHILOSOPHY

As the law changes and as social understanding changes, so does our understanding of the law. It is likely in the future that we shall see law from an increasingly global perspective, defining law by national institutions and by supranational behavior. We will judge the law from traditional models of national and parochial understanding of what good law is or bad law is, but we will judge the law from a variety of perspectives that include greater degrees of controversy as various religious and cultural conceptions of law are given greater weight in both international and local dialogue. The stakes for legal institutions will continue to rise as such debates seem to grant one group or another group power because their conception of justice becomes manifest in local law. Thus the future of law will be a future of controversy both in the consideration of what the law is and what the law should be.

The defining element of law may be institutional: law is a process managed by officials and a legal profession that is responsive to the popular cultures that it serves and that it must regulate. If this is true, then the law is best understood to be rules created and managed by officials within a professional culture. Though there are considerable arguments over what the law should be, it is likely to be some balance between the liberty of the individual and the required support of the common good, such as universal education, safe environment, and sound economy.

Justice and Injustice

The concepts of justice and injustice have been deployed for about two and a half millennia to evaluate human beings, human actions, and the consequences—discrete and aggregate—of human actions. Although the concept of justice has been developed into numerous and often conflicting conceptions, its applications have evolved considerably. A tendency to use the concept dichotomously has persisted throughout its history.

The English term *justice* derives from the Latin word *jus,* which comes in turn from a Sanskrit word meaning "to join" or "to bind." Cognate terms exist in a number of ancient languages. In the Hebrew Bible, *mishpat* is a legal term meaning what a judge should decide, while *tzedek* is an ethical term that refers to a righteous person, and *tzedakah* refers to the abstract quality of righteousness. The early Greek term is *diké,* meaning what is right and implying an idea of order or balance that must be restored when disturbed. A person who did what was right was called *dikaios.* When later Greek writers, including Plato, began to discuss justice as an abstract quality, they invented the term *dikaiosyné* to denote the quality displayed by a *dikaios.* The abstract concept of justice thus makes its appearance in the extant literature with the advent of terms like *tzedakah* and *dikaiosyné.*

As a political concept, justice involves agents (i.e., actors capable of intentional action) and circumstances that are susceptible to change through the actions of agents and have an impact on the benefits they enjoy, the harms they suffer, and the burdens they bear. Beyond these stipulations, the scope of the concept is a matter of controversy.

A widespread early concept of justice is embodied in the notion of *lex talionis,* which refers to the general rule that wrongdoers should be punished for their crimes by being made to suffer the same harm they have inflicted on their victims. The Hebrew Bible decrees that "thou shalt give life for life, eye for eye, tooth for tooth, hand for hand" (Ex. 21:23–24; cf. Dt. 19:21). According to the Roman Twelve Tables, when a man has committed a certain offense, he should suffer retribution like the crime he has committed. By the standards that prevail in "highly developed" societies in the twenty-first century, *lex talionis* may seem inhumane. However, historically it was probably an effective means of minimizing violence by limiting the severity of acts of retribution and asserting some degree of centralized control over them.

CONCEPTS OF JUSTICE

Most of the territory covered by the concept of justice can be mapped by explicating three major distinctions: between natural and conventional justice, between corrective and distributive justice, and between conservative and ideal justice.

Aristotle introduces the first two of these distinctions in his *Nicomachean Ethics,* and his discussion, though far from definitive, has been highly influential. Natural justice, according to Aristotle, is strictly objective and noncontingent; what is just by nature is so, whether or not human beings recognize or accept it as such. In contrast, what is just by convention is so as a result of contingent human agreement or decree. Conventional justice, then, is subject to change by human artifice; natural justice is not. Natural justice also establishes boundaries for the range of possible institutions, practices, and rules that can be established as just by convention. No human agreement or decree can ever make a practice just if it is unjust by nature. This distinction underpins traditions of thinking about natural law and natural rights that have played a formative role in political and legal thinking over the past millennium and that remain vital in some quarters.

Aristotle also distinguishes between distributive and corrective justice. According to his account, the notion of distributive justice applies to "the distribution of honors, of material goods, or of anything else that can be divided" among the members of a group, such as a political association (1962, 1130b). In contrast, corrective justice applies to private transactions, which Aristotle divides into the voluntary and the involuntary. Voluntary transactions arise from private agreements such as those embodied in contractual exchanges. Corrective justice in relation to these transactions is called for when promises are broken or contracts are breached. The involuntary transactions that raise issues of corrective justice are wrongs inflicted unilaterally by one person upon another, such as theft, assault, and defamation. Most if not all of these "transactions" would be classified as crimes or torts in most modern legal systems. In both kinds of cases, the purpose of corrective justice is to restore a relationship between equal parties when one of them has disrupted it by committing a wrong. The restoration is achieved by inflicting a loss on the offender and, whenever possible, either restoring the status quo ante or supplying some compensation for the victim. The fundamentals of this notion of corrective justice persist.

It is also useful to distinguish—following nineteenth-century utilitarian philosopher Henry Sidgwick—between conservative and ideal justice. Conservative justice upholds established rights and entitlements, whatever these happen to be, regardless of whether they are established through criminal laws, tort law, contract law, or institutions designed to give effect to a conception of distributive justice (such as tax codes or laws regarding the inheritance of property). The notion of ideal justice, in contrast, is intended to serve as a critical standard that might be used to guide reform of established rights and entitlements.

Sidgwick's notion of conservative justice is roughly equivalent to Aristotle's idea of justice by convention. While the notions of ideal justice and natural justice overlap, however, they are not identical. The idea of natural justice presupposes that at least some things are endowed by nature with moral significance; the notion of ideal justice does not. Further, while the idea of natural justice establishes boundaries that restrict the range of justifiable human practices, it does not, as usually conceived, provide a basis for thoroughgoing assessments and possible reforms of existing institutions, practices, and rules in the way that ideal justice often does. It is plausible to think of the idea of natural justice as a particular, limited theory of ideal justice, and of the latter idea as a modern generalization and extension of the former. The distinction between distributive and corrective justice stands in a roughly orthogonal relationship to both these other great distinctions.

The most widely accepted general definition of justice is expressed in the Latin phrase *suum cuique tribuere,* "rendering to each person his due," found in the *Digest* of Roman law and in earlier writings by Cicero (the same idea is expressed in the opening arguments of Plato's *The Republic*). Of course, this formula is mute about questions concerning precisely what things are due to which people.

CONTENT OF JUSTICE

The substantive content of justice—of claims about what is due to whom—is hotly contested. The principal alternatives are separated by two major fault lines. The first has to do with the relationship between distributive justice and corrective justice. According to one family of views, corrective justice either comprises the whole of justice so that the notion of distributive justice is meaningless or inconsequential (philosophers Cicero, David Hume, and Friedrich Hayek share this view), or the notion of distributive justice is essentially reduced to that of corrective justice (philosopher Robert Nozick). According to a rival family, distributive justice comes before corrective justice either in the sense that the principles of corrective justice are derived from those of distributive justice or in the sense that corrective justice is fully applicable only to situations in which at least a modicum of distributive justice has been realized.

A second major fault line divides proponents of distributive justice from one another. One view is that the primary or sole basis on which goods should be distributed is desert or merit. According to proponents of this view, some people should, as a matter of justice, receive greater shares of certain goods than others because they deserve them. According to an alternative view, the primary basis on which goods should be distributed is need. This view leads to a presumption that goods should be distributed equally to all people—or to all members of a political association—unless differences in individuals' needs justify inequalities or there is another compelling reason to accept inequalities.

The notion that corrective justice comprises the whole of justice has a distinguished pedigree in the political thought of Europe and its extensions, with Roman thinker Cicero standing as one of its principal progenitors. Cicero's argument for this view rests on a sharp distinction between justice and beneficence. Justice is violated, he claimed, only when people inflict actual harm on one another. By contrast, failures of beneficence merely deprive people of a possible benefit rather than of something that is their due.

Cicero's argument is probably the most influential defense of the view that corrective justice should be understood to comprise the whole of justice. Yet neither Cicero nor anyone else has ever made a compelling case for the corollary claim that existing distributions of holdings of property and other goods should be exempt from critical scrutiny on grounds of justice. An argument for this view can be reconstructed from the writings of David Hume, who suggests that human beings are so competitive, egoistic, and unsociable by nature that it is far more important for people to respect established entitlements than it is for those entitlements to conform to any particular principle of distributive justice. Even if this claim is correct, however, Hume's conclusion that distributive justice has no role to play in our conception of justice as a whole does not follow from it. Indeed, Hume's particular arguments against notions of distributive justice are vitiated by the fact that he considers (and rejects) only two alternatives to the maintenance of the status quo of his time, namely,

the abolition of all private property and the thorough equalization of all property holdings. Most proponents of distributive justice argue for neither.

Most prominent advocates of the idea of distributive justice hold that it theoretically precedes corrective justice. The basic idea of corrective justice is to redress an imbalance caused by a violation of an existing rule of justice by inflicting punishment in some form on the violator, restoring the status quo ante, or supplying compensation to approximate a restoration. This idea makes sense only if the status quo ante is just, or at least not grievously unjust because it would be perverse to invoke corrective justice to restore a status quo ante that cannot be defended on grounds of justice.

One could argue, as Friedrich Hayek does, that it makes little sense to apply the concepts of justice and injustice to a social or distributive order as a whole. Hayek would like us to regard the distributive consequences of social institutions as if they were facts of nature altogether beyond the scope of human control. He suggests, at times, that human beings do not possess the collective capacity to shape distributions of entitlements on a societywide scale; at other times he asserts that we possess this capacity, but the costs of exercising it would be unacceptably high.

Hayek believes that the capacity of human beings collectively to shape their societies in accordance with common purposes is far more limited than some eighteenth-century Enlightenment and later enthusiasts have believed. We shape our social institutions and their consequences through fits and starts, by trial and error, often taking one step—or more than one step—backward for every two steps forward. It is not true, however, that we possess no capacity to predict the consequences of our institutions and to adjust them accordingly. Modern representative democracy stands as a monumental, if flawed, testament to the effective human capacity for invention. So do modern market systems, which only a century or so ago helped make it possible for societies in which they had taken hold to eliminate from within their borders the dire poverty that was long regarded as a fact of nature.

CONCEPTS OF DISTRIBUTIVE JUSTICE

Although the idea of distributive justice is certainly defensible and arguably presupposed by any persuasive theory of corrective justice, the proponents of distributive justice are deeply divided between two alternative conceptions.

Historically, the dominant conception of distributive justice is that the primary basis on which goods should be distributed is desert or merit. Aristotle argues that distributive justice is proportional—that is, that goods (honors, wealth, and the like) should, as a matter of justice, be distributed among persons in proportion to their deserts. Indeed, he asserts that this claim is uncontroversial, though he concedes that people disagree about the basis of desert. This view appears to have gone nearly unchallenged among political philosophers for some two millennia; Henri de Saint-Simon reasserted it in the nineteenth century, albeit with an entirely different conception of the basis of desert from Aristotle's.

Advocates of ideal distributive justice on the basis of desert typically, and perhaps necessarily, view desert as a "natural" or prepolitical moral notion, because the point of such a conception is to constitute a standard that can be used to criticize existing institutions and to guide reforms. Suppose desert were purely an artifact of existing institutions and practices. In that case, while the members of a given society could deploy their notion of desert for piecemeal criticism of particular practices or institutions that fail to live up to the standards embodied in that notion, they could not invoke their notion of desert as a standard to judge institutions or practices as a whole because to do so would be viciously circular. However, it does not seem possible to sustain the view that desert is prepolitical. A society that is constantly concerned about defending itself from attack, for example, is likely to hold the characteristics typical of successful warriors in high esteem and to regard them as highly deserving, whereas a society that thrives on the production and dissemination of knowledge is likely to regard intellectual virtues as more worthy of rewards. The qualities that are grounds of desert seem to be, at least to a significant degree, products rather than presuppositions of institutional arrangements.

The principal alternative conception of distributive justice is that it is based primarily on need. In the 1790s, both philosopher Johan Gottlieb Fichte and political journalist "Gracchus" Babeuf argued that states should, as a matter of right or justice, redistribute wealth from the wealthy to the poor, so all citizens could have an agreeable life. In 1839, politician and historian Louis Blanc formulated the principle, "from each according to his ability, to each according to his need." The most elaborate and rigorous defense of this broad conception of distributive justice was developed in the second half of the twentieth century by philosopher John Rawls. In his theory of justice as fairness, Rawls argues that inequalities in people's shares of goods can be justified but only if they satisfy certain conditions, the most innovative of which is that the inequalities must work to the benefit of the least advantaged members of a society (i.e., those who are least well-off). Rawls calls this condition the *difference principle.*

Although the notion of distributive justice based on need is ancient, it has gained prominence only since the French Revolution (1789–1799). One likely factor behind its recent prominence is the emergence in the Enlightenment of the perception that human problems once considered insoluble might be susceptible to human intervention and amelioration. Another may be the democratization of political discourse and theorizing that accompanied the modern democratization of political institutions.

Desert-based and need-based conceptions of distributive justice are inherently in tension with one another. At least from Aristotle onward, the assumption behind desert-based conceptions has been that desert is distributed unequally among people, so the implication of principles based on desert is that benefits should be distributed unequally as well. Most advocates of need-based distributive justice have assumed that genuine needs are generally distributed in a roughly equal manner so that goods should be distributed in an egalitarian manner unless departures from an equal distribution are justified on some other ground.

In recent years, the range of subjects to which the concept of justice has been applied has grown. St. Augustine and others early in the Christian era attempted to apply the concept of justice to the initiation and conduct of war; these efforts have been refined significantly over the past several centuries. Since the middle of the twentieth century, scholars and other interested parties also have begun to apply the concept of justice to circumstances in the immediate aftermath of war and the collapse of authoritarian regimes, applications that have led to the invention of a new field of *transitional justice.* The scope of the concept of justice also has been extended—controversially—in "inward" and "outward" directions. In recent years, the concept of justice has been applied to personal and familial relations that were once widely considered exempt from considerations of justice, mainly through the work of feminist writers who have argued that the division of labor, responsibilities, benefits, and burdens within families should be subject to critical scrutiny in much the same way as more public institutions are. Scholars and activists have argued also that both corrective and distributive justice should be extended beyond their traditional range, which customarily has stopped at the borders of established political associations, and applied to some of the most heinous transgressions without regard to borders, as well as to the global distribution of benefits and burdens.

Just War Theory

Just war theory is a body of principles developed over centuries that attempt to delineate what justifies the initiation of armed conflict and what rules govern the subsequent conduct of fighting. The contemporary dominant strand of the concept developed from the Western, Judeo-Christian canon, but non-Western philosophies, including Hinduism and Islam, also have rich just war traditions. The main rival philosophies to just war theory are pacifism and political realism. The main tenets of just war theory have been incorporated into international law and custom and are enshrined in various key documents such as the United Nations Charter.

JUS AD BELLUM

The Latin phrase *jus ad bellum* (justice toward war) is generally used to describe the criteria by which a state has a legal or moral right to resort to force. In the Western tradition, six factors were necessary for the instigation of a just war. First, war could only be waged by a recognized, legitimate, sovereign political authority. Key to this principle was the notion that only the highest political actor, whether it is a sovereign or an elected or appointed body, had a legal monopoly on the use of force. Consequently, substate actors could not legitimately resort to force as a private initiative or venture because such actions would undermine the stability of society and the international system. Second, war should only be undertaken for the right goals. Conflicts were not to be initiated because of greed or revenge or antagonism. Instead, the ultimate goal of the use of force was to restore peace. Third, there had to be just cause. Just cause has historically manifested itself in one of three ways: defense against attack, the reclamation of territory or property unlawfully taken, or to combat a recognized evil or danger to the international system. Fourth, war must be the last resort after all other options have been exhausted. Fifth, the destruction of war must not outweigh the potential benefits of the conflict. Sixth, and finally, conflicts should be initiated only if there is a reasonable expectation that a lasting peace may be achieved.

JUS IN BELLO

Jus in bello (justice in war) describes the rules of war once a conflict has begun and is based on two main tenets. Proportionality requires that combatants only use appropriate force to achieve their objectives and avoid gratuitous violence or destruction of property. Discrimination obliges belligerents to avoid direct attacks on civilians or other noncombatants. Instead, combatants should employ all necessary and proper steps to protect noncombatants from violence.

THE WESTERN FOUNDATIONS OF JUST WAR THEORY

In the Western philosophical tradition, the roots of just war theory can be traced to disparate sources ranging from Plato's discussions of the proper conduct of soldiers and warfare in *The Republic* to passages in the Old and New Testaments that call for mercy toward enemies during war and efforts to avoid armed strife. The theologian St. Augustine is generally credited with developing the first extensive effort at just war theory, which included a prohibition against warfare based on hatred or greed, developed in works such as *Against Faustus*. Augustine also argued for the importance of legitimate authority in initiating conflict to maintain order, as well as the need to limit conflict. St. Thomas Aquinas codified what became the basis for contemporary just war theory in his work the *Summa Theologicae,* including the main tenets of *jus ad bellum* and *jus in bello.* Nonetheless, wars of conquest and religious conversion became common during the medieval period. Later contributors to just war theory included Hugo Grotius, John Locke, Immanuel Kant, and, in the contemporary period, political philosopher Michael Walzer, whose *Just and Unjust Wars* develops a secular form of just war theory. Walzer discounts pacifism, but stresses the importance of ethical behavior in the conduct of war.

NON-WESTERN JUST WAR THEORY

Both Hinduism and Islam developed a form of just war theory that emphasizes the importance of stability and the protection of the social unit from external threat. Ancient Hindu philosophy argued that leaders had not only a right to defend their people from internal and external threat, but also both a moral and religious duty to do so. Under Hindu custom, justifiable wars included those to expel foreign invaders, disputes over territory, and conflicts in response to affronts to royal power. Nonetheless, as with Western just war theory, war should be the last resort. Sacred Hindu texts also endorsed discrimination and the protection of noncombatants and the principle of proportionality in the use of force. In the twentieth century, nonviolence became increasingly important through the advocacy of Mohandas Gandhi.

As with Christianity and Hinduism, Islamic tradition accepts that force may be needed to preserve order and to ensure the triumph of good over evil. The main justification for the use of force is to protect the community from external threat. However, some Sunni scholars also justified conflict that spread Islam. Typically, secular conflicts to expand territory or gain wealth were not considered just. Under other branches of Islam, the use of force is acceptable only in defensive wars.

Buddhism typically rejects warfare and emphasizes nonviolence. However, under some circumstances, force may be justifiable, such as when it is used to protect innocents from evil. However, even when force is used, peace and the restoration of stability remain paramount.

JUST WAR THEORY AND PREEMPTIVE WAR

Under just war theory, preemptive war is acceptable only if an attack is imminent and all other efforts to resolve a conflict have been exhausted. Preemptive wars are distinct from preventive wars, which are waged to overcome a pending threat, but one that is not necessarily imminent. Preventive wars are generally held to be illegal under modern just war theory. The 2003 invasion of Iraq was criticized under the just war doctrine as a preventive war.

Kant, Immanuel

Immanuel Kant (1724–1804) was a German philosopher and a thinker of the very highest rank. He is considered by many to be the most important philosopher of the modern age.

In his so-called first critique, *The Critique of Pure Reason* (1781 and 1787), Kant sought to describe the inherent logic of the truth claims routinely made about the world. Arguing against the empiricism of Scottish philosopher David Hume, according to which all of our thoughts result from sense impressions reflected in the mind, Kant proposed a different kind of empiricism in which a priori intuitions and categories of human cognition impose an intelligible structure on the phenomenal world. He argued, further, that this logic denies reliable access to "things in themselves," such as the metaphysical reality that is behind, beneath, or beyond the world of appearances. In his second critique, *The Critique of Practical Reason* (1788), Kant sought to reconstruct the inherent logic of moral reasoning. Arguing against utilitarianism, he proposed a deontic—or duty-based—theory according to which, in the formulation of the *categorical imperative*, an action is moral if and only if a universal law can be rationally endorsed that would prescribe or permit, for all rational agents, any action of the very same type. Such a theory emphasized the centrality of free will—an individual cannot be morally praised or blamed unless it is believed that the individual could have chosen to act otherwise. The theory also defined freedom in terms of rational self-legislation. In his third critique, *The Critique of the Faculty of Judgment* (1790), Kant sought to describe the logic of claims that we make about individual particulars—this is an X, that is a Y—in circumstances where there are no rules, formulas, or scientific tests for doing so. Principal examples are aesthetic claims, in which something is said to be beautiful, and functional claims, in which something should be understood in terms of the role it plays as part of a larger organic entity.

For political scientists, Kant's epistemology has been a direct or indirect source of resistance to the perceived positivism or scientism of behavioralism. For political theorists, his ethical theory has been the fundamental source of anticonsequentialist views—morality involves a concept of right that is not fully reducible to the maximization of the good—of which the *Kantian constructivism* of American political philosopher John Rawls is the most well-known example. Kant's theory of judgment, in part through the work of political theorist Hannah Arendt, has been enormously influential in debates about the nature of prudence and practical wisdom.

Although Kant himself produced no systematic treatise on politics, his writings endorse a version of liberal social contract theory, and his famous essay "Perpetual Peace" (1795) argues for a worldwide federation of free republican states.

Kashmir

Kashmir is the northwestern region of South Asia. It refers to a geographical area that includes the Indian-administered regions of Kashmir Valley, Jammu, and Ladakh; the Pakistani-administered Northern Areas and "Azad" Kashmir; and the Chinese-administered region of Aksai Chin and Trans-Karakoram Tract.

The political and religious dominance of different rulers has punctuated the history of the area. It was an important center of Hinduism and Buddhism until 1346, the year of the advent of Muslim rule. In 1820, the Sikhs under Ranjit Singh annexed Kashmir and held it until 1846, at which time the Dogras, starting with Gulab Singh, became its rulers upon the purchase of the region from the British under the Treaty of Amritsar. The Dogra rule (under the paramountcy, or tutelage, of the British Crown) lasted until 1947, when the former princely state became a disputed territory.

The Kashmir dispute has multiple dimensions. First, it is a conflict between India and Pakistan over territorial sovereignty.

Kashmir is a disputed region in South Asia. Parts of it are administered by India, Pakistan, and China, though the greatest tensions over the region are between India and Pakistan.

Since the 1947 partition, which resulted in the independence of India and Pakistan, the central pillar of Indian argumentation on Kashmir rests on the Instrument of Accession to India, signed by Hari Singh, the maharajah and last Dogra ruler, on October 26, 1947. Pakistan refutes this argument on the grounds that the maharajah had no political legitimacy to sign the document since his rule was contested. Pakistan highlights that the Instrument of Accession was signed in the midst of an agitated political atmosphere, since the maharaja had taken refuge in the Hindu-dominated Jammu province following a widespread Muslim riot, which led to the invasion of Kashmir by members of Pakistani tribes.

The legal contention gained a new dimension when India took the dispute to the United Nations (UN). In the Security Council resolutions of April 21, 1948; June 3, 1948; and March 14, 1950, the UN called on the Pakistani government to initiate the withdrawal of the tribe members and Pakistani nationals from Kashmir. Simultaneously, the UN asked the Indian government to start withdrawing Indian forces while maintaining the minimum force level necessary to maintain law and order. It also mandated that a free and fair plebiscite be held to determine the wishes of the Kashmiris about accession to either India or Pakistan.

India and Pakistan engaged in active combat over Kashmir in 1947, 1965, and 1999. Additionally, India waged an armed dispute with China in 1962, which led to the loss of the strategic region of Aksai Chin in Kashmir to China. However, since the 1947 war, which led to the division of Kashmir into two areas controlled by India and Pakistan respectively, separated by a line of control (LoC), none of the military disputes have been able to significantly influence the dynamics of the conflict, either from a territorial or political perspective. While the general animosity between India and Pakistan may have seemingly abated in the early years of the twenty-first century, the situation remains problematic.

The Kashmir dispute is also a conflict between India and the Kashmiris living in India-administered Kashmir. Their central claim is the fulfillment of their right to self-determination, meaning the right to determine their political future based on their common identity (*Kashmiriyat*). Kashmiri native insurgency against Indian rule emerged in the late 1980s and aimed at contesting the increasing erosion of the special status Indian-administered Kashmir held since 1947. As of 2009, however, the voices of the Kashmiri people are being represented more emphatically through political separatism rather than through armed militancy.

Another angle to the dispute is the conflict between India and foreign religious militants who have been operating in Kashmir since 1996 to wage a jihad for the establishment of a rigid Islamic theocracy. These foreign militants, driven to Kashmir by the end of the Soviet-Afghan War (1979–1989) and by the adoption of a radical interpretation of Islam, have been incorporated into organized militant groups, allegedly with the support of Pakistan's Inter-Services Intelligence (ISI). The support Kashmiris give to foreign militants is somewhat ambiguous. While some may be sympathetic to the militants' violent resistance to Indian rule, others are wary of the implications of tagging Kashmir as a religious struggle.

Kashmir is an intricate and multidimensional conflict, the resolution of which seems to be tangled by divergent political and religious arguments. Whereas India seems to assent on the maintenance of the status quo and the transformation of the LoC into an international border, Pakistan, in opposition, vindicates the self-determination agenda—aspiring, nonetheless, for the complete accession of Kashmir into its territory. On the other hand, Muslim Kashmiris living in the Kashmir Valley (and probably also in Pakistan-administered Kashmir) are inclined to choose complete independence. In order to address these competing views, some proposals suggest, for instance, further autonomization of Jammu and Kashmir within the Indian federation; shared sovereignty, partial or total condominium, between India and Pakistan; the Chenab formula, which divides Kashmir along the line of the Chenab River); the creation of a free economic trade area; the transformation of Kashmir into a buffer state; a region-by-region plebiscite; the establishment of a UN trusteeship; the ethnic-religious division of Kashmir in administrative units; or the creation of a confederation.

Kautilya

Kautilya (flourished ca. 300 BCE) is the purported author of the *Arthashastra,* a sprawling work of political thought dating from some time between the third century BCE and the second century CE. Tradition states that Kautilya, a poor member of ancient India's priestly caste, trained Chandragupta Maurya, the first Maurya emperor, and helped him overthrow the Nanda dynasty. After they had achieved victory, Kautilya retired and poured his lifetime of experience into the *Arthashastra.* Most modern scholars have concluded that Kautilya is an otherwise unknown author who lived under the Maurya, but new archaeological evidence may clarify the origin of this work, much as it has for other ancient Indian texts.

Kautilya's *Arthashastra* has only recently garnered much attention in the West, but is usually compared with China's *Han Feizi* (ca. 250 BCE) by Han Feizi and Italy's *The Prince* (1531) by Niccolò Machiavelli. Although some commentators have criticized the totalitarian nature of the state that it proposes, the *Arthashastra* contends that ubiquitous government regulation through the rule of law is the best way to achieve material prosperity for all. This goal is enshrined in the name of the text itself. The term *artha* carries the meaning of material wealth, health, and safety, and the text examines all three of these topics. *Shastra* means treatise, rules, or general knowledge. Hence one modern scholar proposes translating the title as *The Treatise on Material Prosperity.* According to the text, government plays a primary role in securing artha*,* and it advises the ruler on making every aspect of government administration serve this purpose.

According to the text, artha requires wealth, justice, and territorial expansion. To achieve these goals, the state should consist of seven elements, including the king, his counselors and other officials, the treasury, military and police forces, territory and population, fortified cities, and allies. The king's role is to ensure that each of these elements remains oriented toward the state's three goals by safeguarding the welfare of the people from both internal and external dangers. Performing this tremendous task requires government control of every aspect of people's lives, from economic activity to travel and family planning, and the enforcement of a balance between individual wealth and community responsibility.

The *Arthashastra* helpfully provides lists of specific laws and punishments for each area of regulation. For instance, it details the rules for a national curfew, including circumstances for exempting certain individuals (like midwives and police officers), as well as guidelines for labor contracts and fair prices for various commodities. Enforcing all these laws requires, according to the *Arthashastra,* an elaborate secret service of professional agents who infiltrate all aspects of life, reporting on and influencing people's behavior. Rather than wrestling with possible moral implications of this system of strict control, the *Arthashastra* takes it as given that life will be best for all under this authoritarian system.

Kautsky, Karl Johann

Karl Johann Kautsky (1854–1938) was one of the leading figures in socialist theory in the late nineteenth and early twentieth centuries. In the immediate aftermath of Friedrich Engels's death, Kautsky arguably became the most influential proponent and defender of orthodox Marxism. His works were translated into several languages in his lifetime, and he played a crucial role in the networking of Marxian movements and thinkers across the globe.

Kautsky was born in Prague, Czechoslovakia, on October 16, 1854. He studied history and philosophy at the University of Vienna between 1874 and 1879 but did not complete any degree. Kautsky's political activism seems to have been originally inspired by Czech nationalism, which he became aware of during a visit to his aunt in Bohemia in 1868. In his formative years, he was influenced by figures as diverse as English historian Thomas Buckle, German biologist and philosopher Ernst Haeckel, German physician and philosopher Ludwig Büchner, Czech historian and politician Frantisek Palacky, and French novelist George Sand. Beginning in the early 1870s, Kautsky became increasingly more interested in various strands of socialist thinking. In January 1875, just nine months after its establishment, Kautsky became a member of the Austrian Social Democratic Worker's Party. However, it would take him several years to adopt a Marxist framework of analysis.

Kautsky established himself as a leading socialist thinker in the 1880s; developed personal contacts and friendships with the most important exponents of Marxian thinking of his time, such as Friedrich Engels, Max Adler, August Bebel, and Eduard Bernstein; and became the primary editor of the famous socialist periodical *die Neue Zeit.* His standing in the Marxian movement was obvious at the Erfurt Congress of 1891, where he wrote the theoretical part of the official program of the world's largest socialist party, Germany's Social Democratic Party (SPD). *Das Erfurter Programm,* Kautsky's pamphlet that was later turned

into a book in 1892, became his most famous work, and is still considered one of the important Marxist classics. In the 1890s, he was also at the forefront of Marxist reflections on the so-called agrarian question, namely, the intensely debated potential impact of nonproletarian classes on the proletarian struggle.

From the early 1900s forward, Kautsky found himself in the unfortunate position of having to fight simultaneous battles on numerous fronts: against the establishment of the day, against noncontinental socialists such as Ernest Belfort Bax, against Bernstein's controversial revisionism, and against the more revolutionary exponents of Marxism. In all his battles, he tried to expose the silent and hidden debates involved. For example, he wrote a remarkably candid article in which he reflected on his own initial encouragement of Bernstein's Marxist self-criticism. Such intellectual integrity, however, would cost him dearly. Following the Russian Revolution of 1905, Kautsky came increasingly under attack from radical Marxists. In the aftermath of the Bolshevik Revolution of 1917, Lenin openly targeted him for his theories such as *ultra-imperialism*, in which Kautsky entertained the possibility of relatively peaceful continuation of capitalist exploitation under evolving interimperial strategies. Thereafter, "renegade Kautsky," as he was labeled by Lenin, became gradually marginalized both politically and intellectually. Kautsky died in Amsterdam on October 17, 1938, leaving behind a wide range of writings in different formats.

Kelsen, Hans

Legal scholar Hans Kelsen (1881–1973) was born in Prague, Czechoslovakia, on October 11, 1881, and raised in Vienna, Austria-Hungary. He came from a Jewish family but was not particularly religious, and in 1905 he converted to Catholicism in an attempt to more fully assimilate into Austrian society. In 1906, Kelsen received a doctorate in law from the University of Vienna, where in 1911 he became a professor of constitutional and administrative law.

Kelsen served during World War I (1914–1918) as a legal advisor to the Austrian war minister. Following the war and subsequent collapse of the Austro-Hungarian Empire, he resumed teaching law in Vienna, founded the *Austrian Journal of Public Law,* and played a central role in drafting the constitution of the First Austrian Republic. This constitution, which was implemented in 1920, is still in use (albeit in altered form)

in present-day Austria. From 1921 to 1930, Kelsen was a member of the Austrian Constitutional Court but was eventually dismissed for political reasons. He moved to Germany in 1930 to teach international law at the University of Cologne, but, being of Jewish descent, fled to Geneva, Switzerland, when Adolf Hitler and the Nazi Party came to power in 1933.

Kelsen was a prolific writer on a wide range of legal topics, but he is best known as a legal positivist and for his *Pure Theory of Law* (1934). In this work, Kelsen argues that an effective legal system should be based on objective laws rather than subjective political, social, or moral values. Lawyers should act as legal scientists and the law should be practiced and carried out as scientifically as possible. The law, Kelsen believed, is ultimately derived from a basic norm—or *Grundnorm*—and deals not with what is, but with what ought to be.

In the late 1930s, Kelsen taught at the Graduate Institute of International Studies in Geneva as well as the German University in Prague, but increasing anti-Semitism and the onset of World War II (1939–1945) made it virtually impossible for him to continue working. As a result, he and his family immigrated in 1940 to the United States. Kelsen lectured for two years at Harvard University, while simultaneously learning to speak English, before joining the political science faculty at the University of California at Berkeley. A highly productive period followed in which he published *Peace Through Law* (1944), *General Theory of Law and State* (1945), *The Law of the United Nations* (1950), *Principles of International Law* (1952), and *What is Justice?* (1957).

In the course of his long and productive career as a law professor, scholar, judge, and political philosopher, Kelsen influenced generations of students in Europe and the United States. In particular, his ideas had an enormous effect on the Vienna School of Legal Theory and legal positivists such as H. L. A. Hart. When Kelsen died in Berkeley, California, on April 19, 1973, he was recognized as one of the most notable legal scholars of the twentieth century. Today, the *Hans Kelsen-Institut* in Vienna, a federally funded foundation, commemorates his life, work, and legacy.

Kemalism

Kemalism is the collection of political principles assembled by Mustapha Kemal (later Ataturk; 1881–1938), who is credited with founding the Republic of Turkey in 1923. Kemalism has served as the basis for state nationalism in Turkey, although

Mustafa Kemal Ataturk founded the modern nation of Turkey in 1923. The basic principles behind his rule, referred to collectively as Kemalism, include republicanism, secularism, populism, revolutionism, nationalism, and statism.

The caliphate—the position as head of the Islamic community which was held by the Ottomans—was abolished in 1924. Ataturk also carried out a series of reforms to secularize education and the civil service and to prohibit many public displays of religion.

3. Populism: Associated with social revolution and promotion of equality, populism sought to put class-based and occupational organizations under the control of the state in order to stress the unity of Turkish society.

4. Revolutionalism: Traditional ways were abandoned in favor of modernity and Westernization, and included elements such as changing the alphabet to Latin script and banning old forms of dress.

5. Nationalism: Political aims focused on the desire to create a nation-state out of the ruins of the multinational Ottoman Empire and on the Turkish language as the unifying factor. Pride in being a Turk—exemplified in Ataturk's saying "How happy I am to be a Turk"—was a special point of emphasis.

6. Statism: The state was perceived as necessary to take the lead in economic development.

Although a contemporary of Nazism and Stalinism, Kemalism was not a totalitarian ideology. It did, however, foresee a strong role for the state in economic, social, and cultural life, and during Ataturk's leadership Turkey remained an authoritarian, single-party state. Ataturk did not envision the principles of the state to be an ideology, which he equated with something dogmatic and static. Instead, he preferred to see his vision as progressive, pragmatic, and dynamic.

Since Ataturk's death, Turkey has made various efforts to establish democratic government and has experienced great political, social, and cultural changes. Kemalism, however, remains as a sort of state ideology and a powerful influence especially in the military, which sees itself as the guardian of Ataturk's principles; in addition, Ataturk is a highly revered figure among most Turks. However, Kemalism has been challenged on a number of fronts. Political Islam emerged as a force in Turkey in the 1970s, and a party with Islamic roots won the 2002 elections. Issues about the proper role of religion in the public sphere, such as female students wearing the Islamic headscarf, remain very controversial, although secularism remains enshrined in the Turkish constitution as an unalterable principle. Some Kurdish groups have taken up arms against the state, objecting to Kemalism's view of a monoethnic, unitary Turkish state. Whether and how to grant rights to Turkey's large (up to 20 percent) Kurdish minority has also been a major issue within Turkey. Free market reforms in the 1980s undermined the principle of statism, and the growth of civil society and pressures to create a more liberal democracy in the 1990s have worn away at the traditional Kemalist concept of populism.

As it was grounded in Turkish nationalism, Kemalism was never intended to be a model for other countries. Some leaders in central Asia—composed of Turkic peoples—spoke in the 1990s of Turkey as serving as a model, but there has been

many of its principles have eroded or been challenged since the 1970s.

The history of Kemalism stretches back to the last decades of the Ottoman Empire, when various groups attempted to reform the empire and articulate Turkish nationalism and new principles for governance. These efforts led to political instability and conflict, and the Ottoman Empire itself collapsed as a result of World War I (1914–1918). In its stead, Mustapha Kemal, an Ottoman military officer, organized Turkish resistance to foreign occupation. He spearheaded the creation of the Republic of Turkey, based on Turkish nationalism, and served as Turkey's president from 1923 until 1938. He took the name Ataturk, meaning "father of all Turks." The basic principles of the early Turkish Republic, put into formal form by Ataturk's Republican People's Party, eventually became known as Kemalism.

Kemalism is made up of six components or *arrows*:

1. Republicanism: Political power in Turkey would come from the Turkish people, not the Ottoman sultan, who was stripped of power by Ataturk.

2. Secularism: Separation of state and religion, which in the Turkish state was primarily Islam, was established.

no systematic, explicit effort to adopt Kemalism as a guiding principle.

Key, V. O., Jr.

Political scientist and empiricist Vladimer Orlando Key Jr. (1908–1963) graduated from the University of Texas at Austin and completed his doctorate at the University of Chicago in 1934. The bulk of his academic career was spent at Johns Hopkins University (1938–1949), Yale University (1949–1951), and Harvard University (1951–1963).

Key was a central figure in the postwar development of political science in the United States. He combined an extraordinary grasp of detail and data overlooked by others, with an equally exceptional capacity to integrate this information into compelling propositions about the nature of democratic politics in the United States. He regarded political parties as central to the vitality of a democracy. Key's work was noteworthy for the innovative use of charts, scatterplots, maps, and tables that accompanied his texts. He was a founding personage in the behavioral revolution that swept political science in the 1950s.

In his later years, Key became increasingly alarmed by changes in the polity that undercut the role of political parties as organizers of electoral politics. Toward the end of his life, the media-and-poll-driven politics of the so-called permanent campaign were still in its infancy, but he clearly perceived the trend and its implications. He came to be equally concerned that the pioneering survey-research enterprise of that period was, by excluding politics, gravely devaluing the role of the electorate in the political system's decision making. While deeply committed to the use of statistics and quantification in political research, Key was strongly opposed to the *presentism*—the omission of the time dimension—that so often accompanied the behavioral revolution. For Key, the time dimension was an essential ingredient in adequate analysis of the complex structures and processes of electoral politics; in other words, history mattered. As Key stated in his work *The Responsible Electorate* (1966), "The perverse and unorthodox argument of this little book is that voters are not fools."

Key was a venerated figure within his profession, but his practical influence on developments within American political science went into decline for some years. However, there has been a reversal of interest more recently. This may be because of Key's early work in at least three areas of research that later scholarship has expanded upon. The first of these areas concerns the cognitive capacity of voters and retrospective voting. The second involves the professional study of critical realignments in American electoral politics and dates back to Key's seminal article of 1955, "A Theory of Critical Elections." The third area is American political development. Here the link between contemporary study and Key's work may be found in Key's insistence on the central political role of institutions and processes, as these are shaped by the contingencies of time.

Keynes, John Maynard

The father of the school of liberal economics, Britain's John Maynard Keynes (1883–1946) is considered by many scholars to be the most influential economist of the twentieth century. After graduating from King's College of Cambridge University in 1905, Keynes accepted a position at Britain's India Office. In 1913, he was appointed to the parliamentary Royal Commission on Indian Finance and Currency. World War I (1914–1918) interrupted Keynes's career, and he developed a life-long hatred of war.

Keynes's economic expertise earned him a seat on the British delegation to the Versailles Peace Conference, where he argued that the Allies were defeating themselves in demanding that Germany pay reparations beyond their capabilities. In *The Economics of the Peace* (1919), Keynes made a strong case for establishing economic stability in Germany through increased industrialization. His supporters believe that if the Allies had followed Keynes's recommendations at Versailles, World War II (1939–1945) could have been averted.

Keynes's unpopular views on postwar economic policies caused his reputation to decline briefly, but he redeemed himself in 1921 with the publication of *Treatise of Probability,* followed by *A Treatise on Money* in 1930. Keynes also published a large body of articles that appeared in newspapers and journals such as the *London Times,* the *New York Times, Atlantic Monthly, Yale Review,* and *Political Quarterly.*

Keynes's most influential work, *General Theory of Employment, Interest and Money,* was published in 1936. In it Keynes rebuts the economic theories of French economist Jean-Baptiste Say, who argued that supply creates its own demand. *General Theory* also offered alternatives to Scottish philosopher Adam Smith's laissez-faire theory based on the belief that the best thing a government could do for the market was to leave it alone. Keynes suggests that economics are cyclical, responding to fluctuating wages, employment, prices, and production output. Whenever the economy enters a downward spiral, in Keynes's view, the government is obligated to institute measures designed to stimulate the economy.

Keynes's ideas won wide acceptance during the Great Depression of 1929 and influenced President Franklin Roosevelt's New Deal policies in the United States. At the end of World War II, Keynes was one of the British delegates at the Bretton Woods Conference in New Hampshire at which forty-four nations examined ways to rebuild countries debilitated by the war. The result was the creation of World Bank, the International Monetary Fund, and the International Bank for Reconstruction and Development. In the early twenty-first century, these international organizations continue to be involved in the economic development and rehabilitation of developing countries.

In the post–World War II years, Keynesian economics led to the establishment of social welfare states in Western democracies and has continued to influence government policies throughout the world. However, Keynesianism has not been without its critics. Those detractors have faulted Keynes for a number of failings, charging him with neglecting to develop comprehensive theories on significant concepts such as those dealing with inflation and bureaucracy.

The theories of post-Keynesians have continued to come into conflict with the views of classical economists, particularly those of Milton Friedman and others at the Chicago School of Economics. A major clash between the two groups occurred in the 1980s, when such views provided the basis for Reaganism in the United States and Thatcherism in Great Britain. Neo-Keynesians returned to favor with the election of Tony Blair in Great Britain and Bill Clinton in the United States. In the latter instance, however, neo-Keynesians soon lost ground with the election of George W. Bush in 2000.

Keynesianism

Conventionally, Keynesianism refers to Keynesian economic theory and its policy implications based on the ideas of British economist John Maynard Keynes (1883–1946), whose main book, *The General Theory of Employment, Interest and Money,* was published in 1936. Keynesian economics argues that in absence of state intervention, markets often lead to inefficient macroeconomic outcomes, such as unemployment and low economic growth, due to insufficient aggregate demand. Aggregate demand, in the simplest case of a closed economy, consists of consumption, investment, and public spending. According to Keynesianism, consumption depends on individual income level, while investment depends on the unpredictable "animal spirit" of investors. Public spending is the only variable left for governments to regulate aggregate demand, and through it, the level of economic growth and employment.

Keynes's classical framework was later expanded in the box of tools of post–World War II macroeconomics, popularized by a new generation of textbooks. This toolbox included fiscal and monetary policies to stabilize demand and therefore output over the business cycle. Fiscal policies included public spending and taxation, while monetary policies included changes in the interest rate and the money supply. This postwar version of Keynesianism—known as the neoclassical synthesis built on analytical models first developed by John Hicks in 1937—is controversial as it is based on theoretical foundations and policy instruments that Keynes is believed to have rejected.

THE EMERGENCE OF KEYNESIANISM

With respect to economic crises, pre-Keynesian economics was based on Say's law, according to which the main source of demand is the flow of factor income generated through the process of production. Demand is thus generated by the increase in supply. Say's law therefore rules out any possibility of systemic demand-deficit crises once resources are employed. In its most basic formulation, the mechanism that allows full employment of all resources is wage and price flexibility, through which markets are believed to equilibrate, hence making unemployment a theoretical impossibility.

This economic theory, however, provided little insight in dealing with the persistent level of unemployment in the Great Depression. The threat of social unrest and political instability put pressures on Western governments to intervene. Classical economists' theoretical apparatus, with its implication of laissez-faire and its prescription for nonintervention, was increasingly at odds with what Keynes termed in 1937 as "practical conclusions" and proposals of public spending to respond to the crisis.

Keynes understood that unemployment was no longer a means to retrieve profitability and, as explained by Robert Skidelsky, that wages were "downward sticky." Hence, when profit expectations become increasingly uncertain, investors hoard money instead of lending for productive investments with an uncertain return—a phenomenon known as the liquidity trap. Thus, economic growth could not be reestablished through wage flexibility, due to the growing power of

organized labor, or a fall in interest rate, due to the liquidity trap. With investors no longer investing, only the government could expand aggregate demand by expanding public spending. Keynes saw this expansionary fiscal policy as triggering a multiplier process that would expand output above the initial increase in public spending. The initial increase in output induced by public spending would increase jobs, thus also increasing consumption. This in turn would further increase output, and so on. This multiplier effect, originally discovered by Richard Kahn in his 1931 article "The Relation of Home Investment to Employment," became the central analytical tool of postwar income determination models and modern macroeconomics.

THE SPREAD, CRISIS, AND RETURN OF KEYNESIANISM

Keynesianism represented an important theoretical, policy, and pedagogical rupture with previous practices. Its wide acceptance within academic and policy circles in the West warranted the label of Keynesian revolution. This general consensus defined the economic problem as unemployment, the means for its solution as economic growth, and the set of policy instruments for managing and achieving growth as monetary and, especially, fiscal policies. To work, this consensus required a "deal" among social forces in society—namely organized labor and capital—that allowed the creation of a social and institutional context within which Keynesian policies could be implemented without threatening profitability. The principle of yearly wage increases was accepted by capital in exchange for productivity increases granted by organized labor. These *productivity deals* allowed the profit and wage share of total output overall to remain constant, while both wages and profit increased. Only in this context is the fiscal multiplier truly stable, which is the basic condition for Keynesian government policies to operate. The institutional arrangement making this possible is dubbed in the 2000 book *Keynesianism, Social Conflict and Political Economy* as the "social microfoundations of Keynesianism" (De Angelis, 37).

Keynesianism entered into crisis in the mid-1970s, through a confluence of stagflation (simultaneous high inflation and high unemployment) and pervasive social unrest, especially from social sectors previously excluded from the Keynesian deal. In the 1980s, Keynesianism as a paradigm based on the triad goal, policy means and instruments was abandoned, superseded by the monetarist critique and the advent of *monetarist* and *supply side* policies. Politicians privileged monetary policies and abandoned full employment objectives, although an ad hoc use of expansionary policy tools (e.g., military expenses in the early 1980s) remained. In the early twenty-first century, especially after the global economic crisis of 2008, there is a growing debate about returning to Keynesianism, especially a *green Keynesianism*, which would undertake massive public expenditure policies in renewable energy sources, promote employment policies, and increase regulation of the economy.

Kirchheimer, Otto

Otto Kirchheimer (1905–1965) is considered one of the most important constitutional theorists of the twentieth century. He received his doctorate from the University of Bonn where he was a student of political theorist Carl Schmitt. Kirchheimer joined the Socialist Party of Germany and from 1930 to 1933, while employed as a professor of political science, he edited the party magazine *Society.* During the Weimar Republic, in 1930, he published a groundbreaking study of the Weimar constitution entitled *Weimar and Then What? Formation and the Presence of the Weimar Constitution.* In 1932, he published a seminal article on fascism entitled "Legality and Legitimacy" in the socialist journal *The Company.*

After the seizure of power by the Nazis in 1932, Kirchheimer became an outcast both as a Jew and as a socialist. He spent the next seven years in Paris at the French office of the International Institute of Social Research. Here he worked with George Rusches on *Punishment and Social Structure,* which was published in 1939. Kirchheimer emigrated to the United States in 1937 but continued his work for the institute, both as a research assistant and as a lecturer for its Columbia University program. In 1943 he moved to Washington D.C., working from 1944 to 1952 in the Research and Analysis Branch of the U.S. Office of Strategic Services (OSS), and from 1952 to 1956 he worked for the U.S. State Department. Kirchheimer was also a visiting professor of sociology at Wellesley College in 1943, a lecturer at the American University from 1951 to 1952 and a lecturer at Howard University from 1952 to 1954. In 1954, he joined the graduate faculty of the New School for Social Research, and he was professor of political science at Columbia University from 1961 to 1965.

Kirchheimer published only one other major book in his lifetime, *Political Justice: The Use of Legal Procedures for Political Ends* (1961). His collected essays were published in *Politics, Law and Social Change* (1969). Never engaging in system building, his great achievement was to uncover the basic mechanisms of political order and disorder. He had an extraordinary ability to sort through massive quantities of data and derive significant

and original insights. His work had a central theme of political tension resulting from legal order and economic power. Democratic consensus, Kirchheimer held, was precluded by class struggles, as Weimar proved.

Kirchheimer shifted his focus to fascism after the Nazis took power in Germany. He became an opponent of the Frankfurt school and its economic theories, believing that under the Third Reich the state had become a monopoly that suppressed all opposition. After World War II (1939–1945), Kirchheimer turned his attention to political justice and the role of political parties in postwar development. He formulated the concept of *catch-all parties,* which would displace confessional parties. Catch-all parties—more commonly known in the twenty-first century as *big tent parties*—do not insist on ideological conformity, choosing instead to include individuals who embrace differing points of view. In his work on political justice, Kirchheimer condemned the use of the court system to exclude certain political parties on the basis of their ideology. His concept of the catch-all party was part of his more comprehensive theory of party transformation. It characterized opposition parties as the principal check against the unbridled growth of an authoritarian state.

Kirchheimer's other works include *Boundaries of Expropriation* (1930), *The Government of Eastern Germany* (1950), and *Politics and the Constitution* (1964). Three collections of his essays were published posthumously: *Political Domination* (1967), *Functions of the State and Constitution (*1972), and *From the Weimar Republic to Fascism* (1976).

Kita Ikki

Kita Ikki (1883–1937), born Kita Tirujiro, was the principal theoretician and strategist of the National Socialist movement in the early Showa period in Japan before World War II (1939–1945). In 1906, the first book that he published, *The Theory of Japan's National Polity and Pure Socialism,* was banned. Thereafter he became associated with Okamai Shumai, Kotoku Shusui, Sakai Toshihiko, and other revolutionary socialists in Yuzonsha, an ultranationalist organization. Kita's revolutionary fervor led him to go to China as a member of the Tongmenghui, an underground resistance movement organized by political leader Sun Yat-sen. Here he sought to help in the Chinese Revolution (1911–1912) and to overthrow the Qing dynasty. However, after the assassination of Liberal Party leader Song Jiaoren, Kita was ordered to leave China.

After returning to Japan in 1913, Kita published an account of his Chinese interlude under the title of *The Chinese Revolutionary Party and the Chinese Revolution.* He went to China again in 1916 but returned to Japan in 1919 as a disillusioned socialist. He became an ardent chauvinist and nationalist and sought to promote Japan's imperial ambitions. These attitudes were at odds with Marxism, which tended to de-emphasize national identities, so he abandoned his Marxism and became thereafter the spokesman for the far right. His new fascist sympathies appeared in his next book, *An Outline for the Reorganization of Japan* (1923). His goal was Kokutai (the national polity), through which Japan would unify and lead a free Asia.

Under Kita's plan, a military coup would usher in a totalitarian regime under the emperor, who would then suspend the constitution, reorganize the Diet, nationalize industries, impose limits on private property, and, above all, liberate the rest of Asia and bring it under Japanese rule. Kita's ideas were a mixture of Marxism, fascism, agrarianism, religion, and militarism. He soon attracted support from young army officers, and on February 26, 1936, approximately fourteen hundred soldiers, from three regiments belonging to Kita's Yuzonsha, launched a coup and took over key buildings and assassinated top public officials. The emperor denounced the coup and it slowly failed. Kita was arrested, convicted of treason, and executed.

Although Kita's ideas were aborted, they lingered in the imperial court and were instrumental in the vision of the Co-prosperity Sphere that Japan tried to create during World War II. This concept focused on the idea of Western powers being expelled from Asia and replaced by Japan. In this sense, Kita was one of the instigators of World War II in Asia. Kita was a nationalist in the sense that he bitterly hated all Western powers, but in the end he advocated a form of Japanese imperialism that was worse than the one it would supplant. Kita also retained strong socialist ideals although he claimed that he had abandoned socialism. He advocated the confiscation of large corporations and the imposition of limits on the amount of wealth or land that a person could possess. He also called for workers to receive one-half of the profits of their employers. In the 1963 book *Thought and Behaviour in Modern Japanese Politics,* leading Japanese political theorist Maruyama Masao called Kita the "ideological father of Japanese fascism." He referred to Kita's book, *An Outline for the Reorganization of Japan,* as "the *Mein Kampf* of Japanese militarism."

Knowledge Management

Knowledge management is the comprehensive effort to acquire, manage, and disseminate information in order to achieve specific goals or objectives. The dramatic rise in data resulting from the information revolution of the 1990s prompted organizations to endeavor to develop broad-based strategies to integrate knowledge and experience across all sectors. Knowledge management is designed to enhance the individuals' ability to easily access information and to spread their insights and discoveries. It uses technology to increase efficiency and expand capabilities, and it has been implemented along with other organizational improvements, such as total quality management, in an effort to reduce redundancy and enhance innovation. The field inspired a range of multidisciplinary books, essays studies, and seminars in the early twenty-first century.

Because of the enormous amount of information collected, analyzed, and maintained by modern bureaucracies, knowledge management systems have become increasingly important. For instance, after the September 11, 2001, attacks in the United States, the inability of counterterrorist organizations to share intelligence prompted reforms to better manage and share information, including the creation of the U.S. Department of Homeland Security and the creation of the Office of the Director of National Intelligence. Knowledge management systems have also been important for researchers by expanding data and providing new means to distribute analyses.

Kohr, Leopold

Leopold Kohr (1909–1994) was an Austrian philosopher who formulated the theory that small is beautiful. Although he is little known outside his home country, he had a profound impact on economic and political thought in the latter years of the twentieth century. Born in Oberndorf, Austria, he insisted that everything he learned worth knowing he learned from that small town of fewer than two thousand people. He obtained his doctorate in law from the University of Innsbruck, his doctorate in political science from the University of Vienna, and he also studied at the London School of Economics. In 1937, Kohr became a freelance correspondent during the Spanish Civil War (1936–1939). Although not Jewish, he fled Austria in 1938 after the Nazi takeover and immigrated to the United States where he became a citizen. He taught economics at New Jersey's Rutgers University from 1943 to 1955, at the University of Puerto Rico from 1955 to 1973, and the University College of Wales at Aberystwyth from 1973 to 1978.

Kohr described himself as a philosophical anarchist. He protested the cult of bigness and unrestricted economic growth, and he promoted the concepts of human scale and small community life. He argued that massive external aid to poorer nations stifled local initiatives and participation, and he called for the dissolution of centralized political and economic structures in favor of local control. In his first published essay, "Disunion Now: A Plea for a Society Based upon Small Autonomous Units" (1941), Kohr called for the breakup of Europe into smaller parts. He developed his ideas further in his best-known work, *The Breakup of Nations* (1957), in which he states, "There seems to be only one cause behind all forms of social misery: bigness. . . . Whenever something is wrong something is too big." He cited examples such as the dinosaurs and the Soviet Union to prove his point. He argued that small organizations and small cities are more benevolent, creative, efficient, and stable than their larger counterparts. His ideal was Switzerland, which maintained itself as a prosperous state amidst warring Europe.

Kohr continued to express his ideas in a series of books over the next thirty years. In *Development Without Aid* (1979) he calls on developing nations to reject Western aid and to seek self-sufficiency. In *Overdeveloped Nations: The Diseconomies of Scale* (1978), he proposes that the larger the state, the worse off the citizen. In *City of Man* (1976), he praises the medieval city as more culturally and socially effective than its modern counterpart. In *The Inner City: From Mud to Marble* (1989), he maintains that urban giantism will lead to a breakdown of the social order and that human settlements need to return to "the human scale." Two of Kohr's profound contributions to social science were his use of the terms *verhaltnismassigkeit,* or proportionality, and *appropriateness*. Proportionality is a measure not only of efficiency but also of goodness. Appropriateness is the correlation between size and harmony.

Kohr helped cement the foundations of alternative economics and political science; he was an important inspiration to the green, bio-eco, fourth world, decentralist, and anarchist movements. One of his students was economic theorist E. F. Schumacher, who took Kohr's seminal idea as the title of his 1973 book, *Small Is Beautiful*. A number of thinkers continued to develop Kohr's seminal ideas, including Austrian philosopher Ivan Illich and English anarchist poet and critic Herbert Read. Kohr was awarded the Right Livelihood Award, often called the alternative Nobel Prize, in 1983.

Kollontay, Aleksandra Mikhaylovna

Aleksandra Mikhaylovna Kollontay (1872–1952) was a major figure in the Russian Socialist movement from the

late nineteenth century to the Bolshevik Revolution (1917). Born in St. Petersburg in the noble Domontovich family of Ukrainian, Russian, and Finnish background, at age twenty-two she married her cousin Vladimir Kollontay, but after the birth of a son in 1894 became increasingly dissatisfied with domestic life. In 1899, after a year of study in Switzerland, she embarked on a career as a revolutionary journalist, joining the then-illegal Russian Social Democratic Party. At first, Kollontay was neutral in the Bolshevik-Menshevik split but in 1904 she joined Leon Trotsky's Bolshevik faction, only to leave two years later over the issue of boycotting elections to the Duma.

Kollontay's first publications were studies of the Finnish economy. By 1905, she became an ardent feminist and had found the issue that would engage her for the rest of her life: the emancipation of women. Her first major work was *The Social Basis of the Woman Question,* published in 1908. That same year, Kollontay fled Russia to avoid arrest and remained in Western Europe until 1917, lecturing and writing. She worked for the German Social Democratic Party and taught at Russian dramatist Maxim Gorky's school in Italy.

In 1914, Kollontay established contact with Vladimir I. Lenin and was a principal organizer of the Zimmerwald Conference against World War I (1914–1918). She returned to Russia in 1917 after the February Revolution. When the Bolsheviks seized power in November of that year Kollontay was appointed commissar of social welfare. As commissar, she promoted funding for maternity care, drafted protective legislation for women workers, and revamped divorce and civil marriage laws. Kollontay resigned in 1919 in protest against the Treaty of Brest-Litovsk, which ended the war with Germany.

Also in 1919, Kollontay was named to head the *Zhenotdel,* an official agency devoted to women's issues. Over the next two years Kollontay developed the organization's program of setting up nurseries, day care centers, and maternity hospitals. Her vision of Zhenotdel as an advocate for women did not sit well with the male-dominated Bolshevik leadership. Further, Kollontay's involvement in the 1921 Workers' Opposition Party, a group critical of Lenin, led to her downfall. In 1922, she was dismissed from Zhenotdel and demoted as a member of the diplomatic service. After two decades as a Soviet diplomat, Kollontay retired in 1945 and died in 1952.

The leading Marxist feminist of her era, Kollontay, through her work with Zhenotdel, was a trailblazer for both socialist and nonsocialist governments in the twentieth century. The emancipation of women from subordination within marriage was the central issue of her agenda. Viewing the traditional family as an outgrowth of feudal social structures rooted in the concept of private property, Kollontay believed that society, rather than the family, should be the source of support for both men and women.

Between 1918 and 1923, Kollontay wrote extensively, calling for the abolition of existing family structures and their replacement with what she called "winged Eros," a form of free love without formal or legal imprimatur. Winged Eros would be free of economic considerations or child-bearing responsibilities, for children would be reared communally, as wards of the state. Even the radical Bolsheviks found the idea abhorrent. Rediscovered by Western feminists in the 1970s, Kollontay became once again an icon in the history of feminist thought.

Kollontay's works include *The Love of Worker Bees* (1923), *The Autobiography of a Sexually Emancipated Woman* (1927), and *Selected Writings* (1978).

Kropotkin, Peter

Peter Kropotkin (1842–1921) is principally known as a revolutionary anarchist and is particularly regarded as an inspiration to green anarchists. He was born to a land-owning aristocratic family in Moscow, Russia, in 1842. He was educated at home and later the Moscow gymnasium before entering the prestigious Corps of Pages in St. Petersburg, a military school whose students served as pages to the imperial court. In 1861, the same year as the emancipation of the serfs, Kropotkin, as the best student in his class, served as personal page to Emperor Alexander II.

Kropotkin then chose to join an obscure Cossack regiment in eastern Siberia. His letters from this time to his brother, to whom he was especially close, indicate that Kropotkin was already critical of the government and was keen to be useful to his fellow man. In Siberia, he undertook studies of the surrounding geography and nature and involved himself in (largely unsuccessful) reform projects. His later writings would continue this twin focus on the natural and political environments. In 1867, Kropotkin resigned from the military and entered St. Petersburg University, where he studied mathematics and worked for the Russian Geographical Society. In 1872 Kropotkin travelled to Switzerland, then home to a number of radical Russian émigrés, but to his regret failed to meet the anarchist Mikhail Bakunin, by whom he was greatly influenced.

On his return to St. Petersburg, Kropotkin joined the radical Tchaikovsky circle, which held to the principles of collective landholding, autonomy, and egalitarianism. He rejected the Western route to socialism via industrialization and proletarianization. Instead, the principal influences on Kropotkin's thought would remain French philosopher Pierre-Joseph Proudhon's antistatism; Bakunin's emphasis on mass insurrection, which might include violent revolution; and the example of the peasant communes.

In 1874, Kropotkin was arrested and imprisoned for his political activities, but through family influence he was transferred

from a political prison to a less harsh hospital prison when he became seriously ill. After his recovery he was able to escape, seeking refuge first in Britain and then Switzerland, where he married fellow radical Sofia Ananeva-Rabinovich. He was later expelled from Switzerland and imprisoned in France before eventually settling in London. After the Russian Revolution of 1917, Kropotkin returned to Russia, where he was treated with toleration by the Bolshevik regime and was apparently admired by Lenin.

During Kropotkin's long exile, he wrote and lectured extensively. His work appeared in an impressive range of outlets such as the anarchist paper *Le Révolté,* which he cofounded; the *Atlantic Monthly;* the respected scientific journal *Nature;* and the *Encyclopaedia Britannica.* His books include a study of the role of the masses in the French Revolution (1789–1799), an examination of the tsarist tyranny in Russia, and *Mutual Aid: A Factor in Evolution* (1902), in which he refutes the primacy of the competitive drive in social Darwinist theory. His best-known work is *Memoirs of a Revolutionary* (1899), but his clearest and most detailed descriptions of anarchist society are *The Conquest of Bread* (1892) and *Fields, Factories and Workshops* (1899).

Kuhn, Thomas

Thomas Kuhn (1922–1996) was an American historian and philosopher of science. His book *The Structure of Scientific Revolutions* (1962) has been an enormously influential text for all subsequent students of the nature and logic of scientific and social scientific inquiry.

According to standard views, science is a rational, cumulative process in which discovery builds upon discovery, theory builds upon theory, and the growth of scientific knowledge is linear and relatively constant. Kuhn's historical investigations suggested a very different view. According to Kuhn, there are two kinds of science. Normal science—which includes most science—is always undertaken internal to a particular *paradigm*, a worldview that comprises or is constituted by a distinctive set of methodological, conceptual, theoretical, and even metaphysical presuppositions. The task of normal science is to pursue the implications of the paradigm and, in particular, to explain findings or phenomena that seem puzzling or anomalous. Revolutionary science, on the other hand, occurs when anomalous results turn out to be so numerous or important as to undermine the authority of the paradigm. In such a circumstance, the revolutionary scientist proposes an entirely new paradigm—a radically different way of thinking about things; a new worldview emerges that can explain formerly anomalous findings and that gives rise, in turn, to a new practice of normal science. The Copernican theory of planetary motion is a standard case of Kuhnian paradigm change.

In political science, critics of mainstream behavioralism used—and sometimes misused—Kuhn to question the claims and ambitions of those who sought a truly objective science of political behavior involving the formulation of testable empirical hypotheses, the gathering of large sets of data in strictly quantified form, and the rigorous application of statistical tests. These critics argued that behavioralism was, at best, merely one paradigm among many. Hence, behaviorist claims to objectivity were, allegedly for Kuhnian reasons, untenable and political science ought to be, instead, a multiparadigmatic discipline that embraces a wide range of methodological, epistemological, and political perspectives.

Kyoto Protocol

The Kyoto Protocol is an international agreement that contains legally binding greenhouse gas emissions targets for industrialized (Annex 1) countries. Signatories committed to cutting their combined emissions of six key greenhouse gases to 5.2 percent below 1990 levels by 2008 to 2012, with each country agreeing to its own specific target. For instance, Japan was expected to achieve a 5 percent reduction, while the European Union (EU) had a target of -8 percent. Low emitters, such as Norway and Iceland were permitted to increase their emissions.

BRIEF HISTORY OF THE KYOTO PROTOCOL'S GENESIS

In 1992, the United Nations Framework Convention on Climate Change (UNFCCC) established an international framework to gather and share information, strategies, and policies for reducing greenhouse gas emissions and adapting to climate change, and to provide technical and financial support to developing countries. While the UNFCCC

benefits from nearly universal membership, it contains no formal obligations.

Recognizing the need for binding commitments, the UNFCCC Conference of the Parties (COP) adopted the Kyoto Protocol at its third meeting in 1997 and was implemented in February 2005. The world's largest emitter, the United States, never ratified the treaty.

POLICY MECHANISMS

While there is wide discretion as to how countries meet their obligations through national policies (alternative energy sources, transportation, land use, etc.), the Kyoto Protocol introduced market-based mechanisms to stimulate technology transfer, private sector involvement, or to enhance the cost effectiveness of meeting targets through reductions in other countries. Creating a *carbon market*, these mechanisms include: *emissions trading* among Annex 1 countries; *joint implementation,* allowing an Annex 1 country to earn carbon credits for projects that reduce emissions or enhance carbon sinks in other Annex 1 countries; and *clean development mechanisms,* permitting Annex 1 countries to accrue credits for projects in non–Annex 1 countries.

SIGNIFICANCE

The Kyoto Protocol is the first and only climate change treaty as of 2009. Its detractors emphasize that its targets, to be reached by 2012, are relatively short term, affect a limited number of developed countries, and require no firm commitments from rapidly industrializing countries—most notably China and India. The U.S. rejection of the treaty is also often singled out as a major failure. In terms of achieving emissions reductions, the treaty had not fulfilled its initial targets as of 2009, though some sixteen industrialized countries were on target. At that time it was unclear if the industrialized countries would realize the goal of 5.2 percent reduction in greenhouse gases by 2012.

The Kyoto Protocol established a global climate regime, set specific targets (see Table 1) and timetables, and developed an institutional framework with flexible implementation mechanisms. While much of the focus is on national level targets and

   *The 15 States who were EU members in 1990 will redistribute their targets among themselves, taking advantage of a scheme under the Protocol known as a "bubble," whereby countries have different individual targets, but which combined make an overall target for that group of countries. The EU has already reached agreement on how its targets will be redistributed.

implementation, the effects of a climate regime are much more diffuse. Increased awareness of climate change and support for action has manifested in policy change at the local level. As of August 2009, more than seven hundred local authorities participate in the Cities for Climate Protection (CCP) Campaign, including a number of major U.S. cities.

FUTURE INFLUENCES

While the obligations under the Kyoto Protocol expire in 2012, its influence will continue. The next phase of negotiations is scheduled to take place in Copenhagen, Denmark in December 2009, and will build on the framework and mechanisms already established. The European Union emissions trading scheme, established in 2005 as a result of the Kyoto Protocol, is likely to be the cornerstone of an eventual global climate regime.

Labor Policy

Government involvement and scholarly interest in labor policy have been consistently strong for several decades. The post–oil shock unemployment crisis of the 1970s, combined with the growing importance of the service versus the manufacturing sector in the industrialized world that followed, created conditions of economic hardship that, for most governments, were serious enough to mandate substantive policy responses. These responses, which have included a broad assortment of policy instruments, have been divergent—in both scope and level of effectiveness. Scholarly interest in labor policy, then, has focused not only on identifying and explaining specific policy responses to the aforementioned developments, but on comparatively evaluating government labor policy programs.

Another substantive area of political science research related to labor policy is the issue of *industrial democracy*. With the ascension of social democratic and labor parties in western Europe during the 1950s and 1960s came significant government efforts to democratize capitalism at the point of production. Such efforts have included *codetermination* laws designed to enhance worker participation in company boardroom decision-making processes and so-called quality of work life initiatives targeted at promoting greater participatory rights for workers on the shop floor and other places of employment.

ACTIVE AND PASSIVE LABOR MARKET POLICIES

Government involvement in matters concerning the labor market has been most substantial in the advanced industrial democracies, particularly in western Europe. Such involvement has been characterized by the use of both passive and active labor market policies. Passive labor market policies include such instruments as unemployment benefits, severance pay policies, and various disability benefits. These traditional policies are called passive because they are designed simply to provide financial assistance to workers during unemployment or disability. As such, they do little if anything to enhance workers' employability, skill levels, or technical competence. Such objectives are more commonly associated with active labor market policies, which were first instituted in western Europe in the 1960s. As active labor market policies have been associated with such ambitious objectives as promoting economic growth and transforming labor market characteristics, such initiatives, despite receiving slightly less government financial support than their passive counterparts, have received the bulk of attention from the policy analysis community.

Active labor market policies (ALMP) were initially developed in response to certain labor market conditions that were created by the sustained period of rapid economic growth following World War II (1939–1945). ALMP, it was thought, could be employed (on a limited and temporary basis) to prevent labor market bottlenecks and other demand-side labor market problems that might prove detrimental to existing growth patterns. In contrast, during the 1970s and 1980s, as mentioned above, ALMP were used much more comprehensively in an effort to counter problems caused by the slow growth and high unemployment that had come to plague the industrial democracies. This comprehensive approach to ALMP persists today in many countries, as governments seem to have reached the conclusion that permanent, active involvement in labor markets is vital to long-term economic stability.

Active labor market policies have been designed to achieve a number of objectives. For instance, governments in many countries typically employ such ALMP as direct job creation programs, wage subsidies, job-training subsidies or grants, and subsidies and other financial supports for self-employment initiatives to counter economic downturns. They also utilize wage subsidies, job search assistance, and worker retraining programs to reduce problems caused by decline in the manufacturing sector and other structural economic changes. Governments seeking to enhance labor force skills and productivity also frequently use job training and retraining programs. Finally, some ALMP are aimed at supporting specific societal groups, such as women or the disabled. Here, governments have employed such policy instruments as employment counseling, job search assistance programs, training or retraining grants, wage subsidies, antidiscrimination regulations, and informal or formal quotas.

Scholars such as Richard Layard (and colleagues) and Peter Katzenstein have suggested that in countries such as Austria and the Scandinavian democracies, where industrial and active labor market policies have been most comprehensively and systematically implemented, governments have demonstrated an ability to successfully sustain satisfactory economic

performance levels during difficult periods of structural economic change, most notably the decline in the manufacturing sector in the 1980s. While acknowledging that dramatic reductions in manufacturing employment levels similar to those experienced in other advanced capitalist countries were eventually realized in these smaller European democracies, these authors suggest that through systematic ALMP programs, their governments could effectively manage processes of economic adjustment while avoiding the kinds of structural unemployment problems and other hardships experienced by workers in countries like Britain and the United States, where governmental use of ALMP has been much less extensive. These conclusions have been tempered somewhat by the work of authors such as John Martin and Robert Flanagan, who argue that, in general, ALMP have thus far been only marginally successful in addressing such labor market challenges as structural unemployment and the need for greater labor mobility. Comprehensive Organization for Economic Cooperation and Development (OECD) studies of the macro impact of labor policies have reached few definitive conclusions.

INDUSTRIAL DEMOCRACY INITIATIVES

Another topic associated with labor policy is industrial democracy. Related primarily to the established democracies of western Europe, industrial democracy policies are designed to enhance worker participation in the capitalist economy at the level of the individual business firm. Such policies have mandated expansions in employee information concerning changes in company policy, consultative rights for workers, and participation by workers in management decision-making practices—both at the company boardroom and on shop floor levels. In Germany, for example, the government has promoted industrial democracy through various postwar codetermination and works constitution acts. The Codetermination Act of 1976, for instance, mandated that supervisory boards composed of equal numbers of employee and employer representatives be created for firms with at least two thousand employees. These boards have either consultation or codetermination (with management) rights in areas such as work time scheduling, overtime policies, vacation time planning, occupational safety issues, wage scales, rules for hiring or dismissal of workers, and job classification policies.

While generally popular among employees and their respective trade unions, the practice of codetermination has of late been viewed by employer associations in a more critical light. In Germany, for instance, recent modifications to codetermination laws seem to have been driven by the demands of industrial firms to reduce the consultative authority of advisory boards to allow for greater managerial decision-making flexibility, which is seen by capital as being essential in today's increasingly competitive global economy. Furthermore, German employers, concerned with remaining competitive within the single European market, have articulated the need to further adjust Germany's codetermination practices to bring them more in line with the less extensive codetermination laws in the European Union's other member countries.

Besides enhancing labor's decision-making powers at the company boardroom level, industrial democracy initiatives have been directed also toward the shop floor. In Sweden, among other countries, quality of work life (QWL) programs were established by public law to promote substantive rank-and-file participation on matters directly related to the production process. Through regularly scheduled consultative meetings, worker input is encouraged in a number of areas, such as production methods, technology usage, and product refinement. Here, the goal is not only to increase workplace democracy, but to enhance worker productivity and overall product quality as well. The elimination of assembly-line production techniques in many Swedish industries, which has been linked to both greater worker job satisfaction levels and enhanced labor productivity, has been attributed in part to QWL dialogue sessions.

Research related to industrial and workplace democracy has centered around three general topics of interest. First, some scholars have been concerned about determining the extent to which industrial democracy efforts have actually promoted greater, more meaningful labor force participation in the capitalist economy. Second, scholars interested in determining the effects of corporate governance laws on the economic competitiveness of business firms have attempted to examine the impacts that industrial democracy initiatives, most notably codetermination laws, have had on such issues as managerial flexibility and company responses to global economic challenges. Finally, some research has focused on labor productivity levels and how they have been impacted by codetermination laws and QWL measures. Regarding the first two areas of scholarship, conclusions vary depending on the country being analyzed, as the various case studies contained in a volume edited by M. Donald Hancock and colleagues indicate. As for the issue of labor productivity, much more consensus prevails, with the bulk of scholarly analysis suggesting notably positive relationships between the extent of industrial democracy (particularly shop floor initiatives) and labor productivity levels.

Labor Strikes

A labor strike is a mass work stoppage by union members designed to disrupt business production or the provision of services. A strike normally takes place in response to a critical impasse in negotiations between a union and an employer in collective bargaining. Electing to withdraw one's labor as part of a concerted strike action is the most powerful form of leverage available to workers, given the power imbalance inherent in the employment relationship. Labor strikes are designed to exert pressure on the employer to come to an agreement with the union on the terms and conditions of employment.

Labor strikes, which were legalized in most advanced capitalist countries in the early twentieth century, are regulated by a strict legal framework and are seen as a last, but often necessary, resort when a labor union and an employer cannot reach an agreement in collective bargaining.

A labor union's ability to strike is often juxtaposed with an employer's ability to lock out its workers. In a lockout situation, an employer withholds work from union members and denies them access to the workplace to exert pressure on the union to settle the collective agreement.

Workers who are on strike or who have been locked out normally picket their workplaces to advise the public of the labor dispute and discourage customers from doing business with the employer. Picket lines are used also to dissuade replacement workers, often referred to as strikebreakers or scabs, from performing the work of striking union members. Labor strikes are sometimes associated with picket line violence, motivated primarily by the tension caused by an employer's decision to hire scab labor. To offset the loss of wages experienced by striking union members, labor unions typically distribute pay to union members who participate in picket duty.

The success of a labor strike is often measured by what the union gained in the long term, rather than what it sacrificed in the short term, by engaging in industrial action. Prolonged strikes normally cause deep-rooted resentment between the union and management, as well as between union supporters and strikebreakers.

Although labor strikes normally take place within the regulatory frameworks imposed by states, instances of illegal strike activity are not unprecedented. Workers infrequently engage in wildcat strikes (illegal work stoppages that occur while a collective agreement is in force), sympathy strikes (striking in support of another striking union local to demonstrate solidarity), and general strikes (a concerted effort by several unions across several industries to strike all at once to shut down a city's economy). Labor strikes also have been used as political weapons to pressure elected governments into agreeing to the demands of the labor movement. These more militant forms of illegal strike activity usually are treated with open hostility by the state, often resulting in fines and even imprisonment for labor union leaders.

A more moderate variation of the conventional labor strike is a tactic known as *work-to-rule*. Union members engaged in a work-to-rule campaign do not withdraw their labor completely, but rather continue to perform their work duties exactly as required by the collective agreement, without any extra effort. A work-to-rule campaign could, for example, take the form of a mass refusal to work voluntary overtime, or a strict adherence to complex occupational health and safety regulations to slow production. Work-to-rule campaigns often are launched in response to specific workplace grievances during the life of a collective agreement. This type of workplace action is popular in the public sector, where the conventional right to strike is more restricted. A large proportion of public sector union members do not enjoy a statutory right to strike by virtue of working in what governments have deemed "essential services."

The incidence of labor strikes in most advanced capitalist countries has been in decline since the 1970s because of structural shifts in the economy, the deradicalization of the labor movement, and the state's increasingly hostile attitude toward the right to strike and labor rights. The decline in the incidence of labor strikes has closely reflected declines in levels of union density, the proportion of a country's nonagricultural workforce belonging to labor unions.

Labor Unions

Labor unions are collective workers' organizations, and their central purpose is to represent employee interests vis-à-vis employers and the state through collective bargaining and political action. While the earliest unions were formed to protect the interest of skilled trades and craft workers in the eighteenth century, these organizations enjoyed no formal

legal status. Technological advancements in the late nineteenth century radically altered the mode of economic production and gave birth to industrial-based labor unions representing primarily blue-collar workers. The growing popularity and discontent of labor unions during this period forced governments to afford legal recognition to unions in exchange for labor's acceptance of a highly regulated system of labor relations. The subsequent recognition and growth of public sector unions changed the predominantly male, blue-collar character of organized labor by dramatically increasing the proportion of women and white-collar workers belonging to labor unions. Thanks in part to the state's legal recognition of labor unions, organized labor reached its peak in terms of union density, the percentage of the nonagricultural workforce belonging to unions, in the years following World War II (1939–1945).

Labor unions are generally organized along industry lines with affiliated union locals representing workers at individual workplaces or in specific geographic locations. Unions typically work together as part of the broader labor movement to promote the political aims and objectives of the working class. In most advanced capitalist countries—with the exception of the United States—unions share close ties to socialist or social democratic political parties. This party-union relationship is premised on the belief that unions have a direct stake in influencing broad areas of public policy to achieve a degree of social justice and economic equality for the benefit of the working class. Labor unions are credited with playing a key role in welfare state expansion and progressive labor law reform, including the enactment of a minimum wage, a reduced workday, and workers' compensation.

Collective bargaining is the central function of labor unions. Through this process, unions and employers negotiate legally binding employment contracts, known as collective agreements, which protect union members in a particular workplace or industry. Collective agreements typically outline wages, working conditions, grievance procedures, benefit entitlements, and other rules governing the employment relationship.

To exert greater pressure on employers in collective bargaining, members of labor unions sometimes will vote to engage in strike action by withdrawing their labor, thereby disrupting business production or the provision of services. Strikes are the most powerful form of leverage available to unions. Labor unions are charged also with representing union members in grievance disputes with management over adherence to the collective agreement.

The value and desirability of labor unions is highly contested. Unsympathetic neoclassical accounts of organized labor primarily focus on unions' ability to develop labor monopolies that drive up wages and interfere with the functioning of the free market. From this perspective, labor unions are essentially viewed as businesses charged with protecting the economic welfare of union members at the expense of nonunion workers and corporate profits. On the other hand, Marxist accounts of organized labor view the development of workers' organizations as the inevitable outgrowth of capitalist class divisions. Although theoretically well positioned to spread class consciousness and advance the cause of socialism, the Marxist view generally argues that most labor unions in advanced capitalist societies have accepted the logic and desirability of capitalism and therefore have lost any serious revolutionary potential. Institutionalist scholars view the growth and development of labor unions as a response to harsh and often unsafe working conditions that accompanied the introduction of the Industrial Revolution. From this perspective, labor unions are seen as a counterweight to the dominant power of business and an important agent of workplace democracy. In other words, labor unions assist in humanizing capitalist employment relations without necessarily questioning the legitimacy of the system.

Union membership in most advanced capitalist democracies has been in decline since the 1970s, corresponding with the ascent of neoliberalism and the new right. This decline is largely due to structural shifts in political economy, deindustrialization, globalization, trade liberalization, strong employer resistance to unionization, and unsympathetic government policy in labor law.

Laicite

Laicite is the French ideal of a secular society with a distinct separation between church and state. Laicite emphasizes individual religious freedom as well as organized religion free from state intervention and sponsorship. Laicite originates from the French Revolution (1789–1799), when the absolute monarchy collapsed along with the overthrow of contemporary political and social order. Prior to the revolution, the Catholic Church had considerable economic and political power, but afterward subsequent French governments confiscated the church's landholdings and wealth, eliminating many of the privileges of the clergy.

In 1801, an agreement between Napoleon Bonaparte and Pope Pius VII known as The 1801 Concordat restored the

Roman Catholic Church as the majority religion in France, but did not declare Catholicism as the official religion of the state. The Concordat reinforced the religious freedoms mandated in the 1789 Declaration of the Rights of Man and the Citizen, adopted by the French National Constituent Assembly during the revolution and introduced man's universal human rights into the French constitution. In 1905, laicite was more fully developed and protected by legislation, which forbade state support for any religion and banned religious education in the public schools.

Other countries, including Belgium, Brazil, Turkey, and the United States, have enacted similar laws and customs to practice secularism. More recently, with increases in immigration in the late twentieth century, new challenges have been posed to the French concepts of laicite prompting legislation in 2004 to ban religious garb, including Islamic headscarves, Christian crosses, Jewish Stars of David, or Sikh turbans, in the French public school system. However, some French laicite regulations have been criticized as too stringent and discriminatory, needing reform. French president Nicolas Sarkozy has publicly urged a more active role for faith in French public life and met with Pope Benedict XVI in 2007; however, despite attempts at modest reform, Sarkozy as well as the majority of France continue to advocate for a strong separation between religious practices and domestic politics.

Laissez-faire

The apocryphal origin of the term *laissez-faire* is traced to Jean-Baptiste Colbert, finance minister to Louis XIV in seventeenth-century France. Colbert, who believed in state wealth and regulation (turning France into "a nation of shopkeepers" according to English political economist Adam Smith), at one time asked a group of manufacturers what the state might do for them. One replied, "*Laissez nous faire,*" translated as "let us do" or "leave us alone." These words, recorded by French physiocrats in the eighteenth century who believed in unhindered commerce, were later taken up by influential thinkers such as Smith, who made them famous in his work *The Wealth of Nations,* first published in 1789. While writing of the free exchange and trade of goods, Smith shied away from the term *laissez-faire* itself, which is now closely associated with him, especially in the rise of capitalism and free trade in nineteenth-century Europe. Meanwhile, economic historians often note that the physiocrats stood more for "*pas trop gouverner*" (do not govern too much) than a complete hands-off approach. Advocates of laissez-faire agree on minimal government intervention in the economy; the debates are on what minimal would constitute. Smith himself relegated issues such as defense, currency, education, and control of monopolies to public means. The popular meaning of the term *laissez-faire* now refers to minimal government interventions and unhindered capitalism, markets, and commerce thereof.

EUROPEAN ORIGINS

Ideas of laissez-faire contain several antecedents in the moral political economy of the modern era. That human beings should profit from their enterprise and be allowed to exchange the product of their labors can be traced back to Niccolò Machiavelli, who distinguished between "virtue" that is acquired and "fortune" given from birth. He privileged virtue, the exercise of which he saw as the source of good governance. However, Machiavelli's contribution to a laissez-faire approach lies in favoring virtuous conduct among individuals, consistent with Renaissance philosophy; ideas of a noninterventionist state arose later. For example, French physiocrats likened the economy to a human body, believing that a natural harmony among various parts was possible if economic flows were continued unhindered and each part was allowed to function independently with its productive capacity encouraged. Adam Smith would reflect this idea of moral harmony in his writings on political economy, speaking of the "invisible hand" that guides productive endeavors:

> It is not from the benevolence of the butcher, the brewer, or the baker that we expect our dinner, but from their regard to their own interest. We address ourselves not to their humanity but to their self-love, and never talk to them of our own necessities but of their advantages. (Smith, 1977, 18)

Ideas of self-love were also part of Scottish Enlightenment, which Smith furthered. For Smith, self-love and self-interest would generate growth and wealth rather than the visible hand of the state.

The growth of the English Industrial Revolution, attributed to economic incentives rather than regulation, boosted laissez-faire ideas and capitalism itself. In particular, enforcement of private property rights created large landholdings. The increased economies of scale from production and the consequent fall in the prices of products along with improvement in the means of transportation led to the creation and unification of national markets and search for international ones. By the mid-nineteenth century, exports accounted for about 20 percent of Britain's national product. German markets began to be unified with the creation of the *Zollverein,* or the customs union, in 1834. France, by the mid-nineteenth century, was the leading producer of textiles on the continent. Modern markets were themselves a result of the Industrial Revolution.

The repeal of corn laws in Britain in 1846 was a triumph of industry over agriculture and followed the tilt of British legislative policies in Britain, which began to favor industrial towns over the agricultural countryside by the 1830s. These changes in the 1850s might be seen as the climacteric toward free trade in Britain followed by continental Europe. Again, free exchange and possibilities of peace were emphasized in intellectual thought best summarized in French economist Frédéric Bastiat's words: "Where goods do not cross frontiers, armies will."

DECLINE AND RENEWAL

Between the late nineteenth century and World War II (1939–1945), laissez-faire ideas declined as many countries turned again to restrictions on trade and policies of mercantilism enforced through the visible hand of the state. This rise in protectionism coincided with the growth of the modern welfare state, central planning, and public ownership. Criticism of these developments was leveled by thinkers like Austrian economist Ludwig von Mises, who argued that the calculations required to sustain an economy were too complex for central planners. The Austrian school (which included F. A. Hayek and von Mises) and the Chicago school (including Milton Friedman) of economists intensified their defense of laissez-faire in the mid-twentieth century in response not only to the Soviet and Chinese central planning models, which they attacked as inimical to human freedom and enterprise, but also to Keynesian policies that grew the welfare state in the West. Meanwhile, at the international level, the foundation of the General Agreement on Tariffs and Trade (GATT) in 1947 led to progressive doses of liberalized, if not free, trade among its member states. GATT evolved to become the World Trade Organization (WTO) in 1995; together the two bodies have undertaken nine major rounds of liberalizing trade negotiations among countries.

CONCLUSION

Despite the continuing presence of the WTO and other regional trade blocs, the cause of free trade is increasingly in jeopardy, at least in Western countries, due to slow growth rates, global financial crises, and fears of imports from emerging markets. Academic and policy communities question whether unregulated self-interest or markets by themselves generate wealth and consumer welfare without leading to vast income inequalities or deleterious business cycles. The political will to open international markets is also declining. Nevertheless, world exports of goods and services were at an all-time high of $15.8 trillion and $3.7 trillion, respectively, in 2008. Domestically, capitalism is flourishing, even if government intervention occurs in varying degrees. Nevertheless, despite a brief period of success in the 1980s influencing U.S. president Ronald Reagan and British prime minister Margaret Thatcher, laissez-faire advocates have yet to win the battle of ideas in politics. The political fortunes of laissez-faire from Colbert's France to the current regime in Communist China have been tied up in economic interests and their ability to persuade the state to "let go."

Language and Language Policy

Language policy involves taking an official or authoritative stand about languages and the use of languages in a given territory or state. Language policy that legitimizes language X may be perceived by the users of language Y to disfavor their language. Therefore, there are usually political, social, economic, and cultural consequences when one language is made official while others are not, making language policy not only a linguistic issue, but a political issue as well.

Language policy specialists are interested in the outcome of language acquisition, language use, and language change as a product of state-citizen relations. Language public policy studies are gravitating toward the following five special issue areas: linguistic history and etymology; official language policies and nation-building; language and culture; monolingualism, bilingualism, and multilingualism; and language policy management and development.

THE DEVELOPMENT OF LANGUAGE POLICY

While ancient languages abound, the written records of the kinds of language policies employed by ancient states have yet to be uncovered. From our contemporary perspective, the systematic treatment and study of language only appeared much later in the work of post-Enlightenment phenomenologists. Edmund Husserl and Ludwig von Wittgenstein were two nineteenth century European phenomenologists who exemplify research interest in the structure of language. The existentialist tradition in the work of French philosopher Jean-Paul Sartre and the ontological value of language and technology in German philosopher Martin Heidegger's work represent some of the more interesting turning points in contemporary political theory. Most modern political philosophers and political theorists themselves often focus on language and meaning. In *Language Policy and Modernity in Southeast Asia,* Antonio L. Rappa and Lionel Wee raise the complexities involved in understanding the social construction of language and the political consequences of the nonneutral construction of language in terms of linguistic instrumentalism, displacement, complementarity, equivalence, and language management systems.

The resources for language policy analysts include Swiss linguist Ferdinand de Saussure's linguistic structuralism and theory of the signifier and the signified (*document de langue*).

French anthropologist Claude Levi-Strauss viewed culture as a system of symbolic communication but through diachronic analyses rather than Saussure's synchronic analysis. Anthropologists Bronislaw Malinowski and Franz Boaz examined variations in genealogical linguistic histories. American linguist Noam Chomsky's ideas about surface structure and deep structure as *a priori* semantic constituents continue to dominate the study of language and its subfields. George Lakoff, an American student of Chomsky's interpretive semantics, built on Chomsky's structured/nonstructured rules involving reality-dependent grammar (native experts) rather than a grammar-dependent reality (scientific experts). In the "linguistic wars" that followed in the 1960s and 1970s, Lakoff and his collaborators tried to show how reality was an important variable in generative semantics—that is, influencing grammatical rules that governed phrase structure. But it was only in his coauthored book with Mark Johnson published in 1980, *Metaphors We Live By,* that Lakoff presented the seminal nature of his thesis: metaphor is central to political reality. Nonmetaphorical work is reserved mainly for descriptors of a physical science of the world. Metaphors tend to generate embedded nuances within vocabularies and the larger paradigms within which cultures exist. Hence, a single metaphorical unit can represent a potentially infinite set of meanings within a given culture. In the case of the Inuit, metaphors used in Inuit share the larger linguistic material of Eskimo languages; this is similar in standard Thai, Bahasa Malaysia, and Bahasa Indonesia. An officially recognized language with an abundant set of metaphors is likely to be a more useful policy instrument.

SHIFTING LANGUAGE AND LANGUAGE POLICY

Some scholars of language policy believe that languages tend to "shift" or evolve over time. Therefore, it would be useful for scholars to study an official language's evolution. This is especially important if the language in question might impact the existing government policies on language. For example, Joshua A. Fishman's graded intergenerational disruption scale in language policy analysis might be used to understand how languages shift. Rappa and Wee adapted the Fishman scale to examine how "an indigenous language, while widely used in highly prestigious domains, can, over time, become restricted to 'mere' community and family-based interactions" (2006, 131). An example of this is the *Papia Kristang* (the language of the Christians), a Eurasian Portuguese creole that arrived in Southeast Asia in 1511, that suffers from the fact that:

> as younger generations of speakers lose touch with the language so that most speakers tend to come from the older generations, there is, in the final stage, a very real possibility that indigenous language may be completely displaced . . . correlating with this decline in the fortunes of the indigenous language, of course, is the rise of its potential replacement, English. (131)

A significant contribution to the understanding of language policy and meaning comes from the postmodern and poststructural schools associated with Jean Baudrillard, Jacques Derrida, Michel Foucault, Henry S. Kariel, Jacques Lacan, Jean-François Lyotard, and Richard Rorty. Their complex analytical methods deconstruct language formations and language games as discursive power arrangements that impact society, culture, gender, class, and citizenship and the state to examine the marginal, the *other*, voice and noiselessness, contingency, weak ontology, simulacra, and "origins" in language policy.

THE IMPORTANCE OF LANGUAGE POLICY

Language policies are important because governments have long known that languages are valuable political tools of communication and control. Indeed, language policy is so important that very often official policies exist about how languages ought to be studied and taught within a given education system. Within democracies, there are often large lobbies for language recognition. While the United States, for example, does not have an official language policy, the wide use of Spanish within the American polity had led to Spanish being used in many government departments, offices, and bureaus. Because language itself is a very sensitive issue that can raise emotional feelings among people, language policies and their policy makers have to tread carefully as some language policies can do more harm than good.

In conclusion, research on language policy remains a very important area in policy studies and political science, as language policy is about legitimizing or "authorizing" a predominant human language in a given territory. The debates within language policy are significant for a large variety of political and linguistic reasons, including the life of the language itself, the value of the language to the people within a given language community, and the financial support that follows government policies on language.

Language and Politics

Anthropologists, social psychologists, and linguists have long known that language is not usefully thought of as a mechanism that conveys meaning all by itself. Meaning, political and

otherwise, is always a function of the context from which it springs. It is as dependent on the various needs, desires, myths, and legends that inform the society interpreting it as it is on the literal meaning of the words used to articulate it.

In *Doing What Comes Naturally* (1989), Stanley Fish targeted the political actor's ambitions by stating in the preface that "the realm of the probable—of what is likely to be so given particular conditions within some local perspective—is the only relevant realm of consideration for human beings." Given this abrogation of absolute truth, a political scientist, in the full majesty of the scientific project, might question the prominent role language has historically maintained in the political maneuverings of actors in the allocation of goods and values. One might assert that appropriation backed up by the credible threat, or actual application of violence, is the most measurably direct way to power, whereas nothing is directly appropriated by talk. What has been overlooked in such a stance is the cost of the opposition to one's appropriations, and it is to limit these costs that rhetoric has found its place in the political game.

The use of language to morally justify an action is precisely what makes politics distinct from other methods of allocating values. Not only is such language useful in homogenizing the reactions of one's allies to an action, but it can win the acquiescence of others whose lasting support is needed to reduce the possible opposition to one's own plans. In this way discourse has become the measure of long-lasting political effectiveness as opposed to the more immediately satisfying, but ultimately unstable, outcomes resulting from violent conquest. As Fish (1989) notes, it is not that the categories of the true and the good have been abandoned, "but that in different contexts they will be filled differently and that there exists no master context . . . from the vantage point of which the differences could be assessed" (478). Fish goes on to state that "truth itself is a contingent affair and assumes a different shape in the light of differing local urgencies and the convictions associated with them" (481).

Most pragmatists locate the origins of rhetorical, as opposed to philosophical, truth in the rise of democracies in fifth century BCE Greece. In 1907 Ferdinand C. S. Schiller wrote that "the rise of democracies rendered a higher education and a power of public speaking a *sine qua non* of political influence—and what acted probably as a still stronger incentive—of the safety of the life and property, particularly of the wealthier classes" (31). Language is an important catalyst for political action, because without it leaders could not serve the groups seeking political favors while encouraging spectators to abstract reassurances from a complex environment. Democracies have long realized that unmediated force equals weakness in politics just as it does in marriage. Because democratic politics is primarily about nonviolent persuasion and language is the least violent means of political persuasion we possess, the symbiotic relationship enjoyed by language and politics is crucial to effective democratic life.

A strong example of the subliminal nature of much political language is the speech act. John L. Austin is credited with describing, if not naming, the speech act in his 1962 book *How to Do Things with Words,* in which he introduces an illocutionary (or speech) act as the idea that "by saying something, we *do* something," as when a minister joins two people in marriage by saying, "I now pronounce you husband and wife" (1975, 108). In law, and by extension therefore in politics, certain phrases have all the import of acts, as when a person says that "I nominate Hillary Clinton to be president," "I sentence you to life imprisonment," or "I promise I'll pay you back on Thursday." In these examples the implicit authority or promises confirmed by such statements carry with them meaning significant enough to garner respect or raise expectations that should the speakers fail to follow through with their declaration or should they be made by someone without authority to speak, then there are real consequences in the world.

THE LANGUAGE OF POLITICS

Political language is at its most efficient when it is reifying an abstraction, a valuable asset in a contemporary political culture that deals in abstractions to a remarkable degree. Despite being an abstraction, the "state" for example has become a potent and obsessively protected symbol entirely on the basis of the language that describes it. It is part of a movement that has developed that encourages citizens to focus their political imagination on the quantitatively remote and symbolic aspects of urban life and away from the qualitatively personal relationships of family and community. This trend has magnified the possibility of people being manipulated through vague symbols that still engage them emotionally, albeit with less and less conscious comprehension over time. This becomes an even greater problem when cultural assumptions clash in heterodox social groupings.

Every culture contains a uniquely parochial system of values in its understanding of linguistic values. As Edward Sapir (1949) notes,

> distinctions which seem inevitable to us may be utterly ignored in languages which reflect an entirely different type of culture while these in turn insist on distinctions which are all but unintelligible to us. . . . It would be difficult in some languages . . . to express the distinction which we feel between 'to kill' and 'to murder' for the simple reason that the underlying legal philosophy which determines our use of these words does not seem natural to all societies. (36)

Even within a single society, there are subtle distinctions in word use that resonate at a different pitch for different audiences. The word *freedom* tends to be favored by those George Lakoff describes in 2004 as employing "strict father" principles to the world. It suggests a "freedom from" removal of constraints so that the actor can engage in self-improvement and familial protection "free" of the interference of dangerous liberals and their ideas. The word *liberty,* on the other hand, speaks to those who favor a "nurturing parent" approach who see civil liberties as a protection that offers citizens the "freedom to" bring out the best in people.

A recurrent problem with political language is its relatively short shelf life. The chronic repetition of stale metaphors

evokes only conditioned and uncritical responses in one's supporters, who are grateful for the opportunity to lapse into a mentally restful state while old clichés wash comfortingly over them. On the other hand, such language produces no material proposals for the opposition to critique. This situation forms the focus of George Orwell's 1946 essay "Politics and the English Language," in which he criticizes the bad writing that signals a political tract: "If the speech he [a political actor] is making is one that he is accustomed to make over and over again, he may be almost unconscious of what he is saying, as one is when one utters the responses in church" (Orwell, 1961, 363). Once a term, or a series of statements, becomes a regular vehicle for expressing group interests, it loses its descriptive qualities, becoming merely evocative and consequently extremely dangerous. To declare that a "worker has nothing to lose but his chains" or to insist on asking "whose side are you on?" during a long strike that threatens the viability of the worker's company creates an uncompromising mood that threatens to transcend the reality of the global marketplace, the incremental value of any offer the company makes, or the sustainable lifestyle that may vanish once the company closes its doors.

While spoken words have the power to create negative outcomes for individuals who rely on their authority for good, language that is never uttered can be equally lethal to rational outcomes. For example, a growing number of unlikely foodstuffs, including flavored soda drinks, most condiments, and even McDonald's salads, contain high-fructose corn syrup. Highly refined corn syrup has been linked for some time to an epidemic of obesity, type 2 diabetes, and heart disease in Americans, including an alarming number of children. To explicitly verbalize the problem is to begin to look for a solution, while for those who cannot or will not articulate the problem, there is no possibility of articulating a solution.

THE POLITICS OF LANGUAGE

Political correctness, which seeks to minimize offense to racial, cultural, or other identifiable minority groups, is the result of the increasingly vague understanding people have of the heuristics of language that make up so much of our contemporary lexicon. Critics have argued that political correctness is tantamount to censorship, endangering free speech by limiting what is considered acceptable public discourse in a culture. It has even been argued that political correctness is a Marxist plot to express liberal conceptions of free speech as a pernicious form of social and cultural repression, especially in federally controlled institutions such as government offices and universities.

There is little doubt that word choices have measurable framing effects on the perceptions and attitudes of listeners. The practical question is whether the use of racially derived terms, for example, promotes racist acts and attitudes. In the case of *ascription,* which is to *description* as *racism* is to *race,* it appears inarguable that to view ourselves as relatively variable in terms of personality, behavior, and mood while viewing others as much more predictable in their personal traits damages our ability to

accept them as fully human in ethical, if not ontological, terms. To declare women incapable of parallel parking serves to irrationally and unfairly reduce one's capacity to accept women as deserving of as much respect as men, at least in the realm of vehicular manipulation.

For political science, a concern worthy of analysis is the degree to which people forget to apply thought to the application of self-censorship leading to certain words becoming taboo without sufficient critical evidence to back such an elevation in etymological power. In the United States, the so-called N word is in danger of such critical neglect, in that it is a common expletive among young blacks of a certain generation but is social and political poison coming out of a nonblack person's mouth. In 2008 New York City banned the use of the word *nigger* by all citizens. The ban is a symbolic one and it is, in effect, a plea for the public to stand in solidarity to restigmatize the word, and it underlines the emotion and political potential that can be condensed into a single word.

As documented by Randall Kennedy in *Nigger: The Strange Career of a Troublesome Word* (2002), even words that have slight resemblance to the "troublesome word" have caused problems, such as when David Howard, a white city official in Washington, DC, was forced to resign from his job when he noted that the administration would have to be "niggardly" with its finances in the upcoming year. Black colleagues took offense at his use of the word, and even when it was pointed out that niggardly has no etymological connection to the American word, coming as it does from an Old Norse word meaning a miserly person, and that Howard, who was gay, would not have knowingly maligned another minority, they still insisted that he step down.

Political language has an even darker side, which is generally evoked by the words *propaganda* and *rhetoric,* and although their reputations are much maligned by philosophers they continue to have real political value. At root, effective propaganda does little more than call the attention of a group with shared interests to a proposed line of action that appears to further their interests, as does the federal government's food pyramid. Words and phrases are chosen that permit the broadest possible number of sympathetic associations, which is the criticism aimed at it by more rationally inclined analysts, whereas if those evocative phrases are substituted for clear and truthful declarations, the propagandists fail in their task. Poor propaganda attempts to change citizens' behavior without evoking the concerns of its target audience, since what is valid for philosophy or logic is anathema to propaganda. The worst aspect of effective propaganda is that it offers a substitute for thinking on the part of this group, because someone has already done the thinking that they should have done themselves.

RHETORIC

Contrary to the arguments of philosophers stretching back to Plato, the power of rhetoric is not due to any mystical power in words themselves, or even in their particular arrangement, but rather in the degree to which they answer the emotional and practical needs of human beings. Men have long harbored

the belief that the perfect "pickup line" will result in an infallible series of sexual conquests, whereas the truth is that only on those occasions when the emotional needs of the object of desire match the tenor of the introductory statement will a successful union result.

Not all of the Platonists' complaints are invalid, however; it remains true that accuracy or truth has little currency in rhetoric, because the single criterion of value is that the statement resonates with the beliefs of the target audience. These beliefs may be as irrational or as false as any one might imagine, but if the rhetor fails to conform to the belief systems of the group, no organizational or grammatical principle will bring about a political success. As Richard Rorty (1979) points out, the only political certainty human beings have access to is that "our certainty will be a matter of conversation between persons, rather than a matter of interaction with nonhuman reality" (156). Such a conversation will no doubt be filled with the mixture of sensible and irrational beliefs to which humans are prey. Teachers who hear the phrase "federally mandated testing" will not react to the dictionary definition of those three words but rather will have a Pavlovian response filled with social, economic, and professional anxieties that they might fairly or unfairly believe is directed at curtailing teachers' freedom to teach or even at terminating teachers' employment. Schiller (1907) states that "it is still possible to observe how society establishes an objective order by coercing or cajoling those who are inclined to divergent judgments in moral or aesthetic matters" (38). This cajoling rarely focuses on truth claims made by those who remain socially recalcitrant, as a philosopher might demand, but on the utility an alternative social and political approach promises. Truth claims are relative to individuals, and different individuals might make a series of reasonable but different arguments based on the same evidence that, when contradicted, cause individuals to stop interacting with the heretical speaker. However, utility, varied as it is, when activated rhetorically as a motive, has the power to cause the agent to agree to the principle in order to enjoy the specific benefit that agent has in mind. Rorty believes that winning debates with rhetorical imagination will return us to "where the Sophists were before Plato brought his principle to bear and invented 'philosophical thinking': we shall be looking for an airtight case rather than an unshakeable foundation" (157).

This accumulation of emotional value in individual words led to George Lakoff's (2004) explanation of the power of political framing. In *Don't Think of an Elephant,* Lakoff notes the power of certain words to frame a debate so that one's opponents are constantly defending an emotionally unacceptable position they have been led into by the careless use or dismissal of a trigger word. The Democrats' failure to prevent the phrase "death tax" from framing the debate in the late 1990s rather than the more emotionally neutral "estate tax" caused them to fight the subsequent legislative battle to repeal it on their back foot. Even wealthy Democrats were concerned over the inevitability of a punitive tax on the death of a loved one, to say nothing of the nonaligned public, who were unclear as to what an "estate" might involve but were quite sure about

the finality of death and taxes. When their political naiveté was exposed they were quick to react. In May 2005 Bill Frist, the U.S. Senate majority leader, declared that to defeat the Democratic filibuster against the Republican state supreme court nominees he would employ "the nuclear option." Although Republican PR firms spent millions to rename the attack on the filibuster "the constitutional option," their efforts could not overcome the emotional power with which the word *nuclear* was invested. Such trigger words can mollify and placate just as easily as they can excite and radicalize. Indeed most trigger words, such as *social security, national security, democratic election,* and *military intelligence,* overcome their oxymoronic juxtaposition when they serve to calm the public's fears. When common language is profoundly irrational in its claims, it is wiser to think of it as a heuristic series of cues than a tool for reasoned analysis; to ignore this application in the real world is to ignore the political heart of rhetoric.

Fish (1989) gives the rhetorician of common language a true place in a state's hierarchy of values:

> The skill which produces belief and therefore establishes what, in a particular time and a particular place, is true, is the skill essential to the building of a civilized society. In the absence of a revealed truth, rhetoric is that skill, and in teaching it the sophists were teaching "the one thing that mattered, how to take care of one's own affairs and the business of the state. Laski, Harold Joseph

Harold Laski (1893–1950) was a twentieth-century British political theorist and the author of more than twenty books and thousands of articles. He was also a celebrated teacher at the London School of Economics and Politics, a prominent leader in the Labour Party, and a widely read public intellectual

in both Britain and America. His extraordinary career led one Oxford historian to dub 1930s England "The Age of Laski."

Born in Manchester, England, Laski was the son of a successful Jewish cotton shipper. He was a precocious youth who suffered from bad health. At the age of sixteen, Laski met his future wife, Frida Kerry, who encouraged his interest in eugenics and the suffragette movement. His first article, "The Scope of Eugenics" (1910), published in the *Westminster Review,* impressed Francis Galton, the scientist who founded eugenics. Laski entered Oxford University to pursue his interest in science but switched to studying history and politics under H. A. L. Fisher and Ernest Barker.

After graduating from Oxford in 1914, Laski was hired to write editorials for the *Daily Herald*. Turned down for military service due to a weak heart, Laski accepted a history lectureship at McGill University in Canada and, two years later, taught at Harvard University. To supplement his teaching salary, Laski contributed articles for the *Nation* and the *New Republic* and published his first book, *Studies in the Problem of Sovereignty* (1917), in which he praised American pluralism and the federal system. His second book, *Authority in the Modern State* (1919), called for trade union organization and rigorously defended free speech. Laski's writings not only established his scholarly reputation, but they also enabled him to cultivate friendships with prominent American figures including associate Supreme Court justice Oliver Wendell Holmes Jr. and future president Franklin Roosevelt. While in America, Laski also had begun writing one of his most widely read works, *A Grammar of Politics* (1925). In this book, Laski set out the principles of Fabian socialism and explored how the British industrial society could be organized according to a more just productive and distributive plan. Like most of Laski's writings, *Grammar of Politics* combined general theorizing with practical suggestions for reforming the existing society.

Upon returning to England in 1920, Laski joined the London School of Economics. He was affiliated with the London School for thirty years and, in 1935, became professor of political science. Laski's radical politics tested the limits of academic freedom. Critics complained that he indoctrinated students in communism. Laski, however, may be more aptly described as a democratic socialist. In Isaac Krammick and Barry Sheerman's 1993 *Harold Laski: A Life on the Left,* Laski is quoted as saying "The true socialist is a libertarian, not an authoritarian."

Laski preferred using words rather than a violent revolution to transform society. Putting his philosophy into practice, he helped found the Left Book Club (which launched English author George Orwell's writing career) and *Political Quarterly,* a British journal on politics. In the hope that an educated workforce would bring "revolution by consent" through the electoral process, he encouraged workers to start their own literary periodicals.

Laski often presented himself as a radical, intellectual outsider, but he also was an insider who influenced current events through connections with important political actors. While keeping up his vigorous teaching and writing schedule, he served from 1937 to 1949 on the executive committee of the British Labour Party and was elected chair when the party came to power in 1945.

In his final years, Laski published one of his most popular works on American politics and society, *The American Democracy: A Commentary and an Interpretation* (1948). He remained actively engaged in teaching and writing until his death from pneumonia at the age fifty-six.

Lasswell, Harold Dwight

American political scientist Harold Dwight Lasswell (1902–1978) was considered a great scholar and a terrific mentor, but his name was never a well-known one in his field. Lasswell joined the American Society of International Law in 1948. He was vice president of the organization from 1966 to 1970 and then held the office of president until 1972. While part of the society he created the Board of Review and Development, was a chair on the Panel on Communications and Linguistics, and served as a member of the Panel on Self-Determination.

In his first book, *Propaganda Techniques in the World War* (1927), Lasswell creates what he calls propaganda analysis to understand the complexities of collective communication flows. This later bloomed into the fields of content analysis and communications theory. Another of Lasswell's most remembered contributions is to the idea of modern democratic theory. He mentioned four points that new democratic systems would have to take into account: flawed personality structures, man's predisposition to self-defeating symbolism, the rise of precarious elites of ability, and the surfacing of contemporary propaganda.

One of Lasswell's more interesting studies was of political symbolism, one of the four parts of his democratic theory. He put forth the idea that symbols are used to exemplify power. An example of this can be found in barriers used to separate political power from intruders. In medieval times this would be a moat. In the contemporary world this could mean walls or gateways. Lasswell also originated the term *policy sciences,* which are an approach to understanding and solving problems, contributed to multidisciplinary inquiry about man in society, and created a structure of inquiry about worldwide social processes.

In his 1939 work *World Revolutionary Propaganda: A Chicago Study,* Lasswell stated that propaganda is "the control of attitudes by the manipulation of symbols." Since the advent of world wars, Lasswell argues, democracies have needed to

bring their entire nation's focus on the single effort of winning the war. To achieve this, the government must turn to propaganda to keep the citizenry in agreement with the government's cause. Lasswell gives an example of this as the war bonds issued during World War II (1939–1945). He goes on to show that propaganda is used extensively in circumstances other than war and uses its expansion in the United States during the Great Depression as an example. He claims that propaganda has become a part of the democratic process and observes that elites see world politics as only a competition where the most deceitful image maker wins.

Lasswell is also well known for his use of psychoanalysis to explain political behavior. He argued that applying Freudian theory to politics would reveal deep knowledge of politicians and political systems themselves. Lasswell believed that to survive in the future political realm, such analysis was pressing and necessary.

Latin America and Globalization

Since the 1990s, *globalization* has become a buzzword in Latin American political science. Although it has many meanings, the term is generally employed as a metaconcept to explain a complex set of processes. These processes include the liberalization of trade; the emergence of new forms of social relations; and increasing cross-border flows of services, capital, technology, people, information, ideas, and culture, facilitated in large part by innovations in communication, technology, and international governance structures.

DEBATES SURROUNDING GLOBALIZATION IN LATIN AMERICA

Two central debates have guided much of the literature on Latin America and globalization. The first debate centers on the novelty, scope, and inevitability of globalization's effect on the Latin American state. On this account, Held (2000) identifies three basic positions in contention: the *globalist,* who sees globalization as inevitable and irresistible by the national order; the *traditionalist,* who rejects the novelty of the process and clings to traditional, state-level explanations; and the *transformationalist,* who sees a significant shift at the global level but questions globalization's inevitability and

scope. The second debate, in contrast, accepts globalization's transformative properties and seeks to unravel its positive and negative features in Latin America. This debate is typically characterized by two, competing narratives. The first narrative, *globalization as progress,* has tended to stress the positive features of globalization in Latin America, including its capacity to increase wealth, freedom, democracy, cultural diversity, civil society, and social relationships. The second narrative, *globalization as disaster,* has tended to stress the negative features of globalization in the region, including its imperialistic tendencies, exploitation of labor and the poor, the undermining of democracy, the homogenization of culture, and the destruction of the natural environment.

CURRENT GLOBALIZATION ISSUES IN LATIN AMERICA

What is new about globalization for Latin America? As demonstrated in the writings of Raul Prebisch, Latin American dependency theorists, and the Import Substitution Industrialization policies of the 1950s and 1960s, Latin America has long recognized that it is part of an international economic system. However, when referring to globalization in Latin America, scholars typically are referring to the critical period of state restructuring and market liberalization that began with the Mexican debt crisis in 1982 and 1983 and continued throughout the 1990s and 2000s. The root cause of this crisis is often traced back to the world energy crisis in 1973, when the Organization of the Petroleum Exporting Countries (OPEC) limited the supply of oil and drastically raised prices. While many Latin American countries were severely hurt by the increase in oil prices, OPEC countries accumulated unprecedented amounts of excess reserves, or *petrodollars,* which were subsequently recycled through loans to Latin America and other middle-income developing countries to help these countries pay for oil and elaborate development projects. A second oil shock in 1979 led to additional lending to help Latin American countries pay for oil price increases. This second price increase also produced inflationary pressures, which industrial states sought to control by raising interest rates. The overall impact of these events was excess lending, inflation, and higher interest rates, leading to the debt crisis in Latin America in 1982. Starting with Mexico, numerous Latin American countries found themselves no longer able to service their debt payments. On the brink of bankruptcy, these countries were forced into negotiations with multilateral lending institutions, namely, the International Monetary Fund (IMF) and the World Bank.

The ensuing restructuring initiatives and the prolific role of multilateral lending institutions in these negotiations of the mid-1980s is often taken as early evidence of globalization's presence in Latin America. These negotiations spawned a multitude of economic policy recommendations that meant to stabilize Latin American economies, rectify the region's balance of payment difficulties, and integrate Latin American economies into the emerging global economic system. Initial measures in the 1980s included reducing deficits, restricting credit,

instituting devaluation, and holding down wages. However, beginning in the 1990s, more extensive market liberalization policies were deemed necessary and subsequently introduced throughout the region. In some cases, such as Nicaragua in the early 1990s, market liberalization initiatives were introduced directly and voluntarily by Latin American political and policy elites who were committed to an emerging free market international policy culture. In other instances, such as Bolivia in the late 1990s and 2000, market liberalization reforms were introduced as conditions of IMF and World Bank lending through structural adjustment programs. The conditions of these loans entailed a variety of market liberalization measures, including the reduction of tariffs and the elimination of quota restrictions, privatization of public companies, deregulation, curtailment of social spending, and reductions in the cost of labor. A well-publicized instance of structural adjustment is the privatization of the Cochabamba water supply in 2000 as a condition of Bolivia's acceptance of a $25 million loan from the World Bank that year. The economic philosophy behind this restructuring effort is often referred to as *the Washington Consensus,* a phrase first coined in 1989 by John Williamson, then of the Washington-based Peterson Institute for International Economics, to connote the consensus that existed among members of the U.S. Congress, international financial institutions, the U.S. Federal Reserve Board, and U.S. think tanks about what constituted desirable economic policy reforms for stabilizing Latin American economies and integrating Latin America into global markets.

EFFECTS OF GLOBALIZATION ON LATIN AMERICA

Given the number of Latin Americans living below the poverty line, the market liberalization policies and global economic integration plans associated with globalization have been contentious policy solutions in the region. For example, during the 1990s and 2000s a number of Latin American countries privatized their water supplies to reduce state spending and open channels for foreign investment. This move sparked massive resistance from civil society organizations, arguing that water is a basic necessity of life and a basic right of the people as exemplified in Bolivia's Cochabamba "water wars" in 2000. In addition to privatization, numerous Latin American countries engaged in contentious social policy reforms, capping social spending, launching ambitious decentralization projects in health and education, such as Argentina, Colombia, and Mexico in the 1990s. Some countries, like Nicaragua in 1993, even went so far as to implement a system of user fees in education and health care. In response, actors from various segments of civil society have mobilized to confront their governments and to rally against a perceived futility and cruelty of free market solutions.

POLITICS AND GLOBALIZATION IN LATIN AMERICA

In addition to economic restructuring and global market integration initiatives, globalization is associated also with the concerted move toward political liberalization, political reform, and democratization in Latin America. These initiatives were cast under the rubric of "good governance" and were promoted extensively by the World Bank and other international institutions. The demands for global market integration reinforced pressures for governance reform in Latin America as foreign investors demanded investment guarantees and political stability as safeguards for their investments. The initiatives for good governance reform included anticorruption measures, the creation of judicial branches, accountability reforms, political liberalization, and democratization. Although the impact of these initiatives is debatable, a growing number of countries have nevertheless proven capable of surviving economic crises and transferring power through elections. However, despite adopting electoral procedures, many Latin American countries continue to suffer from high levels of corruption and clientelism.

While global market integration initiatives and good governance reform are said to constitute *globalization from above,* globalization also has led to a convergence among diverse grassroots movements in Latin America, a process referred to as *globalization from below.* Innovations in technology and communications have enabled local movements in Latin America to become aware of common interests, build networks and alliances, and promote a unified front in the struggle for social justice. Emphasizing the grassroots nature of social movements and the solidarity and networking properties that link them across traditional boundaries, scholars of this alternative perspective demonstrate how globalization enables civil society to pressure states and other powerful actors to take certain positions. For example, in their struggle for land reform and social justice that began on January 1, 1994, the same day the North American Free Trade Agreement entered into force, the EZLN (Zapatista Army of National Liberation) built key networks and alliances with the international community that enabled the movement to achieve significant victories in its struggle against the Mexican state. Labor unions and grassroots nongovernmental organizations (NGOs) throughout Latin America, such as Brazil's Landless Workers Movements, have appealed also to global civil society, building transnational advocacy networks to lobby for land reform, fair wages, human rights, education, restrictions on child labor practices, and other policy changes.

The debates surrounding globalization continue to this day. Specifically, the literature on this subject continues to examine and explore the scope and depth of neoliberal penetration in the region, the capacity of states to resist these pressures, and the benefits accrued from global policy prescriptions. In recent years, these debates have taken a new twist as several left-leaning social movements have swept to power on distinctly antineoliberal agendas. The election of Hugo Chávez in Venezuela (1998), Luiz Lula da Silva in Brazil (2002), Néstor Kirchner in Argentina (2003), Evo Morales in Bolivia (2006), and Daniel Ortega in Nicaragua (2006) may be a sign that Latin Americans are reconsidering their role and place in the new, global economy. For example, Chávez has called for "alter-globalization" in Latin America through Pan-Latin Americanism,

expressed through regional cooperation in trade negotiations with the rest of the world. While a number of countries have expressed their support for this arrangement, it remains to be seen if Latin America can develop and sustain its own, unique alternative.

Latin American Political Economy

Latin America's political economy has been marked by major swings from outward-oriented, liberal trade policies in the late nineteenth and early twentieth centuries, to some of the most sustained efforts at import-substituting industrialization (ISI) in the mid-twentieth century, back to significant experiments in neoliberal, market-oriented reforms in the late twentieth century. Economic development strategy proved to be the most contested issue on the policy agenda in Latin America in the twentieth century. Agrarian interests and transnational capital have preferred free trade and liberal investment policies since the 1880s and earlier, while populist coalitions of the domestic business class, workers, and many peasants have advocated protectionism and state control of the economy. International actors, especially from the United States and including international financial institutions such as the International Monetary Fund (IMF), have played critical roles as they have pursued their investment and trade interests or pressured Latin American governments to adopt orthodox economic policies.

While the Latin American political economy has been strongly influenced by free trade liberalism emanating from Britain and the United States, a homegrown challenge to liberal hegemony has come from dependency theory. Dependency theory grew out of Latin American intellectuals' reflections on the constraints posed to economic development and democratic politics given the region's place as a primarily natural resource or agricultural exporter in the global capitalist economy. Dependency writers emphasize the historical roots of contemporary underdevelopment and non-democratic practices. Latin Americans' choice to focus on primary product exports owing to their comparative advantage in those goods worked to their disadvantage because the terms of trade favored the manufactured goods purchased from the industrialized nations. Dependency writers emphasize class conflict as the driving force in Latin American politics, seeing the local bourgeoisie as the agents of transnational capital and highlighting the role of the United States in perpetuating the dominance of economic elites. Dependency writers provided an intellectual basis for ISI pursued by regional governments in the mid-twentieth century.

PHASES IN LATIN AMERICAN ECONOMIC POLICY

The Iberian empires strived to maintain tight mercantilist control of their colonial economies but were often thwarted by smugglers who sought to trade more directly with Britain, its American colonies, and northwest Europe. The destruction wrought by the wars of independence (1810–1825) caused many newly independent republics to turn inward to rebuild their economies. However, conflict between those preferring free trade and those favoring greater central government control of the economy emerged early in the postindependence period. International demand for primary products—foodstuffs, nitrates, fertilizers, and industrial ores—grew as Europe and North America industrialized in the late nineteenth century. Landed elites and mining interests responded by promoting an export-import model of economic growth. Significant volumes of British and later American capital flowed into the region to finance the building of railroads and ports and the development of mines and food-processing factories.

The export-import model built the fortunes of the landed elites of the Argentine and Uruguayan pampas; coffee growers in Brazil, Colombia, and Guatemala; and U.S. and British mining, sugar, and fruit-growing concerns in countries ranging from Chile to Guatemala to Cuba. The middle and working classes grew as immigrants and country dwellers flowed into the burgeoning cities to service the growing economy. When the 1929 stock market crash depressed demand for Latin American exports, those urban sectors became the social bases for ISI, promoted by populist leaders Getúlio Vargas in Brazil and Juan Perón in Argentina, as well as by Mexico's Institutional Revolutionary Party (PRI) and then most other governments in South America in the 1940s and 1950s. The ISI model generated tension between those sectors favoring the export-import model, especially agricultural exporters who preferred free trade, and the industrialists and workers who would be protected by tariffs and other restraints on trade.

ISI proved successful in terms of replacing imports of consumer goods. Countries with small domestic markets sought to expand them by forming common markets such as the Andean Pact and the Central American Common Market. However, domestic firms proved resistant to tariff reductions, the ISI economies remained dependent on the advanced industrial

economies for capital goods imports, and the capital intensivity of Latin American ISI did not absorb the rapidly growing labor supply. Frequent balance-of-payments crises provoked the imposition of orthodox structural adjustment policies demanded by the IMF to resolve such external disequilibria, yielding little in the way of new economic growth but exacerbating political conflict in Argentina and Brazil. By the late 1970s, economic stagnation, a highly skewed income distribution, and growing external debt resulted, despite attempts by harsh authoritarian regimes to reinitiate industrial growth with both orthodox and heterodox stabilization programs.

Under military rule, Chile in the late 1970s adopted the neoliberal strategy of removing trade barriers, deregulating financial markets and inviting in foreign investors, cutting government subsidies to both consumers and domestic producers, and privatizing state-owned enterprises. While other countries initially sought to weather the debt crisis-induced regional depression of the 1980s through heterodox strategies such as wage-and-price freezes and the surprise introduction of new currencies, most eventually joined Chile in adopting neoliberalism, beginning with Mexico and Bolivia (1985), followed by Argentina (1989), Peru (1990), and finally Brazil (1994). The orthodox policy mix adopted by these nations came to be called the *Washington Consensus,* reflecting strong advocacy by the IMF, the World Bank, and the U.S. Treasury.

While neoliberalism's strongest performer, Chile, has experienced more than two decades of sustained economic growth, the diversification of its export products and markets, and increasing opportunities to invest in other Latin American economies, Chilean income distribution remains severely skewed. Mexico has maintained economic growth by yoking its economy to that of the United States via the North American Free Trade Agreement (NAFTA). However, hundreds of thousands of Mexicans emigrate to the United States annually because Mexico's national economy cannot create enough jobs to meet the growing labor supply. Argentina and Brazil decided to avoid the worst aspects of global economic competition by creating the Southern Cone Common Market (MERCOSUR). Argentina's pursuit of neoliberal policies came to an abrupt end in the economic crisis of 1999 to 2002, during which the IMF refused to bail out the nation it had regarded as an exemplar of orthodox policies after a decade of supporting its fixed exchange rate, arguably the source of that crisis.

CONTINUING CHALLENGES

Neither the trickle-down distribution model in force when liberalism has been in vogue nor the more direct redistributionist policies of populism had much impact on the pattern of income distribution inherited from colonialism. Education policies create too few highly trained scientists and engineers and too many barely literate individuals for the region's economies to effectively capitalize on investments in high-technology industries. Many elites continue to advocate free trade in the belief that only competition can force their societies to become efficient, but critics suggest that only those who already have capital or have benefited from a high-quality education, namely the elite itself, will benefit from free trade.

Latin American Political Thought

Latin American thinkers have always engaged themselves with the main intellectual currents emanating first from Europe and later from the United States, adapting them to their particular societies. After securing independence from Spain and Portugal, the region confronted the challenges associated with nation-building, while liberal and conservative parties, founded in many countries, provided contrasting views. Early Latin American liberalism was infused with notions of republicanism and constitutionalism but gave them a philosophical foundation that generally departed from traditional social contract theory. Juan Bautista Alberdi, Argentina's most notable liberal thinker, argues in his *Bases y puntos de partida para la constitución política de la República Argentina* (1852) that each nation receives from God a particular nature and character, and therefore the role of legislators is to discover and reflect those traits in their constitutions.

In the final decades of the nineteenth century, ideas associated with European positivism swept the region. Order and progress became appealing principles to nations embarked in state building. Positivism provided a secular rationale for the government of the enlightened and educated, and while positivists had strong republican feelings, they rejected demands for universal suffrage and unfettered democracy with the argument that illiterate and poorly educated masses could not possibly serve as the foundation for a well-designed order. In Mexico, positivist thinkers known as *Los Científicos* (The Scientists) provided both the legitimizing ideology and the technocratic cadre for the despotic Porfirio Díaz regime

(1884–1911). Benjamin Constant Botelho, founder of the *Socie-dade Positivista do Brasil,* became influential among the military circles that eventually deposed the emperor and established the republic in Brazil. In Peru and Chile, positivist thinkers advocated in favor of strengthening public education.

LATIN AMERICAN POLITICAL THOUGHT IN THE TWENTIETH CENTURY

The advent of the twentieth century brought new ideas to the region. The influx of European workers, the rejection of the consumerism and materialism that many thought characteristic of the United States, and the examples of the Mexican and Russian revolutions, among other factors, generated an unprecedented outburst of intellectual activity. In a clear rejection of the scientific outlook and faith in material progress of positivism, a number of influential thinkers advocated spiritual revival and humanistic values. In Cuba, José Martí offered a new foundation for Latin American nationalism based on a spiritual attitude toward life. But it was the Uruguayan José Enrique Rodó who personified this idealist outlook that ended up influencing so many of his contemporary fellow writers. In his memorable *Ariel,* Rodó confronted the materialism and utilitarianism of Caliban (that the United States represents) to the idealism and classical values and virtues embodied by Ariel. This contrast between the crass materialism of the north and the spiritual ideals of the south became a powerful undertow that influenced writers in the region such as José Ingenieros in Argentina, Antonio Caso in Mexico, and Alejandro Deústua in Peru.

While some found comfort in *Ariel*'s humanism, others embraced the emergent ideologies of anarchism and socialism. Latin American anarchism, influenced by Italian and Spanish anarchosyndicalism, is rightly credited with creating the labor movement in the region. One of the most influential anarchists was the Peruvian Manuel González Prada, who harshly criticized his nation's politics for being corrupt and out of touch with common citizens. His famous indictment in *Pájinas Libres* (1894), "Peru today is a sick organism: wherever you poke your finger, pus erupts," put into words the feelings of disaffection prevalent among many Peruvian intellectuals in the wake of their country's military defeat in the War of the Pacific (1879–1884). Other prominent anarchists were Mexican Ricardo Flores Magón, Argentine Alberto Ghiraldo, Brazilian Avelino Fóscolo, and Colombian Vicente Rojas Lizcano (aka Biófilo Panclasta).

SOCIALISM, APRISMO, AND LIBERATION THEOLOGY

Socialist thought also emerged with force during this period, and one of the most original thinkers in this tradition was Peruvian José Carlos Mariátegui. After a short exile in Europe, Mariátegui founded the Peruvian Socialist Party and began to develop a Marxism that was dramatically at odds with the Soviet orthodoxy. In 7 *Ensayos de Interpretación de la Realidad Peruana* and *El Problema de las Razas en América Latina,* Mariátegui argued that the indigenous problem in Peru was essentially a social and economic problem, not a racial one, thus rejecting Soviet demands for independent indigenous republics. While less devoted to intellectual production, Luis Emilio Recabarren in Chile, Astrojildo Pereira in Brazil, and Aníbal Ponce in Argentina were also instrumental in developing socialist thought in the region. Julio Antonio Mella from Cuba deserves special mention for he, like Mariátegui, also clashed with the Soviets over policy disagreements. One of Mella's pamphlets, *Los Nuevos Libertadores* (1924), stresses that the main challenge socialists face is to adapt their doctrine to their own reality.

Decades later, socialist thought received a significant boost from the Cuban revolution and its most important theoretician, Ernesto "Che" Guevara. In his *La Guerra de Guerrilas* (1960), Guevara drew on his revolutionary experience to develop a new theory of revolution that came to be known as *foquismo.* According to this view, a small core (*foco*) of committed revolutionaries can create the subjective conditions for revolution when the objective conditions are absent. This theory, later expanded by Regis Debray, became an article of faith to many of the guerrilla organizations that sprang up in Latin America and Africa in the 1960s and 1970s.

An important ideological alternative to socialism came from the works of Victor Raúl Haya de la Torre, a Peruvian who founded the *Alianza Popular Revolucionaria Americana* in Mexico City in 1924. Haya defined *Aprismo* (as Haya's ideas came to be known) as a noncommunist Marxist movement that advocated regional unity to fight American imperialism and a national front of manual and nonmanual workers to demand the progressive nationalization of land and industries. Later on, when campaigning for the 1931 presidency, Haya tempered the most radical aspects of his ideology by proposing a "minimal program" that included state reform, redistribution of wealth, land, and tax reform, as well as free and universal education and social security. *Aprismo* influenced the programmatic outlook of key Latin American parties such as Venezuela's *Acción Democrática,* Costa Rica's *Partido Liberación Nacional,* and Bolivia's *Movimiento Nacionalista Revolucionario.*

In more recent years, a highly influential progressive thought emerged from the fusion of Marxism and Catholicism, which came to be known as liberation theology. Leonardo Boff and Gustavo Gutiérrez, a Brazilian and a Peruvian priest, are among the most important representatives of this confluence. Liberation theology argues that salvation is not possible without achieving liberation from unjust social and economic structures. Thus, fighting poverty and adopting a "preferential option for the poor" become imperatives for the Catholic Church's evangelical mission.

Latin American Politics and Society

Latin America is composed of those twenty-one republics of the New World formed from the Spanish and Portuguese empires. Often former British, French, and Dutch colonies in or bordering on the Caribbean are included in the definition, although by culture and historical experience they are distinct. Because the scale of the nations ranges from continental-scale Brazil, with more than 190 million people, down to Panama, with about three million, generalizing about politics in the region proves challenging. However, the twenty-one nations speaking Spanish and Portuguese share the historical record of Iberian rule, including the culture the colonizers and colonized forged together during nearly three centuries of colonial rule; a common effort to achieve late economic development; and two centuries' experience of the economic, political, and now cultural influence of the United States. Political ideas and practices initiated in one or more countries of the region often diffuse across the continent due to these shared characteristics and the common familiarity with the Spanish language.

As of 2008, all of the Latin American states except Cuba had adopted electoral democracy. However, only Colombia, Costa Rica, and Venezuela can boast a half century of democratic rule, and Colombia's record of civil war and Venezuela's constitutional discontinuity leaves only Costa Rica with an unambiguous record of more than fifty years of democracy. Independence came to Latin America as the result of the disruptions in colonial rule caused by the Napoleonic Wars (1799–1815). Although conservatives attempted to preserve most features of the colonial political regime—an established church, an inward-oriented economy based on the hacienda (a largely self-sufficient landed estate), and a highly stratified society based in part on racial distinctions—liberals in favor of free trade and universalistic norms won out after intense postindependence struggles. Nineteenth-century liberalism tended to be restricted to property holders and educated members of Latin American societies, however. Hence, most Latin American nations began the twentieth century governed by limited, oligarchical democracies, most of which fell to military coups in the 1930s. Democracy returned to the region in a populist, mass-based form after the Second World War (1939–1945), but it again succumbed to military rule in the 1960s and early 1970s before resurfacing in the 1980s and 1990s. Scholars such as Karen Remmer and Kurt Weyland consider today's democratic regimes more stable but less inclusive and responsive than the democracies of the postwar era.

CONTENDING MODES OF EXPLAINING LATIN AMERICAN POLITICS

Social scientists seeking to explain the rise and fall of democracy in the region and the public policy choices made by Latin American governments have typically approached the topic from four different approaches. A long-popular mode of explanation emphasizes Latin America's Iberian heritage, including the centralist traditions of its colonial administrations and the domination of the intellectual sphere by the anti-Reformation Catholic Church. Frequently, those writing about Latin America from a culturalist perspective, such as Howard Wiarda and Claudio Véliz, draw sharp contrasts between North America, with its British and Lockean liberal heritage that spawned democracy and freewheeling capitalist development in the United States, and Latin America's tendency toward authoritarianism, patrimonialism, and corporatism in the political sphere, along with a rigid, hierarchical class system and a preference for mercantilist policies that have hindered economic development. Culturalists typically draw pessimistic conclusions about the prospects for democracy's quality and longevity or for rapid economic development in Latin America, or they conclude that inequality and undemocratic practices reflect cultural preferences. Political scientists studying Latin America in the 1950s (e.g., William Stokes and Merle Kling) argued that political violence in the region was rooted in its political culture. More recently, Lawrence Harrison attributed Latin America's difficulties in achieving democratization, economic development, and social justice to its Hispanic political tradition.

North American scholars uncomfortable with culturalist modes of explanation adopted modernization theory's more optimistic perspective in the 1960s and 1970s. Modernizationists such as Martin Needler saw in Latin America's rising middle classes and the region's more educated youth the basis for an emerging commitment to democracy and the adoption of the North American economic model. Events in the region proved unsupportive of modernization theory's optimistic predictions, however, and Guillermo O'Donnell's critique, the theory of bureaucratic authoritarianism, drew heavily on dependency theory to propose that in the context of late industrialization, economic modernization could be inhospitable to democracy. Dependency theory, the third approach, although influenced by the writings of Karl Marx and V. I. Lenin, grew out of the reflections of Latin American intellectuals on the constraints posed to democratic politics and economic development given the region's place in the global capitalist economy. Dependency writers put emphasis on class conflict as the driving force in Latin American politics, including the transnational character of ruling class interests and the role of the United States in perpetuating the dominance of economic elites. For these theorists, understanding the historical roots of contemporary underdevelopment and nondemocratic practices is central.

Since the early 1990s, scholars studying Latin American politics have sought to draw on the insights of the new institutionalism in political science to explore electoral politics and party system development, executive-legislative relations, and federalism and decentralization in the region. Although recognizing and sometimes lamenting the prevalence of presidential regimes in Latin America, these scholars have tended

to draw out the differences among the cases in the region as much as their similarities in contrast to the rest of the world. Scott Mainwaring and Matthew Shugart, for instance, argue that the strength of presidents rests on both specific constitutional authority and partisan powers, and hence that presidents vary considerably in their capacities across Latin America. Institutionalist scholars have created a rich body of empirical research on the operation of Latin American political systems.

CYCLES OF DEMOCRACY AND AUTHORITARIANISM

Many scholars have observed the cycles of democracy and dictatorship noted in this article's introduction. Modernization and dependency thinkers both have sought to connect Latin America's political evolution to phases in its economic development. In this approach, the mercantilism that characterized the Spanish empire and that conservatives sought to reconstitute in the newly independent republics in the nineteenth century—with its limitations on free trade and its desire to control the economic activities of individuals—made the emergence of liberalism—with its preference for separation of church and state, for representative institutions, and for federal structures—difficult. Those favoring an outward-oriented, free-trade strategy of development preferred democratic institutions, but with representation limited to those holding property. Oligarchical democracies emerged to accommodate this largely landholding or natural resource–extracting, export-oriented elite in Argentina, Brazil, and Chile, while in other countries "order-and-progress" dictatorships promoted their societies' integration into the globalizing international economy of the late nineteenth century. Mexico's Porfirio Díaz, nominally a liberal, led the region's most successful order-and-progress regime from 1876 to 1910, profoundly integrating the Mexican economy with that of the United States while suppressing the resistance of peasants, miners, and indigenous peoples who were marginalized in the process.

The success of the export-import economic model beginning in the last quarter of the nineteenth century produced an emergent urban middle class as well as a growing working class. In the first decades of the twentieth century, the oligarchs met demands for political inclusion by these rising classes by co-opting the middle class through the modest expansion of the franchise while continuing to exclude workers and peasants from the ballot by restrictions based on property, literacy, or citizenship. Even so, middle-class parties such as the radicals in Argentina and Chile gained power, threatening agrarian elites' control of their societies. Labor mobilization brought incipient class conflict in the 1920s. Tensions caused by the difficulties of integrating these new actors into the political game in oligarchical democracies came to a head with the onset of economic crisis, during which traditional agrarian elites turned to the military to help them preserve the export-import model by excluding the rising urban middle class and the nascent working class from power. Governments in Argentina, Brazil, Chile, El Salvador, Guatemala, Honduras and Peru fell to the military at the Great Depression's outset.

The depression and the Second World War (1939–1945) had the consequence of provoking many trade-dependent countries to adopt import-substituting industrialization (ISI), with varying degrees of success. The global prestige of democracy at the war's end helped diffuse competitive regimes to Latin America, with most of the larger nations adopting or readopting democratic regimes. The small nations of Central America (other than Costa Rica), Haiti, and Paraguay remained ruled by despots, however. The combination of ISI and democracy created the conditions in which populist leaders could easily emerge. Populists built coalitions of the beneficiaries of industrialization—industrialists and the urban middle and working classes who would staff their firms—and led their followers against the landed elites who allegedly stood in the way of both modernization and justice for the people. Prominent populists like Argentina's Juan and Eva Perón and Brazil's Getúlio Vargas defined the terms of political discourse in their nations for many decades after they were forced from power by militaries who felt threatened by popular political agitation. Populist coalitions also contained the seeds of their own demise because they included both industrial employers and their employees; populist leaders found it difficult to resist turning their mass followings against industrialists once ISI had initial success. Those industrialists joined landed elites in inviting the military to end the populist experiment in the 1960s.

Unlike the military regimes that ruled in the 1930s, those that seized power in the 1960s and early 1970s settled in to rule as institutions, with the goal of ridding their nations of what they saw as feckless populist politicians and the subversives that their rhetoric encouraged. Harsh anticommunist regimes emerged in Argentina, Brazil, Chile, and Uruguay, while in Peru a progressive military enacted preemptive land reform in an attempt to undermine the bases of rural rebellion. These regimes outlawed parties and generally sought to depoliticize their societies. They saw limitations to the ISI model, particularly in that domestic demand for consumer goods was restricted to the size of the internal market and ISI had not reduced dependency on rich nations like the United States but instead had replaced imports of consumer goods with imports of capital goods and industrial inputs. These bureaucratic-authoritarian regimes set about pursuing economic policies that would be inviting to foreign investors and permit a "deepening" of the industrial structure, including suppressing labor unions and relaxing restrictions on foreign investment. Arguably, only Brazil succeeded in building a deeper industrial structure, which owes much to the scale of its internal market compared to other countries in the region. Recognizing the limitations of its internal market, Chile promoted export diversification, although mostly of primary products.

These harsh military regimes killed or disappeared tens of thousands of their populations. In this respect these regimes were no different from the personal dictatorships of Central America and the Caribbean, where despots like the Somoza family in Nicaragua or Haiti's Duvalier family or the militaries of El Salvador and Guatemala killed thousands of rebels

and suspected insurgents. Across the continent human rights and democratic movements began to demand that the military release political prisoners or reveal what happened to those who disappeared. The most prominent example of such movements was Argentina's Mothers of the Plaza de Mayo. Underlying the military's decision to leave power in the 1980s was its own inability to manage the economy, but in the event a variety of circumstances brought democracy back to Latin America, including Argentina's failure in its war with Britain over the Falklands (Malvinas) in 1982 and General Augusto Pinochet's loss in a plebiscite about remaining in power in Chile in 1988.

Though many observers expected the new democracies that emerged in the 1980s to be fragile, they have proved more durable than earlier experiments in democracy in the region. Most Latin American militaries, discredited but for the most part not prosecuted for their human rights abuses, have preferred to stay on the sidelines. The depoliticization the military sought to achieve was accomplished to a considerable extent, so that popular political participation in the early 2000s tends to be low, in activities ranging from signing petitions to confrontational acts like blocking traffic, occupying buildings, or taking part in unauthorized demonstrations. Mexico, which has not had a military regime since the end of its revolution in 1917, became democratic by means of a protracted transition in which the opponents to the long-ruling Institutional Revolutionary Party (PRI) built up the nation's respect for electoral democracy as the opposition built its own capacities to govern. Democracy has proved more fragile in countries that avoided the bureaucratic-authoritarian phase; two examples are Colombia and Venezuela, with the former struggling with a long civil war having roots going back to the 1950s and earlier and the latter experiencing a failed military uprising whose leader, Hugo Chávez, was elected in 1998 as a populist president after his release from jail and has rewritten the constitution to allow him to remain in power until at least 2012.

FEATURES OF LATIN AMERICAN POLITICS

A key characteristic of Latin American politics has been a preference by elites for corporatist interest intermediation. Some scholars, such as Wiarda, trace this inclination to the organic statist political philosophy inherited from early modern Spanish philosophers, such as Francisco Suárez and Francisco de Vitoria. Others, such as Alfred Stepan, emphasize a more instrumental use of corporatist theory by elites to allow political and economic leaders to better control the organizations of the peasantry and the working class. Prominent examples of corporatism in the Western Hemisphere include the sectoral organization of Mexico's PRI, corporatist labor legislation under Vargas's Estado Nôvo and the military regime (1964–1985) in Brazil, and the Peruvian reformist military's effort (1968–1975) to coordinate the political participation of land reform beneficiaries.

Clientelism is another common feature of politics in the region. Political machines such as Mexico's PRI and the

Argentine Justicialist (Peronist) Party have often employed patronage targeted to individuals and small groups as carrots to attract electoral support. Within such parties, political recruitment and upward mobility have taken place via tight patron-client relations. In many contexts, rural Brazil being a prominent example, local economic elites serve as patrons to their social inferiors, often intervening with local or national authorities to secure private goods for their clients, cementing their local power in the process. Although progressive political activists recognize that clientelism can entrap their organizations in a reliance on patrons for discrete material benefits rather than an improvement of the structural relationships of power, patron-client relations prove difficult to circumvent in societies in which the state lacks the resources or the will to provide universalistic benefits. Because clientelism emphasizes the distribution of discrete benefits from the state to individual beneficiaries and indirectly contributes to the sense that politics involves the private appropriation of public resources, the perception of corruption is widespread among citizens of Latin American countries and those outsiders doing business there.

Scholars like Véliz, Wiarda, and Richard M. Morse place great emphasis on centralism as a key enduring feature of Latin American politics. Concentrated centralized power manifests itself in three ongoing struggles in the region. First, in the mid-twentieth century, urbanization, partly promoted by ISI, aggravated tensions between rural elites and the urban coalitions put together by populist leaders. In many Latin American countries, that urban-rural divide is accentuated because of the concentration of the urban population in the capital city—for example, Buenos Aires (Argentina), Caracas (Venezuela), Lima (Peru), and Santiago (Chile). Urban-based elites promoted land reform (Chile and Peru) and imposed high export taxes on agricultural products (Argentina) that prompted sectoral conflict.

Second, the proponents of centralized power have at times made formal federalism a fiction. From the time of independence, advocates of federalism and state and municipal autonomy have struggled against those favoring the centralization of state power. The military and other nondemocratic rulers, including Mexico's PRI, have tended to erode the autonomy of state and local governments. Democratic regimes have often coincided with the reassertion of decentralized authority. Since the 1980s, the World Bank and other multilateral organizations have promoted decentralization to overcome the barriers to development posed by excessively centralized bureaucratic power. The larger countries, especially Argentina, Brazil, and Mexico, have had more effective federal structures than the smaller countries of the region.

Third, centralized rule has often come at the expense of indigenous peoples' autonomy. Indians have occupied the lowest rung on the ladder of social status since the conquest by Europeans. Liberal constitutions have made little or no allowance for the special circumstances of indigenous groups. Even postrevolutionary regimes that have celebrated the indigenous heritage of their populations, such as Mexico, have tended to treat Indians no differently legally than other poor people

while the reality of racism has made their conditions the worst of all social groups. The 1992 Columbian Quincentenary gave focus to a hemispherewide social movement of indigenous peoples seeking to claim constitutional rights to autonomy within their communities. Guatemalan Rigoberta Menchu, recipient of the 1992 Nobel Peace Prize, emerged as the most successful proponent of indigenous rights. The 1994 uprising of the Zapatista National Liberation Army in Chiapas, Mexico, effectively promoted the cause of indigenous autonomy internationally, although the Mexican state proved unwilling to grant special status to indigenous groups. More recently, Evo Morales, president of Bolivia, rose to power partly on the basis of an appeal to ethnic solidarity among indigenous Bolivians.

While populism defined the politics of mid-twentieth-century Latin America, the inclination to populist-type relations between charismatic leaders and the masses has often reasserted itself throughout the region's postcolonial history. Salvador Allende's socialist regime in the 1970s had distinct populist features, including the adulation of the leader and a redistributionist ideology. In the 1990s and 2000s, Argentina's Carlos Menem, Bolivia's Morales, Peru's Alberto Fujimori, and Venezuela's Chávez, have developed populist-type relations between themselves and their followers. These individuals have at best paid lip service to constitutional procedures and the rights of minorities, with Chávez, Fujimori, and Morales all convening constituent assemblies to write new constitutions in which executive prerogative was increased while institutions that might protect minority interests were weakened or eliminated. Populists claim to be the voice of the people yet often refuse to accept the verdicts of democratic institutions. Prominent examples include Fujimori's closing of the Peruvian congress in 1992 when that body refused to grant him the powers he sought to pursue the Shining Path rebels or to radically restructure the economy, and the refusal of Mexico's Andrés Manuel López Obrador to accept his presidential electoral defeat in 2006 despite rulings against him by the nation's independent electoral agency and its electoral tribunal.

INSTITUTIONS OF GOVERNANCE

Latin American nations have chosen presidential forms of democracy. Serious suggestions to replace presidentialism with parliamentary regimes have been few; the most recent attempt, which came when Brazil wrote a new constitution in 1988, met defeat by old-time politicians. Because many Latin American countries have multiparty systems, often abetted by proportional representation, presidents can come to power with nothing near a majority of the popular vote, as Allende did in Chile in 1970 (36.6 percent) or Felipe Calderón in Mexico did in 2006 (36.7 percent). The Allende example encouraged many newly democratizing regimes in the hemisphere to adopt runoff elections so that a new president could claim to have taken a majority of the vote in a popular election.

Multiparty systems also lead to legislatures in which no party has a majority. While a strong coalition has allowed Chile's center-left *Concertación* parties to rule as if a majority party, few parties in any of the larger Latin American countries have held majorities when one of their leaders sat in the presidency. Building coalitions to govern proves extraordinarily difficult for this reason, and frequently presidents do so on an issue-by-issue basis, with legislators requiring various types of payoffs for their support. Not surprisingly, in those countries that allow them, the presidential decree has found frequent use.

Only Argentina, Brazil, Mexico, and Venezuela are federal republics. In the former two countries, however, state-level actors have proven to be key veto players, with governors embarking on fiscal strategies that have undermined central government efforts at financial discipline, helping to precipitate, for example, the Argentine economic crisis in 2001 and 2002. Mexican and Venezuelan federalism has been less robust, although Mexico's National Action Party embarked on a successful strategy in the 1990s of taking power nationally by winning governorships and ruling effectively in those states.

Weak judiciaries and the failure of legislatures to hold presidents accountable have yielded what many regard as low-quality democracies in the period since the military ceded power in the 1980s. Even where judicial review formally exists, courts without effective independence have failed to check executive power. In many countries, notably Brazil, Colombia, and Mexico, narcotics traffickers have corrupted the police and the courts, often killing those law enforcement officials who refuse to be compromised. The weakness of legislature and the courts in the face of presidential power has created what Guillermo O'Donnell labels "delegative democracy," in which presidents rule virtually unchecked during their terms of office.

REVOLUTION AND SOCIAL MOVEMENTS

While the bureaucratic-authoritarian regimes of South America effectively eviscerated national urban guerrilla movements, the revolutionary tradition has proven deep-rooted in the Andes and Central America. Fidel Castro's success in taking power via guerrilla insurrection in Cuba in 1959 has since inspired similar attempts across the hemisphere. Peru nearly succumbed to the Maoist Shining Path before Fujimori's government arrested the movement's leader in 1992. Colombia has fought a four-decade struggle against the Revolutionary Armed Forces of Colombia (FARC). In 1979, guerrillas toppled the Somoza dynasty in Nicaragua, setting an example that Salvadoran and Guatemalan revolutionaries sought to emulate. Revolutionary movements in the hemisphere often expressed ideological sympathy with socialist regimes, communist China, or the Soviet Union, and thereby incurred the enmity of the United States, which committed considerable resources to defeating rebels in Central America in the 1980s, including overturning the Nicaraguan regime.

Those eschewing violent revolution have turned to social movements to promote political change. A continentwide indigenous rights movement has won land demarcation agreements from the Brazilian government, contributed to the downfall of two Ecuadoran presidents, and brought

Morales to the presidency in Bolivia. Rebels in Mexico's state of Chiapas have capitalized on indigenous rights themes as well as the antiglobalization movement. During the economic crisis that gripped the hemisphere in the 1980s, many neighborhood-level popular movements emerged in the slums of the continent's largest cities—Lima, Mexico City, Rio de Janeiro, Santiago, among others—and banded together in broader social movements to demand utility services, subsidies on staple goods and public transportation, and democracy. The hemisphere's largest social movement, Brazil's Landless Workers' Movement, has seized underutilized lands and settled them with thousands of landless families who then cultivate them cooperatively. Political parties and formal representative institutions often ignore social movements, but those movements have succeeded in calling attention to the deficits of contemporary Latin American democracy.

Latino Partisanship and Ideological Orientations

Latino partisanship in the United States, as measured by voting behavior, has typically favored the Democratic Party by a two-to-one margin. This preference is due in part to Latinos holding a more positive image of the Democratic Party—specifically, as being more receptive to the needs of economically and socially disadvantaged groups and supportive of ethnic and racial minorities. However, their allegiance to the Democratic Party is considered more variable than the strong Democratic affiliation of African Americans.

This lack of cohesion is due in part to the partisanship differences among Latino national-origin and religious groups. Most Latino national-origin groups, such as Mexicans, Puerto Ricans, and Central Americans, are solidly Democratic in party orientation and have traditionally had a strained relationship with the Republican Party. In contrast, Cuban-origin Latinos are considered the Republican-leaning exception. Cuban Americans have had a more positive experience with the Republican Party, specifically because of GOP support for a strong anticommunist and proembargo agenda. The Republican Party also has benefited from a growing number of evangelical Protestants and Pentecostals among a traditionally Catholic Latino population, as the latter are more likely to vote Democratic.

In exploring the factors that influence Latino partisanship, research suggests that traditional variables of influence work differently for Latinos. When examining the effect of political ideology on party identification, ideology does not appear to correlate as strongly among Latinos as whites. Latinos are more likely to classify themselves as conservative, but under closer analysis they appear more ideologically complex. Latinos tend to be socially conservative, but are liberal on economic issues, making it difficult to root Latino partisanship within a single left–right continuum. Some scholars suggest that this ideological complexity has not strained Latinos' affiliation with the Democratic Party because Latinos do not tend to base their party affiliation on Republican "family values" issues. Latino partisanship appears to be more political in nature, driven by policy preferences that favor a more activist government.

Debate has been considerable over the strength and stability of Latinos' attachment to the Democratic Party and the potential for Republican gains. In U.S. presidential elections, Democrats have received solid support from Latinos, typically averaging 65 percent of the Latino vote. However, Republican presidential candidates have at times made inroads with Latinos, leading some to consider Latinos a "swing group." In 1980 and 1984, Ronald Reagan captured a substantial 37 percent of the Latino vote. Republicans would not again reach such a high level of support until the 2000 election, when George W. Bush received 35 percent of the Latino vote. In 2004, his support further increased to an unprecedented 40 percent of the Latino vote. Evidence from the 2008 presidential election suggests, however, that Bush's gains among Latino voters were most likely candidate-specific and temporal in nature, as Latinos went back to a Democratic candidate, favoring Barack Obama over his Republican rival, John McCain, by the traditional two-to-one margin. Overall, while findings suggest Latinos' attachment to the Democratic Party to be somewhat malleable, a Latino realignment is seen as an unlikely prospect.

Latino Politics

Latino politics refers to the political values, attitudes, and behaviors of the Latin American–origin populations in the United States. This includes how they engage U.S. political, economic, social, and cultural institutions, as well as how these institutions respond to Latinos.

DEFINITION

Latinos (also known as Hispanics) are U.S. residents who have personal or ancestral ties to Latin America. They can descend from the indigenous peoples of Latin America, the Caribbean, and the American southwest as well as from arrivals to the Americas from across the globe, including Europeans, Africans, and Asians. However, the definition typically excludes individuals from non-Spanish-speaking nations, such as Brazil,

and there is some debate about whether it should include individuals born in Spain. As this suggests, such categorizations are not always clear, consistent, or compelling.

Furthermore, Latinos include contemporary legal and unauthorized immigrants as well as the long-standing and historically rooted Mexican and Puerto Rican communities, which were incorporated into the United States in the nineteenth century as a result of American territorial expansion. The story becomes even more complex when relatively recent Latin American immigrants—such as Cubans, Dominicans, Salvadorans, and Colombians—are added to the picture.

Therefore, instead of a single Latino group, there are numerous national-origin groups, varying racial and ethnic self-identifications, different legal standings, a variety of expanding regional U.S. contexts, different pathways to incorporation into the polity, and varying receptions and treatments.

It is also important to note that *Hispanic,* the U.S. census term chosen in 1970 to identify these populations, is rejected by some individuals, activists, and scholars. They argue that *Hispanic* has conservative ideological implications and overlooks the presence of indigenous groups—although the word *Latino* poses its own difficulties. However, the Latino public at large uses a variety of panethnic (e.g., Latino, Hispanic) and national-origin group (e.g., Mexican American, Puerto Rican) identifiers, and Latino political organizations similarly use diverse terminology (e.g., Congressional Hispanic Caucus, League of United Latin American Citizens, National Council of La Raza, Mexican-American Legal Defense and Education Fund).

What is most essential to any definition of Latino politics is that it is about politics in the United States. While this may extend to Latin America vis-à-vis foreign policy, migration, and transnationalism, it does not focus on the core issues confronting Latin American polities.

GROWTH OF LATINOS IN POLITICAL SCIENCE

Historically, the academy and political science in particular have shown little interest in Latino politics. The *American Political Science Review* (APSR) published its first article on what we now call Latinos in 1930, eighty-two years after the end of the United States–Mexico War (1848). More generally, political science has only recently engaged in the serious and sustained study of Latino politics.

This historic disinterest may reflect the fact that the Latino vote was electorally insignificant until the 1960s. Two exceptions were northern New Mexico and south Texas, locations that were not coincidentally the setting for the first two *APSR* Latino articles.

Another problem was a lack of Latino political scientists for much of the twentieth century. Few Latino scholars therefore were available to critique ill-informed research or to bring fresh perspectives reflective of Latino experiences to the discipline. This changed with the ferment of the 1960s as more Latinos (and non-Latinos) began to research Latino politics.

Before the 1960s, no article on Latino politics was written by a Latino scholar. By the 1990s, approximately half of

such articles were written by Latinos, and this growing Latino authorship is evident in the highly ranked journals. In the big three journals, a single Latino authored the four Latino politics articles published before the 1990s. In the decade of the 1990s, by contrast, four of the seven articles in the big three had at least one Latino author.

The above also illustrates that Latino politics research is becoming more prominent in these journals. In addition, several interdisciplinary social science journals and respected but lower-tier political science journals have long served as important research outlets. The pattern is similar with book publishing: the relatively few monographs and edited volumes from the 1970s to 1990s are now joined by a growing number of new books by major presses.

KEY ASPECTS

One of the key political science developments in the twentieth century was the behavioral revolution that began in the 1950s. One can argue that this made the study of Latino politics more difficult. As the discipline increasingly emphasized the analysis of large data sets, scholars were increasingly constrained to study topics for which data were available, and there were almost none on Latinos prior to the 1990s. The pathbreaking Chicano Survey (1979) was somewhat relevant to political research, but the Latino National Political Survey (1989–1990), the Pew Hispanic Center surveys, and the recently completed Latino National Survey provide today's political scientists with political data of the highest quality. The availability of these recent surveys parallels the growth in the number of published Latino politics articles and tenured Latino political scientists.

In terms of content, the most researched topic is behavior (voting and participation), followed by public opinion and public policy (immigration was the main interest in the early decades of the field). In addition, the first panethnic reference does not appear in a political science article title until 1981, but by the 1990s, many of the articles examine Latinos or Hispanics more generally, as well as specific national origin groups.

This recent increase in publications notwithstanding, one challenge to the field is the distinctively complex character of the subject. This leads to a core question: In light of so much diversity, is the study of Latino politics even possible?

One response is that a sense of panethnicity may emerge over time through political elites, government terminology, Spanish language media, business marketing, and reactions against nativism. In addition, there are several potential components to a Latino-Hispanic research agenda. The first is a literature that better takes into account intra–Latino differences while not fractionalizing into narrow literatures on the various national–origin groups. Second, while the tendency in political science is to study phenomena nationally or at the highest level of aggregation, valuable opportunities to learn about Latinos exist at local levels. Third, more research should compare Latinos and non-Latinos. Fourth, it is essential to examine how immigrants affect Latino politics. Finally, the influence of unions, religious groups, and state institutions could usefully be studied through American political development approaches.

Law, Comparative

Comparative law is the study of different laws, legal cultures, and legal systems. The study of comparative law can be traced back to the earliest studies of law and politics. Plato's *Laws,* for example, centers on a stranger's quest to examine the laws of the different cities of his traveling companions to determine the best legal system. Many centuries later, Charles-Louis Montesquieu focused a great deal on understanding different legal systems in *The Spirit of the Laws.* Alexis de Tocqueville, John Locke, Henry Sumner Maine, Friedrich Karl Von Savigny, François Geny, and many other great legal and political thinkers have focused on comparative law as a crucial part of understanding how to create the best government, the best state, and the best society. After World War II (1939–1945), however, the study of law and the study of politics split apart. As a result, while the study of comparative law continued as an integral part of the study of law, it lost its role as a key component of the study of political science.

Recently, however, interest has been renewed in the study of comparative law within the field of political science. In the same way that scholars study the effects of different executive and legislative structures within states, it is possible to study the role different legal systems play in shaping state behavior, both domestically and internationally. The study of comparative law sheds light on our own legal system and also furthers our understanding of other states and peoples around the globe.

PURPOSE OF COMPARATIVE LAW: SUBJECT VERSUS METHOD

There is often debate over whether it is more appropriate to think of comparative law as a subfield to be studied or as a method to use to address particular research questions. In many instances, however, comparative law serves as both a subject and a method. Understanding the differences and

similarities among legal systems allows us to reflect on our own system, as well as to better understand other cultures. For example, a U.S. lawyer whose client is arrested in France will be better able to represent the client if that lawyer understands the differences present in the criminal justice systems of the two countries. Similarly, a U.S. scholar considering the effect interest groups have on judicial decisions would greatly expand the potential universe of cases if, rather than engage in a unitary case study of the U.S. Supreme Court, that scholar considers cases from other judicial systems.

COMPARATIVE LAW, COMPARATIVE CONSTITUTIONALISM, AND COMPARATIVE JUDICIAL INSTITUTIONS

Comparative law as a field may take on a number of meanings within the disciplines of law and political science. The first, and traditional, meaning of comparative law refers to a comprehensive examination of the different legal traditions that make up the legal culture and shape the legal institutions of a state. Closely related to this more broad-based conception of comparative law as a field of study are the subfields of comparative constitutionalism and comparative judicial institutions. While comparative law as an examination of legal traditions includes both constitutions and institutions, each of these has become significant in its own right.

Comparative constitutionalism considers the elements of state constitutions and a comparative analysis of the effects of these constitutions within the state context. This subfield may focus on the issue of rights protected or omitted from a state constitution, as well as the effect of the presence or absence of such rights on the citizens of a state. Another area of focus for comparative constitutionalism is the institutional setup present within constitutions, particularly centered on the concept of judicial review. In both cases, comparative constitutionalism often uses court decisions on constitutional matters as a main component of comparative discussion.

Contrary to comparative constitutionalism, comparative judicial institutions focus on the institutions that comprise the judiciary rather than the law itself. Topics include the independence of the judiciary from other branches of government, the court structure within a state from local courts, through appeals courts, to high courts, and the different types of high courts within a state. The study of comparative judicial institutions also may consider the role that nonjudicial parties are allowed to play in judicial decision making, such as intervenors or amicus curiae.

THE WORLD'S MAJOR LEGAL TRADITIONS

Comparative law research begins with the foundational components of the world's major legal traditions. While highly generalized, these traditions—also called *legal families*—provide an initial basis to begin addressing questions of comparative law. The legal tradition present within a state shapes not only the legal culture and societal understandings of law within a state, but also the types of laws and legal institutions that a state develops. For example, whereas the revolutionary origins of the U.S. legal tradition produced a legal culture focused on the protection of individual rights, a strong constitution, and a clear separation of powers with significant power for the judiciary, the religious origins of the Egyptian legal tradition results in the maintenance of the relationship between church and state and a respect for the authority of sharia law and a court system that combines secular courts and religious courts to decide different issues.

Six legal traditions are outlined below, including an overview of the origins and major characteristics of the tradition, as well as a list of states with that legal tradition.

COMMON LAW

The common-law legal tradition traces its origins to the arrival of William the Conqueror in England in 1066. Once established as king of England, William set up a legal system based on a hierarchical system of courts, in which the judges were responsible for rendering decisions in the cases before them and for synthesizing the varied customary laws found throughout the English territory. By collecting these "common" laws, early judges solidified the prominent role of the judiciary in the common-law system and made judicial decisions a primary source of law.

States with the common-law tradition share a number of specific characteristics. Given that the foundations of the legal tradition are centered in early English court cases, judicial decisions remain the focus of the legal system. This has led to a general understanding of law as a tool for the individual, a system within which individuals have rights and may redress grievances against one another or against the state. Rather than being viewed as an overarching code of conduct (see the civil-law tradition below), the common-law tradition focuses on practical outcomes to individual problems.

This prominence of the judicial branch has led, in many common-law countries, to the creation of judicial review, although the strength of such review varies. For example, judicial review is very strong in the United States, where the U.S. Constitution gives the Supreme Court the power to review legislative and executive actions for conformance with the Constitution and strike them down if necessary. On the other hand, in England, the power of judicial review is much weaker. The High Court of England may only strike down Acts of Parliament in very limited circumstances.

Today, countries with common-law systems include England and Wales (Scotland has elements of the common law, but they are mixed with the civil-law tradition), Australia, Canada, New Zealand and the United States. A number of other countries—many members of the British Commonwealth—also have significant elements of the common-law tradition incorporated into their legal systems. These include India, Nigeria, South Africa, and a number of Caribbean islands.

CIVIL LAW

The civil-law tradition dates to the time of the Roman Empire and the Corpus Juris Civilis and has three main periods of influence: Roman law, Canon law, and the *jus*

commune. The Corpus Juris Civilis was compiled by Emperor Justinian in the sixth century CE. The Corpus Juris Civilis was a comprehensive compilation of Roman law into a single, codified written form. This is the foundation from which the core of the civil-law tradition—written law and codification—originated. After the disintegration of the Roman Empire, much of Europe entered into the Dark Ages—a period in which legal systems were largely absent and law was predominantly customary. The Catholic Church's power, however, kept the Roman writings on law alive, and scholars such as Augustine and Aquinas even added to these laws, incorporating elements of morality and a communal purpose into the largely secular Roman laws. In the eleventh century, the university at Bologna began to revive the study of law. A group of scholars, known as the glossators, began to lecture on Justinian's codes; more importantly, they began to recodify the law in a manner that made it applicable to Renaissance Europe. The new law was called the *jus commune* because it was to be a law that was common to all of Europe. This was possible because scholars from all over Europe came to study law at Bologna, and when they left they took the *jus commune* with them, incorporating it into their own legal systems. This is the reason that the countries of continental Europe have such similar legal systems.

Modern civil-law systems maintain significant ties to this historical development, and many are even further linked as a result of the spread of the Napoleonic Codes. One of Napoleon's primary accomplishments was to consolidate French laws into a number of comprehensive codes. These codes were then transplanted to those countries under the French empire. In other countries, particularly those in South America, the Napoleonic Codes were used as guidelines for their own legal systems.

Codes are the foundation of the civil-law tradition. Codes are designed to be all-encompassing, providing not just a list of legal obligations, rights, punishments, and remedies, but also an overall guide for people on how to conduct their daily lives. Civil-law systems are, therefore, more communal in their focus than common-law systems. Much of this can be traced back to the influence of the Canon law on the civil-law tradition, an influence that incorporated ideas of morality into the law. This communal purpose, however, also can be traced to the minimal role that the judge plays in the civil-law tradition. The role of the judge in the civil-law tradition is to apply the laws, as written by the legislature, to the facts of the case under consideration. Because the codes are so detailed, there is little room for judicial interpretation, and even less for judicial law creation. This is very different from the common-law system described above. Moreover, given the clear delineation of lawmaking authority, judicial review is not often found in civil-law systems.

More countries around the world have civil-law systems than any other system. France, Germany, Italy, Spain, and most of the other countries of western Europe maintain civil-law systems. Argentina, Brazil, Mexico, and most of the other countries of South America also maintain civil-law systems.

Also, many states have adopted civil-law systems and mixed them with other legal traditions. These include Cambodia, Egypt, the states of French west Africa, Morocco, Russia, Tunisia, Turkey, and Vietnam.

ISLAMIC LAW

The Islamic legal tradition is the most dominant of the religious legal traditions today. The Islamic legal tradition stems from the religion of Islam and began with the preaching of Muhammad around 613 CE. As a religious legal tradition, the Islamic tradition is founded on a number of beliefs that are very different from those of the secular traditions described above. These include the belief that law comes from Allah and, because of these origins, law is unchangeable by man. Moreover, because law comes from Allah, the role for the judge is minimal, and breaking the law means more than a fine or jail—it is a sin. Islamic law also focuses on the duties, rather than the rights, of the individual.

The purpose of an Islamic state is to assist Muslims in living according to the tenets of Islam. The whole body of Islamic law is called the sharia, which encompasses the rules that Allah laid down for Muhammad. The sharia consists of a number of specific sources of law. The first of these is the Quran, which is the book containing Allah's revelations to Muhammad. A second source of law is the *sunna*, which is the record of the words and deeds of Muhammad during his lifetime, which are to be emulated by all Muslims. The third source of law are the *ijma*, which are those doctrines and laws on which the majority of Islamic scholars agree. The fourth source is the *Qiyas*, which is a method of analogical reasoning used to fill in gaps when the other three sources of law do not touch on a particular issue.

The extent to which each of these sources of law are used varies according to which branch of Islam (Sunni or Shia) and which school of Islamic thought (Hanafi, Maliki, Shafi'i, and Hanbali) are present within a state. Islamic scholars disagree on the relative importance of these four sources. Most recognize the preeminence of the Quran and the *sunna*, but disagree over the validity of the *ijma* and the *Qiyas*. For example, the Hanafi school allows for consideration of all four types of law, and in some Hanafi countries, such as Egypt, *ijmas* and *Qiyas* have been used to incorporate civil-law and common-law components into the legal system. Other countries, such as Saudi Arabia, which follow the Hanbali school of thought, discourage the use of both *ijmas* and *Qiyas* and maintain much more traditional Islamist legal systems.

The Islamic legal tradition is the primary legal tradition in a number of countries including Afghanistan, Iran, and Saudi Arabia. The Islamic legal tradition is also a major component, mixed with common law, civil law, customary law, or other religious traditions, in many countries throughout Africa, the Middle East, and Southeast Asia, including Egypt, India, Indonesia, Iraq, Jordan, Nigeria, and Syria.

HINDU LAW

The Hindu legal tradition can be traced as far back as 2500 BC. The Hindu tradition is based on dharma, which is the

belief that there exists a universal order inherent in the nature of things. Like the sharia in the Islamic legal tradition, dharma is designed to guide all of an individual's behavior and does not distinguish between religious duties and legal obligations. Any concept of individual rights is foreign to the Hindu tradition, which focuses instead on maintaining balance and harmony within the community.

One belief that distinguishes the Hindu tradition is that the duties and obligations each individual must carry out vary according to each person's status. The Hindu tradition divides people into three primary social groups, each with its own rules and obligations. These include the scholars and priests, the warriors and merchants, and the artisans and tradesmen. This division is necessary in the Hindu tradition to ensure proper balance.

Historically, in the Hindu legal tradition, rules were primarily enacted, implemented, and enforced at the local level. The village *panchayat* was responsible for hearing and deciding legal disputes on the basis of religious laws and existing local custom. Given the diversity that existed throughout the Indian subcontinent, there could be a significant difference between the laws as applied in the local communities.

The primary sources of law in the Hindu legal tradition are the religious texts (the *sastras* and *sustras*) and the accepted interpretations of these works by religious scholars (the *vedas*). One distinguishing characteristic of the Hindu tradition, however, is its flexibility in terms of the recognition of new laws. Unlike some other religious traditions, in which change to the laws is very difficult to achieve, the Hindu tradition accepts change as a natural part of life. The dharma always has accepted that new laws will have to be made by men to govern their current situations. Whether the laws are created by custom, legislation, or judicial decision, the Hindu tradition accepts manmade law as an essential component of a functioning social order, while at the same time recognizing the transient nature of this law and the fact that it will continue to change as circumstances and societal needs change.

Hindu law, both historically and today, has largely been centered in India. The legal system of India today is no longer purely Hindu law; it is a mixed system incorporating common law, customary law, and Islamic law, but Hindu law does remain a part of the legal system and is dominant in the area of family law. The Hindu legal tradition also has had some influence in a number of other countries in Southeast Asia, including Bangladesh, Nepal, and Pakistan.

CUSTOMARY LAW

For centuries, throughout Africa, legal rules came in the form of customary laws. The basic tenet of this customary tradition is that law stems from respect for the traditions of one's ancestors. The binding nature of law in these societies came from the pressure of the group and not wanting to act against the group for fear of shame and banishment.

The customary legal tradition centers on social groupings such as tribes, castes, villages, and bloodlines. These social groupings are thought to endure through time, and therefore no laws can exist that adversely affect either past or future generations. Because of this, certain Western conceptions of law do not have a place in the African tradition. For example, personal property rights are generally not found in customary legal traditions because property was thought to belong to one's ancestors and descendents as well as oneself. You are merely entitled to use the property during your lifetime. Corresponding to this focus on the group, the law is ordered primarily based on individual obligations to the community rather than individual rights.

Colonialism had a significant effect on the customary legal tradition, and today most African states maintain mixed legal traditions, with some elements of customary law still existing alongside civil law, common law, and religious law traditions. In many states, local and family issues may still be handled through customary law. For example, in Nigeria, a country where the national legal system is founded on the British common law, both local and national judges still refer to local customary law to decide issues related to property and marriage disputes.

Countries that still maintain elements of customary law include Burma, Burundi, Chad, Ethiopia, Ghana, Kenya, Mali, Nepal, Nigeria, Rwanda, Togo, and Uganda, among many others throughout Africa and Southeast Asia.

ASIAN LAW

A number of characteristics bind individual Asian states' legal traditions together into a legal family. One of the primary components of the Asian legal tradition is that law, historically, was not considered a means of promoting peace and stability. As with the religious and customary legal traditions, the Asian tradition relies on something other than legal rules to maintain order in society; formal legal rules are considered secondary. Like the customary tradition, the community plays a significant role in the Asian tradition, and the focus is on consensus and mediation, rather than the determinative outcome of an adversarial legal procedure. In many Asian countries, even today, seeking resolution in the legal system is considered shameful. Disagreements are still handled within the community, and in resolving disputes the focus is on the outcome that will best restore harmony to the community rather than solely punish an offender or provide a remedy to the victim.

Many Asian countries, China in particular, also have been influenced by Confucianism. Within the Confucian tradition, society is structured according to a natural order, in which each person has a designated place (in a manner very similar to the Hindu tradition). Society is hierarchical, with the family as the primary unit, followed by the village, then the region, and then the country. Disputes are resolved under this hierarchy as well—first within the family, but if that is not possible then within the village. Resorting to regional or statewide solutions is frowned upon.

As with the other legal traditions described herein, however, these general characteristics vary from country to country, depending on the particular historical development and societal characteristics of that country. China, for example, has been strongly influenced by Confucianism, but also in more

recent times by socialism. Japan, on the other hand, while sharing the historical influences, has been influenced also by its Shinto tradition and, particularly after World War II, the Western traditions of the civil and common law.

States that reflect evidence of the Asian tradition include China, Japan, and South Korea.

CONCLUSION

The six legal traditions described in this entry are commonly identified as the primary legal families that have developed across the globe. Largely this is due to our ability to trace the origins of today's current legal systems for most countries to one of these traditions. As mentioned, however, these classifications are a starting point for further study and understanding of comparative law. Today, the legal traditions of very few states remain "pure," meaning a state that can trace the origins of its legal tradition back to only one of these major legal families. The vast majority of legal systems found in states today are mixed systems—legal systems that have incorporated two or more of these legal families into their current legal structure. In some instances this mixing was the result of conquest or colonialism. In other cases it was the result of borrowing from successful systems in an attempt to improve one's own. Even the United States, one of the classic examples of the common-law tradition, maintains traces of the civil-law tradition through the Napoleonic Codes that are still part of the laws of the state of Louisiana. Most of the countries of Africa, Asia, and the Middle East are mixtures of three or more systems including Western-style secular law, religious legal traditions, and customs.

Despite this mixture, however, understanding the primary characteristics that form the origins of the world's major legal traditions helps us to understand the perceptions and understandings of law that exist in different countries around the world. This understanding makes the field of comparative law such a vital and important one.

Law and Society

The phrase *law and society* refers to three interrelated phenomena of relevance to political scientists. First, the phrase signals the general tradition of interdisciplinary sociolegal scholarship that developed over the past half century around the globe to analyze how law, politics, and social forces or practices are interrelated and influence one another. Second, the phrase evokes more specifically the interdisciplinary, international (but North American centered), social science–oriented Law and Society Association (LSA) and various other national and regional associations around the world, which since the 1960s have provided organized leadership promoting this type of scholarship. A third referent is the manifestation of these previous two phenomena within the discipline of political science, especially in the Law and Courts section of the American Political Science Association (APSA), but also among political scientists throughout the world, and increasingly in related fields of comparative politics and international human rights. This entry begins by outlining the institutional history of the interrelated academic traditions (second connotation), and then discusses the types of law and society scholarship that have been most prominent among political scientists.

PROFESSIONAL ACADEMIC HISTORY

Law has long been a topic of research and teaching by political scientists. In the half century before the 1950s, law was implicated in a wide range of studies. The study of public law by political scientists in the United States prior to World War II (1939–1945) included constitutional law, administrative law, business regulation, and international relations. Amid the polarized cold war era that gave birth to the positivist, behavioral revolution in social science, all this changed. International law became almost meaningless, while studies of international organization and international relations developed in directions more attentive to the interests and interplay of key actors. Administrative law and regulatory law likewise were exposed as formalistic facades obscuring the behavior of interested public and private parties. Finally, traditional attention to constitutional structures and discourse was substantially shrunk to a focus on the U.S. Supreme Court, which was too important to discount. And even in

this domain, study shifted from matters of jurisprudence to judicial behavior, and especially to questions of why justices voted as they did and to what effect. As Martin Shapiro has noted, "public law and judicial behavior thus dwindled into a marginalized constitutional law-Supreme Court ghetto of little interest to other political scientists" (1993, 366).

During the period before World War II, law schools in the common law–based United States and, even more, in civil-law countries showed little interest in political science. In the 1960s, however, a loose alliance of individual law professors around the United States began to embrace newly developing social science approaches in an effort to invigorate the realist debunking of formal law taught in law schools that began in earlier decades and to marry sophisticated study of legal practice to the liberal social engineering schemes initiated during the New Deal and expanded by the Great Society. Select law professors and social scientists during this era found common cause in collaborative use of empirical study to make law "work better," to promote making legal justice serve the ends of social justice. The primary thrust of the newly emerging scholarship was behavioral, positivistic, nominally quantitative, and policy oriented.

Sociologists and sociological inquiry led the initial wave of law and society collaboration, which was formally initiated with the birth of the Law and Society Association in 1964. By the 1970s, though, a number of political scientists became active in LSA and started to publish in the *Law and Society Review,* introducing a wider range of sociolegal inquiry into public law scholarship. Political scientists at Berkeley, Northwestern, and Wisconsin in particular developed small centers of sociolegal scholarship connected to the growing LSA intellectual community. These initiatives developed as confidence in social scientific research flourished, boundaries distinguishing national legal systems seemed relatively stable, interest in legal culture was confined to mass behavior and opinion, and scientific analysis provided a basis for policy prescription. Interest in joining sophisticated social science to the study of law began to grow beyond the United States, especially in the English-speaking world, leading to regional associations of scholars committed to the study of law and society.

These developments were uneven, halting, and mixed in implications, though. By the 1980s, very few law schools in the United States had hired political scientists into their faculty, and political scientists still largely dismissed law schools as havens of old-fashioned formalism. Indeed, the primary reason for inclusion of public law scholars in most political science departments was to serve the high demand expressed by undergraduate students for classes in constitutional law, civil liberties, and the U.S. Supreme Court. And while sociolegal scholarship was widely respected in the Law and Courts group, the latter subfield itself remained a relatively marginal, low-profile area of research activity in the broader discipline. Conversely, when law schools did begin to hire social science–trained scholars in 1990s, it was mostly in law and economics, an approach that never carved out much place in the law and society community. If institutionalists in sociology and political science once connected with law professors for the study of law in positive states of the global North, the rapid, widespread saturation of law schools with law and economics both paralleled and supported diminishing political commitments to the social welfare state.

Overall, the relationship between political scientists in the Law and Courts section of APSA and sociolegal scholars identifying with LSA has weakened since the early 1990s. One often cited reason was the influx of humanities-oriented scholars and the related "interpretive turn" in LSA. This pushed sociolegal scholarship in the direction of postrealist, postpositivist, and noninstrumental directions that offered little for the types of causal explanation or policy prescription valued by mainstream political scientists, at the very moment that the Law and Courts subfield was struggling to prove its social science credentials. Also relevant was the strong impulse to regionally informed, non-U.S.-centered comparative and global study among sociolegal scholars. This expanded law and society professional affiliation and intellectual focus around the world much more quickly and substantially than among U.S. political scientists in the Law and Courts subfield. Yet another factor was the resurgent refocusing of interest on the U.S. Supreme Court by political scientists, which was welcomed but not a prominent part of the sociolegal tradition. Thus, while a number of leading scholars and graduate programs kept sociolegal scholarship alive among U.S. political scientists, the linkage diminished in visibility and significance relative to previous decades.

Even so, the options for publication in interdisciplinary law and society journals and with good academic book presses, as well as for access to funding from the Law and Social Science Division of the National Science Foundation, have sustained the professional interconnections. Moreover, the alliance of political science and law and society outside the United States—in Australia, Europe, Israel, Latin America, and parts of Asia—prospered and grew. The recent growth of empirical legal studies, a classic form of mostly positivist, quantitatively oriented social legal scholarship, has won support from many LSA, law school, and political science scholars alike, so it has become a new source of vital interaction.

SUBSTANTIVE AREAS OF INQUIRY

Interdisciplinary law and society scholars traditionally have tended to define their work more by the domains of legal practice that are studied than by the epistemological or methodological approaches that they bring to those topics, although in some ways sociolegal studies have increasingly come to congregate in separate methodological camps much as in the disciplines. Most efforts to map sociolegal scholarship do focus on analytical frameworks for making sense of law in action, and that approach will be replicated here. Seven substantive areas of sociolegal inquiry to which political scientists have contributed are worth noting.

COURTS

As noted earlier, the Law and Courts section of APSA has been fixated on federal court judges and, especially, on U.S.

Supreme Court justices. This focus has been replicated by political scientists outside the United States as well. Much of the attention has aimed to explain what judges and justices do and why, or the relationship between high courts and other government branches. Scholarship has divided generally among three separate approaches: (1) analyses of how individual judge's attitudes or values shape or determine judicial behavior; (2) studies that build on game theory to address the strategic calculations of judges relative to other political actors, and (3) institutionalist analyses of high courts, which draw heavily on traditions of "new institutionalism" and American political development in political science. Scholars in all three camps are active in LSA, but none of these approaches, all of which are very centered on courts and the nation-state generally, have been prominent in the sociolegal tradition.

A second area of inquiry is judicial impact studies, a topic in which political science and sociolegal studies share more in common. It is significant in this regard that a classic essay by political scientist Robert Dahl contributed a major thesis—that the Supreme Court is not highly independent and typically follows other national branches—which much contemporary study still takes as a central question or point of reference. A third area of inquiry has concerned mass perceptions of federal courts, both as a measure of institutional "legitimacy" and as an ongoing process of producing institutional legitimation.

Studies of U.S. judicial behavior have influenced some comparative cross-national study of non-U.S. courts in ways that are routinely debated among sociolegal scholars with strong regional grounding; this is an area of research growth in both LSA and political science, with a fair amount of crossover, enlisting scholars from around the world. Study of lower trial courts and of state appellate courts thrived in the 1970s and still occupies some prominent scholars, but it has been somewhat marginal in both political science and sociolegal study.

DISPUTING AND LEGAL MOBILIZATION

One of the most innovative developments in law and society scholarship began from complementary studies of ordinary disputing among individuals—over personal injury, contracts, workplace discrimination, divorce, and the like—*in* society. Anthropologists and sociologists pioneered influential approaches to the topic, but one major study enlisting a number of political scientists in the United States had enormous impact on the field of law and society. The key contribution of this study was to decenter courts and even lawyers, focusing instead on everyday disputes in society and the inclinations of citizens or social groups to "mobilize" legal norms and rights in "naming, blaming, and claiming" practices. Frances Kahn Zemans's theorization of legal mobilization by ordinary citizens as a distinctive, widespread, and important form of democratic political participation put a uniquely political science spin on this type of inquiry. Much of the early study was highly behavioral and represented quantitatively, but such studies raised questions about how legal knowledge "constituted" legal subjects and generated a

"legal consciousness" of citizen subjects that encouraged, even required, more qualitative study. This generated a great deal of sociolegal study beginning in the 1980s but, not surprisingly, relatively little by political scientists.

The biggest impact of disputing studies for political scientists was around the subject of group disputing, whether framed as studies of law and social change, law and social movements, or legal impact. The earliest and most conventional inquiry centered on the impact of reform litigation in the U.S. Supreme Court. Study of reform litigation and group politics—whether interest groups or social movements—led to a wide range of approaches to organized legal mobilization. These two general frameworks, sometimes categorized as top down (judicial impact) and bottom up (legal mobilization) approaches, remain vital areas of study and debate among political scientists in the sociolegal tradition. The legal mobilization approach to group struggle also stimulated much study about politics constituted by rights-claiming specifically, which often is bound to a focus on law's constitutive power; this inquiry also has enlisted some political scientists.

ADMINISTRATIVE AND REGULATORY POLITICS

Both political scientists and sociolegal scholars have undertaken considerable study of law and politics of administrative and regulatory state institutional practice. However, there has been surprisingly little direct overlap, in part because the topic does not fit the "court-centric" thrust of the Law and Courts section while law professors have tended to dominate sociolegal studies in this area. That said, some very prominent political scientists have contributed important sociolegal studies of administrative and regulatory politics. Many of them have been associated with the Center for Law and Society at the University of California, Berkeley, where a strong tradition of policy-oriented and institutional study of the welfare/regulatory state has thrived since the 1970s.

CRIMINAL PROCESS

Attention to lower criminal courts, criminal plea bargaining practices, and the overall institutional structure of criminal justice in the United States was a hallmark of sociolegal studies in the 1970s and 1980s. A number of prominent political scientists made important empirically grounded analytical contributions to such inquiry. This area of inquiry generally has engaged fewer political scientists in the past several decades, and its place in the Law and Courts section has diminished. The scholarly legacy continues to thrive, however, and some innovative inquiry among younger scholars has developed in recent years.

POLITICS OF LAW AND POLICY AGENDA SETTING

Another area of robust inquiry among sociolegal scholars has concerned the macropolitics of agenda setting and policy discourse regarding criminal, civil, and constitutional law matters. Political scientist Murray Edelman's work on symbolic politics was a critical catalyst and template for much of this scholarship, which has been dominated by sociologists as well as political scientists. This scholarship often combines

attention to elite political discourse, media coverage, public opinion, and, increasingly in recent years, mass entertainment media (e.g., movies, TV, novels). The primary contribution has been to show how legal policy discourse and knowledge is at once generated and reconstructed in mass culture, producing a politics of law that is far less rational and empirically grounded than much policy-oriented discussion assumes. Most of this research by political scientists has concerned the symbolic politics of either the Supreme Court or crime discourse and reporting, but much recent attention has been directed to civil law as well.

LEGAL PROFESSION AND CAUSE LAWYERING

Sociologists have, not surprisingly, dominated study of the legal profession. Still, political scientists have conducted a fair amount of study of lawyers in the criminal process and, especially, in civil matters of divorce, torts, discrimination law, and other ordinary disputes. Studies have probed how lawyers wield power, how lawyers relate to clients and represent their causes, and how lawyers organize themselves politically around various professional interests. One very robust area of sociolegal study led but hardly monopolized by political scientists has been directed to cause lawyers, who represent movements for social justice, civil rights, and human rights in the United States and around the world. This work has produced at least five volumes of essays and one original book at the time of this writing.

COMPARATIVE CROSS-NATIONAL LAW

Shapiro, an eminent political scientist, long has been a leader in advocating comparative sociolegal study. Nevertheless, study of law beyond the United States has lagged among political scientists, and the recent spurt of interest has been devoted almost exclusively to high courts, much of it relying on models generated to make sense of the U.S. Supreme Court. However, an impressive cohort of creative political scientists also active in LSA has begun to develop interesting comparative studies of high court politics that integrate institutionalist approaches with historical, political, cultural, and economic knowledge of regional contexts. And some comparative studies of cause lawyers, the role of lawyers in democratic development, legal reform politics, regulatory and administrative law, and constitutional structure have been undertaken by political scientists well connected to the larger sociolegal community.

CONCLUSION

The contributions of political scientists to studies of law and society have varied widely in different periods over the past fifty years. Since the 1980s, the once-vital relationship between political scientists in the Law and Courts section and LSA in North America have become less firm, even somewhat strained. Interdisciplinary sociolegal studies associated with the LSA have continued to proliferate in a variety of different substantive and methodological directions, expanding an ever bigger tent whose boundaries are blurred to include a plethora of increasingly unconnected intellectual subgroups. In this regard, sociolegal studies both in North America

and beyond have gravitated toward inclusion of the diverse epistemological and methodological frameworks, including humanities as well as social sciences. Austin Sarat has rightly labeled the trend "vitality amidst fragmentation." By contrast, political scientists, in North America and beyond, have not expanded or altered very much either their court-centered substantive agenda or methodological orientations beyond traditional disciplinary boundaries in recent decades.

Moreover, interdisciplinary sociolegal scholars tend to remain more substantively oriented toward comparative cross-national and transnational legal developments as well as globally connected through professional networks than political science scholars, although the latter seem to be slowly developing greater global awareness about high courts and constitutions. For several decades, some leading political scientists have been urging and even predicting the latter trends. However, much interesting study of law and politics recently has taken place among political scientists aligned with comparative politics, international relations, and human rights, often with little reference to U.S.-focused scholarship by political science specialists in the Law and Courts subfield. At the same time, the rapid rise of interest in law and economics by law schools has provided incentives for such study of law among political scientists, thus pushing away from the diverse perspectives of approaches familiar among law and society scholars. Perhaps the ascendant orientation most likely to reconnect some political science scholars of Law and Courts to sociolegal study is related to the empirical legal studies movement—a realist-inspired, positivist-oriented, quantitatively leaning movement of scholars in many ways representing a return to the earlier era of behavioral study that initially joined the two camps.

Lazarsfeld, Paul F.

Mathematically trained Paul Felix Lazarsfeld (1901–1976) was a leading empirical sociologist who is celebrated for his contribution to, in the words of Jonathan Cole in his 2004 keynote address at a symposium honoring Lazarsfeld, "scholarly revolutions that catapulted American research universities to positions of preeminence."

Lazarsfeld was born in Vienna, Austria. He was an active academic and taught at a gymnasium. Lazarsfeld also helped establish a research institute at the University of Vienna, headed by German psychologist Karl Bühler. This would be the first of four institutes Lazarsfeld established in his lifetime. His position at the gymnasium came to an end in 1933 as the Nazi regime forced many Jewish academics from their positions.

After the loss of his post in Austria, Lazarsfeld went to the United States on a Rockefeller Foundation traveling fellowship after having attracted the foundation's attention with a study on unemployment in an area close to Vienna. Lazarsfeld quickly became well established in the United States. By the end of the 1930s he had set up a research center at the University of Newark in New Jersey and became the director of the Office of Radio Research, working with sociologist and philosopher Theodor Adorno. In 1940, Lazarsfeld moved to New York and began to teach at Columbia University. The Office of Radio Research also relocated to Columbia University and became the Bureau of Applied Social Research, with Lazarsfeld still serving as its director. Eventually, he became president

of the American Sociological Association and was elected to the American National Academy of Sciences.

Fascinated with methodology, Lazarsfeld is perhaps most known for combining qualitative and quantitative methods. He came up with the panel study or panel analysis, an innovative new way of surveying. By taking the same panel, or group of people, and interviewing them at intervals, Lazarsfeld found it was possible to identify changes in personal preference regarding any number of issues. Using this method, Lazarsfeld found that it was also possible to comment on the role of the media in influencing preference. The method was applied to a study of presidential election campaigns, and the results were published in *The People's Choice: How the Voter Makes Up His Mind in a Presidential Campaign* (1944) and *Voting: A Study of Opinion Formation in a Presidential Campaign* (1954), both of which continue to be instrumental in the contemporary study of public opinion surveying and election polling.

Lazarsfeld's research challenged the popular notion that society was composed of completely individual-minded and autonomous actors who were directly influenced by the media. His two-step flow of information model showed that opinion leaders were largely responsible for interpreting the flow of information from the media and diffusing it to larger societal groups.

The methods and ideas Lazarsfeld brought to the social sciences have continued to be influential since his death in 1976 from cancer. Tributes in the form of symposiums, conferences, and publications dedicated to his work are a testament to the value of the contribution he made to disciplines as diverse as mathematics, history, psychology, sociology, political science, and mass communications.

Leadership

Leadership refers to a social relation in which one actor influences numerous supporters in a lasting and systematic way. Definitions of leadership highlight actors' abilities (e.g., talent,

virtues), personality features (will, determination), relational characteristics (trust, charisma), functions (directing, transforming), and social status (aristocratic background) as bases for holding lasting influence over followers. Political leadership is typically discussed in the context of power structure and political leadership skills. The former focuses on hierarchies of positions infused with power; the latter includes a broad range of abilities attributed to incumbents of these positions.

Some scholars restrict the notion of leadership to voluntary following and see it, as Dwight Eisenhower put it, as "the art of getting someone else to do something you want done because he wants to do it." "True" or "authentic" leaders are expected to generate loyalty and voluntary subordination. Such leaders also are credited with strengthening group integration, cohesion, and identity. However, most observers also agree that authentic leaders are rare. They are expected to have popular appeal, as well as persuasive skills, vision and determination, and realism and passion.

In microlevel organizational literature, leadership is contrasted with management and analyzed in its formal and informal aspects. Thus, according to Warren Bennis, leaders innovate, inspire, show new directions, and develop new strategies, while managers administer, follow routines, maintain order, and control systems. In the micropolitics of organizations formal leaders, the incumbents of authority positions, are contrasted with informal leaders, whose influence reflects social status and informal networks.

Macrosocial and political perspectives focus on national political leaders: presidents, prime ministers, and leaders of national movements. Social and political historians like Thomas Carlyle locate such leaders in a broad historical context. Political psychologists and sociologists like Vilfredo Pareto typically focus on personality features of leaders and elites. In political sociology, leadership is seen embedded in complex power relations that link leaders with wider groups: elites, ruling classes, and state-governmental organizations. These differences in disciplinary perspectives reflect divergent explanations of leadership: in terms of distinctive and unique personality traits, superior motivation and drive, superior social status, conducive historical circumstances, response to collective demands, and reflection of group or organizational functional needs.

TYPES OF POLITICAL LEADERS

Popular typologies of political leaders follow these discipline-specific accounts of leadership. Perhaps the best known are Max Weber's typology of leadership and authority, Kurt Lewin's typology of leadership climate, and social-psychological typologies derived from Niccolò Machiavelli's and Pareto's personality types. Weber distinguished three bases of authority: traditional, legal-rational, and charismatic. They correspond to three types of leaders. Traditional leaders—kings, chieftains, and *pater familiae*—are followed out of respect for sacred traditions. In contrast, modern bureaucratic leaders—presidents, prime ministers, cabinet members, party bosses, and top government officials—rely on respect for laws and formal (mostly constitutional) rules. Charisma, or the "gift of grace," rests on the followers' devotion to "the exceptional sanctity, heroism or exemplary character of an individual person, and of the normative patterns or order revealed or ordained" by the leader (Weber 1978, 134). While both traditional and modern forms of leadership are institutionalized and stable, charismatic leadership is "revolutionary" and transient. Charismatic "heroes" are capable of overcoming both sacred traditionalism and bureaucratic inertia. Napoleon, Adolf Hitler, Martin Luther King Jr., and Nelson Mandela are examples of such transformational charismatic leaders. But charisma is personal and fragile. It evaporates after failures, and it cannot be transmitted through office; therefore charismatic leaders are succeeded by bureaucratic officials and statesmen.

Lewin's typology of dictator, autocrat, and participatory and laissez-faire leaders combines psychological and social characteristics. Each type creates a distinctive leadership climate, culture, and style. As mentioned earlier, some scholars exclude dictators and autocrats from the ranks of "leadership proper" because such figures rely on involuntary following. They are said to rule and govern, rather than lead. Others extend the notion of leadership to all cases of mass compliance. One such broad typology follows the classic distinction between "lionlike" and "foxlike" leaders and elites popularized by Machiavelli and elaborated by Pareto. According to Pareto, great political leaders are endowed with dispositions that are either "leonine"—showing determination, bravery, faith, and loyalty—or "vulpine"—showing intelligence, flexibility, negotiating skills, and cunning. This typology has been embraced by contemporary political leadership literature informed by studies of authoritarian personality, by Erich Fromm, and revolutionary elites, by Harold Lasswell and his collaborators. They focus on leadership styles and personality types (e.g., authoritarian-liberal, cautious-risk taking, conventional-innovative), as summarized in James Burns's 1978 book *Leadership*.

HISTORICAL EVOLUTION OF LEADERSHIP

Most students of social and political leadership stress the historical evolution of its form from premodern, typically based on traditions and status conventions, to modern, meritocratic, formalized, differentiated, and based on rules. Modern leaders are typically incumbents of leadership positions that combine clearly defined social roles and rules of operation. They are progressively differentiated: political-parliamentary leaders are distinct from state-administrative, corporate, religious, and cultural leaders. While all modern leaders are selected on merit, this does not eliminate privilege, but rather changes the way privilege is transmitted. Similarly, formal rules and democratic conventions do not prevent arbitrary exercise of power. Strong democratic leaders are capable of bending and changing rules to fit their power needs. It is widely recognized that leaders shape institutional rules as much as rules shape leadership styles.

One of the major contemporary debates is on the relationship between political leadership and democracy. Some

political analysts see strong leadership as inimical to partici-patory democracy, and they point to charismatic authoritarian leaders such as Napoleon, Joseph Stalin, and Hitler, who undermined democratic processes. Others stress that democratic representation relies on strong and legitimate leadership, and point to the importance of charismatic leaders such as King Juan Carlos in Spain, Lech Walesa in Poland, Václav Havel in Czechoslovakia, and Nelson Mandela in South Africa as key agents in recent transitions from dictatorships to democracy. Leadership, it seems, can be democratic and autocratic, depending on the orientations of the leaders.

League of Arab States

See *Arab League.*

League of Nations

The League of Nations was founded as a result of the Treaty of Versailles that ended World War I (1914–1918). The League's primary goal, to prevent war, would be accomplished through collective security, the peaceful settlement of disputes between nations, and ensuring good behavior of nations through the application of sanctions against those that violated international law or threatened world peace. While initially successful, the League could not halt the aggression that culminated with World War II (1939–1945), and the organization officially ceased to exist in April 1946.

ORIGIN OF THE ORGANIZATION

The League of Nations emerged from the carnage of World War I. The first truly "total war" in Europe, more than 8.5 million soldiers were killed in action and 21 million more were wounded, with another 10 million deaths among Europe's civilians. Called "the war to end all wars," many political leaders turned to the question of how to avoid a future catastrophe. The idea of a League of Nations was raised by American president Woodrow Wilson in his Fourteen Points for Peace,

which were proposed before a joint session of Congress on January 8, 1918: "A general association of nations must be formed under specific covenants for the purpose of affording mutual guarantees of political independence and territorial integrity to great and small states alike."

Following the armistice ending World War I, Wilson attended the Paris Peace Conference where the Treaty of Versailles was negotiated. The proposal to create a League of Nations was agreed to, and the organization was established by Part I of the Treaty. On June 28, 1919, forty-four nation-states signed the covenant creating the League of Nations. The League would have three objectives: pursue collective security, facilitate international cooperation, and execute the mandates of the peace treaties.

THE UNITED STATES AND THE LEAGUE

President Wilson, who received the Nobel Peace Prize for his work at the Peace Conference, attempted to secure American approval of the Treaty and entry into the League. However, he was opposed by Republicans in the U.S. Senate (notably Henry Cabot Lodge of Massachusetts and William E. Borah of Idaho), who believed that joining the League would threaten American sovereignty. Facing opposition in the Senate, Wilson attempted to rally public opinion by going on a national speaking tour, traveling eight thousand miles (12,900 kilometers) in twenty-two days and giving thirty-eight speeches. He experienced bad headaches and collapsed in Pueblo, Colorado. His train took him back to Washington, where he suffered a stroke that left the left side of his face and body paralyzed.

Senator Lodge proposed ratification of the Treaty but demanded the inclusion of reservations that he believed would preserve American sovereignty. Wilson refused, claiming that ratification by the Senate with conditions would be repudiating what each nation had signed. If the United States demanded changes, then why could not the Germans also? Wilson asked his supporters to vote against ratification with reservations, and the Treaty was never ratified by the United States.

On January 16, 1920, President Wilson formally convened the Council of the League in Paris in accordance with the League provision for the summoning of the first council and assembly by the president of the United States. It would be the last official participation by the United States in the League of Nations. The League, which the United States was expected to lead, lost much of its credibility without the American power.

HISTORY OF THE LEAGUE

In November 1920, the League established its headquarters in Geneva, Switzerland. The first meeting of the General Assembly convened in the Palais Wilson on November 15, 1920, with forty-one nations taking part. Eventually, assembly meetings would be held in the Batiment Electoral in Geneva, with meetings of the council being held at Palais Wilson. In 1936, the League moved into the Palais des Nations.

Membership in the League fluctuated, with the high point reached between September 28, 1934, and February 23, 1935,

when fifty-eight nations participated in the organization. Germany was originally barred from the League because it had been deemed, by the Versailles Treaty, as the aggressor in World War I; it was allowed to join in 1926. Costa Rica (1920–1925), Brazil (1920–1926), Japan (1920–1933), Germany (1926–1933), Haiti (1920–1942), and Luxembourg (1920–1942) all withdrew from the League. The Soviet Union, which had been prohibited from joining the League because of the Bolshevik takeover, was admitted in 1934. In December 1939, the Soviet Union was expelled for aggression against Finland. This was one of the League's last acts as it stopped functioning due to World War II.

In its early years, the League successfully mediated a number of border disputes that had not been settled by the Treaty of Versailles or by the San Remo Conference of April 1920. The settlement of the dispute between Sweden and Finland over the Aland Islands (1921) was the first international agreement made through the League. The League also intervened in an armed conflict between Greece and Bulgaria in October 1925, with Greece accepting the League's resolution that it withdraw from Bulgaria and provide compensation.

However, the League would suffer a number of failures that would eventually lead to its demise. When the League condemned Japan for its 1932 invasion of Manchuria, Japan withdrew from the League. The League could not halt Mussolini's invasion of Abyssinia (Ethiopia) in 1935. Notwithstanding the League's efforts to encourage disarmament (including the 1932 World Disarmament Conference convened in Geneva by the League), Germany, Italy, and Japan continued their arms buildups. The collective security functions of the League, which should have been mobilized during the Manchurian and Abyssinian crises, were not because the United Kingdom and France were unwilling to go to war.

World War II began on September 1, 1939, and the last significant action of the League was to expel the Soviet Union after it invaded Finland in December 1939. At the 1943 Tehran Conference, Franklin Roosevelt, Winston Churchill, and Joseph Stalin agreed that the League would be replaced by a new organization at the conclusion of the war, the United Nations. The final meeting of the League Assembly was held in April 1946 in Geneva for the purpose of dissolving the organization and liquidating its assets. The Palace of Peace (the headquarters of the Permanent Court of International Justice), located in the Hague, and the League's Archives were transferred to the United Nations. The League ceased to exist on April 20, 1946.

ORGANIZATIONAL STRUCTURE

The League of Nations had four principal organs: a secretariat, a council, an assembly, and the Permanent Court of International Justice. The League secretariat was the administrative arm of the organization, responsible for preparing the agendas for the council and assembly and publishing reports of meetings. The secretary-general headed the secretariat, and the British diplomat James Eric Drummond was the first secretary, serving until June 1933. He was replaced by Joseph Louis Anne Avenol, a French diplomat who had served as

under-secretary-general (at the Paris Peace Conference it had been agreed that the first secretary-general would be British and that he would be succeeded by a French national). Sean Lester, an Irish diplomat, succeeded Avenol and served as the last secretary-general from August 31, 1940, to April 18, 1946.

The assembly, which met annually in Geneva each September, was composed of three delegates from each member-state. The League council was to consist of the five Allied powers that won the war, but without the United States this became Britain, France, Italy, and Japan. Four other nations were elected by the assembly for a three-year term on the council. Initially, Belgium, Brazil, Spain, and Greece were selected. In later years, the number of nonpermanent members would vary. In 1922, the number was increased from four to six. In 1926 the number was increased to nine. When Germany joined the League in 1926 it became a fifth permanent member of the council (giving the body a total of fourteen members). After Japan and Germany withdrew in 1933, the number of nonpermanent members of the council was increased to eleven.

Any member could go to the council with a concern and was allowed a vote at the council on that issue. League decisions were recommendations for the states to follow, but no state could be legally bound against its consent and thus maintained sovereignty over its own decisions. The council held 107 public sessions between 1920 and 1939. In September 1921 the Permanent Court of International Justice with nine judges was established at the Hague, as the League covenant was amended.

OTHER LEAGUE ENTITIES

The League also had responsibility for a number of other bodies created to deal with international issues. These included the Disarmament Commission, the Health Organization, the International Labor Organization, the Mandates Commission, the International Commission on Intellectual Cooperation, the Permanent Central Opium Board, the Commission for Refugees, the Committee for the Study of the Legal Status of Women, and the Slavery Commission. The Permanent Mandates Commission, established in February 1921, supervised the nation-states that were given the authority to govern the territories of the German and Ottoman empires that were determined to be incapable of ruling themselves. Belgium, France, and Great Britain were responsible for governing the territories, subject to oversight by the Mandates Commission.

The Governing Commission was established to supervise the Saar Territory for a fifteen-year period. A plebiscite would be held to determine the region's sovereignty. On January 13, 1935, 90 percent of the residents voted for Saar to be reintegrated into Germany; that took place on March 1, 1935.

Le Bon, Gustave

Gustave Le Bon (1841–1931) was a French medical doctor and psychologist who had a major impact on the study of crowd psychology and mass political behavior. Le Bon was a prolific writer and a popular fixture in French intellectual society in the early years of the twentieth century. His work defends an elitist view on the behavior of social classes and non-European societies. In his book *La psychologie des foules* (*The Crowd*), published in 1895, Le Bon was very critical of the tendency toward democratization and mass behavior in contemporary societies. He argued that an individual could act rationally, but that unconscious powers took over when the individual was submerged in a crowd or another form of collectivity. In his view, crowds led to a regression toward primary instincts, emotional behavior, and group hysteria. This rejection of mass behavior, which during Le Bon's time referred mainly to the emerging labor movement, was not uncommon among conservative intellectuals in western Europe.

Le Bon's theories were highly influential. Well-known Austrian psychologist Sigmund Freud further developed the idea that the rational force of the individual could be undermined by subconscious powers and emotions that emerge when the individual is submerged in a mass. Le Bon's work was quoted widely in the field of mass behavior until the 1950s. It was assumed that mass gatherings constituted a major threat to democratic and social stability, and authors also stressed that crowds could easily be manipulated by movement leaders or agitators. After the 1950s, however, a new, more positive paradigm for the study of collective behavior emerged.

Le Bon went on to apply his ideas in his book *The Psychology of Socialism* (1898), arguing that socialism amounts to a rebellion against the natural and rational order of society. According to his view, socialist movements are inspired by a feeling of resentment among members of the labor class, as they are envious of the riches enjoyed by the well-off in society. This group envy leads to an attack on the legitimate power position of the social and intellectual elite and on the social order the elite embodies. Le Bon further suggested that maintaining civilization and protecting social values were mostly the work of this ruling elite.

Le Bon was widely quoted by various authoritarian authors and movements during the 1930s. He also tried to apply his insights in a comparative manner, examining the national psychological characteristics of nations in Europe, Asia, and the Arabic world.

Left

The left-right dichotomy is a conceptual tool to describe and classify political parties, actors, ideologies, attitudes, and specific policies along a spectrum. Historically, the terms *left* and *right* refer to the seating positions in the National Assembly, during the French Revolution, of pro– and anti–Ancien Régime members. The terms became part of the mainstream political language in the nineteenth century and are still used to describe opposed political affiliations—notwithstanding debates on the contemporary relevance of the dyad.

Positions on a left–right axis are relative and not absolute. The left is not monolithic and one can distinguish between extreme, moderate, or center lefts. The substantive content of the term *left* varies according to the political, social, cultural, or historical contexts, which explains that several disputed criteria have been put forward to differentiate the left from the right.

Very often the left has been defined as more in favor of change (seen as social progress), of collective (as opposed to individual) rights and responsibilities, of some forms of government or social interventions in the economy, and of redistributive social programs in order to reduce (or eliminate) inequalities construed as (largely) socially constructed. In contemporary political discourse, the left often refers to variants of communism, socialism, social democracy, and in the United States, liberalism.

Legal Profession

Since the founding of the United States, law and politics have been clearly intertwined. Alexis de Tocqueville reported that, in the United States, most legal issues become political issues and vice versa. Tocqueville also stated that lawyers were the American aristocratic class, influencing both law and politics in this country. Many of the signers of the Declaration of Independence and the writers of the Constitution were lawyers. Today the United States has one of the highest numbers of lawyers per capita in the world and has a very high number of lawyers in elected and appointed government positions.

A BROAD AND POROUS PROFESSION

The legal profession in the United States is quite broad and flexible, especially when compared to most other countries. American lawyers provide a wide range of services, work for a wide range of entities, and have the ability to enter and leave the profession quite easily. In other countries, lawyers are usually restricted to specific roles while American lawyers can perform many tasks done by nonlawyers elsewhere. Law degrees are graduate degrees in the United States, requiring that the student complete a four-year university degree before entering law school. American law schools tend to use similar teaching methods and a common substantive curriculum. The goal of law schools is to teach students to "think like a lawyer," and many scholars argue that lawyers thus share a common worldview, decision-making style, and other aspects of professional socialization to a higher degree than found in many other professions.

Because the legal profession is so amorphous in the United States, it is a challenge for the political scientists who study it. Some political scientists study the relationship between lawyers and their clients; some study law firms or other collections of lawyers; some study lawyers who handle a specific type of case, such as divorce lawyers, environmental lawyers, or death penalty lawyers; some study the role of lawyers in settling disputes without resorting to the courts; some study lawyers at the trial level courts; some study appellate lawyers; some study the role of lawyers in interest groups or social movements; some study lawyers who work for the government in various capacities; some study lawyers in elected offices; and some study lawyers as judges. In general, then, political scientists either study the impact of lawyers in the legal system or the impact of lawyers in the broader political system. Sometimes these two areas merge.

LAWYERS IN THE COURTS

In the legal arena, many lawyers work hard to keep their clients out of court (for example, tax lawyers, corporate lawyers, professional sports agents, trusts and estates lawyers). Some lawyers focus mainly on litigation in the trial courts (for example, criminal prosecutors and defense attorneys or personal injury lawyers). While litigators make up a very small percentage of U.S. lawyers, they often get the most attention because their work can be effectively dramatized in novels, television, and the movies. Litigators must present facts, evidence, and witnesses to a trial judge and perhaps to a jury. The main job of litigators is to persuade the legal fact-finders (either judges or juries) to accept their version of the facts in a live public performance in the courtroom. Thus trials determine unique questions of fact that probably do not have many applications to other cases.

Appellate lawyers, on the other hand, do most of their communicating in writing. In the United States, appellate courts have multiple judges hear a case, but no juries. The panel of judges (three, five, seven, or nine at the U.S. Supreme Court) must determine questions of law, which can have enormous impact on future court cases. The appellate lawyers must write legal briefs on the questions of law at issue, with oral arguments serving as the mechanism for lawyers to explain the arguments they already made in writing. Appellate lawyers must help the courts determine how the current case should be decided, but more importantly how future cases should be determined. Because appellate courts make a great deal of public policy in the United States, appellate lawyers play a key creative role in helping courts shape those eventual policies.

At both levels, sometimes lawyers merely represent the best interests of their clients and sometimes the lawyers have an independent legal and perhaps even political influence on the process. Lawyers certainly translate their clients' legal needs into legal language and help them navigate the legal process, but lawyers also can bring their own ideas, goals, and values to the case. Cause lawyers may care more about the broader political nature of the case than they do the specific needs of their individual clients. Repeat players, or parties who frequently use the legal system, may have more control over the actions of their lawyers than do so-called one shotters, who depend more on the legal expertise and experience of their lawyers. Some political scientists would argue that clients with more financial resources receive better legal representation than those with fewer resources. Lawyers often adapt their legal approaches to the norms and needs of communities of practice. Political scientists have linked the effectiveness of lawyers in both negotiations and in litigation to their reputation and to their reliability.

LAWYERS IN THE BROADER POLITICAL SYSTEM

In addition to their roles in the courts, lawyers also affect governmental decisions in other ways. Many lobbyists in the United States are lawyers, and they often draft legislative and regulatory proposals for the interest groups who employ them. They attempt to convince governmental decision makers to enact policies that their groups support. They also may lobby the courts by bringing politically charged cases to the judiciary. Lawyers also serve as important leaders of various social movements in this country.

A great deal of work has been done on lawyers as judges, because almost all judges in the United States are recruited from the legal profession. Because judicial selection methods for both federal and state judges are highly political in nature, judges must have had some political contacts to become judges. There is also some scholarly work on lawyers as elected or appointed governmental officials in the executive and legislative branches. Many U.S. presidents have had law degrees, while a large percentage of the U.S. Senate and a smaller proportion of the U.S. House are lawyers. Lawyers also dominate many state legislatures.

Lawyers have a variety of advantages when running for elected office in the United States. Some elected offices at both the state and federal level, such as district attorneys or attorneys general, are only open to candidates with law degrees. These offices are often stepping stones to higher elected office such as governors or legislators. Because political parties are generally weak in the United States when compared to those in other countries, candidates for elected offices tend to be individualistic political entrepreneurs. They need the public

speaking skills, negotiation skills, and decision-making skills that lawyers usually possess and that are necessary in both campaigning and governing in the United States. Some practicing lawyers, especially in some state legislatures, use their elected offices to recruit clients for their law practices if they can do both simultaneously. Lawyers also come and go from the practice of law quite easily, which makes it easier for them to take the risks of losing an election. With so many lawyers in various governmental positions, American voters seem quite comfortable electing more lawyers. Some individuals with political aspirations actually attend law school simply to enhance their chances of eventually getting elected into political office. Thus Tocqueville was quite right in referring to lawyers as the political class in the United States.

Legal Realism

Legal realism, as an approach to politics and law, developed in the early twentieth century. It arose in response to the mechanistic view that the law was objective and unchanging, not influenced by external events, and was distinct and separate from politics. This mechanistic view of the law was known as *formalism*. The formalistic view of the law required that judges apply the law, objectively, without reference to political ideology or policy considerations.

During the 1920s, a group of legal philosophers and judges developed what is known as *legal realism*. These people included several famous judges such as Benjamin Cardozo, Roscoe Pound, and Oliver Wendell Holmes. Eminent legal philosophers Karl Llewellyn and Jerome Frank were intimately involved in the movement. The formal recognition of the movement has been thought to be a discussion in journal articles and correspondence between Llewellyn and Pound.

From the 1920s to the 1940s, legal realism developed into a force to be reckoned with, but there has been no unified theory concerning it. There were several aspects to legal realism, although not all of the purported legal realists agree on what constituted it. Indeed, what appeared to bind the legal realists together was more of a rejection of the formalistic view of the law in the search for something better that would address the problems of formalism.

The first basic aspect of legal realism was a rejection of the absolute nature of legal rules. Though legal realists, as a practical matter, would recognize that statutory laws exist and have at least some influence on the application of the law, the statutes, themselves, did not absolutely determine the outcome of any particular case. Indeed, any statute simply could not account for all of the possibilities concerning the prohibited conduct. Essentially, the statutory law was considered to be indeterminate. Many other factors could enter into any judicial decision. These factors could and did include social, economic, and political considerations.

The second aspect of legal realism was the recognition of judicial power. Judges had extraordinary power in the exercise of judicial discretion. Judges were the final authority in the application and interpretation of law. As such, they could and did (and, based on their office and duty, were required to) make decisions to, if for no other reason, address those circumstances that the statutory law did not address.

The third basic aspect was that the law was an instrument to serve social ends. In other words, both policy and ideology could be implemented through the law. Social ends were within the power of the judges. Progressive political agendas were within the power of the judges. The purpose was to mesh both policy and law for the benefit of society.

The fourth basic aspect was that the law was a profession that should be improved through legal education and making the law and the outcomes of cases more predictable and certain. The application of the law was considered to be a social-scientific endeavor. Though judges had the authority to bring other factors into the decision-making process, this did not mean that such decisions should be arbitrary and capricious. The law was the guide and not an inflexible mandate.

The final basic aspect was that the law was a result of competing social, political, and individual interests. Thus, the law was malleable and the best agency to balance these interests was the judges. But this did not mean that the legislatures were without purpose.

In contemporary times, the principle of legal realism has been subject to significant criticism in both the legal and political arenas. This is especially true concerning the power of judges to inject their own political views into the decision-making process, which has been, correctly or not, labeled as *judicial activism*. Another significant contemporary criticism of legal realism is its use of the courts as an agent for social change. However, this does not change the fact that the school of thought of legal realism had a profound impact on the practice of politics and its relationship to the judiciary as an agent of political and social change. Legal realism influenced the development of contemporary approaches in political science, including law and society, empirical studies in judicial behavior (e.g., the attitudinal model), and critical legal studies.

Legislative Drafting

Legislative drafting is the process of writing a text with the aim to enact it as legislation. In most democracies, legislation is an important medium through which law is expressed. Before a document can function as law it needs to be enacted in some form or other. Most of the time, the constitution of a country will define the proper procedures for enactment (or promulgation) of legislation by a legislature (i.e., the enacting authority). There are two sorts of legislative procedures: first, ones involving a representative body (e.g., a parliament), often resulting in primary legislation (e.g., acts of parliament, statute law); and second, ones without direct involvement of representative bodies, usually enacted by the administration or executive branch of government, resulting in secondary legislation (e.g., regulation, delegated or subordinated legislation, statutory instrument, executive order, decree).

Legislative procedures determine how legislation is drafted. In some constitutional systems, proposals for legislation (bills) can only be tabled by the members of a representative body itself, as is, for instance, the case for the U.S. Congress. Members often seek the assistance of specialized consultants at law firms for the actual drafting. In other systems, the administration or executive branch can suggest, propose, or even table bills for primary legislation as well. Usually ministerial departments and administrative units can pool their resources (legal expertise and skills) to come up with good quality drafts. The quality of a draft—and ultimately legislation—is dependent on the legal quality (does it fit in existing law?), the political quality (how are trade-offs between opposing interest fixed?), the instrumental quality (will the set objectives be met?), the democratic quality (enough popular participation, transparency?), symbolic quality (does it communicate and reaffirm public morals, values, and goods?), and technical quality (is the text clear, readable, understandable, and accessible to the addressees?).

Over the past decades, a lot of countries have set up programs to improve the overall quality of legislation. These programs aim to reduce administrative or economic burdens of legislation and have affected the way in which legislation is drafted.

Drafting legislation is complicated because it requires legal expertise and specialized skills. Typically, specialized units in departments or cabinets (e.g., the British Parliamentary Counsel) come up with first drafts of legislation. It is good practice to consult interested parties or the public on drafts in order to have their input. Increasingly, drafts are subjected to impact assessment (i.e., ex ante reviews on the economic, societal, or environmental effects a draft might have). Once a draft is submitted (tabled) to parliament, it is called a bill.

The skills and expertise required to draft legislation are mostly not taught in academic curricula but trained on the job. A lot of countries use drafting manuals to transmit the necessary skills. Of late, some dedicated training institutes for legislative drafting have been established (e.g., European Academy for Law and Legislation at the Hague; Institute of Advanced Legal Studies of the University of London; International Legislative Drafting Institute of Tulane University, in New Orleans) to offer some form of academic training to professionals.

Legislative Hearings

Legislative hearings are the primary institutional mechanism for collecting information about policy-related issues from a variety of actors, including Congress, the executive branch, interest groups, and citizens. Most frequently conducted on Capitol Hill in Washington, DC, witnesses run the gamut

from executive branch officials to interest group lobbyists to academic experts to current and former congressional members and staffers to ordinary citizens. Preparation for legislative hearings on the part of witnesses as well as committee staff members typically is intensive. Staffers prepare notebooks of pertinent information for committee members and interview prospective witnesses.

Some interest groups, such as the American Medical Association, testify fairly routinely before Congress. While many hearings garner relatively little attention except from the interested parties, others have made witnesses and congressional committee members household names. These include Lieutenant Colonel Oliver North of the Iran-contra hearings in 1987 and U.S. senator Sam Ervin (D-NC), who chaired the committee that investigated campaign finance activities related to the 1972 Watergate break-in. Republican Richard M. Nixon of California parlayed his questioning of witnesses appearing before the House Un-American Activities Committee into a path to successful bids for the U.S. Senate, vice presidency, and presidency. U.S. senator John F. Kennedy (D-MA), as a member of the committee chaired by U.S. senator John McClellan (D-AR) that investigated labor racketeering, gained much favorable publicity that assisted his successful 1960 presidential bid.

Television coverage of legislative hearings first became prominent in 1952, the same year television sets became fixtures in one-half of U.S. households. U.S. senator Estes Kefauver (D-TN) parlayed his chairing of crime hearings into the 1956 Democratic vice presidential nomination. More than twenty years later, ranking Watergate committee member U.S. senator Howard Baker Jr. (R-TN) became famous to millions of television viewers for asking, "What did the president know, and when did he know it?" Baker went on to unsuccessfully seek the Republican presidential nomination in 1980. Fred Thompson, minority counsel to the committee, went on to later fill the U.S. Senate seat previously held by Baker and to make a bid for the 2008 Republican presidential nomination. Other memorable televised legislative hearings included the 1991 confirmation hearings for the nomination of Clarence Thomas to fill the position of associate justice of the U.S. Supreme Court made available by the retirement of Thurgood Marshall. Sexual harassment allegations lodged against Thomas by Professor Anita Hill made for riveting television in sessions chaired by U.S. senator Joseph Biden, who went on to be vice president of the United States.

More legislative hearings are conducted at the subcommittee level than at the full committee level. The prospect of a bill being enacted or a resolution adopted by a legislative chamber will be enhanced considerably if it is scheduled for a hearing by the chair of the committee within whose jurisdiction it falls. The power of committees to issue subpoenas to witnesses enhances the oversight and investigatory capacities of committees. Effective testimony at a hearing can mightily enhance a bill's chances of becoming a law or a resolution's being adopted by a chamber of Congress. For example, the U.S. House of Representatives heard testimony from three former "comfort women" from Korea, who had been girls forced into the sexual service of members of the Japanese military during the Japanese colonial period that ended with the conclusion of World War II in 1945. Thanks to their testimony on February 15, 2007, House Resolution 121 called on "the government of Japan to apologize for its war crime enslaving over 200,000 girls and women during World War II as 'comfort women.'" This resolution was followed by others from Canada, the European Union, and the Netherlands.

Testimony also can be perilous for the careers of witnesses. Alberto Gonzales resigned his position as U.S. attorney general and subsequently retained defense counsel because of his testimony before the U.S. Senate Judiciary Committee concerning matters including the firings of U.S. attorneys, warrantless wiretaps, and the detention of "enemy combatants" in 2007.

In addition to helping Congress perform its oversight of the executive branch function, information gleaned from hearings is important for establishing legislative histories. An excellent example is when U.S. senator Tom Connally (D-TX) secured the agreement of U.S. secretary of state Dean Acheson that the NATO treaty did not confer the power of unilaterally taking the nation to war on the president. Such a record buttresses arguments, such as those put forth by Louis Fisher, that Congress has subsequently unilaterally abdicated for all practical purposes its constitutional responsibility to declare war to the peril of the United States and the rule of law. Representative government is made possible by the information that legislative hearings make available about government to the citizenry.

Legislative Systems

The term *legislative system* refers to the institutional arrangement for enacting laws, centered usually on one or two deliberative assemblies that claim to represent the nation. Those bodies may be called the *legislature* to denote their

lawmaking function, or the *parliament* to denote their deliberative character, or the *assembly, congress,* or *diet* to denote that they are organized as a meeting of one house or of two chambers constituting a *bicameral* assembly.

Political science refers to a legislative *system* because the institutional arrangement consists of interrelated parts, usually including committees among which the legislative work is subdivided; political party groups, which organize partisan differences among members; one or two chambers, which represent the nation in different ways; and individual members, whose behavior is related in a system of roles defined by formal rules and informal norms.

Legislative systems can trace their ancestry to the parliaments of medieval Europe. Parliaments were originally consultative bodies called by monarchs at irregular intervals. They consisted of leading notables from the territorial constituencies that made up the nation. Their members bargained with the monarch, exchanging consent to the monarch's need for revenue and soldiers for legal favors to their constituents. In modern times, parliaments exist in one form or another in every country in the world except in two or three countries where they have been temporarily suspended by dictatorial rulers. Most contemporary parliaments were established in the twentieth century in the wake of the proliferation of independent nation-states, although the most influential parliaments have a much longer history. The Inter-parliamentary Union lists 191 parliaments, 114 of them unicameral and 77 bicameral.

Legislative systems are therefore both very old and very widespread political institutional arrangements, signifying that they serve some general political functions, among which representing the nation and legitimating its laws are the most universal. Yet there are also enormous differences among them. The structure of the core institution of the legislative system has some defining characteristics but varies greatly in detail. The size of legislatures ranges from the fourteen-member Congress of Micronesia to the 2,987 membership of the National People's Congress of China. The size of a legislature is not directly related to the size of a country's population, but is the consequence of the electoral system used to select the members.

Though all legislatures participate in the enactment of laws, the importance of that participation ranges widely. In the United States, at both the national and state levels, legislatures play a more important part in lawmaking than in any other country. However, even in the United States the executive branch of government has increasingly drafted important legislation, although bills are introduced by individual members of the legislature and the final enactment of all bills, wherever drafted, is significantly influenced by the legislature. In political systems in which leaders of the legislature simultaneously hold ministerial positions in the executive branch of government, the role of the legislature in the enactment of legislation consists chiefly of responding to executive initiatives. In many European countries, that response is the product of intraparty and interparty bargaining, either within parliament or by party leaders in the cabinet. Latin American legislatures were historically subordinated to powerful executives. The consolidation of democracy beginning in the 1990s, however, has tended to transform these legislatures into institutions that insert themselves variously into the policy-making process, depending on electoral systems, constitutional powers, and members' career ambitions. Where a single party dominates the assembly, as is true in many African and Asian countries, the participation of the legislature may be merely symbolic.

Legislatures have some common organizational characteristics, regardless of the varying influence they have on the enactment of legislation. They must be able to transform the often contentious views of their individual members into collective decisions, whether in the form of law, of declarations of opinion, of selecting leaders, or of overseeing the executive. To achieve collective decisions requires coordination, a division of labor, and agreed procedures. Although their members are formally equal in their representational status, informal leadership hierarchies develop within them, as does a division of labor among committees and consensus on procedures for determining the sequence of action.

REPRESENTATION

The capacity of a legislative system to legitimate legislative enactments depends on its claim to represent the nation. At one time that claim was justified by the stature of the citizens whom the monarch called to meet in parliament. In contemporary authoritarian states it is justified by the presumed authority of a dictator or of leaders of a dominant party to appoint the members. The claim to representativeness is justified by the extent to which the members reflect the full range of that society's relevant ethnic, racial, religious, and class characteristics, as well as the distribution of members between the genders. In contemporary democracies, representativeness is conferred by competitive elections. Legislatures predate democracy. Democratizing them consisted of extending the right to elect their members from a franchise limited to property holders, to "universal" manhood suffrage, to suffrage without regard to gender, race, or ethnicity, and to the vote for eighteen-year-olds. This development began in the United States early in the nineteenth century, in Great Britain with the first reform of parliamentary representation in 1832, and on the continent of Europe after the revolutions of 1848. It was completed in most countries in the second half of the twentieth century with profound consequences for the composition and internal organization of legislatures.

Democratic legislatures retain the medieval notion that a country consists of geographic communities and that the members therefore should be chosen in territorial constituencies each electing one or a small set of representatives. In a few small countries, there is a single national constituency in which all members are chosen by proportional representation. Political parties, successors to the factions that existed within predemocratic parliaments, organize electorates. Unlike factions, parties work outside of legislatures as well as within them, linking groupings of like-minded members with their

voters. Parties nominate candidates, mobilize voters, formulate electoral programs, and attempt to hold the elected members accountable to their constituents. The electoral connection between members of the legislature and the population provides the incentive for members to be individually responsive to their voters. The frequency of legislative elections varies from the two-year term of the U.S. House of Representatives to the modal four-year and five-year terms of most of the world's legislatures. In parliamentary systems the legislature can be dissolved before the end of its term and new elections can be held under constitutionally prescribed conditions.

To the extent that voters respond to parties rather than to individual candidates, the electoral connection provides the incentive for members to vote in the legislature cohesively by party. This is particularly true in European parliaments in which the electorate is strongly influenced by party labels. Party discipline on roll-call votes exceeds 90 percent in most democratic legislatures outside the United States, except on matters of individual conscience. Since the last quarter of the twentieth century it also attained this level of cohesion on important issues in the U.S. Congress even though members contest their seats far more as individuals than as party members. In parliamentary systems, party discipline in parliament adds to the authority of the executive when the prime minister and the cabinet consist of leaders of the party or parties holding a majority in the assembly. In the U.S. presidential system, where the presidency and Congress are often in the hands of different parties, party discipline may make for "divided government" in which the presidential veto becomes an important source of executive influence over the legislature.

Broadening the right of the population to participate in the selection of members of parliament and broadening eligibility to membership do not necessarily ensure that the composition of legislatures will appear to be representative of the population. A few hundred representatives cannot fully mirror a large population, but democratic publics do expect representative institutions to look like themselves in salient respects. All countries expect that the membership of the legislature should reflect the geographic diversity of the population and most expect that the party composition of the legislature should bear a reasonably close relationship to the distribution of the vote by party in the electorate. Although the nomination of candidates by the political parties is the mechanism by which the composition of the legislature is made to correspond to public expectations, that mechanism is imperfect. The sensitivity of the parties may lag behind voter expectations and election outcomes may in any case be governed by the accidents of the distribution of votes across constituencies and by the electoral system used to translate votes into seats. The very slow increase in the number of women in legislatures exemplifies many of the lags in the mechanism by which changing cultural expectations are translated into changes in the composition of legislatures. Over time, however, legislatures do tend to mirror the expectations of the electorates regarding what constitutes "representativeness."

ORGANIZATION

The diverse composition of a legislature that makes it representative of a nation also makes it difficult for the members to reach decisions. The legislative system requires organization that is not overtly hierarchical, which distinguishes it from bureaucratic institutions. It must provide coordination among a large number of members, a division of labor that reflects the different interests and different skills of members, and an agreement among all members on procedures beginning with the formulation of an agenda and ending with a decisive vote.

There is commonly a party organization within modern legislatures that results from the method of selecting their members. This produces a leadership hierarchy in each party, consisting of the set of party leaders presiding over party committees, caucuses, or factions. This leadership structures the pattern of negotiation among the party groups, shapes the agenda of the legislature, and guides the sequence of action. In parliamentary systems of government, party leaders occupy the principal positions in the cabinet. In systems where there is a separation of personnel between the executive and the legislature, notably in the United States, the parties within the legislature usually choose their own leaders. Parallel to the party leadership, legislatures also have a formal leadership structure prescribed by their rules, consisting of a presiding officer or officers of the assembly, a steering committee, and chairs of committees. The holders of these offices interact with party leaders in shaping the agenda of the legislature and the pattern of policy negotiation among the party groups.

Legislatures delegate their work to a set of committees, usually specialized by subject matter. Committee organization varies across legislatures, reflecting their varied involvement in the details of lawmaking. In the United Kingdom, which long resisted specialized standing committees, a public bills committee is now appointed *ad hoc* for each bill introduced in Parliament and there are nineteen standing oversight committees, one for each government department. In the U.S. House of Representatives there are twenty-two specialized standing committees and 135 subcommittees engaged in both the legislative process and in departmental oversight. Most legislatures have a committee structure between these two models. Ten to twenty specialized standing committees are the usual number, and subcommittees are seldom used outside the United States.

Geographically defined constituencies and committee specialization clearly help legislators to identify the special interests of their constituents and to serve them. However, this emphasis on particular interests presents obstacles to the formation of collective decisions. One way members overcome these obstacles is by trading votes with one another. Relying on differences in the intensity of their various preferences, members exchange support on matters of indifference to them for support on matters they care about deeply. This is the basis of "pork barrel" legislation, typically reflected in appropriations providing individual benefits for every member's constituency. This is the pattern called "distributive politics" or "log rolling," in which everyone appears to win but the collectivity is ill served. But committee specialization also

enables legislatures to compete effectively with the specialized knowledge of executive departments, and the deference that legislative committees show to each other is to some extent also respect for expertise.

PROCEDURES

The collective decisions of the legislative system are channeled by written rules of procedure, by interpretations and precedents based on these rules, and by informal norms of conduct. Although legislatures generally have the authority to make their own rules, in practice there is great continuity of procedure over time and substantial similarity across legislatures. Most newly established parliaments borrow the procedures of long-established parliaments in other countries, recognizing the value of the experience of others in designing ways of reconciling the wills of the members of a large assembly.

On the surface it would seem that legislative decisions should be procedurally straightforward, requiring only an agreement on whether decisions be made by simple or qualified majorities. Such an agreement, however, is by itself inadequate for reaching conclusions in legislative systems. Because the system may consist of two houses, a leadership occupying ministerial offices, committees having procedural privileges, and constitutional courts with the power to nullify legislative enactments, a legislative system has many veto points, and bargaining among the veto players does not follow simple voting rules. Even within a single legislative institution, conclusive votes are not easily achieved. Unlike voters in general elections, members of a legislature vote on a constant stream of related issues. As they do so, they interact with each other, taking a variety of interests into account and negotiating compromises. As soon as there are more than two alternatives on which legislators must vote, each successive pairing of alternatives may have a different result, possibly leading to an endless cycle of majority votes with different outcomes. If alternatives are not paired but are presented in a particular sequence, the choice of the voting sequence will affect the result. The varied preference orderings of a group of legislators choosing among many alternatives will not naturally lead to a single decision. Subsidiary rules must determine the sequence in which alternatives are considered and the point at which a vote is final. That sequence will affect the final outcome. Experienced legislators, who often acquire great skill in exploiting particular sequences to their own advantage, have always recognized its importance. Informed observers can distinguish between "tactical" and "sincere" voting.

The impression that legislatures spend too much time dealing with seemingly basic procedural questions overlooks the importance that procedures have for affecting decisions. Rules are not neutral in their effect on outcomes and that is why they can be controversial. They allocate authority among committees and between them and the whole house, between majorities and minorities, between decisions taken at different points in time, and in parliamentary systems between the leaders of parliament in the cabinet and their "backbench" followers.

In the legislative system the lawmaking process begins with the introduction of bills, either by individual members (as in the U.S. Congress), by the cabinet (as in parliamentary systems of government where the cabinet consists of leaders of parliament), by the component states in a federal system (as may occur in Germany), by voters in the form of an initiative (as in Switzerland and some of the states of the United States), or by committees (as in half of the world's legislatures). Early in the process, bills are nearly everywhere referred to committees. In most countries, committees must send bills to the parent chamber for a final decision. In the Italian parliament, committees may actually enact legislation. Elsewhere committees may revise bills in limited ways, as in Great Britain, or substantially, as in Germany, or even more extensively, as in the United States. In the United States, a committee often fails to report a bill to the whole House. The extraordinarily simple process that allows each member of the U.S. Congress to propose unlimited numbers of bills results in a volume of more than five thousand bills in each biennial Congress, far in excess of the workload of any other legislature. Procedures determine the sequence by which bills are reported back and prescribe restrictions on their further amendment on the floor. In the U.S. House of Representatives, a rules committee proposes a special rule for each important bill to govern the particular circumstances under which the whole chamber will consider it. In the U.S. Senate the sequence of business must be negotiated among the party leaders to achieve the unanimous consent of all one hundred members, because senators are unwilling to delegate this important matter to a committee. Restrictive rules govern final consideration of bills in most legislatures. The appropriation of public funds follows special procedures everywhere, in recognition of the technical expertise required to formulate a national budget and of the temptation of legislators to appropriate funds in excess of what they are willing to vote in taxes.

Where bicameralism exists, it adds to the complexity of the legislative process. When legislatures consist of two houses, as in Australia, France, Germany, Great Britain, Italy, the United States, and altogether seventy-seven countries, special procedures govern the ways in which their separate decisions must be reconciled. In the U.S. Congress, a joint conference committee consisting of sometimes more than one hundred members of the two houses, and at times also divided further into subcommittees, attempts to formulate a compromise that can be identically adopted by each house. This committee's role late in the legislative process gives subject matter specialists who dominate conference committees important influence on the final text of legislation. In other countries, such as Australia, Canada, and France, bills shuttle back and forth between the chambers in a process with the French name *la navette*. Most of these legislatures grant the directly elected house the last word, giving it power depending on the number of shuttle trips permitted and the patience of each chamber.

Thus, parliamentary organization and procedure produce informal hierarchies and asymmetries by which assemblies of equal members are turned into working bodies capable of

decision making. This is also an accomplishment of the subtle, implicit codes of courtesy and good conduct among members that are often called informal norms. In most effective parliaments there is a reciprocity in interpersonal relations that consists of courtesy even in the face of sharp substantive differences, of keeping promises even in the face of intense tactical maneuvering, of cooperation even in the face of competition. Members learn that they must work with each other, learn to respect each other's burden of work, and learn that even the fiercest political differences are best acted out when they are depersonalized. These norms of conduct or "folkways" contribute to the transformation of a collection of individuals into a corporate body.

Legislative Systems, Comparative

Legislatures come in as many varieties as political systems. Most contemporary states, including authoritarian ones, have at least the facade of formal elected assemblies. All but a handful of countries, whether democratic or authoritarian, have some form of legislature. Of 192 states belonging to the United Nations (UN) in 2006, 189 national parliaments were listed by the International Parliamentary Union. While the terms *parliament* and *legislature* have specific meanings in each country, these English-language terms are used interchangeably in this entry. *Deliberative assembly* is a frequently used descriptive term as well.

Many provinces in unitary systems, as well as states within federations, have their own legislatures. Though municipalities and other local units also may have elected deliberative bodies, the formal study of legislatures has concentrated on national and provincial levels. Though executives, and the judiciary to a lesser degree, may be elective, in most countries the legislature is both the main representative organ of the state and at least the formal source of statute law. As representative bodies, legislatures potentially embody society's diversity of people and opinions. Although competitive elections to parliament were the main initial transitional event as communist systems fell two decades ago, in other societies, legislatures are mainly passive symbols to legitimize authoritarian rule. In some regions and eras, democracy and legislatures have been episodic, interrupted by coup or insurrection.

ATTRIBUTES AND GENERIC FUNCTIONS

While legislatures have many specific tasks, varying through time and by societal conditions, they all potentially have two basic generic, intertwined functions: representation of the people and interaction with the executive. Representation has a purpose: minimally to debate and also to approve, modify or disapprove of what the executive—royal, military, or elected—would either do or wish to do in the absence of the assembly. While the main models of the executive-legislative relationship in democracies are the British Westminster system, the American congressional–presidential system, and the continental European pattern, there are many variations in practice. In the Westminster system, the prime minister, elected through parliament, remains a member of parliament, while in the American system, the president is neither elected by nor a member of Congress. In the continental European pattern, prime ministers are elected by parliament but relinquish their own parliamentary membership during their service in the cabinet.

To accomplish their two generic functions, legislatures have five defining characteristics, with many variations: plural, with many members; selection through peaceful means, usually elective; constitutional existence; a complex internal structure among members who are equal in status; and decision making through voting procedures.

PLURAL

Though a country has only one chief executive, assemblies, to be representative, have always had more than one member. The size of legislatures varies roughly with the population size of the country. Small nations, for example, often have fewer than fifty members, while India, the world's largest democracy, has 545 members in the Lok Sabha. In bicameral parliaments, the second chamber is usually smaller than the main chamber. The Nigerian lower house, for example, has 360 members, while the Senate has 109.

SELECTION

Though executives can seize power through coup or insurrection, legislatures are selected mainly through elections. The members of early medieval European parliaments were aristocrats, selected through inheritance or royal appointment. Some assemblies, especially in colonies and traditional monarchies, have been created by decree and filled through appointment. In bicameral legislatures, appointment and indirect elections are sometimes used to diversify the political and social composition of the main chamber.

In the aftermath of World War I (1914–1918), a broad suffrage became the norm among democratic states. The slow change from a selectorate of the few to the electorate of millions, created the conditions for the emergence of mass political parties that have transformed executives and legislatures and their elections. The two main types of legislative election systems are single-member districts with plurality voting (Britain, Malaysia, and the United States) and multimember districts with proportional voting (Indonesia, Sweden). Some countries use a mixed system (Germany, Hungary, and Japan).

CONSTITUTIONAL EXISTENCE

Historically, parliaments have often disagreed with monarchs, who have frequently either dissolved assemblies or have refused to call them into session. Constitutions now frequently limit the capacity of the executive to either call or dismiss legislatures and stipulate that legislatures meet according to a schedule. Members of legislatures often have immunity from prosecution in the exercise of their office.

INTERNAL STRUCTURE

Legislatures have a flat structure in that all members are equal in status and rights, though in many countries, government ministers either belong to parliament or at least may participate in parliamentary proceedings. A complicated division of labor among the members, however, results in a complex structure of committees, parties, and leaders. To manage the process of decision making, legislatures define specific procedures, ranging from how a bill is introduced to how and when a question is decided in a final vote. Organization and procedures expedite work, protect the rights of each member against all others, and are intended to protect the legislature against the executive.

DECISIONS BY VOTING

Decisions by voting among equal members are a continuation of the broader democratic principle of elections. Just as citizens cast votes, so legislators vote to make collective decisions about policy and government.

CHANGING LEGISLATURES IN A CHANGING WORLD

In the rapidly changing post–cold war world, legislatures appear in three new settings, which together potentially increase both the number and variety of institutions called *legislatures.*

First, the rapid formation of new countries leads to the equally rapid formation of new legislatures. In some cases, such as the Czech Republic and Slovenia, a legislature had already been developed at the subordinate republic level within larger states. In others, such as East Timor, prior legislative bodies were rudimentary at best. Some potentially independent states, such as the Palestine Authority, have developed elections and a legislature as part of the process of becoming independent, as former African colonies did.

Second, secessionist provinces, such as Chechnya within Russia or Abkhazia within Georgia, conduct their own elections to create new, but internationally unrecognized governing structures of presidents, prime ministers, and parliaments.

Third, bodies that begin to look and act as legislatures are emerging at the international level. While the Parliament of the European Union is the best example, other international associations, such as the World Health Organization, are developing legislativelike institutions and practices as well.

Over centuries of experimentation and adaptation and across continents, legislatures have proved to be remarkably resilient bodies. In both authoritarian and democratic political systems, legislatures present at least the symbol of, and potentially the opportunity for, independent representation against the executive.

Legislature–court Relations

The relationship between courts and legislatures in the United States is sometimes cordial but often strained. Most court-legislative interactions are routine. For example, courts regularly interpret statutes written by Congress. If Congress is unhappy with a federal court's statutory interpretation decision, the legislature can simply enact a new statute. Under their power of judicial review, the federal courts also can declare an act of Congress to be unconstitutional. If Congress is unhappy with a constitutionally based court decision, in theory the legislature must pass a constitutional amendment to override that ruling. Sometimes Congress will pass a mere statute in an attempt to overturn a court decision, but Congress may be trying also to convince the court to change its ruling on its own. Louis Fisher (1988), among others, argues that the courts do not have the last word on the meaning of the Constitution, but instead constitutional interpretation is achieved through an ongoing conversation or dialogue among the branches of government.

Another routine interaction between Congress and the federal courts occurs annually when Congress provides all funding for the judicial branch. The Constitution prevents Congress from lowering the salaries of federal judges and they serve life terms, but it does not require annual cost-of-living raises. Recently federal judges including chief justices William H. Rehnquist and John Roberts have been quite vocal that judicial salaries are too low. Congress also can create new judgeships or change the boundaries of the U.S. Courts of Appeals. At times, Congress threatens to express its displeasure with particular court decisions by withholding pay raises for judges or by making other changes in judicial branch funding. For example, in 1964 Congress gave Supreme Court justices half the cost-of-living increase that it gave to lower federal judges. Finally, the U.S. Senate must confirm all presidential judicial appointments. Congress can use its confirmation power to attempt to influence the future decisions of the courts.

Sometimes the relationship between the federal courts and the Congress becomes tense. Members of Congress regularly criticize federal court decisions with which they disagree. But Congress also has the power to attack the judicial branch in other ways. For example, Congress can determine the jurisdiction of the federal courts, which means that Congress can decide which cases the federal courts can and cannot hear. Preventing the federal courts, including the U.S. Supreme Court, from hearing a class of cases is called *jurisdiction stripping* or *court stripping.* Members of Congress have long threatened to strip the federal courts of jurisdiction over a variety of cases, such as those dealing with abortion or religion or the Pledge of Allegiance, but have rarely done so. Beginning in the late 1990s, however, Congress did pass various statutes limiting the ability of the federal courts to hear certain types of cases. Congress had not enacted court-stripping legislation since the Civil War (1861–1865) era. It is unclear whether the U.S. Supreme Court will declare such actions to be unconstitutional.

Congress also has threatened to increase its oversight of court decisions and practices. Congressional oversight of executive branch activities is considered routine because those decisions are clearly political in nature. However, Congress has generally refrained from excessive oversight of the courts because judges must be able to make impartial decisions based on legal considerations. The House Judiciary Committee in 2006 passed legislation that would have created an inspector general for the federal courts. An inspector general for the federal judiciary would be an extraordinary step that opponents said would weaken the key principle of judicial independence.

Congress also has the power to impeach federal judges and then remove them from office. Congress has not impeached a federal judge except for high crimes or misdemeanors since the highly political impeachment of Justice Samuel Chase in 1803. Chase was not removed from office in a close vote in the Senate. Many interest groups recently have called for the impeachment of judges because of their decisions. Congress has opened several impeachment investigations recently, but no federal judges have been removed from office to date except for illegal activity. Thus, when Congress is extremely upset with the federal courts, it has a variety of tools at its disposal to attack the courts as an institution.

Legitimacy

Legitimacy is one of the most enduring concepts in modern political science, going back to the opening question of philosopher Jean-Jacques Rousseau's *Social Contract* (1762) of whether "there can be any sure and legitimate rule of administration." It is a concept that spans both empirical and normative political science, and it is one that is widely invoked in everyday political debate.

Legitimacy is often used interchangeably with the terms *political trust* and *political support.* However, it is a distinctive form of trust or support. Legitimacy refers to the rightfulness of a political object. The word *rightfulness* refers to whether something is consistent with a set of norms prevalent in a given political community. In particular, political rightfulness has been defined by David Beetham in his 1991 book *The Legitimation of Power* as consisting of three distinct subtypes: whether a political object accords with the rules and laws of a political community, whether a political object accords with the values and morality of a political community, and whether a political object has secured the willing consent of a political community. Bruce Gilley refers in his 2009 work *The Right to Rule: How States Win and Lose Legitimacy* to these three subtypes as legality, justification, and consent, and shows how they can be measured empirically using a combination of attitudinal and behavioral data.

OBJECTS AND SUBJECTS OF LEGITIMACY

The political objects of legitimacy can take many forms: states, governments, regime types, specific institutions like courts, public policies and laws, political rhetoric, political leaders, or international organizations. While such objects are analytically distinct, in practice the legitimacy of one may exert an impact on the legitimacy of another, as when an unpopular government shakes faith in a state itself.

The relevant subjects of legitimacy range from all global citizens to just a single individual, depending on how the concept is being used. If we are concerned with how legitimacy affects the durability of authoritarian regimes, we may consider new economic classes or military rulers as the most salient subjects. More broadly, such subjective or positive approaches may include all citizens of a given political community, or even all global citizens. For political philosophers, the most salient subject is the philosopher themselves, or more broadly the community of learned individuals engaged in logical reasoning about the meaning of political rightfulness. Such objective or normative approaches thus select their relevant subjects as those holding the most valid set of reasoned arguments. Finally, legitimacy can be treated as a dichotomous or a continuous variable.

The term *legitimacy crisis* is frequently used by political commentators as well as political scientists when discussing the public response to political power. In general, claims of legitimacy crisis have tended to overpredict actual legitimacy crises, suggesting the need for both historical and cross-national context. Many of today's developing countries, from Bangladesh to Egypt, as well as most states in Africa, are frequently described as facing a legitimacy crisis, even as they endure year after year. In particular, it is necessary to distinguish between legitimacy and justice. While *justice* refers to particularistic views of the good society and how political object can serve that end, *legitimacy* refers to a broader consensus on the appropriate uses of political power and the feasibility of alternatives to the given political object.

LEGITIMATION

Five main schools of thought exist on the question of what generates legitimacy. One might be called *localism,* the view that legitimacy is a context-specific concept without universal features. Another is *sociopsychological,* stating that legitimacy is derivative of the social or psychological features of the citizenry. A third school, *developmentalism,* finds the sources of legitimacy in the economic and welfare attainments of the political object. A fourth, *liberalism,* stresses the overarching importance of the provision of an extensive range of rights and freedoms, including democracy. Finally, *bureaucratism* emphasizes the effectiveness and rationality of the object.

The legitimation process is an interactive process in which there are competing evaluations of how well the political object has responded to the demands of a pluralistic society in terms of its rightfulness. The legitimacy of a massive hydroelectric dam project, for example, may derive from its development impact as well as its being a manifestation of democratic policy making and effective bureaucratic implementation. These "sources" thus generate legitimacy by being legal, justified, and consented to.

For the critic of legitimacy, the process of legitimation is marred by the hegemonic influence of certain powerful or better off groups that shape not only the evaluation of a political object but also the basis on which such evaluations are made. Legitimacy is thus a result of some form of "false consciousness" or "fettered imagination."

Closely related to the latter question is the question of why legitimacy matters. German sociologist Max Weber, who pioneered the empirical study of legitimacy, believed that legitimate power, also known as *authority,* was necessary for the modern state because of its extensive regulation of society.

Both defenders and critics of the legitimation process often agree that legitimacy is critical to sustaining certain political objects—philosopher Karl Marx believed that falsely implanted legitimacy was central to the preservation of capitalism while political scientist Freidrich Hayek argued that capitalism's genuine popularity was critical to its durability. Marx and Hayek differed only on the normative defensibility of legitimacy. This "strong hypothesis" about legitimacy is that it is a central, if not the central, force in determining political outcomes, whether domestic or international.

EFFECTS OF LEGITIMACY

In line with the strong hypothesis, legitimacy has been invoked to explain state-building, democratization, and social revolutions, as well as international outcomes such as propensity for war and international cooperation. In this view,

legitimacy is the motive force in politics without which the structural or voluntaristic factors often invoked to explain various political outcomes would be rendered inoperable.

A weaker hypothesis about legitimacy's effects is that while its direct consequences are uncertain, it is nonetheless a critical concept in structuring political argument and debate. Here, the study of legitimacy is directed mainly to "unmasking" certain rhetorical claims found in the political arena.

Finally, for the philosopher, as well as the sociologist, there is a *normative hypothesis*: legitimacy is a great moral good. People are happier, and their position is morally superior, when they relate to political objects on the basis of a shared morality rather than as strategic or interest-maximizing agents whose behavior is subject to "command and control" by the state. To know whether a political object is legitimate is thus an end unto itself.

Legitimate Violence

Legitimate violence emerged as a core theme in social science with the lasting contribution made by German sociologist Max Weber in the early twentieth century. Initially known as (legitimate) use of physical force, the concept became a central contribution in modern sociology and more particularly in the definition of modern states. This line of thought was continued by a number of theorists who described the process by which states, at least in western Europe, became more centralized, impersonal, authoritative, and resourceful. The interest in the capacity of modern states to control violence is a recurrent theme in social science today as numerous societies are affected by illegitimate, public, and private types of violence.

LEGITIMATE VIOLENCE AND THE WEBERIAN SOCIOLOGY OF THE STATE

Max Weber's sociology is central to the explanation of social phenomena and institutions illustrating the various configurations of power, legitimacy, and authority. The importance of these basic processes makes Weberian thinking clearly distinct within the classical sociological contributions. Only in this analytical context can the functioning of political and nonpolitical associations be understood. By Weber's definition, "a state is a human community that (successfully) claims the *monopoly of the legitimate use of physical force*" (*Gewaltmonopol des Staates*) within a given territory. This definition indicates that legitimate use of physical force in the form of violence is a distinctive instrument of modern states but is nonetheless limited in usage and not the only instrument used. Weber considers states, or any other social organization, unable to be defined in terms of function as this range is extremely diverse. Instead, the states should be defined in terms of their specific *means,* that is, the use of physical force.

According to Weber, other types of groups, such as kinship and household groups, medieval guilds, and churches, have historically used violence against their members and external entities to attain their objectives. The physical force used by the state is different, however, in that it is exercised over a continuous community and territory. And even though the use of violence by the state is a specific instrument, it is not an exclusive one. It is a potential and last resort that a political institution may use to attain its goals.

Yet while this is a common characteristic of state action, there exists a huge variation in capacity. Despite their general claim and legitimacy, some states are more successful than others in monopolizing the use of physical force. A key variable describing this capacity is the development and functionality of the administration put in place to enforce binding decisions and use physical force against the members of the community or other states if needed.

For Weber, the nationalization of the legal order and the monopolization of the legitimate use of force developed gradually, starting in late western European Middle Ages. It required the dismantling or embedding of military forces into the political order and purposeful action by agents of the latter. The use of mercenary and nobility-sponsored forces was replaced by professional and national armies supported and funded by the central state. Groups and organizations primarily defined by their economic and peace interests supported the state in this process. Others demonstrated a natural resistance to this monopolization—groups such as the nobility, which previously had the power to use violence for its own purposes, resisted the ultimately successful effort to centralize the political system and contain private violence.

LEGITIMATE VIOLENCE AND THE NEO-WEBERIAN SOCIOLOGY OF THE STATE

A significant number of social scientists accepted political violence and its containment by the state as constitutive to the modern political processes taking place primarily in western Europe starting with the seventeenth century. Following Weber's initial insights, they developed more detailed explanatory frameworks to capture dynamics and relevance of violence in modern politics. Norbert Elias places the centralization of political power and monopolization of violence in a larger process of "civilizing." Bertrand de Jouvenel explains how the power of the state is permanently increasing, allowing

central governments to use without control violence against their own citizens. Charles Tilly puts the capacity of states to organize coercion at the core of the process of state formation in Europe. As state agents and structures stripped other entities of their rights and capabilities to use violence, states, in turn, had to extend their security apparatus and offer external and internal protection services to client domestic groups. Michael Mann defined successful modern states as having two types of power—despotic and infrastructural—both converging to offer stability to the national political order. Anthony Giddens indicates that internal pacification is a key dimension of state action as part of a larger process of increasing its administrative power. Other authors highlighted the potential superior capacity of states to control and organize social interaction. Michel Foucault, for instance, departing from the Weberian primary focus on monopolization of violence, initiated a research agenda dedicated to the advance of state capacity as "governmentality" starting with the eighteenth century.

THE CONTINUOUS RELEVANCE OF LEGITIMATE VIOLENCE IN CONTEMPORARY POLITICS

Legitimate violence is a recurrent theme in the social sciences. Violence and state capacity are central in three topical areas. First, the emergence of totalitarian/authoritarian regimes in the twentieth century highlighted the dangers of unaccountable political and military power. In the cases of these types of regimes, the ability to monopolize violence is secured to such an extent that it becomes the main instrument and support of political rule. At the other end of the state power spectrum are countries that experience civil conflicts and state weakness and failure. These phenomena were present especially in countries gaining independence after colonial rule and the countries facing violent regime change and state dissolution after the end of the cold war in the early 1990s. In this latter case, the role of violence was related to the difficulties of building a recognized and efficient political center able to contain violence and project a legitimate form of it. Third, the institutionalization of human rights regimes created a normative obstacle against illegitimate state violence. The human rights regime is supported by specialized national and international institutions and justifies external intervention in conflict situations, especially after the end of the cold war.

Lenin, Vladimir Ilich

Vladimir Ilich Lenin (1870–1924) was a major Marxist theorist who put his ideas into practice by leading the Bolshevik Revolution in 1917 and bringing communist government to Russia. His political philosophy, called Leninism or Marxist-Leninism, inspired communist movements throughout the world in the twentieth century.

Lenin—born as Vladimir Ulianov—was drawn to revolutionary activity after his brother was executed in 1887 for participation in a plot to assassinate the tsar. Lenin was expelled from Kazan University, where he studied law, for his involvement in radical organizations. He was exiled to Siberia in 1895, where he took the *nom de guerre* Lenin from the nearby Lena River.

After his release from internal exile in 1900, he left Russia and joined a Russian Marxist circle in Switzerland. He helped found the Russian Social Democratic Labor Party (RSDLP) in 1898 and together with fellow radicals Julius Martov and Grigorii Plekhanov edited the journal *Iskra* (*Spark*), which was smuggled into Russia to promote a socialist revolution among workers.

In 1902 Lenin wrote *What Is to be Done?*, in which he argued that revolution would only be brought about by an elite party of professional revolutionaries, not by workers. This was a major departure from the beliefs of German philosopher Karl Marx, who maintained that the workers would attain class consciousness and revolt. Lenin believed that workers, if left to themselves, would develop a trade union mentality and attempt to reform, not overthrow, capitalism. In 1903 he put this idea into practice by forcing a schism in the RSDLP, creating the more radical Bolshevik (from the Russian word for majority) Party. He advocated an immediate and violent revolution to overthrow the tsar and capitalism in Russia, but, as an exile, he lacked the power base to achieve this goal. Instead, he engaged in polemics with other Marxists in Europe and later produced major works extending Marxist analysis, including *Imperialism, the Highest Stage of Capitalism* (1916) and *State and Revolution* (1917). He emphasized that communism would not mean a "withering away" of the state but instead would require a dictatorship of the proletariat, which he equated as rule by a communist party. He split with the Socialist Second International in 1914 over the question of socialist support for World War I (1914–1918), which he opposed.

Lenin did not return to Russia until April 1917, after the tsar had been overthrown. Once there, he argued for another revolution to bring about communism. The Bolsheviks were weaker compared to other political groups, but Lenin's radical

position helped win more converts, including Marxist theorist Leon Trotsky, as the political, economic, and social situation in Russia deteriorated. In November 1917 (October in the old Russian calendar), Lenin convinced his fellow Bolsheviks to seize power from the provisional government. They succeeded, and afterward the Bolsheviks established a Soviet (communist) government in Russia.

Lenin became leader of the Soviet state, fighting off challenges from noncommunist opponents in the Russian Civil War (1917–1923) while attempting to bring about a rapid transformation to communism. He later altered course in 1921 with the New Economic Policy, which envisioned more gradual change. He died in 1924 without naming a successor, and questions about his true intentions as to how to build communism remain debated. His ideas about party organization and the need for violent revolution became the basis for most communist movements in the twentieth century.

Leninism

Leninism is a political philosophy associated with Vladimir Lenin (1870–1924), leader of the 1917 Bolshevik (Communist) Revolution in Russia. Lenin considered himself a Marxist, and much of Leninism is grounded in Karl Marx's observations about politics, economics, and society. Compared with classical Marxism, Leninism gives a greater emphasis to the role of revolutionary "toilers" (both workers and peasants) than the working class per se, to underdeveloped or semicolonial countries than to advanced capitalist countries, and to the leading role of a vanguard party over the spontaneous activity of the working class.

One of Lenin's major innovations to Marxist thought was his belief, expressed in *What Is to Be Done?* (1902), that the workers, by themselves, would not produce a socialist revolution. Instead, the best that workers could do is develop a "trade union consciousness" that would seek merely to reform, not overthrow, capitalism. Hence Lenin argued for the creation of a party of professional revolutionaries that were committed to Marxist ideas and the raising of class consciousness among workers. In so doing, he built upon a tradition in nineteenth-century Russia of revolutionary activity within small party cells. Moreover, the party would be subject to the principles of democratic centralism, meaning that members would participate in the formation of policy and election of leaders, but

after a policy has been decided, all party members would be commanded to loyally carry it out. In Lenin's view, only such a well-disciplined, committed organization could succeed in fulfilling Marx's vision of a socialist society. Armed with such an idea, he forced a split in the Russian Social Democratic Labor Party in 1903, which eventually led to the creation of the Bolshevik Party.

Leninism was also mindful of the international nature of capitalism. In his work *Imperialism, the Highest Form of Capitalism* (1916), Lenin argued that capitalism inevitably gives rise to imperialism, as capitalists in more developed states search for more markets and opportunities for profits. Capitalism thus becomes a global phenomenon. The uneven development of the world economy—split between a developed core and a less-developed periphery—created, in Lenin's view, grounds for conflict among imperial powers and favorable conditions for socialist revolution in less-developed countries, where the nascent proletariat outnumber the native bourgeoisie. Arguing that Russia was the "weak link" in international capitalism, he agitated for socialist revolution there, believing, unlike Marx, that it would not occur first in the developed capitalist world because capitalists there can take advantage of their excess profits from imperialist ventures to placate the demands of their own working class. The fact that socialism can be brought to less-developed states necessitated a role for the peasantry in creating socialism, and Lenin encouraged an alliance of workers and revolutionary peasants, although in practice state and party officials were the dominant and privileged force within the Bolshevik Party and later the Communist Party of the Soviet Union.

Lenin committed the Bolshevik Party and, later, the early Soviet state to establishing a "dictatorship of the proletariat," under which the party would represent the true interests of the working class. In practice, this meant a single-party state and the ruthless suppression of other political movements and social organizations. In his lifetime Lenin also imposed a ban on factions within the party. Leninism thus became associated with the rule of the Bolsheviks (communists) in the Soviet Union, and, during and after the Russian Civil War (1917–1923), it was associated with the use of force against its political opponents in order to pursue its ideological objectives.

By virtue of Soviet influence on communist movements elsewhere, Leninism became both an ideological prism for understanding political and social relations and a mode for advancing the revolutionary cause. Lenin's inclusion of the peasantry as a revolutionary force would influence (among others) Chinese, Latin American, and Vietnamese communist movements, and the idea of a one-party state would remain political orthodoxy until the waning days of the Soviet Union.

Critics of Lenin, such as Rosa Luxemburg, objected to his stress on centralization and control at the expense of working-class spontaneity, and later opponents of Stalin, such as Leon Trotsky and his followers, would claim to be the true practitioners of Leninism or Marxist-Leninism. In the West, Lenin's ideas on the nature of capitalism and his ability as a party organizer were admired by some on the left, but most social

democrats rejected Leninism, seeing it as both based too much on violence and as an application of Marxism to a country with little or no democratic traditions and low levels of capitalist development.

Lerner, Max

Max Lerner (1902–1992) was an influential journalist, scholar, and public intellectual who made contributions to American political thought and culture. During his career, he held a number of faculty positions at leading colleges and universities. He resided the longest at Brandeis University, where he was on the faculty of the American Studies department for twenty-five years. Lerner published more than a dozen books and edited volumes on a wide range of topics. He also wrote introductory essays for a number of others. Lerner served as political editor at *The Nation* from 1936 to 1938 and contributed articles to a host of other magazines, journals, and newspapers.

Born Mikhail Lerner in Minsk, Russia, on December 20, 1902, Lerner immigrated to the United States with his family in 1907. He was a gifted student and received a BA from Yale University in 1923. After graduating, he enrolled in Yale Law School, but left after less than a year. He began reading the work of sociologist and economist Thorstein Veblen, which inspired him to begin studying the social sciences. Lerner earned a masters degree from Washington University in 1925 and his PhD from the Robert Brookings Graduate School of Economics and Government in 1927. After receiving his PhD, he served as managing editor for the *Encyclopedia of the Social Sciences.*

Most of Lerner's early work concerned the U.S. Supreme Court and its role in the New Deal and Great Depression. Two of his most prominent articles at the time were published in the *Yale Law Journal.* Each article was considered politically radical at the time. Both articles, "The Supreme Court and American Capitalism" (1933) and "Constitution and Court as Symbols" (1937), were indictments against the Supreme Court's economic jurisprudence and what Lerner considered indifference to socioeconomic issues affecting the country.

Lerner wrote pieces on a number of Supreme Court justices. Louis D. Brandeis and Oliver Wendell Holmes Jr. occupied most of his attention. Lerner's edited volume, *The Mind and Faith of Justice Holmes* (1943), helped to cement Holmes's reputation as a judicial heavyweight. Similarly, Lerner's work on Brandeis helped the justice to increase his stature in popular culture and the legal community.

Lerner's most well known and influential work was *America as a Civilization* (1957), a two-volume commentary and analysis of American culture, politics, and history. He made the claim that America is a distinctive and new civilization. The reception to the book was mixed. Some hailed it a great scholarly achievement, while others considered it muddled with no clear thesis.

From 1949 to 1992, Lerner was an outspoken liberal columnist for the *New York Post.* During that time, he wrote several thousand articles on a wide range of subjects. Commentators have noted that Lerner began his career on the left of the political spectrum and gradually moved toward the right. In his later years, Lerner became much more conservative, or as he termed it, "liberal centrist."

Despite his contributions, much of Lerner's work is no longer widely read. He passed away on June 5, 1992, after a long battle with cancer.

Lesbian, Gay, Bisexual, and Transgender Movements, Comparative

Concerted activist challenges to the oppression of sexual minorities date from the late nineteenth century, intensifying in the decades following World War II (1939–1945), and broadening across the globe from the 1990s on. From its beginnings, the movement has been based primarily in large urban centers, where anonymity and economic independence from family are more likely.

EARLY ACTIVISM

Scattered calls for legal reform and public acceptance emerged between the 1890s and 1930s, mostly in Europe. Germany's Scientific Humanitarian Committee was the preeminent campaigning organization, and Berlin the epicenter of cultural expression, until Nazis repression.

The brief period of political progressivism immediately following World War II spawned new gay activist energy in several European and American cities, resulting in groups like the Dutch Cultuur en Ontspannings-Centrum (Center for

Culture and Leisure) and the Mattachine Society and Daughters of Bilitis in various U.S. cities. The political, cultural, and religious changes of the 1960s opened up additional space for activist challenge, though still cautious and modest in scale.

LIBERATIONIST RADICALISM AND MAINSTREAM EXPANSION

A major activist surge under the banner of gay liberation swept over several North American and European cities from 1969 through the 1970s, more confrontational in its strategy, ambitious in its agenda, and successful in mobilization than anything before. The movement was influenced by feminism, parts of it by libertarianism, and, in Europe especially, by socialism. Most lesbians avoided male-dominated groups, working either through feminist groups willing to embrace sexual diversity or lesbian-specific groups. Despite the early influence of arguments that gender categories were socially constructed rather than fixed, significant parts of the movement mobilized on the basis of distinct gay and lesbian identities. This was most widely characteristic of the U.S. movement, but less pronounced in countries where class and other divisions were more politicized, such as in France and southern Europe.

Reformist activism did not disappear, but its objectives were broadened by liberationist visibility. That side of the movement grew slowly in the early 1980s in Australia, Canada, northwestern Europe, and the United States as modest political openings appeared in local politics and as leftist parties prepared to move from purely class-based frameworks and look for new constituencies.

AIDS RADICALISM AND POLITICAL MAINSTREAM

The devastation of the first AIDS epidemic threatened the limited gains made through the mid-1980s. At the same time, movement agendas and opportunities for intervention were expanded. By the next decade, impatience with slow response sparked a new wave of radicalism centered on AIDS. It was soon followed by a short-lived but influential wave of "queer" activism, making new demands or reinforcing long-standing ones with theatrical and confrontational tactics. The mid-1990s also saw more visible trans activism, forming distinct groups and claiming more than token recognition of gender identity issues within established groups.

By this time, in Western countries with long-standing lesbian, gay, bisexual, and transgender (LGBT) visibility, mainstream and reformist activism had overtaken transformative radicalism, though many groups contained elements of both. Activism had spread also into religious communities, labor unions, academic institutions, professional associations, media outlets, and ethnic minority communities. Few LGBT movements, however, displayed the institutional proliferation and the mobilization of resources so evident in the United States. In parts of Canada and Europe, new human rights frameworks and much-weakened church authorities allowed for the application of comparative modest resources to effect significant change.

GLOBALIZATION

The 1990s and 2000s saw dramatic growth of activism beyond the West. The catastrophic spread of AIDS in the global South was mostly fueled by heterosexual activity, but sometimes provided an important lever for lesbian, gay, and trans activists, dramatically so in Brazil. Transitions from authoritarian rule to democracy in the Iberian Peninsula, Latin America, South Africa, and Taiwan also created opportunities. In eastern and central Europe, the slow and partial incorporation of sexual orientation and gender identity into the European Union's rights framework created additional leverage for activists, especially in countries seeking EU membership.

Political networks have emerged even in the most dangerous of settings, in some cases aided by diasporic communities in the West. State repressiveness has intensified in parts of eastern Europe and Southeast Asia and in most of Africa, the Caribbean, and the Middle East. These governments and religious authorities frequently dismiss homosexuality as a Western intrusion and defend what they portray as national traditions.

Local activists usually blend indigenous frameworks with those gleaned from the experience of Australian, European, North American, and other movements. Some self-identify as lesbians, gay men, bisexuals, and transgendered in roughly the same way as their Western colleagues; others eschew those categories or blend them with more contextually specific characterizations of sexual difference.

There have been considerable similarities in the cultural and political agendas of activist groups around the globe, though in many countries, state repression or popular prejudice focuses attention on countering violence, eliminating legal or de facto criminalization, and claiming the right to meet or organize publicly. Movements have campaigned against media prejudice, demanded protections against workplace discrimination, and sought recognition of family rights, though marriage has not generally been as much at the center of such campaigns as in the United States and a few other Western countries. Trans rights are now widely included in these agendas.

The global spread of LGBT movements has been aided by the formation of transnational networks, the first of them spawned by the urgency of international responses to AIDS. Apart from AIDS, the most institutionalized transnational activism is in Europe, sustained by the EU's expanding human rights framework and subsidies for LGBT groups like the International Lesbian and Gay Association. Most other international networks remain small or fragile, though they have shown some capacity to mobilize when, for example, LGBT representation is needed in discussions or conferences sponsored by the United Nations. Established groups like Amnesty International and Human Rights Watch have added sexual diversity to their mandates, emphasizing the transnational profile of these issues.

Activist political claims have been most successful in Britain, Canada, the Netherlands, the Scandinavian countries, and Spain. Significant gains have been made in most other countries in western Europe, a few in central and eastern Europe, and several in Australia, Israel, Latin America, New Zealand, South Africa, and Taiwan.

Lesbian, Gay, Bisexual, and Transgender Political Participation

Lesbian, gay, bisexual, and transgender (LGBT) persons participated in electoral politics as voters, activists, and candidates. Of these activities, voting in elections is the most widespread form of political participation of all citizens in liberal democratic societies. The study of how both individuals and groups in society vote (for whom they vote and why) is the study of voting behavior.

Related to voting behavior are the questions of how LGBT candidates and issues have fared when facing the electorate and how state referenda seeking to extend or curtail gay rights have fared. Since the 1930s, electoral voting behavior has been analyzed by comparing certain demographic characteristics of voters and their patterns of support or opposition for issues and candidates. Some of the most common demographic characteristics included by political polls are race, ethnicity, gender, income, education, class, and religion. Historically, what were not included were questions regarding a voter's sexual identity or sexual orientation.

LGBT CANDIDATES

It is impossible to know historically how many LGBT elected officials have served in office in any nation. But in the 1970s, as public attention to gay rights grew, more LGBT candidates presented themselves for election. As early as 1961, José Sarria ran for the San Francisco Board of Supervisors and lost, but his candidacy helped to encourage greater LGBT involvement in politics. Some sixteen years later, Harvey Milk would win a seat on the same Board of Supervisors. In 1974, three years prior to Milk's election in San Francisco, Kathy Kozachenko was elected to the Ann Arbor, Michigan, City Council, making her the first openly gay elected official in the United States. Elaine Noble followed a few months later as the first openly gay state legislator, serving in the Massachusetts legislature from 1975 to 1979. In 2008, in Silverton, Oregon, voters elected the first openly transgender public official when they chose Stu Rasmussen to serve as town mayor.

As of 2009, there were currently three openly gay U.S. House members (eight others have previously been elected), and the number of LGBT elected officials grew from less than fifty to more than 450 in less than two decades. The Gay and Lesbian Victory Fund, established in 1991, has helped many of these candidates with fundraising and professional campaign support. In 2009 alone, they endorsed seventy-six openly LGBT candidates, the largest in their history. To receive support, candidates must demonstrate community support and a realistic plan to win; support federal, state, or local LGBT civil rights legislation; and, via the legislative or regulatory process, support privacy and reproductive rights. Between 2006 and 2008 more than 70 percent of the candidates endorsed by the Gay and Lesbian Victory Fund were elected, a percentage that has been growing since the mid-1990s.

While each year more LGBT candidates join the ranks of the more than five hundred thousand elected officials in the United States, they continue to face significant obstacles to election including explicitly homophobic campaigns. Despite significant progress in electoral politics, very few districts remain in which LGBT candidates are safe from such antigay attacks.

ELECTORAL PARTICIPATION

In the past twenty years, LGBT participation and activism has grown at the federal, state, and local levels. Beginning with the 1992 campaign for president, LGBT activists began to organize and fundraise for then-candidate Bill Clinton, who had pledged to end the ban against gays and lesbians in the military. He was the first major party candidate to add an openly gay advisor to his campaign team, and LGBT citizens came out to work on his campaign as they had never before. Some survey data suggest that the LGBT vote helped Clinton to win in Michigan and New Jersey, as well as gave him a comfortable margin of victory in California and New York.

A new hopefulness for the future LGBT inclusion in mainstream politics quickly faded, however, as President Clinton failed to lift the military ban and in 1996 signed the Defense of Marriage Act (DOMA), defining marriage as an act exclusively between one man and one woman. DOMA also provided that "no state needs to treat a relationship between persons of the same sex as a marriage, even if the relationship is considered a marriage in another state."

This second provision fueled an already ongoing explosion of LGBT activity at the state level as gay activists sought to pass civil liberties protections at the local level at the same time that anti-LGBT activists began to attack such provisions and outlaw future civil rights protections for gays through ballot initiatives and referenda. In 1992, in both Colorado and Oregon, voters were asked to codify a denial of equal protection for LGBT citizens into law. Although the Oregon measure failed and the Colorado amendment was declared unconstitutional by the Colorado and U.S. Supreme Courts, states continue to put the civil rights protections for LGBT citizens to a vote of the population. Six months after gay couples began to marry in Massachusetts in May 2003, eleven states voted on election night to ban gay marriage in their states. By 2009, thirty states had passed bans against gay marriage either through referenda or state legislative action, including a stunning 2008 state referenda defeat in California where gay marriage had previously been legal. More than any other minority group in history, LGBT persons in the United States have had their civil rights protections put to popular vote. Despite the high percentage of the population that tell surveyors that they believe in civil rights protections for gay people, in specific ballot questions, the anti-LGBT activists have continued to strip away or prohibit the passage or expansion of such protections.

LGBT VOTING BEHAVIOR

Throughout the 1970s and 1980s, as increasing numbers of candidates identifying as LGBT emerged, pollsters, potential candidates, elected officials, newspapers, and researchers all began to argue for the inclusion of sexual identity as a demographic category in political surveys. In the late 1980s and early 1990s, many major polls began to include these questions, but the data generated often came with serious caveats—some of which still exist today. The first problem paralleled a debate in LGBT scholarship that raged throughout the 1990s, when concerns emerged about what this new gay/lesbian/bisexual (GLB) variable measured. Was GLB a measure of personal identity, sexual acts, political coalition, or a combination of these factors? The second and more enduring problem is that it is probable that many LGBT persons are unwilling to identify themselves as sexual minorities to pollsters visiting the neighborhood polling stations where they live, creating a conjectured undersampling of their political perspectives and viewpoints, while possibly simultaneously skewing the results reported by heterosexual voters. Problems remain today: only 3 percent to 5 percent of voters identify themselves as GLB to pollsters. Most surveys do not include transgender as a demographic category, still further compounding any efforts to include transgender voter preferences. As a result of these problems, very few studies of LGBT voting behavior have been undertaken. The data that do exist are revealing, however. In national exit polls from 1992 through 2004, GLB voters were significantly more liberal in their social attitudes and reported votes than their heterosexual counterparts. Within this GLB group, lesbians are the most liberal, and, in one 1996 study of voting behavior, this has been attributed to the impact

of feminism. There was little difference between lesbians and gay men who identified as feminists while lesbians who did not identify as feminist held opinions that were much closer to their nonfeminist gay counterparts.

Recent polling data continue to suggest that GLB respondents are among the most progressive on social issues and are much more likely to support Democratic Party candidates. While Barack Obama won the presidential election with 52.9 percent of the vote, exit polls show that more than 70 percent of GLB voters chose him to be president. In a 2008 American National Election Studies Time Series survey of likely voters prior to the election, more than 80 percent of GLB voters preferred Obama. In the same poll, 58 percent of GLB voters supported national health care compared to 50.6 percent of "straight" voters. A significant 47.5 percent of GLB voters supported abortion under any circumstances compared to 39.5 percent of non-GLB voters. And most significantly, 68 percent favored a citizenship process for illegal aliens, while only 48 percent of their heterosexual counterparts favored such a process.

LGBT voters, activists, and candidates continue to be a growing part of the American political landscape. In some cities and urban areas, it is not possible to win election without their votes. As anti-LGBT referenda and ballot questions persist in the politicization of sexual orientation, group solidarity and political mobilization of LGBT voters will remain high, resulting in increased political activism, political participation, and fund raising within LGBT communities.

Lesbian, Gay, Bisexual, and Transgender Politics

The lesbian, gay, bisexual, transgender (LGBT) movement is a modern coalitional movement of people with a same-sex or bisexual sexual orientation, transgender people, and their allies. The movement has legal, social, cultural, and political

dimensions. Those who identify with it seek a wide range of ends that include equal protection under the law, social recognition, and self-determination in their intimate association. The dimensions and practices of the movement have changed considerably over its history, and in addition, they vary globally by nation and geographical region. A wide variation of laws, policies, cultural representations, and social attitudes affect LGBT people worldwide and make it difficult to draw conclusions that characterize either the state of the LGBT movement or the welfare or rights status of LGBT people.

Social and political activism on behalf of people with a same-sex sexual orientation began in Germany in the mid-nineteenth century. Activism emerged in Great Britain soon after, and by the early decades of the twentieth century a variety of groups and individuals advocated for social tolerance and the decriminalization of same-sex relations. Not all of these advocates were homosexual; psychoanalyst Sigmund Freud and the political philosopher John Stuart Mill were prominent Europeans whose attitudes toward same-sex sexuality were relatively tolerant for their time. However, the modern lesbian and gay movement did not begin until after World War II (1939–1945). The homophile movement of the 1950s and early 1960s was motivated by a diverse set of ideas, but it was assimilationist in its objectives when compared with the liberationist activism that followed. A key moment in LGBT rights history occurred in New York City in 1969 when police raided the Stonewall Inn and patrons fought back. Their resistance became a touchstone of an uncompromising gay liberation movement that influenced LGBT people in the United States, the United Kingdom, and elsewhere in Europe.

A decade after Stonewall, the first mass public rally for gay and lesbian civil rights was held in Washington, DC. The demonstration was largely ignored by mainstream media and policy makers. However, by the mid-1980s the movement became more visible because of its activism associated with the AIDS epidemic and the unresponsiveness of governments in the face of the epidemic. By the late 1980s, a social and political backlash inspired by the AIDS epidemic matured into a coordinated movement to contest civil and human rights claims lodged by LGBT people. In the 1980s and 1990s, groups such as OutRage!, ACT UP, and Lesbian Avengers practiced a confrontational form of political activism that relied on spectacle and rejected interest group politics.

Since the 1980s, the dominant mode of LGBT activism in many Western nations has invoked liberal philosophic ideals of toleration and individual rights as grounds for equality claims. Activists for LGBT rights have come to rely on an ethnic model of sexuality that treats minority gender and sexual orientations as immutable. This immutability thesis is strongly contested, albeit for different reasons, by some LGBT people and by religious conservatives who oppose gay rights. Another model of LGBT activism is associated with a "queer" movement that for many is allied with the academic subfield of queer theory. Taking its name from a common English-language epithet for homosexuals of both sexes, queer theory repudiates the status of heterosexuality as a binary referent for

a stable homosexual identity. As a result, queer theory and its related conception of political practice reject a lesbian and gay rights paradigm that is premised on the idea of stable sexual identity and that seeks social and political inclusion.

Some lesbian feminists reject queer theory and the political struggles that may be perceived to arise from it, understanding these as masculine-identified and potentially antifeminist. Many lesbians have pointed out that, although lesbians, gay and bisexual men, and transgender people have common interests in ending discrimination based on sexual orientation and gender identification, women who partner with women also have interests that diverge from those of other groups. Some issue areas in which women's and men's political interests have diverged are parental rights, sodomy laws, and women's health.

One complication in considering LGBT people as a group or as the subjects of a political movement is that many individuals engage in same-sex sexuality or gender-variant behavior but do not understand themselves as gay, lesbian, bisexual, or transgender. Scholars argue that although same-sex desire has existed throughout history, the identity *homosexual* is a relatively recent one that is the product of social and economic changes in modern life. In some cultures same-sex sexuality may be socially acceptable under prescribed circumstances, but this reality does not imply the existence of a movement that advocates for the civil or human rights of homosexuals or bisexuals as a group. An LGBT movement rests on two premises: the conceptualization of LGBT people as people who possess a stigmatized—if not immutable—identity, and the willingness of people to be characterized as bearers of a particular kind of identity for the purpose of advocacy in the public sphere. Many people who might be classified as lesbian, gay, bisexual, or transgender are skeptical of the collective conception of gender or sexual identity upon which rights claims are predicated. As a result, the existence of a "movement" of LGBT people is uneven around the world at the same time that human rights organizations advocate globally on behalf of LGBT people.

In addition to supporting the rights claims of LGBT people, feminists link rigid gender role expectations with normative heterosexuality and, thus, with opposition to LGBT rights. Feminists analyze the ways in which the maintenance of gender hierarchy and male dominance requires the suppression and stigmatization of same-sex sexuality. Besides gender, in heterogeneous societies, LGBT movements have had to confront identity differences of race, ethnicity, and religion among those with an LGBT identity. These differences challenge LGBT organizations to diversify their leadership as well as to recognize the ways in which people with dominant forms of identity may find it easier to use the movement to enact their political interests. In the United States, for example, African Americans have criticized the disproportionate influence of white people in LGBT institutions.

Bisexual and transgender people have always been part of the movement, but it was not until the late 1990s that the gay and lesbian movement began to explicitly incorporate such members and issues. Bisexuals argued that the traditional aims

of a lesbian and gay movement did not encompass the particularities of bisexuality and challenged lesbians and gay men to acknowledge bisexual identity and to incorporate bisexuals' interests and perspectives into the movement's agenda. Likewise, transgender people—a category that includes people who have undergone sex reassignment surgery, those who transgress traditional gender regimes, and some intersex people—have worked to expand the goals of the lesbian and gay rights movement beyond sexual orientation. Transgender rights activism is apparent around the world, most notably in Europe, North and South America, and South Asia.

OPPOSITION TO GAY RIGHTS

Like the LGBT movement itself, opposition to social recognition and rights claims has taken many different forms. Those who oppose rights and recognition for LGBT people most often point to traditional values, authentic cultural or national identity, or religious belief as grounds for their position that discrimination is a social good. Opponents of LGBT rights engage in a variety of practices that are consistent with the social contexts in which they are located. These include lobbying government officials, executing grassroots campaigns to influence law and policy formation, organizing public campaigns against same-sex sexuality and transgender identity, creating instructional materials that instruct followers in their view of same-sex sexuality and transgenderism, and engaging in formal and informal kinds of violence against LGBT people.

The most common foundations for opposition to LGBT rights emerge from the traditional wings of many world religions, including Judaism, Islam, and Christianity. An important political innovation in religious organization is that by the 1990s, opposition to LGBT rights encouraged an unusual degree of transnational cooperation between groups from these faith traditions to inhibit state recognition of LGBT identity and to uphold forms of legal discrimination. One public forum for gay identity that has come under criticism in many nations is the gay pride march, an event usually held in major cities. In 2006 alone, government officials in Latvia canceled a gay pride march after protests and threats of violence by a conservative Christian political party, and march organizers in Jerusalem bowed to violence and threats of violence by ultraorthodox Jewish protesters, substituting a rally outside the city for a march. In cases such as these, social pressures, rather than formal legal processes, are brought to bear to discourage mass demonstrations that either highlight LGBT identity or advocate for rights for LGBT people.

In some nations, opponents of gay rights operate in social and political environments in which rising tolerance for LGBT people threatens traditional forms of gender identity and heterosexual dominance. Hence, these social and religious conservatives work to reinforce the stigma associated with same-sex sexual behavior and identity and with nonnormative gender identity. The degree of stigma attached to LGBT identity varies widely. In the United States, some forms of tolerance have been rising, especially support for protection against discrimination in housing and employment. However, the lessened stigma associated with LGBT identity has not translated into public or official demand for laws such as the Employment Non-discrimination Act, first introduced in Congress in 1994.

In the United States, those who oppose LGBT rights mobilize supporters to influence public opinion as well as political processes. One component of the struggle against LGBT rights and recognition is the ex-gay movement, which advertises its ability to rehabilitate homosexuals and transgender people and return them to normative gender identity and heterosexual functioning. This movement is central to the struggle for LGBT rights because proponents of reparative therapies tend to decry the 1973 decision of the American Psychiatric Association to reclassify homosexuality from a mental disorder to a sexual orientation. In addition, leaders of the movement reject the legitimacy of both LGBT identity and civil rights. The ex-gay movement began in the United States in the 1970s, but branches are now active throughout North and South America and in many other parts of the world, including Brazil, the Caribbean, Germany, Hong Kong, the Philippines, Scandinavia, and the United Kingdom.

THE CURRENT STATE OF LGBT RIGHTS

In the United States, the struggle for LGBT rights takes place simultaneously at all levels of government in a federal system, with local ordinances and state and federal laws and court decisions constituting the multiple battle grounds for progay and antigay forces. Two Supreme Court decisions have had a profound effect on gay rights in recent decades. In 1986, in *Bowers v. Hardwick,* the court declined to find a Georgia statute outlawing sodomy unconstitutional. However, in 2003, the court issued a decision in *Lawrence v. Texas* that reversed the *Bowers* decision and located a right to sexual privacy in the due process clause of the Fourteenth Amendment of the U.S. Constitution. The *Lawrence* decision was a factor in mobilizing social conservatives to campaign against "judicial activism" and to pass laws and state constitutional amendments banning same-sex marriage.

Today, LGBT groups campaign for a broad array of issues: the repeal of discriminatory legislation, equal treatment in public institutions such as the military, hate crimes legislation, protection of LGBT youth, and equality in family policies and public entitlements. Around the world, LGBT people confront discrimination in employment, housing, education, public accommodations, and medical care. A principal arena for the struggle over gay rights in many democracies is same-sex marriage. Proponents of same-sex marriage point to a variety of grounds for extending marriage to same-sex couples: the central place of the institution of marriage in democratic citizenship; the importance of marriage—and the stability it fosters—for long-term adult relations and for the rearing of children; and the role of marriage in some countries in sponsoring eligibility for social welfare entitlements.

In the United States, a majority of citizens oppose extending marriage to same-sex couples, including some critics within the LGBT movement. For example, some queers and political supporters of LGBT rights have linked a political

interest in marriage with gay shame or with a moralism that stigmatizes nonconforming individuals. And some feminists have sounded a note of caution about same-sex marriage, arguing that enrolling same-sex partners in marriage as it is currently constituted threatens to reinforce social hierarchies and exclusionary forms of intimate association. These critics do not campaign against the right to same-sex marriage as a matter of policy but, rather, encourage members of the LGBT movement to be aware of the ways in which rights claims may result in the secondary marginalization of vulnerable members of LGBT communities.

In 2010, seven countries permit legal marriage between same-sex couples: Belgium, Canada, the Netherlands, Norway, South Africa, Spain, and Sweden. In the United States, same-sex partners have the right to marry in Connecticut, Iowa, Massachusetts, New Hampshire, Vermont, and Washington, DC. However, there remains vigorous opposition to same-sex marriage in the United States. The Defense of Marriage Act (1996) guarantees that American states are under no obligation to recognize same-sex marriages performed in any state that permits same-sex marriage. And in 2008, voters in the state of California supported Proposition 8, reversing a court ruling that had permitted same-sex marriages in that state.

Today, LGBT people enjoy the most legal protection of their rights in some states of the European Union. In early 2006, the European Parliament issued a resolution condemning member countries that do not protect gay rights. Members of the European Parliament from states that have legislated against lesbians and gay men remained intractable in the face of parliamentary criticism. Some countries of eastern Europe are sites of antigay harassment and open antigay mobilization on the part of political parties. By contrast, the United Kingdom's Civil Partnership Act of 2004 confers on same-sex couples parity of treatment on legal issues with opposite-sex couples who enter into civil marriage. A variety of other nations and jurisdictions, including some U.S. states, provide some version of civil union as a substitute for marriage for same-sex couples. Though civil unions provide many of the same benefits as heterosexual marriage, they are often contested by those who oppose LGBT rights, as well as by some LGBT people who believe that the civil union alternative to marriage stigmatizes same-sex couples and institutionalizes second-class citizenship for LGBT people.

Human rights organizations such as Amnesty International track violations of human rights that involve LGBT people. For example, sodomy laws criminalize same-sex sexual behavior in many nations, but LGBT people may be punished for a range of other offenses as well. Currently, LGBT people in many countries are at risk of legal punishments, including torture and the death penalty, for engaging in same-sex sexual behavior, being a transgender person, advocating for LGBT rights, or engaging in HIV/AIDS activism. Some countries, such as Bahrain, Grenada, Guyana, Jamaica, Lesotho, Namibia, Nigeria, Turkmenistan, Uzbekistan, and Zambia, only criminalize sex between men. In addition to formal legal sanctions for LGBT people and activism, LGBT people are frequently subjected to informal threats and violence from individuals and groups. At times, transgender people have been subjected to forcible sex reassignment surgery or subjected to violence because of their gender identity or expression. To commemorate and protest violence against transgender people, November 20 is recognized in cities around the world as an International Transgender Day of Remembrance.

Some nongovernmental organizations support the rights and welfare of LGBT people in the societies in which they operate and in international forums. However, organizations that advocate for LGBT people often do not occupy the same status as organizations that advocate against the interests of LGBT people. One site of struggle over LGBT politics has been the Non-governmental Organization Committee of the United Nations Economic and Social Council (ECOSOC), which has often voted to deny consultative status to national and transnational organizations that advocate for LGBT rights. While organizations that oppose the interests of LGBT people have attained consultative status with the ECOSOC and used the status to advocate for conservative morality politics at the United Nations, countries whose antigay practices have been criticized by organizations such as the International Lesbian and Gay Association have often opposed consultative status for LGBT groups.

The LGBT movement continues to publicize and confront the forms of discrimination and violence that affect the lives of LGBT people. The movement also provides support to LGBT people and their families. To these ends, members engage in a wide variety of activities that include lobbying and legal advocacy, marches and community events, therapies and support groups, and the production and dissemination of news and culture.

Lesbian, Gay, Bisexual, and Transgender Rights

Gay rights are also referred to as LGBT rights or LGBTQ rights to encompass lesbian, gay, bisexual, transgender, and queer identities within gay communities. The gay rights movement in the United States can be traced from 1924 with the first known gay rights organization, the Society for Human Rights in Chicago. An objective of the Society for Human Rights was to draw together gay communities and to educate lawyers and lawmakers on gay-related issues.

Since 1924, gay rights in the United States have witnessed setbacks and achievements. In 1951, the Mattachine Society was formed by Harry Hay, a worker on the Henry Wallace presidential campaign. Hay likened the plight of homosexuals in America to an oppressed minority. Though the concept of gays and lesbians as minorities is still debated today, the "minority concept" brought cohesion to the gay rights movement. The Mattachine Society and its pioneering lesbian counterpart organization, The Daughters of Bilitis, are credited as being the first national gay rights organizations in the United States.

After the formation of national, organized groups, there was civil unrest within gay communities for recognition. The Stonewall riots in 1969 in New York's Greenwich Village moved gay rights from a localized effort and focus to a more widespread movement for gay civil rights, equality, and societal acceptance. Approximately four years after Stonewall, the American Psychiatric Association removed homosexuality from its list of mental disorders in 1973 and issued a strong statement supporting gay rights. Twenty years later, the U.S. military established the policy of "Don't Ask, Don't Tell," allowing gays and lesbians to serve in the military but banning the open practice of homosexuality.

The politics of gay rights in the United States is played out by various actors, including legislators, individual actors, the state, and the courts. In the early 1980s, for example, the state of Wisconsin was the first to include *sexual orientation* in the list of prohibited discrimination. Supreme Court cases have had a particular impact on the gay rights movement in terms of setbacks and triumphs. In *Bowers v. Hardwick* (1986), the Supreme Court upheld the constitutionality of a Georgia sodomy law that criminalized oral and anal sex between consenting adults in private when applied to homosexuals, but seventeen years later, in *Lawrence v. Texas* (2003), the court struck down a Texas sodomy law, thereby overruling *Bowers v. Hardwick*. The *Lawrence v. Texas* ruling invalidates laws in the United States that criminalize oral and anal sex between consenting adults acting in private, whether homosexual or heterosexual. In *Romer v. Evans* (1996) the Supreme Court banned a Colorado state constitutional amendment that would have prevented sexual orientation from being included in lists of prohibited discrimination under Colorado law.

While much of the battle for gay rights has been contested in courts, states also have been actively involved in shaping the legal rights of LGBT persons, especially in regards to the question of marriage. In 2000, the state of Vermont was the first state to recognize and legalize civil unions between gay or lesbian couples, giving them entitlements to the same benefits, privileges, and responsibilities as spouses. Several states have followed Vermont in recognizing same-sex civil unions, including Connecticut in 2005. Other states have pushed beyond civil unions to recognize same-sex marriage, beginning in 2004 with the state of Massachusetts. As of 2010, the federal government seemed to prefer to leave the issue to individual states, although Congress did approve a law legalizing same-sex marriage in the District of Columbia, the nation's capitol.

This increase in gay rights has brought on a conservative backlash led by religious activists, particularly opposing the "redefinition of marriage." Referenda to legally recognize gay marriages have been repeatedly defeated. As of 2010, thirty states have passed amendments to their state constitutions to ban same-sex marriage, including California, where voters narrowly overturned a prior California Supreme Court ruling. States like Arkansas have adopted measures to bar gay men and lesbians from adopting children.

As authors Haider-Markel and Meier discuss in "The Politics of Gay and Lesbian Rights: Expanding the Scope of Conflict" (1996), as the scope of the conflict of gay rights expands in the United States, then we most likely will see a morality politics model (where policy is a function of religious forces, party competition, partisanship, and education) where political influence is played out at the ballot box.

Lesbian, Gay, Bisexual, and Transgender U.S. Legal Questions

The 2003 landmark case of *Lawrence v. Texas* is perhaps the most important U.S. Supreme Court case concerning gay and lesbian rights and liberties to date. Although the 1996 case of *Romer v. Evans* was pathbreaking in its own right, ensuring that state referenda could not preempt localities from recognizing gays' and lesbians' civil rights if they so chose, *Lawrence* justly has been deemed the *Brown v. the Board of Education* of the gay and lesbian movement. In *Lawrence*, the U.S. Supreme Court found unconstitutional a Texas law that criminalized private same-sex sodomy (i.e., anal or oral sex). In doing so, the court overturned *Bowers v. Hardwick* (1986), which held that the court would defer to the states on all such questions, having the effect of upholding laws criminalizing sodomy in twenty-five states. Relying on the due process clause of the Fourteenth Amendment, as well as important privacy precedents such as *Griswold v. Connecticut* and *Planned Parenthood v. Casey*, the court declared in *Lawrence* that the right to privacy included nonpublic, same-sex intimate conduct between consenting adults.

The victory in *Lawrence* reignited gay and lesbian demands for equal marriage rights, which had been sought in the United States since at least the early 1970s. This first wave of demands was uniformly rejected by various state courts on the grounds that marriage was reserved for one man and one woman and that as such all citizens could participate in it if they so chose. The second wave emerged during the early 1990s in Hawaii, whose courts recognized the right to same-sex marriage, only to be overturned by a constitutional amendment passed by a referendum that had the support of an overwhelming majority. In apparent reaction to the possibility that one or several states might soon recognize same-sex marriage, Congress passed the Defense of Marriage Act (DOMA) in 1996 to clarify that the federal government would not recognize them. Many states also passed similar statutes and constitutional amendments to that same end, which have sometimes been called "mini DOMAs." The third wave began in 1999 when the Vermont Supreme Court declared in *Baker v. State* that gays and lesbians should have equal access to the same rights and benefits as heterosexual couples. This led the state legislature to institute a parallel system of civil unions for gays and lesbians. In 2003, the Supreme Court of Massachusetts declared in *Goodridge v. Department of Public Health* that denying marriage licenses to gay couples violated the state constitution. To date, none of the many attempts to amend the Massachusetts Constitution to overturn this ruling have been successful.

Because earlier cases such as *Stefan v. Perry* (1988), which excluded gays from openly serving in the military, were largely based on the criminalization of sodomy upheld by *Bowers*, there has been some speculation in the wake of *Lawrence* that Congress might lift the ban. This speculation increased when the United States initiated a war with Iraq (as military exclusions of other minority groups have historically been relaxed when there is a greater demand for troops), and again in 2006 when the Democrats took control of Congress. Public opinion polls also indicate that a majority of the U.S. public favor overturning the current policy. Informally known as "Don't Ask, Don't Tell," it has been upheld in federal court several times since its inception in 1993. It allows gays and lesbians to serve in the military, but only if they are not open about their sexual orientation, on the grounds that open service would undermine morale and unit cohesion.

Transgender issues also have been important in the LGBT movement for equal rights. Earlier concerns included arrests for cross-dressing, while more recent cases have addressed a variety of family concerns (such as marital status and child custody), public funding for sex reassignment surgery, and discrimination in employment. While the transgendered have been included in earlier versions of the Employment Non-discrimination Act (ENDA), a bill that was originally introduced in Congress in 1976 to protect gays and lesbians against workplace discrimination but has yet to pass, the most recent version has excluded transgendered people from protection, despite the fact that all of the principal LGBT legal organizations have lobbied against such an excision.

Liang Qichao

Liang Qichao (1873–1929) was a scholar, journalist, translator, reformer, and historian in China during the Qing Dynasty. His works are a commentary on one of the most eventful eras marking the transition of China from monarchy to republic.

After obtaining his juren degree in 1889, Liang became a student of scholar and intellectual Kang Youwei. He worked

closely with Kang throughout the Reform Movement of 1895 to 1898, editing important journals related to the movement and serving as academic director of its flagship *Shiwu Xuetang* (*Academy of Current Events*). After the conservative coup of 1898 that ended the movement, he was exiled to Japan where he remained for fourteen years while continuing to promote a constitutional monarchy in China. He edited the journals of the Society to Protect the Emperor, *Qingyi Bao* (*Topics of the Day*) and *Xinmin Congbao* (*New People*). Liang's lucid style of writing made him extremely popular, and more than fourteen thousand copies of *Xinmin Congbao* were smuggled into China every week from Japan. However, Liang's influence declined after 1905 and his commitment to gradual evolutionary change lost its appeal to Chinese youth. By 1911 he was calling for the overthrow of the Manchu rulers, whom he had supported until then. He returned to China in 1912 after the collapse of the Qing Dynasty and served in the cabinet of Yuan Shikai, the first president of the Republic of China. In 1913 Liang led the formation of the Progressive Party (*Chin-pu-Tang*). However, when Yuan attempted to declare himself an emperor in 1916, Liang helped to force him to relinquish his throne and restore the republic.

Liang retired from politics in 1917 to pursue his academic interests. In 1920 he became a professor of history at Nankai University in Tientsin. He was one of the most prolific men of letters in the late Qing and early Republican era, writing on everything from Buddhism to modern fiction. His complete works were published as *The Collected Works of Yinbingshi* (1936).

The early twentieth century was one of the most tumultuous periods in Chinese history. The Chinese empire was in its death throes and China itself faced dissolution at the hands of Western powers. At this time, Darwinian ideas were beginning to permeate Chinese intelligentsia and Liang became a powerful voice for Darwinism, calling on the Chinese nation to adapt itself to adverse environments. One of his favorite words was *new* and he tried to portray the necessity of making everything new. He also promoted the theory of survival of the fittest during his tenure as editor of the newspaper *Shiwubao*. He defended the Manchus, who were thoroughly detested by the Chinese, and spoke for the monarchy against those who advocated its overthrow. Later in life he split with Kang, who considered Confucianism essential to maintain China's cultural integrity. Liang, on the other hand, saw Confucianism as the obstacle to modernization.

Liberal Democracy

The term *liberal democracy* usually refers to a system of representative government involving the rule of law; competitive multiparty elections for office; limited government powers; protections for private property and for basic individual rights such as free speech, freedom of the press, and freedom of religion; and a sphere of civil society that is distinct from the sphere of politics. The use of the words *liberal* and *liberalism* in politics dates from the postrevolutionary period in France, when writers such as Benjamin Constant applied a term that had been used to describe a certain sort of religious belief to politics. These writers used the term *liberal* to refer to a platform that was primarily concerned with individual liberty, that was open-minded about new institutional solutions to secure this liberty, and that avoided the extremes of both reactionary monarchism and Jacobin republicanism. Liberalism was then associated with constitutional monarchy, and even today most people would classify monarchies such as those found in the United Kingdom and Spain as liberal democracies.

Today the single most common criterion used to determine whether a government is a liberal democracy is whether fair and competitive multiparty elections are held at set intervals. But many observers have suggested that there ought to be a more robust set of criteria. Suggestions abound as to what those criteria should be, but one influential theory was advanced by political scientist Robert Dahl, who elaborated a concept of *polyarchy* based on a number of different and intersecting scales with which to evaluate a particular country's success in meeting the broad goals of liberal democratic government.

During the twentieth century it was common to explain major world conflicts as wars between liberal democracy and the alternatives of fascism and communism. With the end of the cold war, it therefore became possible to entertain the Hegelian thesis that there were no serious alternatives to liberal democracy left, as Francis Fukuyama suggested in his much-discussed article "The End of History?" Controversy about liberal democracy has not abated, however. Critics continue to suggest that it is a bourgeois form of government in which an oligarchic minority uses its resources to gain access to political office, protect their own property interests, and rule over the majority. Also, the emphasis on individualism implicit in a liberal scheme of rights has been associated with a particular cultural heritage, one that may not be appropriate for all societies. In particular, societies with strong communal traditions may regard the individualism that is a premise of liberal democracy as a threat to the cohesiveness of their community groups. In some cases, such as India, a liberal democratic set of institutions has been modified and adapted to allow for a greater degree of communal control over some parts of the law, as for example when civil law recognizes particular minority communities as distinct subjects and allows traditional courts to adjudicate some matters of dispute.

Perhaps the most interesting theoretical questions about the term *liberal democracy* concern the relation between the

two words: liberalism seems to constrain democracy because a majority is not empowered to violate either the individual rights or the procedures enshrined in the constitution. In addition, the importance of delegation and representation in liberal governments can seem at odds with a democratic interest in widespread political participation beyond the mere act of voting. Indeed, elections were viewed in ancient Greece as an oligarchic or elitist institution because they selected a few citizens to rule the rest. On the other hand, liberal democracies are often justified in the language of popular sovereignty and equality, and political life within such systems of government is filled with claims and counterclaims about which policies adequately and accurately represent the popular will. Both liberty and equality are essential values in liberal democracies, and if they sometimes seem to come into conflict with one another, that conflict is partly constitutive of the form of government itself.

A final area of interest is the question of what sorts of religious beliefs and practices are most compatible with liberal democracy. While some scholars accent the Judeo-Christian roots of this form of government, others argue that there are traditions in Islam and in various religions of Asia that should be equally congenial to liberal democratic rule. The question of whether liberal democracy is a form of government suitable for all societies, or whether it is historically, culturally, or religiously specific, remains an open one.

Liberalism, Classical

Many Americans associate the term *liberalism* with, for good or ill, such emotionally charged topics as big government, welfare, socialism, and civil rights. It is axiomatic that the meanings of political labels can change over time. Liberalism is no exception to this rule. This entry briefly reviews the origins of liberalism and what constitutes *classical liberalism* as it was generally understood at that time, which is different than its meaning in recent American politics.

ROOTS AND BRITISH PIONEERS

Liberalism has a long and distinguished history, starting with the philosophers of ancient Greece and Rome. In the development of the understanding of politics throughout Western history since the time of ancient Greece and Rome,

political philosophy has considered the place of the individual in a society or political system. In many, if not most, political philosophies, the individual has been sacrificed or has been subordinate to the good of the state. However, the good of the individual has occasionally been considered central; it is this focus on the individual that characterizes the common thread of liberalism in all its forms. This common thread can also be described as the value of liberty (both *liberty* and *liberalism* come from the Latin root *liber*, meaning "free") and the minimization of government interference in civil society. Associated with liberalism is the concept that humans have an inherent goodness and rationality.

During the European Enlightenment of the seventeenth and eighteenth centuries, the threads of liberalism began to coalesce into a somewhat coherent political philosophy. Enlightenment philosophers emphasized reason and the nature of the individual man and society, which formed the basis for liberal thought. A number of philosophers epitomize this search, beginning with Thomas Hobbes (1588–1679), a British philosopher. In his masterpiece, *Leviathan*, Hobbes posited that life in a state of nature was "brutal, nasty, and short." Nevertheless, he recognized that man was an individual prior to society, one of the first philosophical recognitions of man as an individual. Hobbes argued that those individual men, through handing their self-rule over to the sovereignty of the government, formed a social contract for their mutual protection.

Hobbes was followed by John Locke (1632–1704), a British physician and philosopher commonly known as the "father of liberalism." Locke's most famous political work was the *Two Treatises of Government*. Like Hobbes, Locke advocated a social contract theory of political life, where men formed governments to ensure peace, but he placed a greater emphasis on individual liberty. In his "Essay Concerning Human Understanding," he expanded on the notion that men were individuals and that they had inherent value separate from the state. Locke presented a natural law theory that men had the natural rights to life, liberty, and property.

Following Locke and Hobbes were a number of continental philosophers who characterized the focus on the individual during the Enlightenment. Jean Jacques Rousseau (1712–1788), a Genevoise philosopher, wrote *The Social Contract*, describing the creation of a society in which men formed governments for the befit of all men, which became a great influence. Baron Montesquieu (1689–1755), a French political philosopher, penned *The Laws*, advocating the separation of powers in government to protect the people, which heavily influenced the American Founders in the writing of the U.S. Constitution. The Scottish Enlightenment included philosopher Adam Smith (1723–1790), whose book *The Wealth of Nations* helped launch the modern discipline of economics, through his theory of a free market, where individuals pursued their own self interest in such as way that would benefit all society.

LIBERALISM AS A LABEL SPREADS

These accomplished philosophers, who lived prior to and during the Enlightenment, were the forerunners of what is known as classical liberalism. Until the early nineteenth

century, the political philosophy of liberalism was not so-named and was a reaction to the abuses of the clerical system of rule and feudalism. The term *liberalism* did not come into use until the early 1800s in Spain, when a general opposition to the clerical establishment developed. From Spain, the label of *liberalism* traveled to the continent and then to England.

From the Enlightenment, some authorities recognize that liberalism, as a political philosophy, went through several stages. Initially, the middle class was in a form of revolt against the established political and economic powers. The middle class had increased its share of the economic wealth but had not had a corresponding increase in its political power. At that time, the middle class began to seek more say in the economic and political affairs of society. This period generally lasted until the early 1800s. The period between approximately 1830 and 1865 is considered the heyday of classical liberalism as a philosophy. Classical liberalism is based on the idea that individuals are independent beings and have free will. This concept of liberty is explained by John Stuart Mill (1806–1873), a British philosopher, in his classic work, *On Liberty*, which illustrates that the notion of liberty is not just freedom from the government but from other people, too. It explains the idea of human individuality and independence.

Classical liberalism is associated with the idea that human beings must be free and subject to the barest minimum of restrictions. Thus, government could be considered evil if it excessively intruded on individual liberty. For John Locke, government should only be allowed to impose regulations to protect a person's life, liberty, and property. It is interesting to note that in classical liberalism, property was very important, as opposed to the more recent variants of liberalism, which focus less on property rights. For Adam Smith, who opposed government regulation, government should be limited to three activities: (1) protect society from external violence and invasions, (2) maintaining internal peace and order and a reliable system of justice, and (3) maintain certain public works to assist individuals in society in their pursuit of their individual interests.

EVOLUTION OF THE TERM

From 1865 until the early twentieth century was the period of *democratic liberalism,* when a greater number of people (the middle class) began to be involved and claim their rights and power in politics with the concept of the individual and liberty as a prime concern. Since the start of the twentieth century, liberalism developed into what is known as *welfare liberalism,* wherein the government is assumed to be responsible for the well-being of individual people through such programs as: pensions, minimum wage, limited work hours, and free education. As welfare liberalism considers the state responsible for the moral and material welfare of the people, its conservative critics compared it to socialism, and even in the early twenty-first century, many Americans consider the term *liberal* an insult or even synonymous with communism. Ironically, however, many contemporary conservatives, at least in the United States where the American founding is revered, are actually liberals in the classical sense.

CONCLUSION

In sum, classical liberalism is based on the works of John Locke and the thinkers of the Enlightenment. Thus, classical liberalism is very different from welfare liberalism and closer to the contemporary perspective of libertarianism. It is a political philosophy that maximizes individual freedom and minimizes government regulation. It is not a philosophy in which the government is considered to be a protector and benefactor of individual morality and material needs.
